Moreover, small medical firms are also the backbone of the economic development of a country through their contributions of taxes to Tanzania Revenue Authority, to reducing unemployment, and to export value. Furthermore, small medical firms form a sector where in the basics of entrepreneurship are practiced in producing entrepreneurs who can catalyze the economy to become, allowing the country to face a competitive world (Misoska et al., 2016). Therefore, it is very relevant to examine factors that affect the performance of small medical entrepreneurs. Among the factors that capture the attention of researchers is the aspect of financial literacy among small medical entrepreneurs.

Financial literacy skills represent an important organizational resource providing benefits to the organization. Gavigan (2010) highlighted that financial literacy skills link business

financial resources with financial products and services. Furthermore, financial literacy allows for sensible financial decision-making to attain financial wellbeing (OECD INFE, 2011). Adomako et al. (2016) suggested that the financial literacy possessed by entrepreneurs constitutes the firm's internal ability to access finance aimed at achieving superior growth. Sucuahi (2013) highlighted that entrepreneurs with a good financial foundation can be an important barometer of business success and growth in a competitive business environment.

When entrepreneurs lack financial literacy can lead to the failure of a business (Niederauer, 2010). As knowledge of financial management is an important aspect in ensuring the firm's financial stability (Talib et al., 2017), it is an essential instrument for small medical enterprise's success (Fernandes, 2015; Kimunduu et al., 2016). Ahmad Rafli et al. (2007) stated that financial literacy is a key support function that plays an important role in determining the life of an entity apart from its core functions (e.g., the offering of products or services). A lack of financial literacy usually has no significant impact at an early stage but turns out to have a decisive impact on the enterprise's growth and sustainability in the long run.

Past studies have shown empirical evidence that a relationship exists between financial literacy and business performance. Dahmen and Rodriguez (2014) found a link between financial literacy and SME performance in Florida, USA. They explained that firms with good financial literacy can identify and respond to climate change in business, economy, and finance. Thus, the decisions made will create innovative and effective solutions for business performance improvement and sustainability.

A study conducted on a soapstone business in Kenya found that the training related to financial literacy has a positive impact on businesses' financial performance (Salome and Memba, 2014). Additionally, other studies in Kenya (e.g., Chamwada, 2015; Cherugong, 2015; Kimunduu et al., 2016; Muraga and John, 2015; Njoroge, 2013; Sabana, 2014) have also shown that financial literacy has a relationship with SME performance.

A study in Portugal shows that a high level of financial literacy possessed by business owners will contribute to better small medical enterprises' performance. This study also identifies the need to strengthen financial education for SME entrepreneurs (Fernandes, 2015). As stated by Aribawa (2016), entrepreneurs with good financial literacy will be able to achieve business objectives, have a business development orientation, and survive in difficult economic conditions. Draxler et al. (2014) assumed that a small medical enterprises owner will be involved in complex and strategic financial decision-making to achieve business objectives and sustainability. In addition, the findings of studies conducted in Central Java, Indonesia are consistent with findings that show a significant relationship between financial literacy and business performance (Aribawa, 2016).

However, findings from previous studies remain inconsistent and vague. In fact, some studies show no association between financial literacy and business performance (Bruhn and Zia, 2011; Eresia-Eke and Raath, 2013; Menike, 2018). Thus, reassessing the impact of financial literacy on small medical enterprises performance is worthwhile in emerging countries like Tanzania. Therefore, this study will include these variables in the small medical firms's

performance model as control variables to estimate the causal effect of financial literacy on business performance.

Regarding the manager profile, age, gender, and education of entrepreneurs were found to influence small medical enterprises business performance (Essel, 2019). Essel (2019) explains that most entrepreneurs have low formal education and face constraints in terms of technical training; thus, the success of small medical enterprises is highly dependent on the age and education of the entrepreneur.

Accordingly, older managers achieve better business performance (Faye, 2017). Moreover, Shava and Rungani (2016) confirmed that male-led small medical enterprises outperform female-led small medical enterprises, while Ndlovu et al. (2018) showed that the influence of owner-manager experience and level of education has a strong relationship with business performance. As such, small medical firm owners can employ human capital, which gives them a competitive advantage. Stelate et al. (2018) found that manager experience plays an important role in a successful small medical firm. Experience helps managers to make the right decisions in business.

Furthermore, the experience gained is in line with the age range and educational background achieved. Although Cowling et al. (2017) suggested that the entrepreneurial experience does not have any impact on sales growth among small medical enterprises in the UK, little impact on employment growth was observed. They also found that level of education is insignificant in influencing business performance. Firm characteristics such as firm size, firm age, business sector, and type of ownership have also been examined as driving factors for firm performance in the past literature. Generally, larger firms perform better than smaller firms, due to the economy of scale (Sellers and Alampì-Sottini, 2018). Empirical evidence can be seen from Cowling et al. (2018) in their study of 3167 SMEs in the UK after the global financial crisis of 2008-2009. Consistently, the analysis of 723 wineries firms in Italy showed a positive effect of firm size on firm performance (Sellers and Alampì-Sottini, 2018). On the other hand, Zhang (2007) suggested that small firms surpassed larger firms among Chinese listed companies.

However, Radipere and Dhliwayo (2014) found no significant effect of firm size on business performance among SMEs in the retail industry. Regarding firm age, Mallingu et al. (2020) found that older firms outperformed younger firms in Kenya. Consistently, firm age has a positive relationship with employment growth but is insignificant regarding the growth of sales among 200 small-scale firms in Ghana (Essel et al., 2019).

Furthermore, Radipere and Dhliwayo (2014) suggested a positive link between firm age and business performance; however, further analysis revealed that the effect of firm age disappears after 20 years of operation. On the other hand, Cowling et al. (2018) found a negative association between firm age and business performance, as measured by sales growth in the UK. In other words, younger small medical enterprises performed better than older small medical enterprises especially those aged above 10 years.

The business sector in which small medical enterprises operate is another firm characteristic that has been examined in past studies on the effect on firm performance. For instance, Mallinguh et al (2020) found that the business sector has a substantial effect on financial performance among 146 medium-size firms in Kenya. Similar findings were reported by Essel et al. (2019) in their study of small-scale firm performance in Ghana.

Consistently, the business sector has strong predictive power for small medical enterprise performance in Pretoria, South Africa (Mothibi, 2015). Several studies have also assessed the type of ownership to anticipate firm performance. For instance, Obasan et al. (2016) found a strong positive association between insider ownership and firm performance in Nigeria. Consistently, Chu (2009) discovered that family ownership had a positive correlation with business performance. However, Mallinguh et al. (2020) and Essel et al. (2019) found no evidence of the effect of ownership on firm performance.

Summary and Conceptual Framework

The review of past studies has shown the influence of financial literacy on business performance, although the empirical evidence remains vague. Therefore, this study proposes a conceptual framework as shown in the figure below. Furthermore, the Resource Based View (RBV) is employed to support the conceptual framework. The internal organizational resources refer to the strengths and weaknesses that exist in a particular firm (Wernerfeldt, 1984). These include the assets, capabilities, information, and knowledge that are controlled (owned) by the firm in question (Barney, 1991; Wernerfeldt, 1984).

Therefore, the competitive advantage of a business comes from internal resources. In other words, any useful resources that can be obtained by a business would determine the competitive advantage of that firm over others. The RBV holds that firms competitive using the resources and capabilities available within them (Peteraf and Bergen, 2003).

Furthermore, Khotimah (2014) highlighted that the RBV sees firms as groups of resources and capabilities. In a broader view, the RBV focuses on the firm's ability to maintain a combination of resources that cannot be owned by or built in the same way by competitors. According to Adoma ko et al. (2016), financial literacy possessed by an entrepreneur would enhance the firm's internal ability to access financing for future growth. Therefore, financial literacy can be seen as an internal capacity of the firm to achieve a competitive advantage.

Based on the review of the past literature and the proposed conceptual framework, this study hypothesizes that: Financial literacy positively influence SME performance.

2.2 Empirical Literature Review

An empirical literature review on the assessment of financial literacy levels among entrepreneurs reveals key insight from existing research. Numerous studies underscore the critical role of financial literacy in entrepreneurial success, emphasizing its impact on decision making, risk management and overall business performance.

Some studies explore how demographic factors such as age, education and prior business experience can influence the financial literacy levels of entrepreneurs, providing insights into potential disparities. Empirical evidence suggests a positive correlation between higher levels of financial literacy among entrepreneurs and improved business performance including increased profitability and sustainability.

3.0 Research Methodology

The research employed quantitative techniques. Quantitative data was gathered through surveys assessing entrepreneur's financial knowledge, practices and decision-making abilities. This methodology aimed to provide a comprehensive assessment of financial literacy levels among entrepreneurs and offer nuanced insights for effective interventions.

3.1 Research design

A cross-sectional research designs was used in this research. It involved collecting data from participants at a single point in time. In this case the study aimed to assess the financial literacy levels of medical entrepreneurs at a specific moment.

The cross-sectional design allowed for the examination of relationship patterns or trends within a diverse sample of entrepreneurs. Surveys and interviews conducted during this period provided a snapshot of the financial literacy landscape among the target population. Additionally, a cross-sectional design is often more practical and feasible for studies aiming to understand the current state of a phenomenon such as financial literacy among a specific group.

Geographical coverage of Katavi region

Katavi region lies between latitudes 5° 15" to 7° 03" South of the equator and longitude 30° to 33° of East of Greenwich. It is boarded by Urambo district (Tabora) to the North, Sikonge district (Tabora) to the East, Chunya district (Mbeya) to the East, Nkansi district (Rukwa) to the South, Sumbawanga district to the South-East, Democratic republic of Congo to the West

(Separated by Lake Tanganyika) and Kigoma to the Northwest. It has a total area of 45,843 km².

Population size and growth

Based on population census reports of 2022, Katavi region has a population size of 1,152,957 people, population density of 25.15/km² and an average annual population change of 7.4% in a period of 10 years from (2012 -2022). 50% of the population (569,902) are male and 49.4% of the population (583,056) are females. 76.7% (883,999) of the population lives in the rural areas while 23.3% (268,959) of the population lives in urban areas. 50% of the population (576,514) have age group between 0-14 years, 47.7% (549,719) have age group of 15-64 years and 2.3% (26,725) have age group of 65 years and above (Tanzania National Bureau of Statistics).

Research sample, sample size and sampling techniques

3.2 Research sample

The research sample was obtained from the populations of medical entrepreneurs in Katavi Region. According to Statistical Business Report of 2014/2015, the population of entrepreneurs in Katavi is 1918. Tare Yamane formula was used to calculate the sample size.

3.2.1 Sample size

The sample size, $n = N / 1 + N (e^2)$

Where,

n - Is the required sample size

N - Is the population of entrepreneurs in Katavi region which is 1918.1.0

e -is margin error which is 0.05

So, the sample size that was used in this research is 200 medical entrepreneurs.

3.3 Sampling techniques

A random sampling technique was used to select the participants of the study.

Description randomly selected entrepreneurs from the entire population were selected. Rationale provides an unbiased representation of the population assuming truly random selection process

3.4 Data collection methods and tools

3.4.1 Data collection methods

Data collections methods refer to ways used to gather information from the participants. The following data collection method was used in this study.

3.4.2 Survey method was used to collect data

3.5 Data collection tools

Structured questionnaires covering key financial concepts and practices were used to assess the financial literacy levels in three financial variables which are financial knowledge, financial attitudes and financial behaviors.

Survey methods are widely used in the study of business, because business is a social phenomenon involving many performed transactions, and the data needed to make decisions come from humans. Accordingly, a questionnaire was developed containing four sections, labeled A, B, C, and D. The sections in the questionnaire are designed to obtain information on the constructs shown in Table 2.

Table 2: shows Parts of the questionnaire

Part	Details
A	Respondent's profile
B	Firm Profile
C	Financial literacy
D	Business performance

Parts A and B contain the respondents' and firm's profiles, respectively. The questions in this section are closed-ended questions with a predefined response format. Meanwhile, the development of questions in Parts C and D, regarding financial literacy and small medical enterprises business performance, respectively uses uni-dimensional methods. According to this method, the measured variables have been hypothesized by relating them to a single construct (Azizi, 2009). For Part C, this study opted to adopt and adjust the instruments developed by Sabana (2014) to represent financial literacy, as shown in Table 3.

The items and dimensions used by Sabana (2014) are more comprehensive than the measurements used in other studies, as they include the dimensions of insurance literacy and mathematical knowledge, which have rarely been considered in measuring financial literacy in other past studies. Performance measurement (Part D) is based on respondents' perceptions of the financial position of the small medical enterprises. The selection of this subjective measurement was made for the following reasons.

Firstly, obtaining financial data from small medical firms is difficult. For small medical enterprise owners/managers, financial data are a sensitive matter, and they tend to provide inaccurate financial data (Khan et al., 2014). Thus, the financial data provided by small medical entrepreneurs are likely inaccurate (Tippins and Sohi, 2003) and

unreliable (Kraus et al., 2006, in excerpts from Khan et al., 2014). Therefore, obtaining objective financial data from small medical entrepreneurs is impractical.

Secondly, based on Sapienza et al. (1988), objective financial data provided by small medical entrepreneurs often do not reflect the actual situation of small medical firms, as managers/owners tend to manipulate financial data to avoid individual or corporate taxes (Zulkifli and Perera, 2011).

Lastly, objective data may be misinterpreted. This condition can occur due to variations in total profits (Covin and Slevin, 1989) and can also lead to inconsistent objective measurement among small medical entrepreneurs in different industries (Dawe, 1999).

Thus, this study used the performance measurement used by Azizi (2009), as shown in Table 4. Measurement of financial performance from this subjective perspective has also been used by researchers such as Man Wing (2001) and Nakhata (2007) in their respective studies.

Table 3: shows Dimensions and item description of financial literacy

Dimension	Item description
Financial management	Our organization has cash books used to record business revenue and expenses
	Our organization separates any personal income/expenses from business income/expenses.
	The organization makes plans for the business and regularly monitors it.
	Our organization implements cash flow projections for businesses.
	Our organization provides financial statements for businesses (e.g., balance sheets and income statements).
	This organization uses the financial information in the financial statements to manage the business
	Our organization has a business plan.

Savings literacy	<p>Our organization knows the importance of saving for business expenses.</p> <p>Our organization has savings plans for business expenses.</p> <p>Our organization regularly saves for business expenses.</p> <p>Our organization will not easily issue organizational savings to finance unrelated business expenses.</p>
Debt literacy	<p>Debt is inevitable in a business.</p> <p>Loans in businesses are a risk.</p> <p>Members of the organization know the differences among a base rate, a nominal rate, and an interest rate.</p> <p>Members of the organization know what is meant by real benefits.</p> <p>Members of the organization know the difference between interest rates and compounded interest rates.</p> <p>Organization prefers business loans to be repaid on a flat basis rather than reducing loan balances.</p> <p>The organization obtained business credit reports over the past 12 months.</p> <p>The organization has too much debt and has problems or will probably have problems in repayment.</p> <p>This organization has the right amount of debt at present and does not have any problems paying it off.</p> <p>This organization has lower debt, and organizations are eligible for other loans.</p> <p>This organization does not know the status of the debts incurred</p>

Investment literacy	<p>This organization has an investment plan.</p> <p>The organization regularly monitors returns from investments.</p> <p>This organization diversifies their investments and change them depending on the return or revenue to be obtained.</p> <p>Investments with high returns may also have high risks.</p>
---------------------	--

Insurance literacy	<p>Business-related insurance is important.</p> <p>The business insurance policies in the market differ from each other.</p> <p>Terms related to business insurance policies must be understood by all members of the organization.</p> <p>This organization cannot afford to have a business insurance policy because it is too expensive.</p> <p>All members of the organization lack information on insurance products suitable for the business.</p>
--------------------	--

Construct	Item
Business performance of a small medical enterprises	Cash flow
	Gross profit margin
	Net profit from the operation
	Sales growth
	Return on sales
	Return on investments
	Net profit margin ratio
	Return on shareholder equity

Ability to finance business from profit

Table 4: shows Description of small medical entrepreneur's business performance items

Source: Azizi (2009)

Sections C and D use a response format based on an itemized rating scale. This scale is an interval measurement scales that allows respondents to use a wide range of point numbers (Cavana et al., 2001). This study uses a 6-point Likert scale; thus, it does not provide a midpoint or neutral point. The use of 6-point Likert scale is supported by Tang et al. (1999), who argued that a 6- to 7-point scale allows respondents to express optimal levels of confidence in their extreme assessments. For financial literacy, the 6-point scale ranges from strongly disagree to strongly agree, while for performance it ranges from very low to very high. In total, this questionnaire contains 53 questions as summarized in table 5.

Table 5: Summarizes the number of items for each part

Part	Details	Number of items
A	Respondents' profile	8
B	Firm's profile	5
C	Financial literacy	31
D	Business performance	9
Total		53

Reliability Test

A research instrument is deemed reliable if it is capable of consistently providing the same result when the elements of the same entity are measured many times under the same conditions (Van Dalen, 1993). Similarly, Lim (2007) defines reliability as a degree of consistency of a research instrument measuring a variable studied. He also stated that the more consistent the measurement is, the higher is the reliability of the instrument. The instrument is considered to have 100% reliability if every time the instrument is managed, the same result is obtained.

According to Sekaran (2000), the alpha coefficient can provide the best indication to determine reliability. Hair et al. (2006) detailed the degree of alpha coefficient reliability as follows: 0.6 or above is average, over 0.7 is better than normal, more than 0.8 is good and 0.9 is very good. For studies related to social sciences, Sekaran (2003) stated that a value of 0.6 or above is often

applied for Cronbach's Alpha. If the items in the variable show a value less than 0.6, then those items should be removed from the questionnaire (Sekaran and Bougie, 2010).

Multiple regressions

Generally, correlation analysis tests the strength of a relationship between two continuous variables (Franzese and Luliano, 2019) using a coefficient correlation ranging from -1 to +1. The higher the value of the coefficient correlation (close to +1 or -1), the stronger the relationship between these two continuous variables, and vice versa. However, correlation analysis cannot assess whether one variable can explain the other variables. Therefore, linear regression can be employed to examine the influence of independent variables on dependent variables.

The following is the basic econometric equation to model the relationship between the independent variable (X) and dependent variable (Y). Indeed, linear regression aims to estimate the model parameters α and β that fit with the joint distribution of X and Y (Franzese and Luliano, 2019). $Y = \alpha + \beta X + \varepsilon$ (1) In this study, small medical enterprises business performance and financial literacy were treated as the dependent variable and independent variable, respectively, while manager profile and small medical entrepreneur specific characteristics were treated as control variables. Control variables were added to the model to anticipate the causal effect of financial literacy on small medical enterprises performance.

Accordingly, multiple linear regression is employed, and the above equation can be rewritten as follows:

$$\text{SMEPer} = \alpha + \beta_1 \text{FinLit} + \beta_t \text{Control} + \varepsilon \quad (2)$$

Where, SMEPer and FinLit represent Small medical enterprise performance and financial literacy, respectively. CONTROL is the control variables, which consist of manager profiles (i.e., gender (GEN), age (AGE), experience (EXP), an education level (EDU)) and SME-specific characteristics (i.e., sector in which SMEs operate (SEC), type of ownership (OWN), business age (BIZAGE), and firm size (SIZE)). Meanwhile, α is the intercept, β measures the regression coefficient and ε represents the error term. The summary of measurement for each variable is presented in table 6.

4.0 Findings and Discussion

4.1 Respondent's profile

The majority of respondents were male (57.5%), and the rest were female (42.5%). The age distribution shows that the fewest respondents were in the age group under 25 (6.5%), and the majority of respondents were in the age range of 41–45 years (28%). Respondents aged between 46–50 represented 19% of the sample, the age range of 31–35 years represented 15.5%, and the age range of 36–40 years represented 15%. For the rest, 7.5% of respondents were aged between 26–30 and only 8.5% were more than 50 years old.

Meanwhile, in terms of educational level, secondary school education showed the highest percentage (45%), followed by bachelor's degree (23.5%) and a diploma (18.5%). The respondents with primary school education represented 8% of the sample, 2.5% at the master's degree level, and 1.5% at the doctoral level. Finally, 1% indicated other educational level. Most of the respondents (67.5%) in this study were married. The other marital statuses, namely single and widowed/divorced, represented 18.5% and 14%, respectively.

Furthermore, in terms of business experience and the period of managing the existing business, the majority (58%) of the respondents had business-related experience before opening their current business, while the rest (42%) did not. Meanwhile, a small number of respondents (2%) had been in business for more than 25 years. Respondents who had managed the business for 5–10 years were the majority at 41.5%, while 26% had managed the business for 11–15 years, and 20% for less than 5 years. The remaining 8% of respondents have managed the business for 16–20 years, and 2.5% of respondents have managed the business for 21–25 years.

4.2 Firm's profile

Table shows the distribution of SME demographic profiles. The majority of SME firms consisted of SME firms from Mpanda (43.5%), followed by Mlele (32.5%) and Mpimbwe (24%). Based on the legal status, 46% of SMEs were not officially registered (unofficial ownership), sole proprietorship (41.5%), partnership (11.5%) and the limited liability partnership represented approximately 1%. The feedback obtained in terms of the sector showed that the majority were from the dispensaries and pharmacy sectors, at 49% and 39.5%, respectively, while the rest were from the laboratory and ophthalmology sector (5%), the polyclinic (3.5%) and the dental sector (3%). In terms of the duration of doing business, most SME firms (35%) had been in business for 5-10 years, while 31% were aged 11-15 years and 15.5% were less than 5 years old. The remaining SMEs had been in business for 16-20 years (8.5%), 21-25 years (5.5%), or more than 25 years (4.5%). The distribution of the number of employees owned by SMEs shows most SMEs (59%) had less than 10 employees, while the fewest (3%) had 41-50 employees

Table 6: showing Summary of measurement of variables

Variable	Description	Measurement
GEN	Gender	1=male, 0=female
AGE	Managers' age	Ordinal: (1) < 25 years old; (2) 26-30 years old; (3) 31-35 years old; (4) 36-40 years old; (5) 41- 45 years old; (6) 46-50 years old; (7) > 50 years old
EXP	Managers' experience – measures whether managers possessed any experience before starting their business	1=experience, 0=no experience
EDU	Education level	Ordinal: (1) primary school; (2) secondary school; (3) diploma; (4) bachelor's degree; (5) master's degree, (6) doctorate
SEC	Sector in which SMEs operate	1=service, 0=non-service
OWN	Type of ownership	1= sole proprietor, 0 = others
BIZAGE	Business age – number of years since SMEs were incorporated	Ordinal: (1) < 5 years; (2) 5-10 years; (3) 11-15 years; (4) 16-20 years; (5) 21-25 years; (6) > 25 years
SIZE	Firm size	Numbers of employees
FINLIT	Financial literacy	6-point Likert scale
SMEPer	SME performance	6-point Likert scale

31 – 40	7	3.5
41 – 50	6	3
>50	29	14.5

4.3 Reliability test results

Table 9 shows that the Cronbach's Alpha coefficients for financial literacy and SME performance are above 0.6, being 0.885 and 0.930, respectively. Therefore, items on financial literacy and SME performance are reliable (Sekaran and Bougie, 2010). Thus, all items in both variables are retained. Table 11 shows the mean value for each element of financial literacy, overall mean value for financial literacy and mean value for SME performance. All elements of financial literacy have scored a mean value above 3.67, except for debt literacy as shown in table 10. Overall, the mean value for financial literacy was relatively high at 4.26. This implies

high financial knowledge among SME owners/managers. Accordingly, SMEs' performance was also found to be at a high level with a mean value of 4.25. The interpretation of the mean value is based on Mukminin and Hidayat (2013), as shown in table 11.

Table 9: Showing Results of reliability test

Variable	Number of items	Cronbach's Alpha
Financial literacy	31	0.885
Performance	9	0.930

Table 10: Results of descriptive analysis for financial literacy and SME performance

	Mean
Financial Management	4.68
Saving literacy	4.68
Debt literacy	3.93
Investment literacy	4.33
Insurance literacy	3.99
Financial literacy	4.26
SME performance	4.25

Table 11: showing Mean score interpretation

Mean Score	Interpretation
1.00 - 2.33	Low
2.34 – 3.66	Medium
3.67 – 5.00	High

4.4 Multiple regression analysis results

The Breusch Pagan and Koenker tests were conducted to detect heteroscedasticity issues, as shown in Table 12. The statistical values of the Breusch Pagan and Koenker tests (LM = 13.143, $p = 0.156$; LM = 15.226, $p = 0.085$) indicate that the null hypotheses cannot be rejected,

thus indicating the absence of heteroscedasticity issues. Table 12 also shows the results from the multiple regression analysis. The value of $R^2 = 0.177$ suggests that 17.7% of SME performance can be explained by financial literacy, manager profile (gender, experience, age, and education), and SME-specific characteristics (sector, ownership, business age, and size).

The remaining 82.3% is explained by other factors, which were not examined in this study. The low R^2 value also implies the low strength of the linear relationship between the independent variable and the dependent variable. However, a low but significant R^2 value could still draw important conclusions related to the influence of independent variable on the dependent variable (Morrison, 1973; Bonnie et al., 2013). Furthermore, Bonnie et al. (2013) also argued that the value of R^2 could be low in certain areas, such as in studies related to predicting human behavior. The output also indicates F values=4.536 and $p=0.000<0.05$, which suggests that the regression model can be applied to SME performance estimates.

As expected, the regression results showed that financial literacy has a positive and significant influence on the performance of SMEs at $\alpha = 1\%$ with $p = 0.000$. This finding supports the proposed hypothesis that financial literacy positively influences the performance of SMEs. In other words, the higher an SME entrepreneur's level of financial literacy is, the better the SME's performance will be. These results are consistent with the findings of Aribawa (2016); Chamwada (2015); Cherugong (2015); Dahmen and Rodriguez (2014); Fernandes (2015), Kimunduu et al. (2016); Muraga and John (2015); Njoroge (2013); Sabana (2015); and Salome and Memba (2014).

A higher level of financial literacy means SME entrepreneurs possess the capability to manage their finances, including debt management, savings and investment, as well as risk management through the utilization of insurance. Indeed, the lack of financial literacy among SME borrowers has been highlighted as one of the key challenges among SMEs in African countries (AEM-METI Economic Cooperation Committee, 2021). Financial literacy allows SME entrepreneurs to be informed regarding the available sources of financing and to subsequently utilize diverse strategies in seeking business financing.

In addition, this study also shows that experienced SMEs managers perform better than less experienced managers, as shown by the positive sign of the parameter for EXP at $\alpha = 0.10$ with $p = 0.085$. This finding is consistent with those of Ndlovu et al. (2018) and Stelate et al. (2018). This result is unsurprising, as it is intuitive to assume that a more experienced manager may possess greater skills in managing a business, from financial matters to human resources management.

Furthermore, the business sectors in which SMEs are involved also significantly affect the performance of SMEs at $\alpha = 0.10$ with $p = 0.093$. On top of this, the educational background of managers has a significant and negative impact on the performance of SMEs at $\alpha = 0.10$ with $p = 0.055$. Specifically, managers with non-tertiary education show better performance than Financial Literacy and Financial Performance 87 SEAM 15, 1 88 those with tertiary education. In fact, previous studies such as those of Ndlovu et al. (2018) and Essel (2019) also found evidence on the influence of education level on SME performance. Other factors such

as gender, age, ownership, business age, and firm size had no significant influence on SME performance

4.5 Managerial Implications in Katavi Region

The results of this study are consistent with the call from the Strategic Action Plan for SME Development 2016-2025 under Strategic Goal (B) to strengthen the financial literacy of SMEs. It is crucial to ensure SMEs possess high awareness of information regarding financial resources and the availability of supporting programs. Under the same strategic goal, SMEs are encouraged to use various sources of financing to minimize financial risk.

Furthermore, the lack of financial literacy and/or resources to manage financial matters were among the top 10 challenges faced by financial institutions in providing financing to SMEs in Katavi region, Tanzania.

Therefore, it is timely for The Association of medical entrepreneurs to energize the formulation of strategies and implementations to improve the level of financial literacy of SMEs. Strategic collaboration can be established among SME bodies and SME financial institutions among member regions to foster integrated financial literacy programs among SMEs.

4.6 Theoretical Implications

This study contributes to the growing body of studies on financial literacy, particularly in the SME context. In particular, this study has shown the importance of financial literacy in driving SME performance in Tanzania. In other words, entrepreneurs with a good level of financial literacy contribute to a better SME performance.

According to Gavigan (2010), financial literacy is the ability to adequately oversee business financial resources and link them effectively to financial products and services. Furthermore, financial literacy promotes the understanding and decision-making towards better financial management. Therefore, financial literacy is needed by entrepreneurs to conduct day-to-day business operations to gain a competitive advantage and subsequently generate positive and profitable business performance.

5.1 Conclusion

This study was conducted to obtain empirical evidence regarding the influence of financial literacy on the performance of SMEs. The analysis was conducted based on 200 responses from respondents covering SMEs from the districts of Mpanda, Mlele and Mpimbwe. The regression results found that financial literacy has a positive and significant influence on the performance of SMEs after controlling for managers' profiles and SME-specific characteristics.

Furthermore, control variables such as managers' experience and education level, as well as the business sector in which SMEs operate, significantly influenced the performance of

SMEs. As these variables were used to control the causal-effect of financial literacy on SME performance, their influence is not discussed further. The findings of this study have shown

Outcome: SMEPer

Constant	2.592	0.344		8.036	0.000

Koenker	LM=15.226	p = 0.085			

that in the environment of Katavi region, financial literacy among entrepreneurs can improve the performance of SMEs.

In addition, the findings of this study can add value to previous studies whilst further highlighting the existence of a significant influence of financial literacy on SME performance. SME managers, owners, and entrepreneurs must make various decisions in running their businesses, and some of the most challenging decisions are related to business finances.

Managers, owners, and entrepreneurs with better financial literacy skills will better understand business-related financial concepts such as matters related to debt, investment, savings, and financial management, among others. Accurate financial decisions can help SMEs reduce administrative costs, conduct cost-benefit analysis, minimize staff turnover, engage in profitable investment schemes, and reduce internal conflicts, among other advantages. Decision-making in such situations will be rational based on the financial information obtained. Thus, SMEs can optimize sales and maximize profits, resulting in better performance.

Table 12: Showing Regression analysis results

*Significance at $\alpha = 0.01$; **significance at $\alpha = 0.10$

Undeniably, financial literacy is important for managers and owners of SMEs. In light of the importance of financial literacy among entrepreneurs, government agencies such as SME Corp need to further accelerate their efforts to educate entrepreneurs, especially young entrepreneurs, to ensure that they possess an adequate level of financial literacy before starting their business. Although various awareness and training programs exist, their approaches might need to be improved so as to better foster financial literacy.

This study found that literacy on debt management had the lowest mean value. Therefore, entrepreneurs need to learn effective debt management strategies in order to generate profit. To this end, guidance and monitoring in terms of financial management in the first five years of business would greatly support entrepreneurs in learning the complexities of finance in business.

One feasible strategy is that of collaboration between SME Corp or similar institutions and a higher learning institution to providing formal education related to financial literacy. Collaboration with other agencies can also be undertaken to implement non-formal entrepreneurial financial education for young people who lack the opportunity to obtain a formal education.

The Impact of Logistics Operational Costs on Information System Performance: A Case Study of the Medical Store Department in Moshi, Tanzania

Omari Hussein¹ & Hamis Sama²

¹College of Business Education, Email: ¹omarkallaghe@gmail.com

² College of Business Education

Abstract

In an increasingly interconnected world, effective logistics management is vital for the performance of information systems, especially in the healthcare sector. This study investigates the impact of logistics operational costs on the performance of health information systems within Tanzania's Medical Store Department (MSD). Employing a mixed-methods approach, data were collected from 90 respondents through structured questionnaires and interviews. The findings indicate a significant negative relationship between high logistics costs particularly transportation and storage expenses and the performance of information systems. Statistical analysis revealed a strong correlation, with logistics operational costs serving as critical determinants of system efficiency ($\beta = 0.65$, $p < 0.000$). Qualitative insights highlighted challenges related to transportation delays and inadequate warehousing technologies, reinforcing the quantitative results. The study underscores the urgent need for effective logistics management practices to enhance system performance, ultimately improving healthcare delivery. Recommendations include investing in technology-driven logistics solutions and implementing cost-saving measures to optimize resource allocation. Addressing

these logistics challenges is essential for ensuring timely access to medical supplies, thereby enhancing patient care and health outcomes in Tanzania.

Keywords: *Logistics Management, Operational Costs, Health Information Systems.*

1.0 Introduction

In an increasingly interconnected world, effective logistics management is essential for the performance of information systems across various sectors, including healthcare. Logistics operational costs, which encompass expenses related to transportation, warehousing, and inventory management, directly influence the efficiency of information systems that support supply chain operations. Globally, organizations are recognizing the importance of streamlining logistics to enhance system performance and ensure timely access to critical supplies. A study by Jüttner et al. (2021) found that optimized logistics processes lead to reduced operational costs and improved responsiveness, highlighting the necessity of integrating logistics strategies with information systems for enhanced performance.

In the African context, the challenges of logistics operational costs are particularly pronounced due to infrastructural deficits and varying regulatory frameworks. Research indicates that high logistics costs can hinder the performance of health information systems, impacting the delivery of essential medical supplies and services (Asong & Kumi, 2022). For instance, a study in Ghana revealed that inefficiencies in logistics contribute to significant delays in supply chain operations, affecting healthcare service delivery (Kumi et al., 2023). This underscores the critical need for effective logistics management to support the performance of health information systems across the continent, especially in the context of public health.

Tanzania, specifically, faces similar challenges in logistics operational costs affecting its healthcare information systems. The Medical Store Department (MSD) plays a crucial role in managing the supply of medical products, and inefficiencies within this department can lead to disruptions in healthcare delivery. Recent research highlights that high logistics costs, exacerbated by poor infrastructure and inadequate technology, adversely affect the performance of health information systems in Tanzania (Mhando et al., 2022). Addressing these issues is vital for enhancing the efficiency of the MSD, ensuring that healthcare providers can access necessary medical supplies in a timely manner, ultimately improving patient care and health outcomes in the region.

2.0 Literature Review

2.2 Theoretical Framework

2.2.1 Transaction Cost Economics (TCE)

Transaction Cost Economics (TCE), founded by Ronald Coase in 1937 and later developed by Oliver Williamson in the 1970s, provides a valuable framework for understanding the influence of logistics operational costs on the performance of information systems. TCE posits that firms

seek to minimize the costs associated with transactions—such as searching for suppliers, negotiating contracts, and enforcing agreements—by optimizing their supply chain operations. This theory is particularly relevant in the context of logistics, where operational costs can significantly impact the efficiency and effectiveness of information systems used for inventory and order management.

In the medical supply sector, understanding and managing logistics operational costs is crucial for maintaining efficient information systems. High transaction costs can lead to delays and inefficiencies in the procurement and distribution processes, ultimately affecting the performance of information systems that rely on accurate and timely data. Recent studies, such as those by Li et al. (2021) and Zhao et al. (2022), highlight the importance of minimizing transaction costs in supply chain management to enhance the performance of information systems, particularly in healthcare settings. By applying TCE, organizations can identify areas where logistics costs can be reduced, thereby improving the overall functionality and responsiveness of their information systems.

2.3 Empirical Literatures

Omachonu et al. (2019) assessed the impact of logistics costs on the effectiveness of information systems in the pharmaceutical supply chain. Utilizing a mixed-methods approach, the researchers employed a descriptive research design with a population of 200 employees from various pharmaceutical companies in Uganda. A sample of 100 respondents was selected using stratified sampling. Data were collected through structured questionnaires and interviews. Statistical analysis was conducted using SPSS. The findings indicated that high logistics costs significantly hinder the performance of information systems, leading to delays and inaccuracies in inventory management. The study concluded that reducing logistics operational costs could enhance system performance, and recommended implementing cost-saving measures in logistics to improve supply chain efficiency (Omachonu et al., 2019).

Muthoni and Wainaina (2020) explored the relationship between logistics operational costs and the performance of information systems in the healthcare sector in Kenya. The study adopted a quantitative research approach, using a cross-sectional design with a population of 150 healthcare providers. A sample of 120 respondents was selected via simple random sampling. Data were collected through structured questionnaires and analyzed using regression analysis. The findings revealed that high logistics operational costs negatively impacted the performance of information systems, resulting in suboptimal service delivery. The researchers concluded that managing logistics costs is crucial for enhancing system performance and recommended that healthcare facilities invest in efficient logistics practices (Muthoni & Wainaina, 2020).

Abubakar et al. (2021) investigated the influence of logistics costs on information systems performance within the Nigerian healthcare supply chain. Using a qualitative research approach, the researchers conducted in-depth interviews with 30 logistics managers from various healthcare organizations. The data were analyzed thematically. The findings

highlighted that logistics operational costs, particularly transportation and warehousing expenses, significantly affected the accuracy and timeliness of information systems. The study concluded that effective cost management strategies could lead to improved system performance and recommended that organizations adopt technology-driven logistics solutions to enhance efficiency (Abubakar et al., 2021).

Ndung'u and Gikonyo (2022) examined the impact of logistics operational costs on information systems performance in the context of medical supply chains in Tanzania. Employing a quantitative research design, the researchers targeted a population of 250 medical professionals, selecting a sample of 150 respondents through stratified sampling. Data were collected via structured questionnaires and analyzed using descriptive and inferential statistics. The results indicated a significant negative relationship between high logistics costs and the performance of information systems, emphasizing the need for better logistics management practices. The study concluded that reducing logistics costs could enhance the overall effectiveness of information systems in the medical sector and recommended that stakeholders prioritize logistics efficiency (Ndung'u & Gikonyo, 2022).

3.0 Material and Methods

This study employed a cross-sectional research design, characterized by the collection of data at a single point in time, which is particularly efficient for social sciences (Bryman, 2004; Malhotra, 2010). A mixed-methods approach was utilized, integrating both quantitative and qualitative research methods. The quantitative aspect involved numerical data collection for statistical analysis, while the qualitative component allowed for in-depth insights through respondent narratives (Bouma-Prediger, 2010). This combination enabled the researcher to achieve a comprehensive understanding of the research objectives by correlating data from various sources.

The target population for this study comprised 124 staff members from the Moshi Medical Stores Department (MSD). A sample size of 90 respondents was determined using Yamane's formula, ensuring a representative selection (Yamane, 1967). The distribution of the sample across different departments, including internal audit, accounting, and logistics, is detailed in Table 1, reflecting a strategic allocation to gather diverse perspectives (Churchill & Peter, 1995). Probability sampling through simple random methods minimized bias, while purposive sampling allowed for targeted insights from specific departments relevant to the study objectives (Kothari et al., 2014).

Data were collected using both primary and secondary methods. Primary data were gathered through structured questionnaires and face-to-face interviews, ensuring diverse data points and participant engagement (John, 2016). The questionnaire utilized a Likert scale for quantitative assessment, while interviews provided qualitative depth. Pre-testing of instruments was conducted to enhance clarity and relevance (Neunert et al., 2011; Baxter & Jack, 2008). Data analysis was performed using SPSS version 25, applying descriptive statistics and regression

analysis to evaluate the influence of logistics information systems on organizational performance. The regression model facilitated a deeper understanding of relationships between variables, further enhancing the study's validity and reliability (Anderson et al., 2016).

4.0 Findings

Table 1: Demographic Features of Respondents

Demographic Feature	Category	Frequency	Percentage (%)
Gender	Male	50	58.8
	Female	35	41.2
Age Group	18-25	10	11.8
	26-35	30	35.3
	36-45	25	29.4
	46 and above	20	23.5
Education Level	High School	15	17.6
	Diploma	30	35.3
	Bachelor's Degree	25	29.4

4.1 The impact of logistics operational costs on information system performance

Table 2: the impact of logistics operational costs on information system performance

Statement No.	Agree (%)	Neutral (%)	Disagree (%)
Logistics operational costs significantly impact the performance of the information system.	65 (76.5%)	12 (14.1%)	8 (9.4%)
Higher transport costs negatively affect the efficiency of the information system.	60 (70.6%)	10 (11.8%)	15 (17.6%)
Storage and warehousing costs contribute to the overall performance of the information system.	70 (82.4%)	8 (9.4%)	7 (8.2%)
Proper inventory management costs lead to improved information system performance.	75 (88.2%)	6 (7.1%)	4 (4.7%)
Employee training in logistics has a direct effect on the effectiveness of the information system.	68 (80%)	10 (11.8%)	7 (8.2%)
The current logistics system is efficient in managing operational costs to support the information system.	50 (58.8%)	20 (23.5%)	15 (17.6%)
Regular monitoring and evaluation of logistics costs can improve the performance of the information system.	55 (64.7%)	15 (17.6%)	15 (17.6%)

Table 3: Regression Analysis Results

Dependent Variable: Information System Performance

Predictor Variable	Coefficient (β)	Standard Error	t-Value	p-Value
Constant	1.98	0.47	4.21	0.000
Logistics Operational Costs	0.65	0.11	5.91	0.000
Transport Costs	0.52	0.09	5.78	0.000
Storage Costs	0.38	0.10	3.80	0.001
Inventory Management Costs	0.28	0.08	3.50	0.002
Employee Training Costs	0.32	0.09	3.56	0.001
R-squared	0.72			
Adjusted R-squared	0.70			
F-statistic	50.13			0.000

To complement the quantitative data from the questionnaire, qualitative insights from interviews were also gathered to provide a deeper understanding of the impact of logistics operational costs on information system performance. Respondents emphasized the challenges associated with high logistics costs and their direct effect on system efficiency. One logistics officer remarked, *“Our transportation costs have skyrocketed due to fuel prices, and this affects how quickly we can update inventory in the system. Delays in transporting goods cause data entry bottlenecks, which ultimately slows down the performance of the information system.”* This observation highlights the connection between transportation costs and system delays, as logistics bottlenecks impede real-time data processing.

Another respondent, a senior manager, mentioned that *“The storage costs for medical supplies are a constant concern. Without proper funding, we can't afford the advanced warehousing technology needed to sync with our information system efficiently. The manual processes we use because of cost constraints lead to frequent system downtimes and errors.”* This comment underscores the financial strain on warehousing operations and its negative impact on the accuracy and speed of the information system. Both respondents pointed out that logistics costs, particularly in transportation and storage, are key barriers to optimizing information system performance, reinforcing the need for better resource allocation to improve system efficiency.

5.0 Discussion

The findings from both the quantitative and qualitative data indicate that logistics operational costs have a significant impact on the performance of the information system at the Medical Store Department in Moshi. From the survey data, the majority of respondents (76.5%) agreed that logistics costs affect the performance of the information system. High transportation costs

were particularly identified as a major barrier, with 70.6% of respondents indicating that higher transport expenses negatively affect system efficiency. The regression analysis further supports this, showing a strong positive relationship between logistics operational costs and information system performance ($\beta = 0.65$, $p < 0.000$). Transportation costs, in particular, emerged as a critical factor, with a significant coefficient ($\beta = 0.52$, $p < 0.000$). These results highlight that logistics costs, especially transportation, play a pivotal role in determining the functionality of the information system.

In addition to transport costs, the qualitative data provided further insights into the effects of storage and warehousing expenses. Respondents noted that financial constraints in warehousing operations directly impact the system's ability to function efficiently. One manager highlighted the reliance on manual processes due to cost constraints, leading to frequent system downtimes and errors. This is corroborated by the quantitative results, where 82.4% of respondents agreed that storage costs contribute to the overall performance of the system, and the regression analysis showed a significant relationship between storage costs and system performance ($\beta = 0.38$, $p < 0.001$). Proper inventory management costs were also identified as a crucial determinant of system efficiency, with 88.2% of respondents agreeing that better inventory management leads to improved system performance.

Empirical studies align with these findings. For example, a study by Tijan et al. (2020) emphasized that logistics costs, including transport and warehousing, are crucial for the operational efficiency of supply chain information systems. Their research found that inadequate logistics funding can lead to delays, inefficiencies, and errors in information system updates. Similarly, Gunasekaran et al. (2017) highlighted the direct relationship between logistics costs and information system performance in health sectors, where insufficient logistical resources can impede real-time data processing, ultimately affecting decision-making. These studies reinforce the assertion that managing logistics costs effectively is essential for the optimization of information system performance, particularly in resource-constrained environments like the Medical Store Department.

6.0 Conclusion

The study has demonstrated that logistics operational costs significantly affect the performance of the information system at the Medical Store Department in Moshi, Tanzania. Key logistics components such as transportation, storage, and inventory management directly influence system efficiency. The regression analysis confirmed that higher logistics costs, particularly in transport and storage, contribute to system inefficiencies. Additionally, the qualitative interviews revealed that cost constraints in logistics lead to frequent delays, manual processes, and system downtimes, which further undermine the performance of the information system.

Furthermore, the findings emphasized the importance of proper inventory management and employee training in logistics, as both positively influence system effectiveness. Inadequate investment in logistics, particularly in transportation and warehousing technologies, was found

to hinder real-time data processing, which is essential for optimal system performance. These insights underscore the critical role logistics costs play in ensuring the smooth operation of information systems, especially in health-related sectors where timely and accurate information is vital for decision-making and resource management.

7.0 Recommendations

To improve the performance of the information system, it is recommended that the Medical Store Department allocates additional resources to cover logistics operational costs, particularly in transportation and warehousing. Investing in modern warehousing technologies, such as automated inventory management systems, could significantly reduce manual processes and errors, leading to better system performance. Additionally, revising transport strategies to optimize routes and reduce fuel consumption could help lower transportation costs and improve system efficiency.

Moreover, regular training programs for employees involved in logistics and system management should be implemented to enhance their skills and understanding of how logistics costs impact system performance. This will not only improve the operational efficiency of the logistics team but also ensure that the information system is utilized effectively. Finally, periodic monitoring and evaluation of logistics costs should be conducted to identify potential areas for cost reduction and system improvement, ensuring the sustainability of the information system's performance.

Abstract

The Monitoring, Evaluation, and Learning (MEL) processes have a critical role in development programs to determine the improvements brought by the interventions in terms of quantity and quality. Most MEL practices in Tanzania experience some challenges due to scarcity of data, scattered databases and lack of proper statistical analysis. This paper outlines a decision-

making framework that incorporates BDA into MEL processes in order to augment decision-making, programme impact, and learning. Using the provided mobile data, satellite imagery, and social media data, the framework develops an integrated MEL system. This paper examines the general benefits, possible difficulties, and consequences of applying BDA in relation to MEL in Tanzania.

Keywords: *Big Data Analytics, Decision Making Framework*

1. Introduction

Monitoring, Evaluation and Learning (MEL) is crucial in evaluating the successful delivery of development interventions, the accomplishment of the intended goals and objectives and using them as a basis for improvement and innovation. It entails planning activities, implementing them and continuously monitoring and reviewing the activities as well as the outcomes. Therefore, with an increased level of complexity and reliance on data for the development programs, the adoption and integration of Big Data Analytics (BDA) provide the right avenue for the improvement of MEL. By using BDA, organizations are able to examine large and disparate sets of data thus improving the understanding and direction of programs. When applied, BDA can therefore assist organizations in tracking progress, assessing outcomes, and modifying strategy based on performance data, making it easier to improve decisions and better results (Mleke et al., 2020).

1.1 Background

Global organizations have experienced unprecedented changes in the last decade brought about by new technologies characteristic of the Fourth Industrial Revolution. This period is characterized by the huge generation and processing of data by smart gadgets and complex analytical tools known as Big Data. This flood of data poses great opportunities for organizations to improve their operational effectiveness, decision-making, and competitive position when such data are properly utilized (Chatterjee et al., 2022). For instance, the worldwide data creation hit 79 zettabytes in 2021, with forecasts predicting that it may grow as high as 181 zettabytes in 2025, the impressive figures prove the immense method by which data is being created and the scope of opportunities the organizations from different industries may have (IDC, 2022).

Big Data Analytics (BDA) is now required for the higher efficiency of using this data stream for MEL purposes in organizations. Because of the ability to integrate, analyze, and interpret data flows in real time, leaders can see performance indicators and use them to make improvements. Research has indicated that companies incorporating BDA to obtain real-time data supposedly achieve a 15% enhancement in process effectiveness and cut down the rendering of decisions by 20%, all of which signifies its role in improving MEL practices (Guo et al., 2023). Notably, MEL has benefited from BDA more than ever, especially in the following ways: prediction and outcome modelling enable organizations to anticipate future developments and evaluate the probability of different outcomes, given historical data – enabling more efficient intervention (Akter et al., 2021).

Some challenges affecting traditional MEL in Tanzania include; inadequate data, limited analytical capacity, and delays in using evaluation findings for programme improvement. For instance, a study conducted by the Tanzania National Bureau of Statistics among civil servants recently revealed that 68% of the public institutions in Tanzania lacked sufficient data more specifically in sectors of health, education and agriculture among others (NBS 2022). This scarcity limits the effectiveness of tracking multifaceted social and economic results; this reduces the efficiency of program evaluation as well as the optimal use of resources. Lastly, the low capacity to perform higher-level statistical analysis in MEL practices means that

organizations are unable to make robust assessments of the overall effects of the projects and thus they cannot make the right decisions as required (UN, 2022).

The pre-implementation challenges are as follows: To overcome these challenges, the integration of BDA in MEL brings revolutionary opportunities. BDA builds on MEL by making data more accessible, enabling current analysis and helping organizations become more proficient at forecasting trends. For instance, in the course of a disease outbreak, decision support systems may predict the pattern and advise on its likely spread and any other resource that may help in managing it. Likewise, BDA in agriculture can check the crop yields on the farmland and the weather conditions to help reduce food security threats in Tanzania. The analysis done by Guo et al. (2023) found that organizations that adopt BDA for predictive modelling in management, evaluation, and control processes highlighted a 25% enhancement of the predictive accuracy, displaying their suitability for BDA to enhance data-driven MEL.

Nevertheless, this study recognizes certain advantages of using BDA in the development of MEL frameworks; however, there is a shortage of empirical research that focuses on the precise application of BDA into MEL frameworks, especially in developing economies. Although current literature suggests that BDA is useful in business intelligence, limited empirical work investigates the role of BDA directly in MEL practices in sectors such as health, education and agriculture in Tanzania. This gap suggests that a rich framework must encompass the technical features of BDA and drive the overall strategic vision and mission of MEL to cast the greatest degree of impact (Akter et al., 2021; Chatterjee et al., 2022). It is identified in this paper that the lack of BDA and other analytical tools in a developing economy exposes organizations to up to 30% in response time to emergent risks. This understanding necessitates the development of a robust BDA-MEL framework (Guo et al., 2023).

This research presents such a framework to reflect the capability developments that confront present-day deficiencies in data access, operational analysis, and integration of timely insights. Thus, by advancing the proposed BDA-integrated MEL framework within this study, the visibility of MEL in Tanzanian organizations is raised, and the MEL process is changed into a more dynamic data-driven process that enhances organizational decision-making and programme performance.

1.2 Problem Statement

The Monitoring, Evaluation and Learning (MEL) in Tanzania has some major challenges such as lack of data, isolated data sources as well as inadequate abilities in statistical analysis which in turn reduce the efficacy of programmes and data-dependent activities. Many companies have problems with receiving the correct and consistent information in time and this information is processed with the help of the tools and methods that cannot predict. This leads to the late generation of information, failure to address new challenges as they unfold, and reduced capacity to evaluate the effectiveness of development programmes and the return on investment (UNDP Tanzania, 2022; NBS, 2022). Big Data Analytics (BDA) seems to be a suitable solution to improve MEL processes through real-time integration of data sources, efficient statistical analysis, and predictive insights to help organizations manage emerging challenges (Akter et

al., 2021; Guo et al., 2023). However, the incorporation of BDA into the MEL in Tanzania is limited in the literature despite gaps that call for structured frameworks that fit Tanzania's context. This paper intends to fill this gap by presenting a detailed BDA-MEL framework in an attempt to enhance organizational responsiveness and strategic learning as well as enhance the already existing MEL practices in the sectors of Tanzania.

1.3 Research Objective

1.3.1 General Objective

The purpose of this study is to propose a decision-making framework that combines Monitoring, Evaluation, and Learning (MEL) with Big Data Analytics

1.3.2 Specific Objectives

For the study to accomplish its general objective, the study has put into considerations the following specific objectives:

- i. To analyze the potential of Big Data Analytics in enhancing MEL.
- ii. To identify potential barriers to implementing BDA in MEL, and how can they be addressed.
- iii. To develop a decision-making framework that integrates BDA into MEL processes.

1.4 Research Questions

- i. How can Big Data Analytics be utilized to enhance MEL processes?
- ii. What are the potential barriers to implementing BDA in MEL, and how can they be addressed?
- iii. What are the key components of a decision-making framework that integrates BDA into MEL?

1.5 Rationale of Study

The purpose of the introduced framework is to enhance the connection between data potential and business outcomes and, therefore, enhance organizational performance, stimulate sustainable development, and help make the right strategic decisions. To organizations that wish to harness Big Data, the framework offers a solution by applying the Monitoring, Evaluation and Learning (MEL) programme cycle to a structured method of collecting, processing, analyzing and using data. This keeps the learning process as a continuous cycle, giving the businesses full advantage of the accumulated data while at the same time updating the model to a level that would properly serve the business.

2. Literature Review

The literature review offers a synthesis of the current state of knowledge on MEL, Big Data Analytics and its relevance to MEL, and BDA institutionalization into MEL practices. It also compiles literature, assesses the research gaps and shows how and why BDA is crucial in MEL in Tanzania.

2.1 Monitoring, Evaluation, and Learning (MEL) in Tanzania

The processes of Monitoring, Evaluation, and Learning (MEL) are critical steps in evaluating the success and the advancement influence of development programs and within the country of Tanzania, these processes have become rather mainstream when it comes to enhancing the effectiveness of development programs (Mkama, 2017). MEL processes are designed to ensure that development programs achieve their intended outcomes and contribute to broader development goals. Monitoring involves the regular tracking of program activities and outputs, while evaluation assesses the impact of these activities on target populations. Learning refers to the process of using insights from monitoring and evaluation to inform decision-making and improve program design and implementation.

In Tanzania, MEL practices are critical for programs in sectors such as health, education, agriculture, and economic development. These programs often aim to address complex and multifaceted challenges, such as reducing poverty, improving health outcomes, and enhancing educational access. Effective MEL practices are necessary to measure progress toward these goals, identify areas for improvement, and ensure that resources are used efficiently.

In the past, Tanzania has had some issues like; limited resources, infrastructural deficiencies which have caused a strain on the development of sound MEL systems (Mkama, 2017; Mleke, 2020). Recent strategies have sought to improve MEL frameworks through the National Monitoring and Evaluation (NME) framework that seeks to improve and standardize the process of data collection and evaluation for better decision-making. Other stakeholders who have supported the activities include Non-Governmental Organizations (NGOs) and international development agencies through offering technical support and training to enhance regional capacities. As such, it is clear that while there is improvement in these areas, issues like data quality as well as timely reporting emerge again and again. Moreover, still there is a very important internal issue on how to improve MEL effectiveness in order to overcome the existing barriers and fulfilled the demands of the development programs. The use of Big Data Analytics as one of the advanced technologies that could be integrated with MEL practices is one of the effective solutions that will be necessary for the further progress of the development programs.

2.2 The Potential of BDA in Enhancing MEL

The study shows that big data analytics also referred to as BDA has the potential of revolutionizing different industries by improving operations and decision-making processes. For example, BDA has assisted big stores such as Wal-Mart to cut costs and enhance efficiency in procurement and stock through real time price setting (Chatterjee, Chaudhuri, & Vrontis, 2022). Thus, BDA has been applied in financial institutions for the detection of fraud and in the case of providing individual financial advisors with recommendation and advice resulting in the improvement of customer trust and security (Brewis, Dibb, & Meadows, 2023). In healthcare, BDA's predictive analytics has enhanced patient's prognosis and other treatment interventions (Galetsi, Katsaliaki, & Kumar, 2020). Timely Data Collection: BDA can leverage real-time data sources, such as mobile phone data, satellite imagery, and social media, to provide timely insights into program performance. This allows for more responsive and adaptive program management.

BDA enables the integration of data from multiple sources, including structured data (e.g., surveys, government records) and unstructured data (e.g., social media posts, satellite images). This holistic approach provides a more comprehensive view of program outcomes and impacts. By providing more accurate and timely insights, BDA can facilitate continuous learning and adaptation in development programs. This helps ensure that programs remain relevant and effective in dynamic environments.

Several studies have highlighted the potential benefits of BDA in MEL. For example, Ahsan and Gunawan (2019) demonstrated how BDA can be used to monitor and evaluate the impact of agricultural interventions in real time, enabling more effective decision-making. Similarly, Zhao et al. (2020) explored the use of BDA in tracking health outcomes in low-resource settings, highlighting its potential to improve health program management. However, current obstacles that are important include issues concerning data security, the high cost of analytics tools and specialized training in analytics (Zhao et al., 2020). To implement and embed BDA into organizational operations and bypass these challenges, there is a need for a strong decision-making framework that will address these challenges while harnessing the benefits that BDA brings to Monitoring, Evaluation and Learning (MEL).

2.3 Case Studies of BDA in MEL

Case studies showcasing the use of Big Data Analytics (BDA) in Monitoring, Evaluation and Learning (MEL) demonstrate its ability to transform various sectors. For instance, in healthcare, BDA has empowered hospitals to enhance patient care through predictive analytics that identify at-risk patients and customize treatment plans leading to improved outcomes (Goyal, Rekha, Malik, & Tyagi, 2020). In the field of education BDA has been utilized to track student performance and assess educational programs enabling institutions to modify curricula and teaching approaches based on real time data thus enriching student learning experiences. Retail giants such as Walmart have leveraged BDA to optimize inventory management and refine pricing strategies resulting in cost savings and increased sales (Guo et al., 2018). Likewise, the banking sector has embraced BDA for fraud detection and personalized financial guidance enhancing both operational security and customer trust (Brewis, Dibb, & Meadows, 2023). These examples showcase how big data analytics can enrich monitoring, evaluation and learning procedures through the delivery of insights, enhancing decision making processes and fostering ongoing progress in various areas.

In Kenya, BDA has been used to monitor agricultural productivity by analyzing satellite imagery and mobile phone data. This helped identify areas where interventions are needed (Giacalone & Scippacercola, 2016). In India, BDA has been employed to evaluate the impact of health programs by analyzing data from electronic health records, mobile health applications, and social media. This has provided valuable insights into the effectiveness of health interventions and informed policy decisions (Zhao et al., 2020). In Tanzania, BDA has been used to monitor educational outcomes by analyzing data from school records, student assessments, and mobile learning platforms. This has helped identify gaps in educational access and quality, leading to targeted interventions (Mkama, 2017).

These case studies demonstrate the potential of BDA to transform MEL practices by providing more accurate, timely, and comprehensive insights into program performance.

2.4 Real-Time Decision-Making Frameworks Through BDA in Implementing MEL

The integration of Big Data Analytics (BDA) into real-time decision-making frameworks has emerged as a pivotal development in enhancing Monitoring, Evaluation, and Learning (MEL) processes. Real-time decision-making frameworks leverage BDA to process and analyze large volumes of data instantaneously, providing organizations with timely insights that are crucial for effective MEL. These frameworks enable continuous monitoring of key performance indicators (KPIs), facilitate immediate evaluations of program outcomes, and support agile adaptations to strategies based on real-time data (Guo et al., 2018).

Research highlights the transformative impact of BDA on real-time decision-making within MEL frameworks. For instance, (Galetsi et al., 2020) discusses how real-time analytics platforms, through their capacity to integrate diverse data sources, enhance the accuracy and immediacy of insights, thereby supporting more responsive and informed decision-making. This capability is particularly valuable in dynamic environments where timely interventions are critical. In sectors such as healthcare, real-time decision-making frameworks have been shown to improve patient care by allowing for the rapid analysis of health data and the swift adjustment of treatment plans (Galetsi et al., 2020).

Moreover, Guo et al. (2018) illustrate how real-time dashboards and monitoring systems, powered by BDA, enable organizations to track performance metrics in real time, facilitating proactive management and rapid course corrections. This approach not only improves operational efficiency but also enhances the overall effectiveness of MEL processes by ensuring that decisions are based on the most current and relevant data. However, challenges such as data integration complexity, the need for robust technological infrastructure, and potential information overload remain significant barriers (Mkama, 2017).

The ongoing advancements in BDA technologies and their integration into real-time decision-making frameworks are expected to further enhance MEL practices. By addressing existing challenges and refining these frameworks, organizations can achieve more effective monitoring, comprehensive evaluations, and continuous learning, ultimately leading to improved program outcomes and strategic success (Zhao et al., 2020).

2.5 Challenges and Opportunities

The amount of research on the topic shows there are many obstacles when using big data analytics, especially for smaller companies with fewer resources (Al-Abassi, Karimipour, Haddadpajouh, Dehghantanha, & Parizi, 2020). Big firms like Google for instance can afford to spend a lot of money on analytics experts and tools but smaller companies might find it difficult to hire data experts or purchase these resources (Naganathan, 2018). The process of gathering storing and utilizing data for analytics is further complicated by laws about data privacy such as GDPR. Companies that overcome these obstacles though stand to gain a great deal. Businesses that are adept at big data analytics can increase customer satisfaction promote innovation and make decisions more quickly and intelligently (Goyal et al., 2020). For example,

Netflix makes use of big data analytics to comprehend viewer preferences which helps it create shows that connect with viewers and boost subscriptions and customer loyalty.

3. Methodology

The methodology section outlines the research design, data collection methods, data analysis techniques, and the development of the proposed decision-making framework.

3.1 Research Design

The objective of this study was therefore to establish a sound decision-making framework that incorporates Big Data Analytics to improve Monitoring, Evaluation and Learning. The mixed-methods, concurrent design was utilized, in which, data both, qualitative and quantitative were collected simultaneously, and analyzed separately with the final results combined in the study of the research problem. The qualitative part of the study incorporated interviews with MEL experts to gather rich ideas and lessons on the issues and prospects in MEL practices. These qualitative findings were critical in determining the areas which BDA could enhance MEL processes at the organization. In parallel, quantitative data were gathered through structured questionnaires to capture more general levels of effectiveness of the challenges under study within a larger population of MEL practitioners. This approach of integrating the use of qualitative data with quantitative data was deemed useful to ensure the validity of the study and propose improvement to the MEL processes by BDA.

3.1.1 Qualitative Approach

Semi-structured interviews and focus group discussions used in order to obtain qualitative data. Such factors as MEL professionals' personal experiences and their expectations from BDA, as well as the opinions of BDA professionals and key decision-makers, were obtained through interviews. Group discussions were conducted with the stakeholders in order to determine their actual experience with the implementation of BDA with regards to MEL and to establish the emerging and reoccurring problems and successes in this matter.

3.1.2 Quantitative Approach

Primary data were collected using structured questionnaires while secondary data collected include; statistical information and reports from existing databases. Further, cross-sectional surveys were conducted with organizations that are already using BDA in MEL to know their experiences, difficulties they faced, and found. The collection of secondary data from industry reports, academic publications and works, case studies for BDA applications in MEL. The analysis defines Trends, Successes, and potential voids in today's MEL approaches.

3.2 Data Collection

3.2.1 Primary Data Collection

Semi structured, face-to-face interviews were conducted with 20 MEL professionals in various sectors such as health, education, agriculture, and economic development sectors. This sample size was kept small on purpose to reach the point of data saturation, which is an important characteristic of qualitative research. The studies have found that saturation means the point that more about the focus of the study can be known when it involves the participation of about 15-30 participants thus, allowing the emergence of more themes that can be reoccurring, as

well as, understanding participants' perception. The interview questions were as follows to effectively capture views about existing MEL practice, experience with BDA, and willingness to adopt BDA tools.

To supplement the interview, two focus group discussions were held with fifteen participants from program managers and data analysts. These discussions have created a conducive collaboration environment to deliberate on how BDA can improve MEL processes and availed insights into the constituent parts of a decision-making model. Indeed, the interviews and focus groups provided a large qualitative data that was valuable in the development of the proposed framework.

3.2.2 Secondary Data Collection

Secondary data sources comprised of studies conducted through review of the previous MEL reports, case studies, and scholarly articles that addressed the concept and practice of BDA in the development programs. This information helped to define the further prospects and peculiarities of BDA adoption in MEL, as well as to determine the key success stories and possible challenges.

3.3 Data Analysis

3.3.1 Qualitative Data Analysis Techniques

This data collection involved interviews and focus group discussions in conducting thematic analysis on qualitative data; the following is obtained from research: Thematic analysis is a suitable method of analyzing qualitative data to identify, describe, and report themes. The first step of thematic analysis was carried out by bringing oneself into the data, the process in which the researcher becomes very acquainted with the data, the transcripts and notes. It was very important to start in this way because it allowed for further investigation of the topics.

After this, the research continued to the initial coding where codes emerging from the data were identified. Codes were short meaningful terms or tags that stood for aspects of data excerpts. This coding was done through the inductive approach, whereby themes were developed directly from the data collected and through the deductive approach whereby the study was informed by theories or hypotheses derived from research propositions. When the first ideas were generated, the researcher grouped these codes into possible themes that had coherent patterns or ideas that were crucial to the research questions.

Once potential themes were generated, the process moved to screen these themes against the dataset to check how effectively they captured the dataset. This led to the fine-tuning of the prior themes and the introduction of new ones to ensure that the thematic organization made sense of the participants' narratives. In the end, all the themes were given a clear and distinct label and the presentation offered a coherent story that would address the research questions and relate to the intents and purposes of the study. It allowed the construction of a nuanced view of the participants' experiences and conceptions about MEL practices and Big Data Analytics processes.

3.3.2 Quantitative Data Analysis Techniques

In analyzing the quantitative data obtained in this study, various statistical techniques were used in analyzing quantitative data originating from the survey and structured questionnaires. The operations began with Simple Measures which included mean, median, mode, standard deviation as well as variance. This first statistical analysis gave a general idea of the data's cardinal descriptive features along with participant descriptive features concerning challenges with MEL practices.

Apart from descriptive statistics, inferential statistics were used in the determination of relationships between the variables as well as in making estimates. Moreover, chi-square analyses were used to compare the participants' scores of the categorical variable, for instance, the workspace sectors in which participants work such as health or education sectors and their perceived BDA. In addition, independent samples t-tests were used to compare means between two groups to understand differences in readiness to adopt BDA tools across different roles including program managers and data analysts. Secondly, multiple regression analysis was used to analyze the effect of some predictors on the BDA readiness, while controlling for other factors.

All quantitative data analysis was done using statistics software (SPSS). The conventional software was used to carry out calculations and generate visuals; graphs and charts which made the results easy to interpret. The following specific quantitative data analysis techniques were then employed to offer a clear insight into the problems encountered in MEL practices in Tanzania and the possibility of BDA in solving the problem.

3.4 Sampling Techniques

The study selection method used is both purposive sampling and random sampling. Purposeful sampling was used to target individuals with knowledge and prior experience in implementing MEL activities in different sectors: health, education, agriculture, and economic development. This approach focused on those who could offer quality qualitative data on the application of Big Data Analytics (BDA) in MEL. In the quantitative framework choice, random sampling was used to obtain data from a larger population using questionnaires and structured questionnaires in surveys and therefore generalize findings from the study and across the sectors engaged in MEL. This approach makes the study even stronger since, on the one hand, it collects qualitative data that allows for deep analysis, and, on the other hand, provides quantitative data that is characteristic of a specific population.

3.5 Development of the Decision-Making Framework

Based on the insights gained from the data analysis, a decision-making framework was developed to guide the integration of BDA into MEL processes in Tanzania. The framework includes components such as data collection and management strategies, analytical tools, decision-making processes, and continuous learning mechanisms.

3.6 Validation and Refinement

The preliminary framework was validated through a sequence of workshops with MEL professionals and BDA experts. The workshop feedback gradually built an increasingly refined framework that would be most relevant to real-world cases.

3.7 Ethical Considerations

Data collection was done strictly following ethical considerations in participant confidentiality, rights, and privacy. Before enrollment, all the participants were given a comprehensive description of the study project, their involvement and the possible costs and benefits of the study initiation. From respondents, informed consent was sought and signed a standard consent form that explained that the participation was voluntary and that they could withdraw at any time without any consequences.

In an endeavor to ensure the anonymity and confidentiality of the participants, the participants were given impersonal numbers to enable researchers to differentiate among the participants while making their responses as well as during the entire research process. Information that was obtained from interviews and focus group were saved electronically in a coded format and only the members of this study team were able to access it. Also, all the audio recordings made throughout the research were transcribed and then all recordings were erased to protect participants' identities.

To follow the rules of the data protection legislation, this study checked that all the personal data, used in the study were processed following the laws. Besides, ethical considerations adhered to participants' rights in the course of the study; participants' rights to dignity consideration were respected. That is why, besides guaranteeing the methods applied, the research implemented a large spectrum of ethical actions to develop trust and transparency leading to the credibility of the chosen approach and the outcomes obtained.

4 Findings

The findings of this study are organized around the key themes identified in the data analysis and are presented in relation to the research questions.

4.1 Potential of Big Data Analytics to Enhance MEL

Participants in the study recognized the potential of BDA to address many of the challenges in current MEL practices:

Table 1: Potential of big data analytics to enhance MEL

The potential of BDA to enhance MEL	Description	Mean (1-5)	Standard Deviation
Improved data integration	BDA integrates diverse data sources, including real-time and non-traditional data, to provide a comprehensive view of program outcomes.	4.3	0.5
Advanced analytical capabilities	BDA tools offer advanced analytical capabilities like predictive analytics and machine learning, identifying patterns and trends not visible through traditional analysis.	4.2	0.4

Enhanced decision-making	The ability to analyze large datasets quickly and accurately facilitates more informed and timely decision-making in program management.	4.0	0.6
Increased efficiency in data processing	BDA automates and accelerates data processing tasks, reducing the time and resources required for data analysis.	4.4	0.3
Improved stakeholder engagement	BDA provides insights that can be easily communicated to stakeholders, enhancing transparency and facilitating better stakeholder engagement in decision-making processes.	4.1	0.5

The findings from the study (Table 1) highlight the significant potential of Big Data Analytics (BDA) to enhance Monitoring, Evaluation, and Learning (MEL) processes in development programs. The data, represented by mean scores on a Likert scale, provide insights into the areas where BDA is perceived to be most beneficial.

Improved data integration (Mean: 4.3): Participants highly rated the ability of BDA to integrate diverse data sources, including real-time and non-traditional data, resulting in a more comprehensive view of program outcomes. This suggests that BDA is effective in overcoming one of the key challenges in traditional MEL practices fragmented data. By bringing together data from various sources, BDA enables a holistic analysis that can lead to more accurate and actionable insights. Mean agreement between participants on the benefits of BDA integration is indicated by a standard deviation of 0.5. Although some respondents had slightly different views, the majority believed that BDA improves data integration. The high rating for improved data integration echoes findings from previous studies, such as those by Kharrazi et al. (2016) and Hernandez and Roberts (2018), which emphasize the ability of BDA to break down data silos and integrate diverse data sources. These studies highlighted how integrating real-time data and non-traditional data sources, such as social media or remote sensing, can enhance the comprehensiveness of MEL systems. The current study reinforces these conclusions, suggesting that data integration remains a core strength of BDA across different contexts.

Advanced analytical capabilities (Mean: 4.2): BDA's advanced analytical capabilities, such as predictive analytics and machine learning, were also rated highly by participants. This indicates that BDA is valued for its ability to uncover patterns and trends that might not be visible through traditional analysis methods. These advanced capabilities are particularly useful in complex development environments where understanding and anticipating changes can significantly improve program outcomes. Responses to BDA's advanced analytical capabilities (such as machine learning and predictive analytics) had a SD of 0.4, indicating that participants generally agreed on its usefulness raise the upgrade of MELs. The advanced analytical capabilities of BDA, including predictive analytics and machine learning, were also highly rated, consistent with the findings of DeSouza and Smith (2017) and Gamage and Mei (2019). These studies discussed how BDA's ability to process and analyze large datasets enables the

identification of patterns that traditional methods might miss. The current study's findings contribute to this narrative, highlighting that practitioners continue to value BDA's capacity for uncovering hidden insights, which is essential for adaptive program management.

Enhanced decision-making (Mean: 4.0): The study participants recognized the role of BDA in enhancing decision-making processes, as reflected in the mean score of 4.0. The ability to quickly analyze large datasets allows for more timely and informed decisions, which is crucial in program management. This finding suggests that BDA is helping organizations move from reactive to proactive decision-making, improving the overall effectiveness of MEL practices. However, there is some variation in perceptions of how BDA affects decision-making, as evidenced by the high standard deviation of 0.6. This suggests that although most individuals agreed on its benefits, others may have differed in how much BDA improves decision-making. Previous research, such as Custer et al. (2018), has documented the positive impact of BDA on decision-making in MEL processes, a conclusion supported by the current study. The ability to rapidly analyze extensive datasets and provide timely insights has been shown to improve decision-making quality, allowing organizations to be more agile in their response to emerging challenges. The mean score of 4.0 in this study reflects a consistent appreciation for BDA's role in making MEL processes more responsive and informed.

Increased efficiency in data processing (Mean: 4.4): The highest-rated potential of BDA is its ability to increase efficiency in data processing. With a mean score of 4.4, participants emphasized the importance of BDA in automating and accelerating data processing tasks. This efficiency reduces the time and resources required for data analysis, allowing MEL professionals to focus more on interpretation and strategy rather than data handling. This also contributes to faster feedback loops, enabling more agile and adaptive program management. With a low SD of 0.3, this indicates strong agreement in the responses of participants as to what role BDA plays in enhancing data processing efficiency; there is little variation in responses. This can be indicative of consensus on the clear advantages of BDA, entailing saving of time and reduction of resources. The increased efficiency in data processing, as indicated by the highest mean score of 4.4, is a finding that aligns with earlier work by Verhulst and Young (2017). Their research highlighted that BDA significantly reduces the time required for data management and processing, which in turn allows for quicker implementation of insights. The current study's emphasis on efficiency suggests that this aspect of BDA is increasingly valued, particularly in contexts where rapid feedback loops are necessary for program success.

Improved stakeholder engagement (Mean: 4.1): Improved stakeholder engagement was also positively rated, with a mean score of 4.1. BDA provides insights that are not only detailed but also easily communicable, enhancing transparency and building trust among stakeholders. This is particularly important in development programs where stakeholder buy-in is critical for success. The ability to present data-driven evidence in a clear and compelling way helps in aligning stakeholder expectations and fostering collaborative decision-making. The SD of 0.5 shows that there is a moderate consensus regarding the capability of BDA in improving stakeholder involvement. Whereas the majority of them found it useful to ensure transparency

and communication, it varied probably because their organizational settings were different. The potential for BDA to improve stakeholder engagement has been explored in studies like those by Waller and Fawcett (2013) and Miller and Wedell (2020), which discuss how clear and data-driven communication enhances stakeholder involvement. The current study's findings reinforce this idea, showing that BDA's ability to present complex data in an understandable manner is critical for building trust and ensuring stakeholder buy-in. This is especially important in development programs where stakeholder collaboration is essential for achieving desired outcomes.

4.2 Potential Barriers to Implementing BDA in MEL and their Solutions

Participants in the study recognized the potential barriers to BDA implementation and suggested solutions. The table below presents the qualitative results.

Table 2: Potential Barriers to Implementing BDA in MEL and their Solutions

Theme	Sub-Themes	Description	Suggested Solutions
Data quality and availability	Incomplete data	Gaps or missing information in datasets make it difficult to perform accurate analysis.	Implement data quality protocols and regular audits. Use data cleaning tools like Talend or Apache Nifi.
	Inconsistent data formats	Variability in data formats across sources hinders integration and analysis.	Standardize data formats and definitions across systems.
	Outdated information	Data may not be current or relevant, affecting the accuracy of insights.	Regularly update data and use real-time data streaming tools like Apache Kafka.
Technical challenges	High infrastructure costs	Significant expenses associated with the technology and infrastructure needed for BDA.	Utilize cloud-based solutions to manage costs. Start with pilot projects to demonstrate value.
	Complexity of tools	Advanced BDA tools can be complex to configure and use effectively.	Invest in training programs and technical support.

	Lack of technical expertise	Shortage of skilled professionals with expertise in BDA and MEL systems.	Offer professional development and engage external consultants for support.
Data privacy and security	Data protection	Risks associated with safeguarding sensitive or personal data.	Implement strong encryption practices and comply with data protection regulations.
	Risk of cyber-attacks	Vulnerability to security breaches and cyber-attacks.	Use robust access controls and conduct regular security audits.
Skill gaps and expertise	Insufficient training	Lack of training for staff on BDA tools and techniques.	Develop and deliver training programs tailored to BDA skills.
	Resistance to new technologies	Difficulty in adapting to and accepting new technologies.	Implement change management strategies to ease technology adoption.
Cost and resource constraints	High initial costs	Large initial investment required for BDA tools and infrastructure.	Conduct cost-benefit analyses and seek external funding or grants.
	Limited budget for BDA projects	Budget constraints limit the ability to invest in BDA.	Start with phased implementations and pilot projects to manage costs.
Data governance and management	Lack of governance framework	Absence of clear policies and procedures for managing data.	Establish a comprehensive data governance framework with defined roles and responsibilities.
	Unclear data ownership	Ambiguities around who owns and is responsible for data management.	Develop clear data ownership and management policies.
Integration with existing systems	Compatibility issues	Difficulties integrating BDA tools with existing MEL systems.	Ensure new tools are compatible with existing systems and use phased integration approaches.

	Workflow disruptions	Potential disruptions to existing workflows due to new BDA tools.	Implement integration in phases to minimize disruptions.
Cultural and organizational resistance	Resistance to technology	Organizational reluctance to adopt and utilize new technologies.	Engage stakeholders early and address concerns through effective communication.
	Lack of collaboration	Insufficient cross-departmental collaboration affects implementation.	Foster a culture of collaboration and communication across departments.

Results in Table 2 above show that data quality and availability are fundamental concerns when dealing with BDA in MEL. Issues like incomplete data, inconsistent formats, and outdated information significantly hamper the effectiveness of analytics. Previous studies underscore the importance of robust data management practices in addressing these challenges. For instance, Chatterjee et al. (2022) highlight that poor data quality can lead to misleading conclusions in BDA, which may compromise decision-making processes. Addressing these issues through data cleaning tools and standardization practices, as suggested in your table, aligns with best practices recommended by other researchers (UN, 2022).

Furthermore, technical challenges, particularly high infrastructure costs and the complexity of BDA tools are common obstacles. The high cost associated with BDA technologies often restricts organizations, especially in developing countries like Tanzania, from fully utilizing these tools. Cloud-based solutions have been suggested as a cost-effective alternative. This recommendation is consistent with the findings of Chatterjee et al. (2022), who discuss the potential of cloud computing to reduce the financial burden associated with big data infrastructure. Additionally, the complexity of BDA tools necessitates substantial investment in training and technical support, as emphasized by Guo et al. (2023) in their exploration of the emerging role of data scientists in organizations.

Additionally, data privacy and security are paramount, particularly given the sensitive nature of data often involved in MEL activities. Risks of cyber-attacks and data breaches are highlighted as critical concerns. Strong encryption and regular security audits are necessary measures, as reinforced by studies such as those by NBS (2022), which discuss the critical need for secure data handling practices in the era of big data.

The thematic analysis also points to significant skill gaps and expertise shortages, which hinder the effective implementation of BDA in MEL. The lack of trained personnel and resistance to adopting new technologies are recurring issues. Professional development and external

consultancy are suggested solutions, aligning with the broader literature on the need for continuous skill development in the face of rapidly evolving technology (IDC, 2022).

Cost and resource constraints are also persistent challenges, with high initial costs and limited budgets often cited as barriers. This is a common issue in adopting BDA technologies, particularly in resource-constrained environments. The suggestion to start with phased implementations and pilot projects is supported by research from Akter et al. (2021), who advocate for incremental adoption strategies to manage costs effectively.

Moreover, the lack of a governance framework and unclear data ownership are identified as major issues in your analysis. Establishing clear governance structures is critical for the successful integration of BDA into MEL processes. This is consistent with findings from Guo et al. (2023), who emphasize the importance of data governance in ensuring data quality and facilitating effective analytics.

Besides, compatibility issues and workflow disruptions are common concerns when integrating new BDA tools with existing MEL systems. A phased integration approach, as suggested, is recommended by Akter et al. (2021) as a way to minimize disruptions and ensure a smoother transition.

Lastly, cultural and organizational resistance to new technologies can significantly impede the adoption of BDA. Engaging stakeholders early and fostering collaboration are crucial steps in overcoming this resistance. Studies by Akter et al. (2021) echo these recommendations, emphasizing the importance of organizational culture in the successful implementation of analytics initiatives.

4.3 Thematic Analysis of Qualitative Findings on BDA in MEL

Theme 1: Enhanced Decision-Making and Strategic Planning

Some participants mentioned that BDA enhances decision-making in the sense that it offers timely informed strategies that assist the programme in making changes where necessary on time. Interviewees noted that BDA could take organizations from ‘rear-view mirror planning’ to ‘forward-looking planning’.

“Formerly, we would have to wait for end-of-the-year reports to be prepared, but with BDA, we can make decisions in real time. This lets us dynamically plan our approach in the middle of the project.” Program Manager, Health Sector.

“In Big Data tools, we can discover correlations which we might have overlooked, and this, in turn, assists in achieving forecasts in a specific result or event.” Administrative professional Position for SMC MEL Specialist in the Education Sector.

Theme 2: Improved Data Integration and Access

The participants also pointed out that the BDA helps to integrate data from multiple sources and, therefore, provides a more holistic picture of program performance. This integration was

found useful because it models a solution to the dilemma of fragmented traditional MEL data sources.

“Data integration has always been a problem in our sector, and surprisingly, with Big Data, we can pull data from social networks, surveys, satellite images, etc., into a single space.” Data Analyst - Agriculture Sector

“We are finding that BDA tools are assisting in the breakdown of silos. Now, the chances of getting a more accurate, instead of a partial, picture of a customer are higher because data streams previously separate are merged.” MEL Officer – Economic Development.

Theme 3: Increased Efficiency and Resource Optimization

The respondents stressed the time and cost savings made by using BDA, as it helps to facilitate various data processing. The lack of incorporated automation was praised in BDA tools for helping to speed up common MEL processes when staff might best be utilized for interpretation and planning.

“Previously, it took sometimes several days to clean and combine data, but now the BDA tool does most of it.” The ICT Specialist, NGO

“Praising the efficiency gains, he noted. All our efforts can now be directed towards what the data is communicating rather than struggling with getting the data to communicate in the first place.” The MEL Coordinator, Health Sector.

Theme 4: Enhanced Stakeholder Communication and Engagement

Another commonly mentioned benefit of BDA was its ability to improve communication with stakeholders. Participants found that BDA's visualizations and predictive analytics help to better communicate program outcomes, making it easier for stakeholders to understand MEL insights.

“Stakeholders want evidence, and BDA gives us that in a visually compelling way. They are more engaged now because we can show real impact.” The Project Leader, Education Sector

“With BDA, we can break down complex data into digestible formats, which is crucial for keeping our partners on board.” The Communications Officer, Economic Development

Theme 5: Challenges of Technical Infrastructure and Skill Gaps

The participants saw the strengths of BDA but often discussed threats more often, especially where infrastructure and specialist knowledge are necessary for the proper implementation of BDA. Issues of data privacy were also an issue of concern, especially for subsectors handling sensitive data.

“Huh, we do not have IT support for BDA analytic systems, which restricts the possibility of implementing BDA for our business.” The MEL Manager, Agriculture Sector

“Despite using BDA, there is still room for training. Often, staff use it like this: “We require more training for our team to unlock the workforce.” The Program Director, Second Health Sector

These themes show the breadth of what BDA can achieve to improve MEL practices and the areas where organizations have difficulties realizing these tools.

Developing a Decision-Making Framework that Integrates BDA into MEL Processes

In the field of Big Data as well as Monitoring, Evaluation, and Learning (MEL), honing a solid framework for decision-making must consider the factors of data management and analysis (Chatterjee, Chaudhuri, Vrontis, et al., 2022). These issues include the origins of data, where data are stored, how data are prepared, and the positioning of the MEL processes relative to existing organizational policies and procedures. The framework defines the main components and practices that should keep the augmenting framework both optimizing the use of data in decision making and optimizing the ways of data usage in line with the highest ethical standards.

4.3.1 Exploring Data Provenance and Data Storage Processes

An inherent part of MEL in Big Data is that there must be knowledge of the sources of the big data (Galetsi et al., 2020). Data authentication is the process of identifying the origin of data, that is, the source, the way it was collected, and how it was processed (Goyal et al., 2020). Data sources are rather diverse and include transactional databases, social media, sensors, and the rest of IoT tools. These sources enrich the dataset in terms of richness and variety; at the same time, the heterogeneity of the sources leads to problems in data quality and handling.

Essential to this category is the storage mechanisms as well. The framework is capable of working on data amounts that can reach terabytes in a scalable and efficient way. Popular distributed file systems like Hadoop’s HDFS and other cloud-based systems are used for data storage in Big Data. These systems do not only record data across various nodes so as to make sure that data are duplicated for hot standby and disaster prevention but also provide fast and efficient way of data accessibility and data analysis for real-time or close-to-real-time MEL activities.

4.3.2 Data Preprocessing to Ensuring Data Quality and Usability

The range of data, which is collected, could be varied, and this makes the preprocessing phase a critical phase within the developed framework. This process encompasses several vital activities:

1. **Data Cleaning:** This step is important so that the framework is built on relevant, consistent data that do not contain or are not influenced by noise. Data cleaning is the first step before data analysis and it is focused at treating missing values, duplicate observations and errors. In as much as Monitoring, Evaluation, and Learning requires high levels of precision, effective data cleaning forms the root to accurate and relevant outcomes.

2. **Data Integration:** The framework combines the data into one single data set for further analysis. It may include units such as converting data from one format to another, transforming the data structures and reconciling semantic differences. Another key practice in MEL is data integration that is critical in MEL since it enable inclusion of all the relevant data in a project to make the evaluation more comprehensive.
3. **Data Transformation:** After cleaning, the data has to be integrated; in some cases, the data may be transformed to meet analysis requirements. This might mean normalization, aggregation, or transformation of the data, depending on the analysis to be conducted. The transformation process within the framework makes data ready for analysis and ensures that the data is best suited for the methodologies used within the framework, thus improving the framework's efficiency.

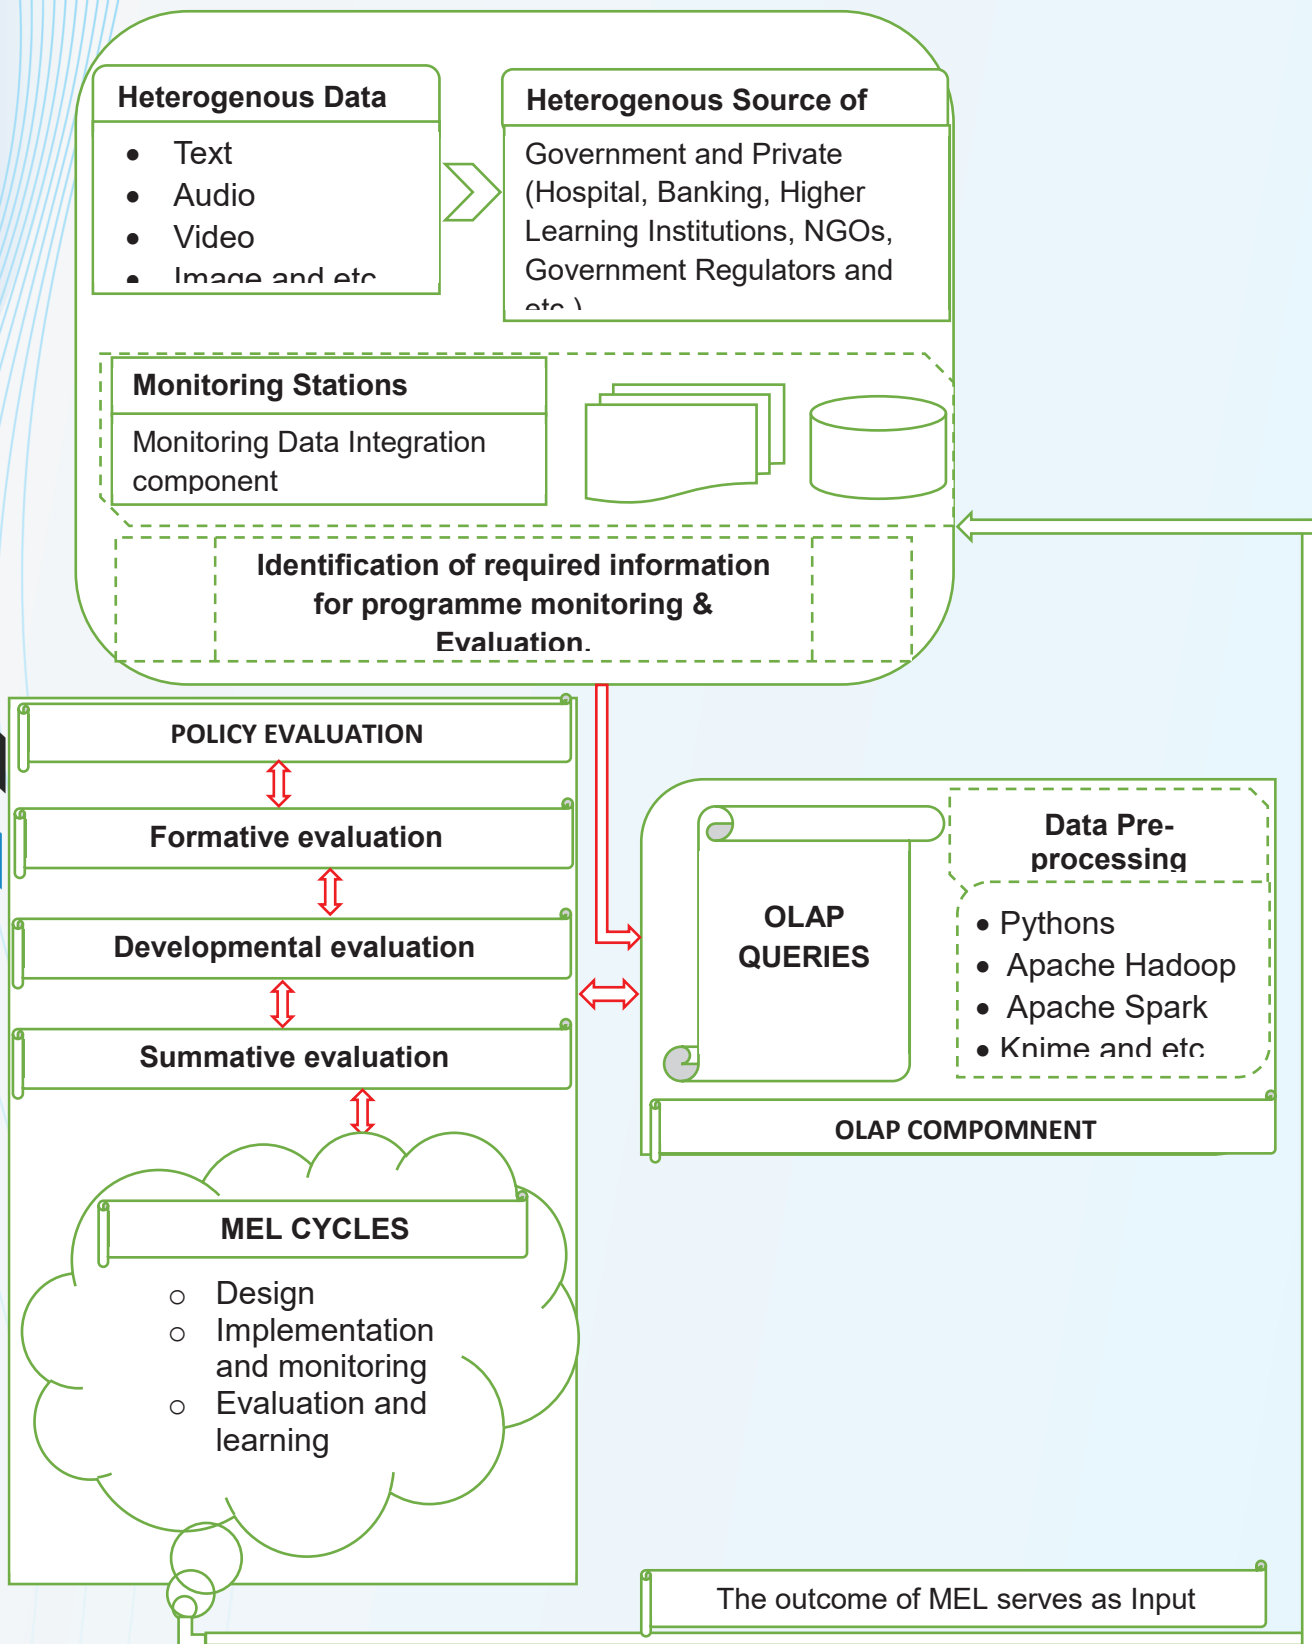

4.3.3 Evaluative Components: Integrating MEL with Big Data

The framework is designed to support four types of evaluation (Policy Evaluation, Formative Evaluation, Developmental Evaluation, and Summative Evaluation) each serving a different purpose within the MEL process.

1. **Policy Evaluation:** In this case, Policy Evaluation looks at the impact and effectiveness of organizational policies through data. With Big Data, Policy Evaluation can give you granular insights into how policies are working across different segments and environments. So, you can see what works and what doesn't and where to improve.
2. **Formative Evaluation:** Formative Evaluation benefits from real-time data analysis. By monitoring program implementation in real-time, the framework can give you feedback to iterate and improve. Big Data helps you spot trends and challenges as they emerge so you can intervene to boost program success.
3. **Developmental Evaluation:** Developmental Evaluation is perfect for innovative or adaptive programs where traditional evaluation methods won't cut it. Big Data can process vast amounts of unstructured data like qualitative feedback and social media interactions to give you rich insights to help evolve these programs.
4. **Summative Evaluation:** At the end of a program or policy cycle, Summative Evaluation uses Big Data to do a full review of overall performance. By analyzing large datasets, the framework can give you a deep understanding of the program's impact, what worked and what to focus on next.

The application of Big Data expands the landscape of Monitoring, Evaluation, and Learning, it becomes more crucial to advance a complex decision-making support system. This framework, therefore, includes understanding data origin, location, and preparation as well as how MEL processes align to the organization's policies. Together, the elements of the framework, allow the organization to reap the full benefits of big data by enhancing the Organization's ability to make better and smarter decisions that improve organizational performance and lead to learning.

Figure 1. Enhancing MEL with Big Data Analytics: A Decision-Making Framework

5 Conclusion and Recommendations

5.1 Conclusion

The study highlights the critical role of BDA in enhancing decision-making in MEL. By providing advanced analytical tools and real-time data insights, BDA can support more effective program management and enable organizations to respond quickly to emerging trends and challenges. The barriers to implementing BDA identified in this study are significant but not insurmountable. Organizations can address data privacy and security concerns by adopting robust data protection measures and ensuring compliance with relevant regulations. Investing in technological infrastructure and building capacity in data analytics are also essential steps to overcome technological and infrastructure limitations. This study set out to explore how Big Data Analytics can enhance Monitoring, Evaluation, and Learning practices in Tanzania and to develop a decision-making framework for integrating BDA into MEL. The findings suggest that BDA has significant potential to improve the effectiveness and efficiency of MEL processes by providing more comprehensive data integration, advanced analytical capabilities, and enhanced decision-making. However, the successful implementation of BDA in MEL requires addressing key barriers, including data privacy concerns, technological limitations, and regulatory challenges.

5.2 Recommendations

The Tanzanian government and development organizations should collaborate to establish and enforce data privacy and security standards that protect sensitive information while enabling the use of BDA in MEL. Also, investments in technological infrastructure, such as data storage and processing capabilities, are essential to support the implementation of BDA in MEL. Furthermore, organizations should invest in training and capacity-building initiatives to enhance the data analytics skills of MEL practitioners and consider adopting BDA in a phased approach, starting with pilot projects to test and refine the integration of BDA into MEL before scaling up.

Future research should explore the application of BDA in MEL across different sectors, such as education, health, and agriculture, to identify sector-specific challenges and opportunities. Longitudinal studies are needed to assess the long-term impact of BDA on the effectiveness and sustainability of MEL processes in Tanzania.

Abstract

This study focused on determinants of service quality on tourist revisit intention in tourism destinations. The study reports findings on the determinants of service quality in tourist destinations and their implication on tourist's revisit intention. The study only focused on the reliability and empathy service quality determinants. Service quality dimensions provided a comprehensive approach to the computation of the study findings. Data were collected from 304 tourists who visited Arusha tourists' destinations, including Tarangire National Park, Ngorongoro Conservation Area (NCA) and Arusha National Park. A structured questionnaire was used to collect data. Data were analysed using the inferential statistics method. Contrary to the usual perception, the study findings present that reliability and empathy were found to have a positive and significant impact on predicting the quality of tourist destination services. The study concludes that reliability and empathy are acceptable determinants of service quality in tourist' destinations, and thus, they contribute towards customers' revisit intention. The study, therefore, recommends that tourist destinations should consider the practicability of reliability and empathy determinants to increase customer revisits.

Keywords: *Service quality, tourist destinations, reliability, empathy*

1.0 Introduction

Tourism has been one among the peculiar fast-growing sector which its contribution to the economy is substantive (Soleimani & Einolahzadeh, 2018). Based on the World Tourism Barometer, the global state of tourism shows that the sector has been growing positively with

increase in its base and flowering the economies. Regionally, the sector has witnessed a 6% degree of growth across Pacific and Asia zones, Africa being 5.6% and East Africa 17.5% (Kyara et al., 2021). That being the case, the sector needs to express high level of quality of services provided including in the tourists' destinations. Since the tourists' destinations are expressed as areas or places that tourists have focused on to pay visits, such destinations must reflect the service quality attributes to capture their attention (Nguyen, 2020). Notably, common related services in tourists' destinations includes conference center, related tourists' transportation, photographic services and documentaries which have impact in customer satisfaction and retention (UNWTO, 2021). The identified services provide tourist destinations the essentiality for enduring retention and ongoing engagement between the respective destinations with their esteemed customers (Cristea & Mocuta, 2018). Customers in the tourist destinations must at first glance perceive that the destination's services are reliable and empathetic attributed therein (Imran et al., 2018). Reliability and empathy as a whole form the essence of service quality in respective tourists' destinations which being crucial for the sustainability of tourism sector. The portrayed nature of tourism industry signifies its outstanding performance globally, regionally and in country specific areas where provision of job opportunities and engagement of stakeholders such as tourists would be possible without the contribution of the service quality attributes (WTTC, 2020; Sharma *et al.*, 2021). Studies regarding determinants of service quality using the SERVQUAL model have proven the contribution of service quality determinants in customer satisfaction and retention and, thus, tourists' destinations being inclusive in the course of improving quality of services from a customer care perspective to real-life situations within (Surahman, & Wahyuni, (2020). The rationale for the provision of quality service in tourists' destinations aligns with the increased growth of the sector, invented tourism activities within the tourist destinations, quality customer handling and smooth flow of generated income (Timur, 2018).

Though there are notable significance of tourism sector in Arusha tourists' destinations, a gap in knowledge concerning the validity of some determinants of service quality in the respective destinations exist (Singh & Singh, 2019). Most of the studies consulted have shown how responsiveness, service assurance and tangibles could have basis for expressing quality of service offered without inclusion of reliability and empathy determinants (Bove, 2019; Van, 2020; Wantara and Irawati, 2021). Based on the exceptional attributes of Arusha including its landscape, attractions and cultural heritage, this study ought to fill the available gap by confirming the rationale of reliability and empathy determining the quality of services provided in Arusha tourists destinations.

The study will be guided by the following questions;

- i. Is reliability a determinant of service quality in tourists' destinations?
- ii. Is empathy a determinant of service quality in tourists' destinations?

2.0 Literature Review

Reliability and Empathy as Service Quality Determinants

Unlike to many previous studies (Bhat, 2012; Ismail et al., 2017; Jansri et al., 2020; Ali, 2021) that did not concur with reliability and empathy determinants of service quality, this study presents the named variables as cornerstone for service quality in tourists' destinations. The inclusion of reliability and empathy in this study is for reducing the gap of excluding some of the service quality variables and to establish the base for practicability of the variables in service quality assessment.

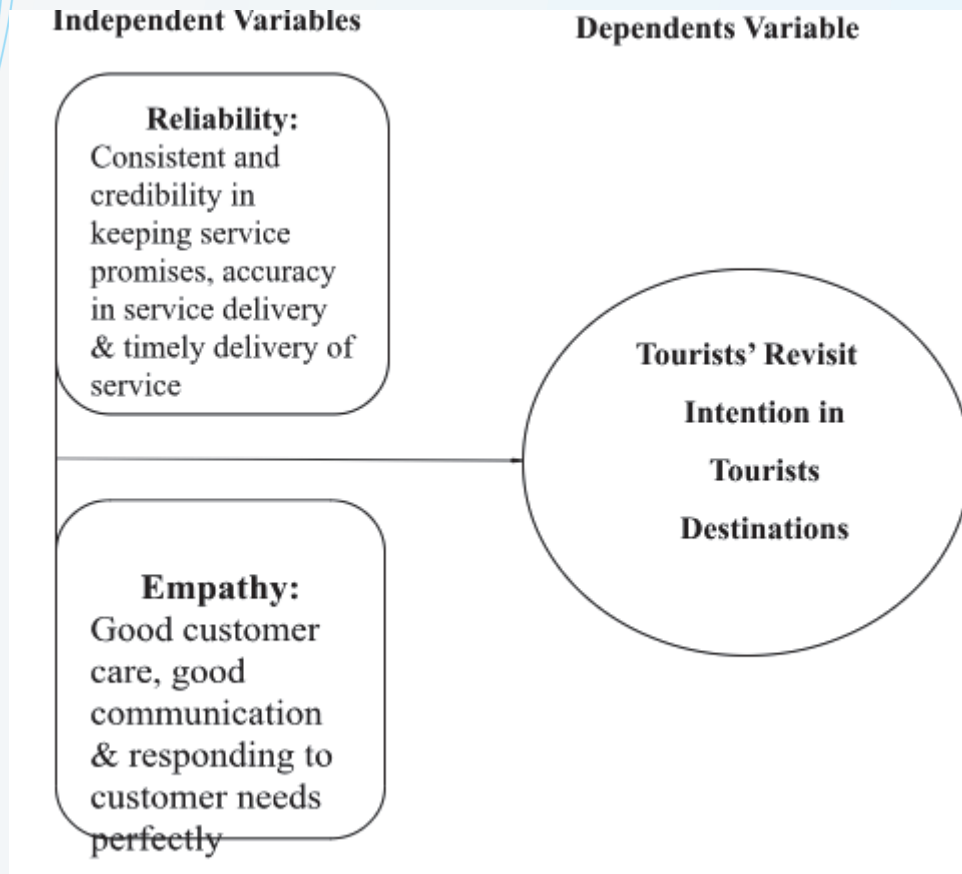

Reliability expresses the ability to deliver services precisely and dependably as promised by a provider at the outset of a relationship (Ali et al., 2021; Anwar & Ghafoor, 2017). This refers to the business's or service provider's capacity to supply clients with on-time, error-free deliveries. When properly addressed, reliability is a key component of service quality that affects how customers perceive the quality of the experience ultimately influences loyalty which plays important role in revisit intention (Rayma et al., 2019).

Empathy is the ability to provide caring and undivided attention to customers from service provider (Rayma et al., 2019). Empathy dimension represents elements such as staff effort and ability to understand customer desires in terms of approachability and sensitiveness during service encounter. This dimension in service quality plays a crucial role in making sure customers are enjoying the moments when contacting with the firm or service provider. In this dimension, customers get special attention and focus, which helps to increase the level of satisfaction and positive experience during service encounters.

In a study about tourism service quality affecting the satisfaction of foreign tourists, Tran and Van (2020) revealed that reliability had a positive and significant impact on service quality in the tourism sector. The significance of reliability was determined using the level to which satisfaction was attained. Wantara and Irawati (2021) examined the relationship and impact of service quality and destination image on customer satisfaction and revisit intention and revealed that reliability has a strong relationship with service quality, thus predicting its influence on service quality. Bove (2019) in the assessment of empathy for service on the basis of benefits, unintended consequences and future research which revealed that empathy has a significant impact on quality of services with an added advantage of being well engrooved to attain target performance.

2.1 Study Theoretical Model

Independent variables comprise reliability and empathy determinants as reflected in the Service Quality Model developed by Parassuraman et al. (1988). Tourist destinations present that, tourists' intent to return to a destination in the future, plans to return to a destination in the future, efforts to return to a destination in the future, interest in returning to similar destinations in the future, recommendations to others positively on destinations depending on the reliability of the services provided and the empathy practices.

Source: SERVIQUAL Model

The model explains the relationship between service quality determinants, which are reliability and empathy in revisiting the intention of customers in tourists' destinations. It explains the need for customers to recognize the reliability of service at tourist destinations, which must be accompanied by consistency and credibility in keeping service promises, accuracy in service delivery and timely delivery of such service, which in turn exercises service quality with an additional package of motivating customers to return for the same services anytime later. Furthermore, based on empathy, the model depicts that good care and paying attention to customers at tourists' destinations would attract their revisit intention and thus quality of service offered becomes valuable.

3.0 Methodology

3.1 Research Approach

This study used deductive approach to include service quality dimensions (reliability and empathy) The approach was appropriate in this study since it provided the study with accepted variables that intends to assess the quality of services in customer destinations.

3.2 Study Area

This study was conducted in Arusha tourist destinations, including Arusha National Park, Mount Meru, Momella Lake, lake Dulluti, Olduvai Gorge, Ngorongoro Creator, Ngurdoto Creator, Meserani Snake Parks and Chemka Hot Spring located in Arusha, Tanzania. The reason for choosing Arusha tourist destinations is that Arusha is the gateway to the majority of the tourist attractions in northern Tanzania, including Ngorongoro Conservation Area, Tarangire National Park, Lake Manyara National Park, Serengeti National Park, Mount Kilimanjaro, Olduvai Gorge and many others. The majority of travelers who fly to Kilimanjaro International Airport (KIA) get to Arusha as their primary destination point. Due to the presence of the African Court on Human and Peoples' Rights, the International Criminal Tribunal for Rwanda, and the East African Community in this city, Arusha functions as an important global diplomatic hub (TTB magazine, 2017). It serves as the starting point and hub for the northern Tanzania safari circuit and draws numerous visitors from across the world (MNRT, 2020).

3.3 Population

This study was conducted in Arusha tourist destinations including Arusha national park, Mount Meru, Momella lake, lake Dulluti, Olduvai gorge, Ngorongoro creator, Ngurdoto creator, Meserani snake parks and Chemka hot spring located in Arusha Tanzania. The reason for choosing Arusha tourist's destinations is that Arusha is the gateway to the majority of the tourist attractions in northern Tanzania including Ngorongoro Conservation Area, Tarangire National Park, Lake Manyara National Park, Serengeti National Park, Mount Kilimanjaro, Olduvai Gorge and many others. The majority of travelers who fly to Kilimanjaro International Airport (KIA) get to Arusha as their primary destination point. Due to the presence of the African Court on Human and Peoples' Rights, the International Criminal Tribunal for Rwanda, and the East African Community in this city, Arusha functions as an important global diplomatic hub (TTB magazine, 2017). It serves as the starting point and hub for the northern Tanzania safari circuit and draws numerous visitors from across the world (MNRT, 2020).

3.4 Sample Size

The sample of the study was obtained through the use of Cochran's (1997) formula. This is a formula for finding sample size when the population is infinite (that is one do not know exact number of the population). Equation 1 presents the Cochran's formula.

$$n = \frac{Z^2 * p * q}{e^2} \dots\dots\dots(1)$$

In the given formula above, n denotes sample size, Z denotes the critical value of a suitable confidence level (in this case 1.96 for a 95% confidence level), p denotes the proportion in the population of interest (in this case 50%), q is equal to 1-p, and e denotes the allowable margin of error which is frequently set at 0.05. The final sample size is 384 respondents as indicated in equation 2.

$$n = \frac{(1.96)^2 * 0.5 * 0.5}{0.05^2} = 384.16 \approx 384 \dots\dots\dots (2)$$

This study Targeted sample size of 384 but the actual number of participants (response rate) was 304 respondents.

Therefore, the final sample size was 304 respondents.

3.5 Data Collection Method

Questionnaire was the data collection method employed in this study. The use of questionnaire data collection method was for the easiness of collecting data from huge number of respondents within short time.

3.6 Data collection tools

This study used a Structured Questionnaire to collect data. Respondents were administered a questionnaire with closed-ended questions. The tool was used because it is cost-effective in terms of time, money, and energy, and it helps to collect adequate information in a dispersed population within the shortest time possible (Gurbuz, 2017).

3.7 Data Analysis

Inferential statistics methods were used to analysed study data. The correlational analysis presents the inter relationship between study variables. The factor analysis test was used to confirm how reliability and empathy influence customer revisits at tourism destinations.

3.8 Reliability Test

Replication, accuracy, trustworthiness, and consistency of the research are all measured by reliability (Chakrabartty, 2013). In order to gauge reliability, a coefficient was used. The coefficients are deemed relevant if they provide values greater than 0.7. However, if the coefficients are between 0.7 – 1, then they are regarded as extremely good (Madan & Kensinger, 2017). Reliability and empathy variables were tested by using Cronbach's Alpha and bared the following coefficients as results for each variable. Reliability had a coefficient of 0.719, which tests significant, and responsiveness index coefficient was 0.719, which tests significant too, and empathy was 0.835, which tests significant as well.

Table 1: Reliability Computations

Variable	Cronbach's Alpha	Items
Reliability	0.719	8
Empathy	0.835	9

Study findings present that reliability and empathy had significant values which were between 0.7-1 and thus indicating reliability of study data. The implication of the reliability results is that reliability and empathy variables were reliable to predict the quality of tourist destinations.

4.0 Findings

4.1 Statistical Tests

4.2 Model Goodness for Fit Test

The study assessed how well the model fit describes study data by statistically computing the required variables. The binary logistic regression model presents omnibus model tests where p value is less than 0.05 (0.000). This implies the model is statistically significant as chi-square (χ^2) test indicates that the model adequately describes data.

Table 2: Omnibus Tests of Model Coefficients

	Chi-square	df	Sig.
Reliability	81.539	6	0.000
Empathy	81.539	6	0.000

The findings obtained in the Omnibus test of model coefficient showed a fit of the model to the study data and thus implied a prediction that reliability and empathy would bring into quality of services at tourist destinations

4.3 Linearity Test

This subsection on linearity test in binary logistic regression assumes the existence of linearity of independent variables and log odds. Additionally, the independent variables were supposed to have a linear relationship with the log odds. Table below presents results that revealed there is significance linearity between reliability and empathy at $p=0.000$. Results implies reliability had linear relationship with empathy and thus could predict quality of services at tourist destination. Empathy linearity tested significant at $p=0.000$ against other variables (tangibles and assurance indexes). Furthermore, empathy had linear relationship with reliability and thus could predict quality of services at tourist destination. Empathy linearity tested significant at $p=0.016$.

Table 3: Linearity Test

	Reliability		Empathy	
	df	sig.	df	sig.
Linearity	1	0.000	1	0.000

Dev. from linearity	48	0.111	32	0.016
---------------------	----	-------	----	-------

4.4 Multi-Collinearity Test

The values of variance inflation factor (VIF) should be equal to or less than ten (10) so that it can be argued that there is no multi-collinearity between variables (Magoma et al., 2022; Epaphra, 2020). Results from Table 7 revealed that predictor variables, tangibles, responsiveness, and assurance, had VIF 1.758, 2.305 and 2.012, respectively, which is less than 10 with moderate VIF cannot affect the interpretation of individual effects of predictors. This suggests that there is no multi-collinearity existed between the variables and data collected. Also, the tolerance of predictor variables (tangibles, responsiveness and assurance) is more than 0.10 which is the minimum tolerance level acceptable. (Magoma et al., 2022; Epaphra, 2020). Hence there is no multi-collinearity between study independent variables.

Table 4: Multi-Collinearity Test

Variables	Unstand. Coef		Stand. Coef	T	Sig.	Collinearity Stat.	
	B	Std. Error				Tolerance	VIF
(Constant)	0.784	0.011		37.56	0		
Reliability	0.048	0.061	0.121	1.744	0.082	0.569	1.758
Empathy	0.076	0.053	0.125	1.686	0.093	0.497	2.012

4.5 Pearson Correlation Test

Pearson correlation presents a relationship between service quality variables (reliability and empathy) and tourists revisit intention in Arusha tourists' destinations. Reliability and empathy had positive association with tourists' revisit intention. However, the study established that the existed relationship was somewhat weak at 0.342. Study findings shows that tourist companies' service quality using reliability and empathy influenced tourist's revisit intention moderately based on tourists recommendations.

Table 5: Correlation Test

	Revisit intention	Reliability	Empathy
Revisit intention	1		
Reliability	0.342**	1	
Empathy	0.342**	0.342**	1

Empathy	.347**	.531**	.1
---------	--------	--------	----

** Correlation is significant at 1%

On the other side, tour company's service quality variables (reliability and empathy) associate with each other as described above. This implies all independent variables (reliability and empathy) had positive relationship and moderate association with each other.

4.6 Reliability and Empathy as Determinants of Service Quality in Tourism

In responding to the research questions guiding the undertaking of this study, a regression analysis was performed thereof. Reliability (consistency and credibility in keeping service promises, accuracy in service delivery & timely delivery of service) and empathy (good customer care, good communication, responding to customer needs perfectly) variables were tested to ascertain if they fit as determinants of service quality in tourists' destinations or not. Study findings for reliability presented a significance level of 0.006 while empathy presented 0.031.

Table 6: Regression Model on Reliability and Empathy Determinants

Variables	B	S.E.	Wald	df	Sig.	Exp(B)
Reliability	0.287	0.35	3.392	1	0.006	1.595
Empathy	1.107	0.27	10.667	1	0.031	3.343
Constant	1.434	0.155	76.528	1	0.001	4.638
-2 Log likelihood	205.915					
Cox & Snell R Square	0.235					
Nagelkerke R Square	0.385					
Hosmer and Lemeshow						
$\chi^2=4.72, P=0.787$						

Given the regression model above, the study findings indicated that reliability had positive and significance in entailing service quality and for that reason it has bases for enhancing intention for tourists destination revisits. The study findings were supported by Van (2020) who commented that reliability had positive and significant impact on service quality and enhanced intention for revisits among tourists as determined by the level to which satisfaction was enhanced. Furthermore, Wantara and Irawati (2021) added that reliability pose strong and relationship on service quality and thus predicting its influence on service quality. On empathy,

the study findings also established a significant and positive relationship with quality of tourist destination services. The study findings were supported by Bove (2019) in the assessment of empathy for service on basis of benefits, unintended consequences and future research which revealed that empathy has significant impact on quality of services with an added advantage of being well engrooved to attain target performance.

5.0 Conclusion

Contrary to most studies that isolated reliability and empathy in predicting service quality in the tourism sector, this study has established that reliability and empathy positively and significantly impact service quality and thus attract revisit customers to tourist' destinations. The study findings conclude that reliability and empathy being acceptable determinants of service quality in tourists' destinations and thus they contribute towards customers revisit intention. The study recommends that tourists' destinations should consider the practicability of reliability and empathy determinants so that to increase customer revisits.

²Department of Procurement and Supplies Management, College of Business Education; Email: mepesesi83@gmail.com

Abstract

Integration into the global value chain (GVC) is a crucial step for smallholder women farmers to attain its innovation inspiration. Despite geographical and technological limitations, a global investigation proved that GVCs are the stimulant of innovation across sectors, including agriculture, where firms have access to new markets, information, and technologies. These innovations have promoted the value chain of agriculture through the adoption of innovative technology in crop production, which has the potential to improve productivity and bring production efficiency to smallholder women farmers. Nevertheless, its potential research on the relationship between global value chains (GVCs) and the adoption of innovative technology by smallholder farmers is inconclusive. To this end, this study intends to investigate the global value chain and the uptake of innovative technology in vanilla production among women smallholder farmers in Bukoba Rural District, Tanzania. The study is quantitative in nature, involving a survey in data collection while utilizing a cross-sectional research design. Also, the multistage cluster sampling technique was employed; the study focused on wards with significant vanilla production and women's participation in agricultural cooperatives. Data analysis utilized descriptive statistics, including percentages, frequency, mean, graphs, and charts, using SPSS version 25. Results indicate high awareness (97.1%) and adoption (90%) rates of innovative technology among women smallholder farmers. Furthermore, it was revealed that the most adopted technologies in vanilla production were pollination technology (25.1%) and farm preparation technology (24.4%). Key findings highlight the significance of technology adoption in enhancing value-added production. The study underscores the role of factors such as export standards, government support, and technical assistance in motivating technology adoption. Moreover, it reveals that technology adoption positively impacts productivity and product quality, with farm preparation and the production process identified as major contributors to value addition. This research provides insights into the crucial nexus between GVCs, technology adoption, and the empowerment of women smallholder farmers in vanilla production.

Keywords: *Global Value Chain; Technology Adoption; Innovation; Small-holder Women Farmers*

1.0 Introduction

Developed and developing nations' economy Global value chains (GVCs) account for 70% of global trade, greatly impacting the dynamics of globalization and stimulating innovation by 5% (Cigna & Gunnella, 2022; OECD, 2022; Rub'inov', 2021). GVC, as a collaborative web of production among nations, have transformed how things are made, and now many businesses, including vanilla smallholder women farmers (VSWF), don't make everything within their own limits. Instead, they split up tasks and send them to different places and people where they can be done best, often through offshoring (Ambos *et al.*, 2021; Fernandez-stark & Gereffi, 2019b; Sébastien Miroudot and Håkan Nordström, 2019).

Additionally, in the 20th century, agricultural global value chains (AGVCs) have grown fast and reshaping the global production of food through their ability to coordinate and spread innovative technologies among local producers. For instance, it has enabled VSWF to focus on

areas of comparative advantage and facilitate broader dissemination of innovation activities (Cigna & Gunnella, 2022; Fieldsend *et al.*, 2021; Sunghun Lim, 2021). Hence, worldwide the leading center for vanilla plantation and export are Mexico, Indonesia, India, and other countries in the United States, (Chambers *et al.*, 2019), which implies the ability to focus on areas of competitive advantages facilitate innovative ability of producers such as VSWF (Rasib *et al.*, 2021).

The perspective of GVCs in Africa situated it in the upstream flow of the value chain as they export commodities as an input to the other manufacturing nations (Cigna & Gunnella, 2022). According to Avenyo *et al.*, (2022), GVCs have increased African firms' potential for innovation by disseminating innovative technologies and information. Despite this affiliation up to date evidence is limited on how GVCs contribute to innovation in Agricultural sector in Africa since the level of productivity is low (Steffens *et al.*, 2020), also, (Deng, 2020; Okpoko *et al.*, 2022), reported technological innovation as one of the barriers for growth of the agriculture and food industry. As a result, an insight related to how vanilla smallholder women farmers obtain innovation from GVCs is also limited due to a weak coordination of actors along the value chain. Although GVCs, have shaped many sectors including agriculture where innovative technology from effective producers and buyers can be obtained domestically which stimulates product innovation, and process innovation for smallholders as well as optimal cost consideration which makes Madagascar to be the global centre for vanilla production (Şerbănel, 2021; Shriver, 2020; Ahmad *et al.*, 2017)

In Tanzania, GVCs intervention in agriculture innovation is motivated by the fact that 70% of Tanzanians depend on agriculture and related value chains and most of them are smallholders who produce variety of cash crops such as vanilla (WB, 2019; Mufuruki *et al.*, 2017). For that case GVCs facilitate agricultural innovation where a number of agricultural frameworks such as agriculture sector development strategy (ii) and the national five-years development plan (phase II) have been developed to ensure revitalization of agriculture sector and reduction of postharvest losses (URT, 2021; WB, 2019). According to Thomas & Makundi, (2020) GVCs have imbedded innovation on production of horticulture crops that include vanilla where smallholder get access to market information and new farming technologies. Also, (Magesa *et al.*, 2019, 2020), reported diffusion of agricultural market information facilitate best farming practices.

Despite government initiatives, the agriculture sector—including vanilla production—continues to highlight the need for technological advancements and stronger connections to regional and international agricultural value chains (BoT, 2021; Finance, 2021; URT, 2021; WB, 2019). As a result, smallholder farmers are vulnerable to limitations of innovation, such as new farming technology and advanced storage facilities, which is justified by postharvest losses in agriculture, which account for 40% of harvested crops in which vanilla is branded (Maziku, 2019). Therefore, this infers that 100% of harvested crops, 40% of them do not meet market standards due to outdated farming technology and storage facilities. Though scholars proposed study on the Innovation System (IS) and lens of GVC (Jurowetzki *et al.*, 2018; Lema *et al.*, 2018; Montalbano *et al.*, 2018;), studies on GVCs and agriculture innovation as well as

related value chain are available (Avenyo et al., 2022; Deng, 2020; Sunghun Lim, 2021; Thomas & Makundi, 2020), however, (Rodriguez, 2018) opened that most AGVCs have isolated smallholder farmers. On that view, still there is a knowledge gap on global value chains and the uptake of innovative technology in vanilla production among women smallholder farmers.

Therefore, this research intends to contribute to the body of knowledge by discovering the given research questions:

RQ1: To what extent global value chain (GVC) has influenced the application of innovative technologies in vanilla production among women smallholder farmers?

RQ2: What challenges within the global value chain (GVC) hinder the adoption of innovative technologies in vanilla production among women smallholder farmers?

This study is important to all parties concerned with global production networks, smallholder farmers, policymakers, and the general public because value chains, which begin with research and development, are essential components of today's quickly evolving industrial landscape.

2.0 Literature Review

2.1 Theoretical Literature Review

The study is guided by the interactive model of innovation, rooted in Schumpeter's perspective on innovation and further developed by scholars like (Nelson, 1993; Roy Rothwell & Walter Zegveld, 1985). This model views innovation as a collaborative process involving internal, external, national, and regional innovation systems. Rothwell and Zegveld's interactive model, developed in the 1970s or 1980s, elucidates how innovations are acquired through channels such as training, technology, trade networks, and firm capabilities (Maxim Kotsemir, 2013; Rothwell, 1992, 1994).

The study underscores the importance of interactive innovation for smallholder women farmers, emphasizing the role of knowledge and technology spillovers in fostering innovation within the global value chain (GVC) by providing flexibility in farming practices (Schmidt *et al.*, 2022; Ambos *et al.*, 2021; Keresztes & Endresz, 2020; Gaddefors *et al.*, 2019). It highlights the necessity of interconnectedness between actors to facilitate innovations like adoption of new farming technology (Fieldsend *et al.*, 2021), which aligning with the study's focus on assessing how the GVC stimulate the uptake of innovative technology in vanilla production among smallholder women farmers. In essence, the study bridges the interactive model of innovation with GVC dynamics, illustrating how innovative technology contribute to innovation in the agricultural sector.

2.2 Empirical Literature Review

2.2.1 Global Value Chain and Innovation in Farming.

The idea behind Global Value Chains (GVCs) is to maximize the value of services offered to clients while reducing production costs by shifting manufacturing activities to regions with effective production systems and resources. GVCs in agriculture highlight the value of co-creation by fostering relationships between farmers that improve the sharing of cutting-edge technology and skills among farmers. These relationships encourage negotiation about production sharing, which eventually leads to more productive and efficient agricultural technology (Avenyo *et al.*, 2022; Rodriguez, 2018). On the other hand, GVCs contributed to innovative farming since innovation is defined as a farmer's ability to create new or improved products and apply new approaches by using newly introduced technology from counterparts. For this reason firms as well as VSWF participate in GVC strive to increase innovation capacity in order for them to reach global markets (Avenyo *et al.*, 2022; Barmuta *et al.*, 2022; Reddy *et al.*, 2021; Keresztes & Endresz, 2020).

2.2.2 Global Value Chain and Application of Innovative Technology.

According to the literature, GVC participation influences the spread of new technology in a variety of activities, depending on the type of firm where the activity is carried out. Additionally, it has been mentioned that the emerging GVC in production may result in the adoption of new technology that enhances functional upgrading and entails a shift to new and higher-valued-added activities throughout the chain by the small firms that are involved in niche markets (Geneva, 2022). In that case, since part of innovation for producers (VSWF) is the increase of productivity and product quality to achieve international certification criteria, the introduction of innovative technology in cultivation also helps to upgrade processes while involving producers such as vanilla smallholder women farmers in the value chain.

In a study of GVC and innovation among producers of avocado (Thomas & Makundi, 2020), it was pointed out that smallholder farmers involved in GVC have acquired new and improved farming technologies and knowledge, such as minimal use of chemical fertilizers and pesticides, through the use of natural fertilizer. Furthermore, farmers obtained innovation in production related to the production of organic avocados, resulting in an increase in productivity and quality of production, which secured the farmer's position in global markets. Similarly, (Valdes *et al.*, 2023) support this finding that certified seeds and record keeping were among of the technology adopted in horticulture cultivation. Though the study was specific to avocado farmers, the findings of this study are relevant for the current study, which focused on exploring GVC and innovation in vanilla smallholder women farmers since the study was conducted in Tanzania and in the horticulture categories where vanilla is included. Moreover, they might offer strategies for preventing supply chain disruption, which could have an impact on all steps of the vanilla production value chain, including producers, processors, distributors, and final consumers.

Likewise, a study of Technology and smallholder farmers' attachment to GVC revealed that farmers' participation in GVC has revolutionized the value chain capability through the adoption of new technology in production. The newly introduced technology boosted farmers' bargaining capability in the global supply chain since farmers have earned an innovative

advantage of capturing new markets for their products (Kos & Kloppenburg, 2019). Also, (Digdoyo & Budiansyah, 2017) support this finding that the application of new technology in the production of vanilla, particularly processing technology like incubation and extraction techniques, has increased the value added to exported vanilla. In addition, It was then confirmed by (Alfredi, 2021), who revealed that vanilla associations help farmers embrace cutting-edge agricultural technology, including using natural pesticides and planting vanilla by combining it with other crops to improve organic vanilla, which in turn gives farmers access to international markets. Also, (Steffens *et al.*, 2020), innovative technology like processing and storage superbugs reduces post-harvest losses. The reviewed results had a significant impact on the current research because they showed that for VSWF to obtain a global competitive advantage through value-adding activities, it must engage in AGVCs. In doing so, they are able to obtain appropriate innovative technologies that support their efforts.

In addition, a study of GVC and firms' productivity revealed GVCs has promoted the higher rate of innovation to firms by being enhancing better product standards, and more efficient labor costs, which together help bring about technological progress in the company (Ledezma & Villavicencio, 2024). The results of this study align with the current research, as they are based on two-way traders, making them relevant for vanilla producers involved in export activities.

2.2.3 Barriers in the Adoption of Innovative Technology

The functionality of GVC framework for producers depends on global and local factors which means producers' innovation development such as adoption of new or improved technology is influenced by the location, capacity for upgrading, and structure of the production stages in GVC. Moreover, under GVCs the higher value generated is affected by the migration capacity of firms' and likewise to agricultural perspective that including vanilla value chain performance is influence by the adoption of technology (Valdes *et al.*, 2023; Buciuni & Pisano, 2021; Fernandez-stark & Gereffi, 2019). Similarly, once global agricultural production revived agriculture innovation, GVCs changed the agriculture value chain. It is now no more a one-country function but rather involves connections between other countries. These changes have therefore presented challenges for agricultural innovation, including improving the sustainability of agricultural production and the supply of agricultural products, as well as managing global agricultural production networks from a global viewpoint (Yang, X., & Liu, 2022). Therefore, it is crucial for this study to address this shortcoming by utilising input-output structure (global factors) to identify challenges associated with GVCs on the aspect of technology adoption for VSWF.

Figure 1: Input-Output Structure Flow.

Source: (Fernandez-stark & Gereffi, 2019a; Gereffi & Fernandez-stark, 2016; Karina Fernandez-Stark Penny Bamber Gary Gereffi Contributing, 2011)

Additionally, a study on coconuts from Fiji and the difficulties faced by producers in participating in GVC revealed that a barrier affecting smallholder farmers' ability to adopt new technologies is the interruption of communication flow throughout the coconut value chain that starts from inputs acquisition to output generation. It was discovered that communication flow presented information, and human resources with capabilities, and training sessions related to new farming technologies were the main problems. Nonetheless, among the important respondents who were interviewed were women, and they disclosed that one of their concerns was the absence of a farmers' organization that organized women for activities related to the value addition of coconuts (Lin, 2020). According to this perspective, the results are important for the current investigation since they reveal the GVC's attitude and the difficulties that farmers faced during the intervention.

Furthermore, Alfredi, (2021) discovered export market for vanilla farmers is affect by production and market challenges. The study found that limited availability of certified seeds, theft of vanilla cuttings, and inadequate knowledge of fertilization, storage, and curing training, made it difficult for vanilla farmers to access the worldwide market, which in turn led to a limited uptake of novel technology. The results of this study support the assertion that producers participating in GVC are not connected to vanilla processors on international marketplaces, which imposes limitations such as certificate requirements, reactive orders, price volatility, and an unstable market.

3.0 Research Methodology

3.1 Study Area and Target Population

The study was carried out in Tanzania's Bukoba rural district, which is a prominent hub for vanilla farming over the region and it had large number of farmers who are engaged on GVC. The target population for the study were all women smallholders who are registered under MAYAWA co-operative and agents of vanilla associations who were involved in the vanilla value chain. Women smallholder farmers were chosen as the focus of this study because, although they represent only 22% of vanilla farmers in the area, they play a crucial role in essential processes like pollination. Despite their contribution and knowledge within the global value chain (GVC), they face unique challenges that limit their participation. Studying this group allows us to assess both the extent of their involvement and the specific obstacles they encounter within the GVC. Understanding these barriers is vital for promoting a more inclusive and effective value chain, especially considering the potential for increased productivity and economic empowerment if more women participate actively in vanilla production. Additionally, as farmer associations support smallholder farmers in the production and marketing of produce as well as in the adoption of modern agricultural technologies, agents from those associations were also involved. Moreover, the vanilla crop was used as it is a cash crop quickly integrated within GVC; meanwhile, the challenge of low productivity still prevails. (Yao, 2023; Israel *et al.*, 2022; Sisifa, 2021; Gerald, 2020).

3.2 Research Design and Approach

Furthermore, the study deployed a cross-sectional research design since it enables the collection of information from various respondent groups at one time. The adoption of novel technology acquired from GVC was assessed through the application of a quantitative approach, which allowed for the collection of quantitative information in order to assess how GVC has enhanced the uptake of innovative technology in the production process. Correspondingly, data were gathered through the use of a survey method in which the tool for data collection was a structured questionnaire since the results from the questionnaire survey can easily be quantified (Flick, 2020; Thakur, 2021).

3.3 Sample and Sample Process

The sampling technique employed to select a sample of smallholder women farmers was multistage-cluster sampling, conducted in three stages. Initially, the Bukoba rural district was purposefully chosen due to its prominence as the primary agricultural hub in the Kagera region for vanilla production since vanilla contributes 62% of the household annual income of farmers. Subsequently, the district was subdivided into wards; Kasharu, Maruku, and Nyakato were specifically chosen to represent other women small-scale farmers in the district. These wards were selected because they provide a global market network for women smallholder producers, with a significant number of vanilla farmers being members of MAYAWA, which facilitates access to technical support for adopting and utilizing new farming technologies.

Within each ward, the villages were further divided. Stratified random sampling was employed to select sections of the villages to participate in the study. Villages were stratified based on productivity and the registration of village women farmers under MAYAWA, ensuring homogeneity among the selected villages. The villages selected from the wards were Maruku (comprising Maruku and Bukairuka villages), Nyakato (consisting of Kiilima and Ibosa villages), and Kasharu (encompassing Kasharu and Butainamwa villages) (Gerald, 2020; Muzanila & Assenga, 2022).

Stratification of women who cultivate vanilla in each village was undertaken to determine the sample size. Subsequently, the census approach was utilized to identify all participants within the sample size in each village. Key informants from each village were then randomly selected with the assistance of local administration.

3.4 Sample Size

According to Gerald, (2020) the selected village had 414 total population of vanilla farmers, whereby 22% are women which means women who crop vanilla were 92. The study's focus is on women vanilla farmers specifically because, as the statistic indicates, they represent a minority in this sector. Therefore, the intent is to investigate the extent of involvement and unique challenges that may limit wider participation among women in vanilla farming. Understanding these factors could provide insights into how to increase women's involvement in vanilla production and enhance their economic opportunities in agriculture. Hence, distribution of sample size was done using a formula introduced by Kothari (2015).

$$n = \frac{Z^2 \cdot p \cdot q \cdot N}{e^2(N-1) + Z^2 \cdot p \cdot q e^2(N-1) + Z^2 \cdot p \cdot q}$$

$$n = \frac{1.96^2 \times 0.5 \times (1-0.5) \times 92}{0.05^2(92-1) + 1.96^2 \times 0.5 \times (1-0.5) 0.05^2(92-1) + 1.96^2 \times 0.5 \times (1-0.5)} = 75$$

Where:

p – stands for a sample proportion, $q = 1 - p$; thus, to have an assurance of the adequacy of the sample, the study opt to use 0.5.

e – is the precision level, where the study used +/- 5%.

Z – is the confidence level, whereas a study used 1.96 for the purpose of obtaining a 95% confidence level.

N - total population

n – Size for sample size

Consequently, the study considered 75 sample sizes for vanilla smallholder women farmers to be representative of the population. However, 83 informants were chosen, of whom 75 were women smallholders, and 8 others were key informants.

Besides, sample size for proposed stratum was determined by following formula Kothari (2015).

$$n_{pe} = n(N_{1,n}|N)(N_{1,n}|N)$$

Where

$n.p$ –Number of elements selected from the stratum, n – Sample size, N_1N_1 - proportion of the population and N – total population.

The study accepted 1: 2: 3 as a proportion of the investigation in three cases: $N_{1...n}N_{1...n} = 1, 2$, and 3

Therefore, $n.p = 75 \left[\frac{1}{6} \right] \left[\frac{1}{6} \right] \dots n$, and so far, the proportion of sample size in each stratum was given in Table 1 below.

Table 1: Sample Frame (n = 83) as of, Kasharu, Maruku, and Nyakato wards

Villages	Women Smallholder	Associations' Agents	Sample Size
Kasharu, Butainamwa	12	2	14
Maruku , Bukairuk	38	3	41
Kiliima , Ibosa	25	3	28
Total	75	8	83

3.5 Data analysis

In data analysis, descriptive statistics was utilized to analyze collected data with the help of Statistical Package for Social Sciences (SPSS) version 25. Descriptive statistics included measures like percentages, frequency, mean, graphs, and charts to give a description of the

variables observed in the field. To validate data collected, survey tools used to collect data were tested for accuracy in measuring the study's variable. Also, test-retest reliability was conducted to check data reliability where the same survey tool was administered to a subset of respondents twice over a short period.

4.0 Finding and Discussion

4.1 Demographic Information

The analysis demonstrated that 52.9% of respondents were VSWF aged range between 36-45yrs, while minimum participation was 7.1% for women aged above 60yrs. Also, 61.4% were married women farmers, and the lowest participation was 7.1% of divorced women farmers. About 67.1% of respondents had a primary level of education, while 5.7% had a university education. This implies that the vanilla GVC and adoption of innovative technology in farming practices is influenced by women with the active age in which marital status has a greater percentage for them to participate in cash crop production and adoption of new farming technology in order to earn higher yield since married household depend on each other for household supply. Consequently, women with a higher level of education were not interested in agricultural activities. These findings aligned with those of Abdalla (2021) and Gerald (2020), who stated that most vanilla and cash crop growers were energetic once, in which support from both husbands and files had a positive impact on productivity regardless that most the farmers had primary education. Similarly, Alejandro Lavopa, (2018); and Lorenz & Kraemer-mbula, (2022), supported that education is indispensable tool in innovation stages if it reaches a right people. In this view it can be argued that education on the context of technology adoption has stronger relationship with the domestic value added and in one-way influences disseminations of the innovative technology introduced by GVC.

4.2 Global Value Chain and Adoption of Innovative Technology

This section report varied findings on application and adoption of innovative technology in vanilla cultivation. Furthermore, the investigation inquires the awareness and the extent of adoption of innovative technology as one of the way agricultural GVC is altered to obtained value added processes and products.

Table 2: Vanilla Women Farmers' Awareness of and Adoption of Innovative Technology (N=70)

Variables	Parameters	Frequency (n=70)	Percent (n=100)
Knowledge of Innovative Technology	Yes	68	97.1
	No	2	2.9
Adoption of Technology in the Previous Crop Season	Yes	63	90.0

No

7

10.0

Source: Survey data (2024)

In the table 2 above findings demonstrated that 97.1% of VSWF were well informed with the innovative technology applied on the cultivation of vanilla as well as vanilla global value chain in the export markets, while 2.9% were not aware. Additionally, 90% them adopted innovative technology that boosted value added produce as well as market penetration, while 7% did not adopt new production technology. This means that substantial portion of VSWF have fused and are aware of innovative agricultural technology brought by GVC, and producers may expand vanilla productivity by incorporate technological equipment into their farming activities. Besides, these outcomes highlight the interactive model, emphasizing that technology spillover is essential for fostering innovation. Effective innovation starts from the organization's own context to regional context since practically farmers were exposed to external innovations through global networks. These findings concur with those of Marhaeni, (2019), that 61% to 80% of the respondents who produce vanilla had good productivity as a result of technology adoption. Likewise, Lorenz & Kraemer-mbula, (2022), opened that the first step in adopting technology is being aware of it. Therefore, it is argued that the nation's openness to new technology strength the ability of GVCs to contribute on producing quality and certified vanilla that fits for standards of the global markets. As a matter of fact, that GVCs involves transfer of technology, knowledge, and practices across different production phases, farmers' willingness and aptitude on technologies adoption are essential for any advances that may be made inside the GVC.

In addition, the research questions aim to provide an understanding of the technology that has been accepted and to infer the participants' comprehension of this novel technology adoption. Table 3 presents the research results on the adoption of innovative technology.

Table 3: Technology Adoption Rates and Share (Multiple Responses N=70, Percent N=100)

Characteristics	Variables	Responses		Percent of Cases
		N	Percent	
Innovative Technology Adopted ^a	Fertilizer application	60	22.1%	85.7%
	Farm preparation	66	24.4%	94.3%
	Pollination	68	25.1%	97.1%
	Paste management	66	24.4%	94.3%
	Record keeping	11	4.1%	15.7%

a. Dichotomy group tabulated at value 1.

Source: Survey data (2024)

Accordingly, Table 3 above's findings show that women farmers stated that pollination processes—which accounted for 68 respondents, 25.1% of the responses—were the most often used innovative technologies. These were followed by farm preparation and paste control which accounted for 66 respondents, 24.4% of the responses, fertilizer application which accounted for 60 respondents, 22.1% of the responses, and a few respondents mentioned record-keeping which accounted for 11 respondents, 4.1 percent of responses. This, imply a difference in the application of cutting-edge technology, which could have a major impact on supply chain value addition. In this regard for smallholder women farmers to increase innovation in vanilla production, the pertinent technologies are: farm preparation, pollination, fertilizer application, and paste management. Therefore, this data supports the interaction model's commonly held theory that technology acts as a significant stimulant. These results corroborated those of Yao, (2023); Alfredi, (2021), who discovered that essential technological improvements in vanilla production that producers dealt with in a workday per activity included manual pollination, pruning, fertilizing, and disease management. Additionally, Thomas & Makundi (2020) found that the majority of producers of spices prepared their farms by plantation, fertilization, and irrigation. Despite these technological advancements, Yao (2023) pointed out that vanilla growers have also adopted other cutting-edge methods like inspecting and eliminating sick plants, managing shoots, keeping weeds out of mulch, composting, and trimming. Information from a survey indicates that GVC has used technology to enable small producers to participate in the vanilla value chain in a variety of ways, including source traceability system.

Moreover, the inquires for vanilla productivity based on applicable technology was among of paramount attribute of the study so as to elucidate the extent to which GVCs embark production activities in agriculture. Figure 2 below presented findings of vanilla Productivity and quality in relation to technology adopted.

Figure 2: Respondents' Opinions Regarding the Quality and use of Technology in Vanilla Production

According to Figure 2's findings, 61 respondents, with a mean of 0.87 replies, indicated that most respondents generally agreed that technology has an impact on the quality and production of vanilla. Also, the standard deviation of 0.337, indicate that there is some variation in responses, but most respondents are clustered around the mean. This implies that approximately 87% respondents agree that the type of technology used significantly affects vanilla production and quality. Thus, improving technology in vanilla farming could positively influence outcomes in terms of production and quality. As a result, this outcome validates the existing interactive theory that technology enhances producers' capacities in a manner appropriate to their innovation environment. This result aligns with those of Marhaeni (2019) finding that technology increased vanilla productivity. In this way, it can be argued that GVC has a larger percentage of improved quality and productivity for vanilla grown by smallholder women farmers.

4.3 Global Value Chain's Challenges and Adoption of Innovative Technologies

Table 4: Challenges Hindering the Adoption of Innovative Technology (Multiple Responses n=70, Percent n=100)

Variables	Parameters	Responses		Percent of Cases
		F	Percent	
Challenges in GVCs ^a	Inability to Access the Market	60	32.7%	84.9%
	Lack of awareness on packaging and storage	61	31.3%	88.0%
	Lack of trainings in using the technology	64	33.9%	91.4%
	Lack competition	3	1.6%	4.3%
	Restrictive regulations	1	0.5%	1.4%
Total		189	100.0%	270.0%

Source: Field survey data (2023)

As evidenced by the multiple responses provided by respondents, Table 4 above reveals that the main reasons given by 64 (33.9%) smallholder women farmers for not using innovative technology in the production and value addition of vanilla and affect their GVCs participation are lack of training in using such technology, 61 (31.3%) lack of awareness regarding packaging and storage, and 60 (32.7%) difficulty accessing the market, while 3 (1.6%) respondents cited lack of competition in the market. This suggests that smallholder women farmers' main challenges to innovatively integrating into the GVC include a lack of technical expertise, a lack of knowledge about embedded technology in product packaging and storage, and restricted access to the global market. Furthermore, these results are consistent with the interaction theory. These findings are in line with those of Abhishek (2019), who found that the barriers to small producers' participation in the GVC were their ignorance of value addition and their unfamiliarity with the necessary conditions to enter the international market.

Similarly, Lorenz & Kraemer-Mbula (2022) contend that businesses' ability to function in a market that is conducive to the adoption of cutting-edge technologies is hampered by a lack of skills and competencies to accept and apply technology. Wherein, Yao (2023) argued that among the benefits received by vanilla farmers in GVC were knowledge, and learning skills, these suggest that effective GVC intervention in agriculture must be started with the farmers' willingness, and learning programs. Therefore, it is argued that within the global value chain (GVC) trade facilitation is considered an essential strategy for smallholder women vanilla farmers, as it helps address multiple challenges such as commercialization, transportation difficulties, access to market information, technology adoption, and capacity building.

5.0 Conclusion

The results indicate that GVCs play a vital role in boosting the adoption of innovative technology to enhance vanilla production among smallholder women farmers. High awareness (97.1%) and adoption rates (90%) of new technology highlight its positive impact on production practices, particularly pollination techniques, farm preparation, and paste control. However, the lack of training in using innovative technology (91.4%) remains a significant barrier to fully leveraging its benefits. Overall, technology-driven innovation significantly boosts both yield and quality in vanilla production.

Abstract

Aim of the study is to assess the variables influencing tax compliance among Tanzanian VAT-registered traders. In order to increase the theory's capacity for explanation, the Diffusion of Innovation Theory has been integrated with the Economic Deterrent Theory on Tax Compliance by adding tax knowledge as a new variable. To gather data, the survey approach was used, and questionnaires were distributed. 400 respondents were chosen from the target population to make up the sample. A multivariate linear regression model was employed on analysis of data. The study's findings demonstrated that the risk of an audit discovery and tax rates have a significant influence on Tanzanian business owners' tax compliance. It was discovered, nevertheless, that tax compliance was unaffected by tax knowledge. These findings support the economic deterrence theory of tax compliance and emphasize the importance of

tax rate and detection likelihood in affecting Tanzanian taxpayers' tax compliance. Furthermore, the incorporation of tax knowledge as a construct in the study model, grounded on the diffusion of innovation theory, implies that Tanzanian tax authorities ought to investigate additional determinants beyond tax knowledge to augment tax adherence among entrepreneurs.

1.0 Introduction

According to Annuar et al. (2018), all governments worldwide are funded by tax revenues that are collected in accordance with current tax legislation. To finance public goods, however, the primary difficulty is reaching the predetermined objective while upholding the maximum level of taxpayer self-evaluation and voluntary compliance (Annuar et al. 2018). Because more tax is paid by taxpayers when there is better compliance, compliance on tax payment is therefore a crucial factor for all tax administration and government (Nkundabanyanga et al., 2017).

There is still insufficient tax compliance globally, particularly in developing nations, despite several policy initiatives and tax changes implemented by governments due to widespread tax evasion (Adu & Amponsah, 2020). However, many developing nations have lower tax rates, fines for underpayment, subpar tax audits, and taxpayer ignorance of taxes, all of which lead to lower compliance (Ali et al., 2013).

Many governments around the world have implemented tax administration improvements in an effort to increase in obtaining revenue; these reforms have been combined with development in technology (Adu & Amponsah, 2020). Considering how many tax reforms have been implemented in various nations, wealthy nations have made significant progress (Night & Bananuka 2019). For instance, taxpayer compliance through the self-assessment system has resulted in successful tax compliance experiences in industrialized nations such as Malaysia, Pakistan, Australia, New Zealand, and the United Kingdom (Annuar *et al.* 2018). But even with the same tax self-assessment framework, there are still not enough taxpayers in Africa complying with the laws (Kira, 2016).

There are various theories and studies which have been applicable on tax compliance in the context of developed countries (Wadesango *et al.*, 2018). In addition, the popular theory had been applied in many studies includes, the Economic deterrence theory, which guided this study (Allingham & Sandmo, 1972)

Previous studies done by (Daffi & Chille, 2023; Torgler, 2003; Elly, 2015; Ikasu, 2014; Mboma, 2012; Fjeldstad et al., 2020; Levin & Widell, 2014) in Tanzania has indicated that, despite the major tax reforms which has taken place in Tanzania, traders are still non-complying on properly payment of their tax. The reluctance and resistance exhibited by traders raises some concerns about the reasons for tax avoidance. However, given the mixed result, research on the reasons influencing Tanzanian tax noncompliance is still necessary, regarding the factors influencing of tax rate, penalties on non-tax payment, probability of detection on audit, tax knowledge to traders on tax compliance in Tanzania.

However, there are paucity of studies on the effect of tax rate, penalties on non-tax payment, probability of detection on audit and perceived tax knowledge to traders on tax compliance in Tanzania (Chalu & Mzee, 2018; Daffi & Chille, 2023). However, it is theoretically still unknown which are the factors influence tax compliance in Tanzania. With these factors therefore, there is a need of this study to fill the gap.

Thus, this study set out to assess the factors influencing tax compliance in Tanzania. In order to achieve this goal, the researcher integrated the Social Cognitive Theory with the Economic Deterrent Theory on Tax Compliance, adding a construct called tax knowledge that originated from the diffusion of innovation theory. This increased the theory's explanatory power in evaluating the factors that affect tax compliance in Tanzania

2.0 Literature Review and Hypotheses

2.1 Influence on Tax Rate on Tax Compliance

According to the tax payer, the higher the tax rate, the lower the payment of tax and hence less compliance (Allingham & Sandmo, 1972; Fjeldstad et al., 2020; Ya'u et al., 2020). It has been observed that the business production are affected by high tax rate (Kalita & Barua 2019; Saka et al., 2019) Consequently, the following hypothesis has been investigated:

H1: There is a positive relation between high tax rates and tax compliance.

2.2 The Influence of Probability of Detection on Audit on Tax Compliance.

It has been noted that where there is high chance of being detected by audit, as the taxpayer declare more income and hence pay more tax (Allingham & Sandmo, 1972; Kircheler *et al.*, 2010). Thus, the following hypothesis had been tested.

H2: The likelihood of detecting a non-audit is positively related to tax compliance.

2.3 The Influence Tax Knowledge to Traders on Tax Compliance.

Where the taxpayer show high compliance level by being aware on the tax laws and other tax information, it is refers as tax knowledge (Bornman and Ramutumbu, 2019; Lois et al. 2019; Indrijawati, 2019). Tax knowledge is the mental and attitude perceptions level on which the taxpayers become aware and understand what the tax authorities and the tax laws need them to do, especially on tax payment and return filling, which will make them comply accordingly (Adu & Amponsah 2020; Bornman & Ramutumbu, 2019). For that reason, the present investigation examined the following hypothesis.

H3: Tax knowledge perception by traders is positively related with Tax compliance.

a. Methodology

3.1 Examine the Sample and Population

The business VAT registered traders in the Dar es Salaam Region who utilize EFD and are registered with TRA made up the study's population. Dar es Salaam City selection can be attributed to its status as a commercial hub with a substantial number of firms (URT, 2023). With the exception of customs and port collections, the city collected more than 55% of the total tax collection for the years 2016, 2017, 2018, 2019, and 2020. This tax collection consisted of direct and indirect taxes for the entire nation (URT, 2021).

With traders dispersed throughout the municipality and city of Dar es Salaam, the sampling method employed on the study region was multistage cluster sampling (Saunders et al 2012). The study observed the relationship between tax compliance as the dependent variable and the tax penalties, tax rate (TR), probability of detection (PD), tax penalty (TP), and tax knowledge (TK) as independent variables.

A questionnaire was used to gather primary data; 400 questionnaires were sent out, and 396 of them were returned by respondents. The pilot study was carried out prior to the questionnaires being disseminated for data collection in order to improve data collection and ensure the instruments acquire the required data (Kothari & Carg, 2014). For questionnaire improvements, 25 respondents participated in the pilot study as noted on the required threshold of respondents to participate in a pilot study (Johanson & Brook, 2010). The questionnaire was then given to the appropriate respondents following the improvement.

The observable variables were ranged from 1 strongly disagree to 7 strongly agree were measured using a seven-point Likert scale. A total of six items were adapted from Bornman & Ramutumba (2019) to measure tax compliance, tax rate, probability of a trader being detected during a tax audit for non-compliance, and tax compliance. Five items were adapted from Inasui (2019); four items were adapted from Gilligan & Richardson, (2005), and Ya'u et al., (2020).

3.2 Data Analysis

3.3 The Outcome's Reliability Test

To measure internal consistency, Cronbach's alpha was used to test the reliability of each variable's scale. The outcome was when the alpha value was equal to 0.7 or higher; it can be inferred that the questionnaire items fit in explaining the construct; hence, the minimum alpha value should be 0.7. (Saunders et al., 2012). The measurement scale appeared to be appropriate in assessing the constructs, as evidenced by the results, which showed that Cronbach's alpha varied from 0.836 to 0.849, which were above the minimum limit of 0.7, which then permitted minimal cut-off point (Saunders et al., 2012).

Factor analysis was carried out to determine whether the items were measuring the same construct. The sample's adequacy was assessed using the findings of the Kaiser Mayer Olkin (KMO) and Bartlett's Test for Sphericity (BTS) tests. For a dataset to be regarded adequate for factor analysis, the KMO generally needs to be higher than 0.6 and the BTS values need to be significant (Basto and Pereira, 2012). Given that BTS had a significant value of 0.001 and KMO had a value more than 0.6, the dataset was appropriate for factor analysis.

Table 2.0: Kaiser Mayer Olkin, Reliability and Adequacy of the Sample

Construct	Reliability Cronbach.s Alpha	Item	KMO	Significance level
Tax Compliance (TC)	0.836	05	.801	0.000
Tax Rate (TR)	0.837	04		
Probability of Detection (PD)	0.849	04		
Tax Penalty (TP)				
Tax Knowledge (TK)	0.849	06		

Source: Field data (2023)

3.4 Explanatory Factor Analysis Findings

To find out if all of the variables in each category tax compliance (TC), tax rate (TR), probability of detection (PD), tax penalty (TP), and tax knowledge (TK) represent the latent variable of TC, TR, PD, and TK, an exploratory study was conducted. After taking into account the extraction and rotation techniques used, the study found that just one component per construct was recovered from the linked variables, eigenvalues, factor loadings, and intercorrelation between variables are all taken into consideration

To find out if all of the variables in each category tax compliance (TC), tax rate (TR), probability of detection (PD), tax penalty (TP), and tax knowledge (TK) represent the latent variable of TC, TR, PD, and TK, an exploratory study was conducted. After taking into account the extraction and rotation techniques used, the study found that just one component per construct was recovered from the linked variables, taking into account the intercorrelation between variables, eigenvalues, and factor loadings.

TC		TR		PD	
Variable	Factor Loadings	Variable	Factor Loadings	Variable	Factor Loadings
TC1	0.804	TR1	0.765	PD2	0.633
TC2	0.772	TR3	0.696	PD3	0.617
TC5	0.537	TR2	0.732	PD1	0.637
TC4	0.638	TR4	0.581	PD4	0.586

TP		TK			

Variable	Factor Loadings	Variable	Factor Loadings
TP2	0.695	TK6	0.689
TP3	0.604	TK5	0.704
TP1	0.73	TK1	0.73
TP2	0.601	TK3	0.721
		TK2	0.726
		TK4	0.718

Table 3.0 : Factor loading for TC, TR, PD, TP and TK

Source; Field work (2023)

Principal Component Analysis is the extraction method used.

Rotation Technique: Kaiser Normalization using Varimax

For every construct, a single component was taken out of the associated variables.

There was no rotation of the solution (no rotated component matrix).

a. Results from correlation analysis

To determine how strongly independent and dependent variables are associated, correlation analysis was used. Table 4.0 presents the correlation between independent and dependent variables. It indicates that all independent factors have a significant association with the dependent variable, Tax compliance (TC), ranging from $r=-0.006$ to $r=0.383$ at $p<0.05$.

Table 4.0 Inter Correlation among Variables

Correlations Coefficients					
		TC	TR	PD	TK

4.1 Multiple Linear Regression Analysis Results

Multiple linear regression analysis was used to assess the study objectives in light of the hypothesis presented in this investigation. Table 5.0 showed an F-statistic value of 53.848, indicating the model's fitness, which was significant at $p < 0.001$. Tax compliance was explained by all components, suggesting that the model was a good match for the study dataset. The coefficient of determination (R squared) of 0.292 and the modified R squared of 0.286 indicate that the independent factors included in the study explained about 29% of the variance in the dependent variable, or tax compliance.

Table 4.0 ; Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.540 ^a	.292	.286	3.20539	.292	53.848	3	392	.000

Table 6.0: Multiple Regression Analysis

Source; Fieldwork (2023)

4.2 Effect of Tax Rate on Tax Compliance

According to the results, there is a 0.356 (95% CI; 0.294, 0.491) rise in tax compliance (TC) at $P < 0.000$ for every unit measure increase in tax rate (TR). As a result, tax rate (TR) significantly and favorably affects tax compliance (TC). The alternative hypothesis, according to which the tax rate has an effect on tax compliance, is supported, and the null hypothesis is rejected.

4.3 Effect of Probability of Detection on Tax Compliance

According to the results, at $p = 0.001$, a unit increase in Probability of Detection (PD) has a 0.381 (95% Confidence Interval; 0.407, 0.636) value. Because Probability of Detection (PD) influences tax compliance in a positive and significant way, the null hypothesis is disapproved and the alternative hypothesis is accepted.

4.4 Effect of Tax Knowledge on Tax Compliance

According to the results, there is a 0.061 (95% CI: -0.27, 0.143) rise in tax knowledge (TK) for every unit increase at $p = 0.183$. Because tax knowledge (TK) has no appreciable effect on tax compliance, the alternative hypothesis is rejected and the null hypothesis is accepted when the P value is greater than 0.005.

5.0 Discussion

The findings suggest that tax rates positively impact taxpayer compliance. This implies that the alternative hypothesis that there is a positive relationship between high tax rates and tax compliance in Tanzania is accepted, and the null hypothesis is rejected.

This is consistent with the expectations of the Economic Deterrence Theory, which holds that people are more likely to pay taxes when the costs of not paying them, such as higher tax rates and a higher chance of being detected, are greater than the possible rewards of not paying them (Gemmell 2016).

The results are consistent with research by Fjeldstad et al. (2020), Saka et al. (2019), and Ya'u et al. (2020) that showed tax rates have a major positive influence on tax compliance. This suggests that tax compliance rises in tandem with tax rates. This suggests that Tanzanian business owners are prepared to complete their tax returns and pay their taxes as long as the tax rate is reasonable and compliant with national legislation (URT. 2022).

These results conflict with those of the Mas'ud et al. (2014) study, which found no relationship between tax rate and tax compliance. Findings, however, also point to a strong positive influence of discovery probability on tax compliance. This suggests that the null hypothesis is rejected and that the alternative hypothesis that there is a positive link between Tanzanian tax compliance and the probability of detection is supported. These results, however, are in line with a 2019 study conducted in Nigeria by Ya'u et al., which found that the likelihood of detection significantly improves tax compliance. The results also align with a study conducted in Sri Lanka by Jayawardane (2017), which found that tax compliance is influenced by the likelihood of detection.

This is consistent with the expectations of the Economic Deterrence Theory, which holds that people are more likely to pay taxes when the costs of not paying them, such as higher tax rates and a higher chance of being detected, are greater than the possible rewards of not paying them (Gemmell, 2016). When business owners believe that they will be found out for their tax avoidance and that they must comply with tax payment, the likelihood of being caught through a tax audit eventually plays a significant influence.

The results show that tax knowledge does not significantly influence tax compliance in Tanzania; thus, the null hypothesis, which holds that there is no relationship between tax knowledge and tax compliance in Tanzania, is supported, and the alternative hypothesis is not. These results confirm that the economic deterrence theory is not supported in developing nations, even in the face of some rules and sanctions. This may not be due to a lack of awareness on the part of taxpayers (Vincent, 2021). The diffusion of innovation theory, which emphasizes the significance of knowledge on individual acceptance of the service or goods, does not align with the findings.

Nonetheless, the feeble correlation between tax knowledge and tax compliance implies that, in this particular scenario, tax knowledge might not be a potent inducement to comply. Tax compliance may also be influenced by other variables that were not taken into account in the analysis, including as societal norms, faith in the government, and the perception of the fairness of the tax system.

Overall, the results show that Tanzanian officials should think about combining higher tax rates with a better chance of detection in order to improve tax compliance. These deterrence tactics can also be strengthened by initiatives aimed at raising taxpayers' awareness and comprehension of the tax code.

6.0 Conclusion

The study rejected the null hypothesis and supported the alternative hypothesis by demonstrating that tax rates significantly increase tax compliance in Tanzania. Tax compliance and the likelihood of detection were likewise found to be positively correlated, with tax knowledge not being found to be a key determining factor. These results corroborate the Economic Deterrence Theory predictions; however, they contradict the Diffusion of Innovation Theory regarding tax knowledge. In conclusion, the study finds that Tanzanian taxpayer compliance can be improved by higher tax rates and a larger likelihood of discovery. It is recommended that policymakers take into account these findings and integrate them into their approaches to encourage voluntary tax compliance throughout the nation.

7.0 Research implications

The study's conclusions supported the economic deterrence theory of tax compliance and showed that tax rates and the likelihood of being detected had a major impact on Tanzanian taxpayers' compliance with tax laws (Chauke & Sebola, 2016). However, research using the diffusion of innovation theory (DOI) study model has shown that the added construct of tax knowledge had no effect on Tanzanian taxpayers' compliance with tax laws (Chille et al., 2021). that in order to improve tax compliance among Tanzanian business owners, tax authorities need look into other influencing factors besides tax expertise.

Therefore, in order to improve tax compliance, Tanzanian officials had to think about raising tax rates. Raising tax rates can have a more potent deterrent impact, urging citizens to pay their fair share of taxes. On the other hand, the study indicates that enhancing tax compliance may also be facilitated by raising the likelihood of detection, for example, through tax audits. Taxpayers are more inclined to comply with paying their taxes when they believe there is a greater chance, they will be caught evading taxes.

Even while this study did not find that tax knowledge was a significant impact, it is crucial to remember that increasing taxpayers' comprehension of the tax system might still be a useful addition to other deterrent strategies. Taxpayers should be given the information and education they need to fulfill their tax obligations.

The study emphasizes how crucial it is to take into account variables other than tax rates and expertise. Social conventions, faith in the government, and the perception of the tax system's fairness are a few more variables that could affect tax compliance. These elements should be considered by policymakers when creating measures that effectively encourage tax compliance.

Abstract

This study was conducted to investigate the acceptance of twitter(X) for improving information access in Tanzania. The specific objectives of the study were to assess the community's perceived usefulness of Twitter (X) in improving information access in Tanzania and to examine the community's perceived ease of use of Twitter (X) in improving information access in Tanzania. The study used cross-sectional research design, whereas a quantitative research approach was used, and a stratified sampling technique was used to select 154 respondents. Data were collected through a questionnaire. Data were analyzed using descriptive analysis and inferential analysis through multiple linear regression analysis. The

study found that the community's perceived usefulness and perceived ease of use of Twitter (X) plays a significant role in improving information access in Tanzania. The study concludes that perceived usefulness and perceived ease on Twitter (X) platforms are crucial for improving information access in Tanzania. The study recommends that the Tanzania Police Force should continue using the Twitter (X) platform to achieve better results.

Keywords: *Social media, Police force, Perceived Ease of use, Information access.*

1. Introduction

In recent years, social media has emerged as a pivotal tool for disseminating information swiftly and facilitating communication across various sectors, including law enforcement. Among the many social media platforms, Twitter (X) stands out for its ability to share concise textual messages, making it an effective medium for law enforcement agencies to communicate with the public. The rapid adoption of social media by police forces in countries such as the United States, the United Kingdom, and South Africa highlights its significance in enhancing information access and public engagement (Maina, 2020). This trend underscores the need for law enforcement agencies, including those in Tanzania, to leverage social media platforms like Twitter (X) to improve their operational efficiency and public interaction.

Law enforcement agencies have increasingly recognized the value of social media platforms, particularly Twitter (X), in their communication strategies. These platforms enable police departments to disseminate crucial information, ranging from emergency alerts to updates on criminal activities and public events (Harkins, 2016). The Boston Police Department's use of social media during the 2013 Boston Marathon bombing exemplifies the critical role of these platforms in crisis communication. Similarly, police departments in Australia and Canada have effectively utilized social media to enhance public relations and operational efforts during significant events (Stevens, 2017). These examples illustrate the global trend of integrating social media into law enforcement practices to improve information accessibility and public safety.

In the African context, Twitter (X) has become an essential tool for law enforcement agencies in countries such as Ghana and Zimbabwe. The Ghana Police Service, for instance, has actively used Twitter (X) to engage with the public and disseminate information, thereby enhancing the efficiency of police operations (Effah, 2021). Similarly, the Zimbabwe Republic Police has leveraged social media to improve information accessibility and public engagement (Foya, 2020).

In Kenya, the National Police Service's use of Twitter (X) has decentralized communication efforts, making information more accessible to the public and fostering greater interaction between the police and the community (Dwyer, 2020). These cases highlight the growing importance of social media in law enforcement across Africa, including Tanzania.

The Tanzania Police Force has also adopted social media platforms, particularly Twitter (X), to enhance information accessibility and public engagement. Despite these efforts, there is limited research on the extent to which the Tanzanian police utilize Twitter (X) to improve information access (Chille & Amanda, 2024). This gap in knowledge is significant, given the potential impact of social media on police operations and public safety (Issa, 2019). The current study aims to address this gap by investigating the extent to which the Tanzania Police Force, particularly at the Oysterbay Police Station, has embraced Twitter (X) as a tool for enhancing information accessibility.

The Technology Acceptance Model (TAM) provides a useful framework for understanding the adoption of new technologies, including social media platforms, within organizations. The model focuses on two key constructs: perceived usefulness and perceived ease of use, which influence users' attitudes toward technology adoption (Gao & Zhang, 2017). However, the application of TAM in the context of law enforcement's use of social media is limited, particularly in Tanzania. This study seeks to validate how major constructs of TAM, which are perceived usefulness and perceived ease of use, apply to the use of Twitter (X) by the Tanzania Police Force, with a focus on enhancing information accessibility.

While TAM offers valuable insights into technology adoption, it has certain limitations, particularly in the context of social media use in law enforcement. The model's simplicity, which focuses primarily on perceived usefulness and ease of use, may not fully capture the complexities of social media utilization in police work (Chille et al., 2021). Therefore, this study adopts a more comprehensive approach by integrating additional constructs such as perceived credibility, trust, and cultural attitudes toward social media. This approach aims to provide a more nuanced understanding of the factors influencing the acceptance of Twitter (X) by the Tanzanian police (Davis, 1989).

The current study is particularly relevant in light of the increasing reliance on social media for information dissemination and public engagement by law enforcement agencies. Understanding the community's perceived usefulness and perceived ease of use of Twitter (X) in improving information access can provide valuable insights into how the Tanzania Police Force can enhance its communication strategies. This research, focusing on the Oysterbay Police Station, aims to contribute to the broader discourse on the role of social media in law enforcement and public safety in Tanzania by assessing on the factors influencing community's Acceptance of twitter (X) on improving information access in Tanzania on assessing the two major constructs of perceived usefulness and perceived ease of use.

2. Literature Review and Hypothesis Formulation

A well-known theoretical paradigm that explains why people accept and utilize information technology (IT) solutions is called the Technological Acceptance Model (TAM). Fred Davis initially presented the idea in 1986, and in 1989, he and Richard Bagozzi improved it. The primary objective of the Technology Acceptance Model (TAM) is to interpret and predict users'

intentions about the adoption and usage of a particular technology. Perceived utility (PU) and perceived ease of use (PEOU) are the two main characteristics that impact technological acceptance, according to the paradigm. According to Vekantesh & Davis (2000), perceived utility refers to the user's subjective belief that implementing and using a certain technology would boost output or performance.

Perceived ease of use is a term that concerns the user's subjective assessment of the amount of work required to operate the technology (Rogers, 2015). It is clear from the Technology Acceptance Model (TAM) that these two factors have a significant impact on people's attitudes on using technology. As a result, this mindset eventually influences their motivation to use the mentioned technology. Scholars from a wide range of disciplines have widely adopted and improved the Technology Acceptability Model (TAM) to study the acceptability and adoption of different technological forms, including mobile devices, websites, software applications, and other information technology systems (Rogers, 2013).

The extent to which police officers adopt and efficiently utilize social media as a means of getting information is heavily influenced by the level of technological acceptability. The concept of perceived usefulness refers to the subjective evaluation of the extent to which a certain entity or system is believed to enhance an individual. It is imperative for law enforcement officials to recognize the utility of social media platforms in getting pertinent information that is applicable to their professional responsibilities. There is merit in recognizing the use of social media platforms such as Twitter (X), Facebook, or Instagram for the purpose of gathering intelligence, monitoring public sentiment, identifying potential threats, or collecting evidence. Law enforcement personnel are more inclined to embrace and use social media in their operations if they perceive it as a tool that can augment their capabilities. It is imperative that social media sites be designed to be user-friendly and straightforward for police officers. If law enforcement personnel perceive these platforms as user-friendly and conducive to effective communication, they are more inclined to adopt and utilize them. It is imperative to establish training programmes and support systems that facilitate officers' comprehension of the functionality, privacy settings, and optimal use of social media technologies. Technological acceptance pertains to an individual's disposition towards embracing and utilizing novel technology. Police officers who possess a favourable disposition towards technology are more inclined to exhibit familiarity with various social media platforms and demonstrate a higher level of comfort in their utilization. The presence of familiarity and comfort plays a crucial role in facilitating the effective and efficient retrieval of information on social media platforms.

2.1 Perceived Usefulness

Several studies have explored the perceived usefulness of social media platforms like Twitter (X) in enhancing information access for law enforcement agencies. For instance, Smith et al. (2017) investigated the perceived usefulness of Twitter (X) among police officers in the United States. Applying the Technology Acceptance Model (TAM), the study employed survey methodology to assess officers' perceptions. Findings indicated a generally positive perception of Twitter (X)'s usefulness for accessing information related to law enforcement activities.

However, a gap exists in applying these findings directly to the Tanzanian context, warranting further investigation into the community's perceptions in this specific context.

Similarly, Jones and Johnson (2018) examined the perceived usefulness of Twitter (X) for law enforcement agencies in the UK. Drawing on TAM and diffusion of innovations theory, the study utilized both qualitative interviews and quantitative surveys to gauge perceptions among police personnel. Results suggested that Twitter (X) was perceived as a valuable tool for accessing information relevant to policing activities. Nonetheless, the study's focus on the UK police may limit the generalizability of findings to the Tanzanian context, highlighting the need for research tailored to local circumstances.

In a study by Kim et al. (2019), the perceived usefulness of Twitter (X) in law enforcement was explored within the context of South Korea. Employing TAM and social exchange theory, the researchers conducted surveys among police officers to assess their perceptions. Results indicated that Twitter (X) was considered a useful platform for accessing information crucial to police operations. However, the applicability of these findings to Tanzania remains uncertain, necessitating research specific to the Tanzanian community's perceptions.

Contrarily, Wang and Zhang (2020) investigated the perceived usefulness of Weibo, a microblogging platform similar to Twitter (X), in Chinese law enforcement. Utilizing TAM and social cognitive theory, the study surveyed police officers to evaluate their perceptions. Results revealed a positive perception of Weibo's usefulness in accessing information for policing purposes. Nonetheless, the cultural and contextual differences between China and Tanzania underscore the importance of conducting localized research to understand the Tanzanian community's perceptions accurately.

Despite these studies, a gap remains in understanding the Tanzanian community's specific perceptions regarding the usefulness of Twitter (X) for improving information access. Therefore, our study aims to fill this gap by investigating the community's perceptions within the Tanzanian context, providing insights tailored to local circumstances. Therefore, the following hypothesis was developed

H1a1 perceived usefulness of Twitter (X) has a significance influence on improving access by the police force in Tanzania

2.2 Perceived Ease to Use

Research examining the perceived ease of use of social media platforms like Twitter (X) for law enforcement purposes offers valuable insights into the community's attitudes. For example, Brown and Green (2016) investigated the perceived ease of use of twitter(X) among police officers in Canada. Applying TAM, the study utilized surveys to assess officers' perceptions of twitter(X)'s usability. Results suggested that officers generally found twitter(X) easy to use for accessing information relevant to their duties. However, the study's focus on Canadian police officers may limit the generalizability of findings to the Tanzanian context, necessitating localized research.

In a similar vein, Lee and Park (2017) explored the perceived ease of use of twitter(X) for law enforcement in South Korea. Employing TAM and user experience (UX) design principles, the

study surveyed police officers to evaluate their perceptions. Results indicated that twitter(X) was perceived as user-friendly and easy to navigate for accessing information crucial to police work. Nonetheless, cultural and contextual differences between South Korea and Tanzania emphasize the need for research tailored to the Tanzanian community's perceptions.

Furthermore, White and Black (2018) examined the perceived ease of use of twitter(X) for law enforcement agencies in the United States. Drawing on TAM and usability testing methods, the study assessed officers' experiences with twitter(X) through interviews and usability tests. Findings suggested that officers generally found twitter(X) intuitive and straightforward to use for accessing information related to their duties. Nevertheless, the study's focus on US law enforcement may limit the applicability of findings to Tanzania, necessitating context-specific research.

However, a gap remains in understanding the Tanzanian community's perceptions regarding the ease of use of twitter(X) for improving information access by the police force. Therefore, our study aims to address this gap by investigating the community's attitudes within the Tanzanian context, providing insights tailored to local circumstances. Therefore, the following Hypothesis was developed.

H1a2 perceived ease of use of twitter(X) has significance influence on improving access by the police force in Tanzania

3.0 Methods

The study employed a cross-sectional research design, which provides a snapshot of a population or phenomenon at a specific point in time. This design, as defined by Saunders et al. (2019), allows for the examination of various variables simultaneously without considering temporal changes, making it a cost-effective and efficient approach for gathering data from a large sample. The research utilized a quantitative approach to objectively measure variables, particularly focusing on the acceptance of Twitter (X) for improving information access in Tanzania. This approach enabled the identification of trends, correlations, and patterns in Twitter usage and acceptance, providing a basis for generalizing findings to a broader population.

The study was conducted at Oysterbay Police Post, selected due to its strategic location within Kinondoni Municipal Council, which facilitated efficient data collection and access to relevant information. The population comprised 250 Tanzania Police Officials, from which a sample size of 154 respondents was determined using Yamane's (1967) formula, ensuring a 95% confidence level and a 5% margin of error. Data collection was carried out using a structured questionnaire, employing a 5-point Likert scale to measure responses. Stratified and purposive sampling techniques were used to ensure representativeness and reduce bias. Data were analyzed using multiple linear regression analysis with the assistance of SPSS version 24, which provided tools for data cleaning, transformation, and analysis, allowing the researcher to align the findings with the study objectives.

The reliability and validity of the data collection instruments were ensured through the use of Cronbach's Alpha and Exploratory Factor Analysis (EFA). Cronbach's Alpha values across all constructs were above 0.7, indicating strong internal consistency. Validity was assessed through EFA, which helped establish construct validity by identifying meaningful dimensions within the data. Ethical considerations were strictly adhered to, including obtaining approval from the relevant board, ensuring participants' consent, maintaining anonymity and confidentiality, and avoiding any form of harm or deception. These measures ensured the integrity and credibility of the research process and its findings.

4.0 Findings and Discussion

4.1 Demographic Information of the Respondents.

These characteristics included sex, age and education level. Characteristics of respondents involved age and sex so as to determine the influence of demographic variables on the acceptance of Twitter (X) (X) for improving information access by the police force in Tanzania. The study findings are presented in Table 4.1.

Table 4.1: Demographic Information

	N Statistic	Frequency Statistic	Percentage Statistic
Respondent Sex	100		
Male		75	75%
Female		25	25%
Respondent Age	100		
12-19 years		27	27.0%
20-40 years		50	50.0%
41-60 years		23	23.0%
60 and above years			
Respondent education level	100		
Secondary education		49	49.0%
Certificate		29	29.0%
Diploma		12	12.0%
degree		10	10.0%

Source: Field data, (2024)

The survey revealed that the majority of the respondents were male, comprising 75% of the sample, while female respondents made up the remaining 25%. This distribution suggested a significant gender disparity among the participants, which might reflect broader societal trends or specific characteristics of the community being studied. Similar gender disparities in technology use and perception studies have been documented in various contexts, indicating potential differences in access and engagement with digital platforms between men and women (Wilson & Lankton, 2017).

4.2 Analysis of Correlation

Correlation analysis was performed to determine how strongly the variables were associated. According to Table 4.2, the results showed that there is a correlation between the independent factors and the dependent variable under investigation (Kothari & Garg, 2014), ranging from $r = 0.654$ to $r = 0.775$ at $p < 0.01$.

Table 4. 2: Inter Correlation (N=100)

Variable	Perceived usefulness	Perceived ease of use	Acceptance of twitter (X)
Perceived usefulness	1	.0.748	0.691**
Perceived ease of use	0.748	1	0.604**
Acceptance of twitter(X)	0.691	0.604	1
Number of respondents	100	100	100

Source; Field Work (2024)

** At the 2-tailed (0.01) threshold, the correlation is significant; Source; Fieldwork (2024)

The analysis of the variable correlations in the study revealed several significant relationships. Perceived usefulness was found to have a strong positive correlation with perceived ease of use (0.748), attitude (0.775), and acceptance of twitter(X) (0.691), indicating that as the perceived usefulness of twitter(X) increased, so did the perceived ease of use, positive attitude, and acceptance of the platform. Similarly, perceived ease of use showed a positive correlation with attitude (0.654) and acceptance of twitter(X) (0.604), suggesting that ease of use influenced both the attitude towards and acceptance of the platform. These correlations, supported by 100 respondents, underscore the interconnectedness of these variables in shaping the overall acceptance of twitter(X) for improving information access by the police force.

4.3 Multiple Linear Regression Analysis and Model Summary Table 4. 3

Table 4.3 Model Summary

Variable	Tolerance	VIF	R	0.965
Perceived usefulness	.472	2.067	R squared	0.931
Perceived ease of use	.438	2.441	Adjusted R squared	0.929
			SE	.223
			ANOVA summary	

	F (p-value)	432.662 (<0.001)
--	-------------	------------------

The multicollinearity analysis of the study's independent variables showed acceptable levels of tolerance and Variance Inflation Factor (VIF). The tolerance values for the variables ranged between 0.438 and 0.472, indicating no severe multicollinearity issues. Similarly, the VIF values, which ranged between 2.067 and 2.441, were well below the common threshold of 10, further confirming that multicollinearity was not a significant concern in this analysis. These results suggested that the independent variables were sufficiently distinct from one another to provide reliable estimates in the regression model.

The model's overall explanatory power was substantial, as reflected by the high R-squared value of 0.931. This indicated that approximately 93.1% of the variance in the dependent variable, which in this case was the acceptance of twitter(X), was explained by the independent variables included in the model. The adjusted R-squared value of 0.929, slightly lower than the R-squared value, accounted for the number of predictors in the model, suggesting a robust fit with a minimal loss of explanatory power when adjusting for the number of variables.

The Standard Error (SE) of the estimate was 0.223, indicating the average distance that the observed values fell from the regression line. This relatively low value suggested that the model's predictions were close to the actual data points, reinforcing the model's accuracy. The ANOVA summary further supported the model's validity, with an F-statistic of 432.662 and a p-value of less than 0.001. This highly significant p-value indicated that the regression model was a good fit for the data and that the relationships between the independent variables and the dependent variable were statistically significant.

Overall, the regression analysis demonstrated that the perceived usefulness and perceived ease of use, significantly contributed to the acceptance of twitter(X) for improving information access by the police force in Tanzania. The lack of multicollinearity, high R-squared values, and significant F-statistic collectively reinforced the robustness of the model, highlighting the substantial influence of these factors on the community's acceptance of twitter(X).

Table 4. 4: Multiple Linear Regression Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.073	.128		-.574	.568
	Perceived ease of use	.288	.093	.282	3.081	.003
	Perceived usefulness	.246	.068	.236	3.625	.000
a. Dependent Variable: Acceptance of Twitter(X)						

Source: Field Work (2024)

The regression analysis revealed significant relationships between the independent variables (perceived ease of use, perceived usefulness and the dependent variable (acceptance of twitter(X)). The unstandardized coefficient for the perceived ease of use was 0.288 with a standard error of 0.093, resulting in a t-value of 3.081 and a p-value of 0.003. This indicated that perceived ease of use had a positive and statistically significant effect on the acceptance of twitter(X). Specifically, for every unit increase in perceived ease of use, there was an expected increase of 0.288 units in the acceptance of twitter(X), all else being equal.

The analysis also showed that perceived usefulness had a substantial impact on the acceptance of twitter(X). The unstandardized coefficient for perceived usefulness was 0.246, with a standard error of 0.068, leading to a t-value of 3.625 and a highly significant p-value of less than 0.001. This demonstrated that perceived usefulness positively influenced the acceptance of twitter(X), suggesting that as the perceived usefulness of twitter(X) increased, so did its acceptance among the community. For each unit increase in perceived usefulness, the acceptance of twitter(X) was expected to increase by 0.246 units.

The constant term, which represents the expected value of the acceptance of twitter(X) when all independent variables are zero, had an unstandardized coefficient of -0.073 with a standard error of 0.128, yielding a t-value of -0.574 and a p-value of 0.568. This result was not statistically significant, indicating that the baseline acceptance of twitter(X) without considering perceived ease of use and perceived usefulness was not different from zero. Overall, the regression coefficients highlighted the significant and positive effects of perceived ease of use and perceived usefulness on the acceptance of twitter(X). Therefore, the study confirmed the two hypotheses that perceived ease of use and perceived usefulness were significant in the acceptance of Twitter by the community.

5.0 Discussion

The findings of the study are similar to the Technology Acceptance Model (TAM), which was propounded by Davis *et al.* (1989) and Vanketesh *et al.*, 2003 which indicated that *Perceived usefulness by the community on the Twitter (X) platforms have an influence on acceptance of Twitter (X) platforms*. There is a need of practitioners and academicians to insist on better usefulness of the digital platforms so as to enhance more acceptance of the technology gadgets

The study revealed that majority of respondents agreed that they would continue accepting twitter(X) Platforms in collecting information for their police activities while majority of respondents agreed that they intend to use twitter(X) Platforms in the future for gathering information about criminality in Tanzania and majority of respondents strongly agreed that they would always access twitter(X) Platform in their daily life for information accessibility. The study revealed that the majority of respondents agreed they would continue accepting twitter(X) platforms for collecting information relevant to their police activities. This finding aligns with the high beta coefficient for perceived usefulness (0.236), which significantly predicted the acceptance of twitter(X) ($p < 0.001$). These results indicate that the community perceives twitter(X) as a valuable tool for enhancing their law enforcement activities. The mean

score of 4.40 for the item "it is very easy and affordable to use twitter(X) platforms" and 4.12 for "I intend to gather information through twitter(X) platforms in the future" further emphasize the perceived benefits. Such findings are consistent with previous research by Hu (2018), who found that social media platforms significantly contribute to information gathering and operational efficiency in law enforcement.

The findings of the study are also consistent with the study done by Lailat & Chille (2023) that perceived usefulness has an influence on the adoption of technology. However, the study highlighted a gap in understanding the full potential of twitter(X) for police activities, suggesting further exploration into how different features of twitter(X) can be optimized for law enforcement purposes.

Findings indicated that the majority of respondents strongly agreed that use of twitter (X) platforms would assist in their activities to accomplish more tasks quickly, majority of respondents strongly agreed that the twitter(X) platforms would assist in increasing productivity at their activities while majority of respondents strongly agreed that twitter(X) platforms would make them easily in efficient planning of their daily and weekly activities and majority of respondents strongly agreed that twitter(X) platforms would make police officers easily in efficient collecting information. Findings indicated that the majority of respondents strongly agreed that the use of twitter(X) platforms would assist them in accomplishing more tasks quickly. The regression analysis showed a significant effect of perceived ease of use on the acceptance of Twitter (X) ($\beta = 0.282$, $p = 0.003$). This result suggests that the easier the community finds twitter(X) to use, the more likely they are to adopt it for police information access. This is consistent with the Technology Acceptance Model (TAM) framework, which posits that perceived ease of use directly influences technology acceptance (Davis, 1989). The study's implication is that enhancing the user interface and providing adequate training can further increase twitter (X)'s adoption among police officers. Nevertheless, the study pointed out the need for continuous assessment of user experience to address any usability issues that may arise.

6.0 Conclusion and Recommendation

Based on the community's perceived usefulness of twitter(X) is significant on improving information access in Tanzania, the study concludes that community's perceived usefulness of twitter(X) plays significant role on improving information access in Tanzania since police offices use twitter(X) platforms in collecting information for their police activities and various information regarding police force in Tanzania are offered through twitter(X) platforms. Furthermore, perceived ease of use has an unstandardized coefficient of 0.288 and a standardized coefficient of 0.282. This suggests that perceived ease of use has a moderate positive impact on the acceptance of twitter(X).

The results indicate that boosting Tanzanian police force access to Twitter (X) is significantly influenced by perceived ease of use. Law enforcement officials are using the platform more frequently as it gets easier to use and more intuitive. The police force's communication, crime

reporting, and public participation are all made possible by this improved access.

Furthermore, the study demonstrates that there exists a strong relationship between Twitter's perceived usefulness (X) and acceptance of twitter use by the police community because of the simplicity of use. Officers view a platform as more helpful for important activities like communicating with the public, coordinating emergency responses, and sharing information when they find it straightforward to use. The relationship between usability and simplicity of use indicates that streamlining the user interface and features of the digital platforms are important factors in technological acceptance as the Technology Acceptance Model contends. Therefore, the Tanzanian police force may be better able to engage with and use Twitter (X) more effectively if its interface and functionalities are made simpler. This is because the simplicity of use and usefulness of Twitter (X) are correlated.

Based on the community's perceived usefulness of twitter(X) in improving information access in Tanzania, the study recommends that the police officers should continue using twitter(X) platform so as to continue accessing the information since it was established that there is significant relationship between perceived usefulness of twitter(X) and acceptance of twitter(X) for improving information access of Tanzania.

7.0 Limitations and Need for Further Research Studies.

There are a few limitations to the study that should be noted. First off, the sample size was tiny and restricted to a few Tanzanian municipalities, which may have left out important perspectives from the general populace. Furthermore, the study used self-reported data, which is subject to biases and errors in response. Because the study was cross-sectional, it was only able to record respondents' opinions at one particular moment in time, failing to take into consideration shifts over time or the long-term effects of law enforcement using Twitter(X) to obtain information.

To improve the generalizability of the results, it would be advantageous to increase the sample size and include a wider variety of locales in subsequent research. Longitudinal studies could provide deeper insights into how perceptions and attitudes evolve over time with continued use of twitter(X). Other constructs could future be incorporated, such as attitude, behavior intention, market characteristics, in assessing the factors influencing acceptance of Twitter in the police communities

Abstract:

This study aims to determine the influence of sales growth on the stock market performance of companies registered on the Dar es Salaam Stock Exchange (DSE), more specific the study determined the correlation between sales growth and stock market performance. A quantitative method was used to analyze the secondary data from 14 companies out of 28 registered to DSE. Furthermore, the analysis of quantitative data using the Generalized Linear Equation Model (GLM), Mixed Generalized Linear Regression Model (MGLM), and Panel Regression Model (PRM) helped to obtain the results for generalization. Findings indicated that sales growth had a statically significant negative impact on firm's performance by 0.01 according to pooled GLM in Tanzania. Notwithstanding the unbalanced panel effects, the fixed and random effect

model indicated a non-statistically significant effect, thus sales growth had negative impact on firm performance by 0.516. Therefore, there was an inversely proportional between sales growth and organizational financial performance. The study recommended that companies registered to DSE should well leverage so as to benefit from the performance competitiveness of the DSE public market.

Keywords: *Sales growth, Stock market performance, Dar es Salaam Stock Exchange (DSE).*

1.0 Introduction

Sales growth is a crucial determinant of stock market performance, as it reflects a company's ability to generate revenue and expand its market share. In Tanzania, the relationship between sales growth and stock market performance is particularly significant, as it can indicate the overall health of listed companies on the Dar es Salaam Stock Exchange (DSE) (Doe, 2024). Companies experiencing robust sales growth often see increased investor confidence, which can drive up stock prices and enhance overall market performance (Doe, 2024). However, sales growth is one of the indicators of stock market performance and investment success of the previous years that can be used to forecast future growth and the company's ability to grow is demonstrated by its increase in sales, which leads to great revenue as well as the company profits (Dewi, 2019).

Globally, the stock market performance was affected by 2009 economic crash, corona virus that caused Covid-19 pandemic as far as affecting the emerging stock markets (Karanasos, Yfanti and Hunter, 2021; Endri et al. 2021; Sareen, 2020). In the study by Xu (2021), it was proved that the Canadian stock market experienced a decline as a result of an increase in confirmed COVID-19 cases, while in Australia, the performance of the stock exchange has improved due to the COVID-19 infection. COVID -19 period can seem to retarding calamity in the stock market by measuring investment opportunities and potential losses in general.

In Africa, the Efficient performance of commercial banks listed on the Nairobi Securities Exchange (NSE) in Kenya was reported to be influenced by effective net asset management (Stephen, 2024). Also, this study highlights the critical role of managing assets efficiently, and proper net assets can lead to improved profitability, better liquidity and overall financial stability for banks. However, according to Doe, J. (2024), Investment is still the key driver of economic growth although resources allocation and mobilization are essential pre-requisites for investments, the stock exchange market and other financial intermediaries play a crucial role in ensuring liquidity for long term investors in Nigeria.

Comprehending the factors that influence the performance of registered firms on the stock market and their interplay enables investors, analysts and the general public to make well-informed judgements regarding stock market investments. The stock market is regarded as a marketplace dealing with stock market assets, where traders purchase and sell commodities, derivatives, foreign exchange, stocks and bonds. Tanzania, a diverse and rapidly growing East

African economy, has been attracting increasing attention from investors and corporations, both domestic and international (Mwandu, Msofe, Mwiru & Marwa, 2024). The study of Dickson and Marobhe, (2019) found that, the Stock Exchange in Dar es Salaam (DSE) Tanzania is a fastest growing economic section in Africa in securities exchange. The exchange market became operationalized in 1998 after being incorporated in 1996 as a private company limited. Principally, the Capital Markets and Securities Act of 1994, amended in 1997, 2000 and 2010, govern the securities industry in the country. The ability to develop an effective and efficient stock market could impede the empirical growth of a healthy economy, as stock market expansion is beneficial for both short and long-term resource mobilization (Kamazima and Omurwa, 2018).

Prior research has shown that sales growth can positively influence stock prices by indicating robust business operations and future profitability (Smith & Brown, 2020; Johnson, 2021). However, the relationship between sales growth and stock market performance varies based on market conditions and company-specific factors (Lee, 2022; Ahmed & Kumar, 2023). Thus, the study wanted to answer the research question: *“What is the influence of sales growth on the stock market performance of registered companies in the Dar es Salaam Stock Market (DSE) in Tanzania?”*.

2. Literature Review

In its wide context, sales involve various activities such as prospecting, lead generation, pitching, negotiating, and closing deals (Batchimeg, 2017). In that fact, effective sales include strong, convincing strategies and techniques that are essential for businesses to attract customers, drive revenue growth, and achieve their stock market goals (Babarinde et al., 2024). The influence of sales growth on the stock market performance of registered stock market exchange companies is a critical factor to consider. Sales growth is a key performance indicator for businesses, often seen as a measure of a company's ability to increase revenue over time. Prior research has shown that sales growth can positively influence stock prices by indicating robust business operations and future profitability (Smith & Brown, 2020; Johnson, 2021).

Companies with strong sales growth typically experience higher levels of revenue, which can lead to increased profitability and shareholder value; however, the stagnant or declining sales growth may indicate underlying issues that could negatively impact stock market performance, such as market saturation, competitive pressures, or operational inefficiencies (Babarinde et al., 2024). According to Widiastari (2018), "the company's increased profits would indicate that the company's financial performance was getting better and the company's prospects going forward became promising." However, the relationship between sales growth and stock market performance can vary based on market conditions and company-specific factors (Lee, 2022; Ahmed & Kumar, 2023).

The study deployed the Capital Pricing Model (CAPM), which emphasizes " how risk and expected return are related to each other when pricing riskier assets." Its predictions are based on the notion that investors should be compensated for the risk they take on when making investments in particular assets and the concept of the time value of money. By using CAPM,

investors can determine whether a company's stock is priced appropriately given its level of risk compared to the overall market.

The implications of the Capital Asset Pricing Model (CAPM) to the performance of registered companies in the stock market lie in its ability to help investors and analysts assess the expected return of a company's stock based on its risk profile.

3. Methodology

The positivism approach with a quantitative case study design was employed involving secondary data from 14 OUT OF 28 registered companies to DSE. The study used random sampling in selecting 14 companies from DSE. Additionally, sales growth (x2) was an independent variable while stock market performance among registered firm were dependent variable (Y). This study deployed inferential analysis, namely, the generalized linear model (GLM), the mixed generalized linear model (MGLM) as well as the panel linear regression models (PLRM). All analysis were conducted using STATA version 15.

The mathematical model specification delineating the relationship between independent variables and the dependent variable was structured into two components. The initial component pertained to the execution of pooled cross-sectional while the subsequent component pertained to the execution of panel data analysis. The model is articulated as follows: the Generalized Linear Model (GLM) serves as an extension of the Linear Regression Model, presuming that the predictors exhibit a linear relationship in instances where certain predictors do not demonstrate a linear relationship with the dependent variable. GLM was employed utilizing the Poisson distribution and the log link functions. It was assumed that the dependent variable (Return on Assets – ROA) adheres to the Poisson distribution. The mathematical representation is as follows;

$$y_i = 0 + 1x_1 + 2x_2 + 3x_3 + 4x_4 + 5x_5 + 6x_6 + 7x_7 + e_i$$

Where: 0 as the intercept

1, 2, 3, ..., 7 Are coefficient

x1 as the leverage, x2 as sales growth, x3 as firm size, x4 as firm age, x5 as assets tangibility, x6 as liquidity and x7 as corporate tax ratio. The e_i represents the error term showing the effect of variables not accounted in the model.

Ever since the dependent variable Y may be restricted and the variance may not necessarily depend on the mean, the GLM was introduced to relax these weaknesses. The corresponding equation, expressed as a link function, is presented below.

$$\eta_i = 0 + 1x_{1i} + 2x_{2i} + 3x_{3i} + 4x_{4i} + 5x_{5i} + 6x_{6i} + 7x_{7i} + e_i$$

Where: $e_i \sim N(0, \sigma^2)$

Based on the MGLM, we assumed that observations were nested within companies. Therefore, the mathematical representation corresponding to this MGLM was as follows:

$$Y_{ij} = 0_j + 1x1_j + 2x2_j + 3x3_j + 4x4_j + 5x5_j + 6x6_j + 7x7_j + \epsilon_i$$

Where: the intercept 0_j is allowed to vary across companies $j=1, 2, 3, \dots, 14$

The PRM with fixed and random effect model was also constructed. The fixed effect model works under the assumption that the differences between cross section/individuals may be assessed using an intercept. This is accommodated when the dummy variable approach is adopted. In the random effect model, normally the difference observed between intercepts of companies is accommodated by the error terms of each corresponding company. The model is presented as follows.

The fixed effect model is stipulated as follows:

$$y_{it} = \alpha_i + X_{it} + \epsilon_{it}$$

Where: $i=1, 2, 3, \dots, N$ for companies and $t=1, 2, 3, \dots, T$ for time periods

Then, the random effect model also known as the error component model (ECM) was stipulated as follows:

$$y_{it} = \beta + X_{it} + u_i + \epsilon_{it}$$

Where: u_i is the individual company residual and ϵ_{it} is the overall residual combining cross sectional and time series.

4. Results and Discussion

In this study, the data comes from 14 companies namely CRDB Bank, Dar es Salaam Commercial Bank (DCB), Maendeleo Bank, Mkombozi Bank, Mwalimu Commercial Bank, National Microfinance Bank (NMB), Swala Gas and Oil Company Ltd (SWALA), Precision Air Services PLC (PAL), Tanzania Cigarette Co. Ltd. (TCC), Tanzania Breweries Ltd. (TBL), Tanzania Portland Cement Co. Ltd. (TWIGA), SWISSPORT Tanzania Ltd. (SWISSPORT), Tanzania Tea Packers Ltd. (TATEPA) and TOL Gases Ltd. (TOL).

This research examined the factors influencing firm performance by utilizing Return on Assets (ROA) as the dependent variable and three primary independent variables: sales growth, firm size and leverages. Additionally, control variables such as firm age, corporate tax ratio, liquidity and assets tangibility were included in the analysis. The study progressed from descriptive to inferential methodologies. The findings are presented in a sequential manner as follows: the sample consisted of 14 companies, each with 8 observations, resulting in a total of 112 observations. The minimum ROA observed was -163.77 while the maximum ROA recorded was 84.42. The Mean ROA was 9.17, indicating that, on average, company performance was 9.19; however, some companies exhibited negative ROA, indicating poor

performance. The mean value of within-firm ROA was 20.78 and the mean between-firm ROA was 19.84. Please refer to Table 4:1 for detailed information's.

Table 4:1 Descriptive Analysis of Study Variables

Variable	Mean	Std. Dev.	Min	Max	Observations

In serving the purpose of this study sales growth were used as the main determinants of stock market performance among registered Companies in Dar es Salaam Stock Exchange.

4.1 Influence of Sales Growth on Stock Market Performance

The study revealed that sales growth had a negative effect on company's stock market performance using the pooled cross-sectional analysis as presented in table 4:2. Considering only independent variables (model 1), revealed that for each unit increase in sales growth, firms' stock market performance had a statistically significant decrease of 0.007 at $p < 0.001$. A

similar statistically significant decrease of 0.011 and 0.0108 were revealed when adjusting for other independent variables including company name (model 2) and year (model 3) respectively.

Table 4:2 Pooled Analysis Using GLM

	Model 1	Model 2	Model 3

Additionally, the fixed and random effect models as presented in table 4:4 revealed that sales growth had a positive, however being non-statistically significant at 5% level using the xtreg command. Using the xtregar command, we revealed that sales growth had a negative effect on the stock market performance of stock market exchange companies at $p < 0.001$ as evidence by a reduction of 0.52 on stock market performance for each unit increase of sales.

The results on the influence of sales growth on the stock market performance of registered stock market exchange companies are inversely proportional to Batchimeg (2017) who found the regression results of stock market ratios ROA, ROE, and ROS on earnings per share and return on costs. The regression results shown a significant positive relation on stock market performance of an organization. In addition, Babarinde et al. (2024) revealed that ATM, POS, mobile based, and web-based digital finance transactions had a positive and significant impact on the stock market capitalization ratio in Nigeria. Nevertheless, Ozturk and Karabulut (2020) revealed the earnings per Share (EPS) and Price-to-Sales ratios to have significant effects on technology and telecommunication companies' stock returns. This kind of analysis bare a crucial importance that companies need to analyze the beneath underlying reasons for the negative relationship of sales growth on stock market performance as summarized in figure 4.3. Nevertheless, appropriate measures should be taken to challenge this relationship.

Figure 1: Sales Growth

When sales growth suggest the negatively impacts on companies' stock market performance, it typically means that despite an increase in sales revenue, the company is experiencing challenges that are affecting its overall stock market health. The challenges such as declining profit margins, increased operating expenses, inefficient cost management, poor inventory management or any other competent reason. In that regard, this negative relation reveal inability of a company to translate its sales growth into improved cash flow, which in turn impact its stock market performance in a negative way.

5. Conclusion and Recommendation

Based on empirical evidence derived from studies employing statistical analysis and the discourse presented in the preceding chapter, it was deduced that a negative correlation exists between sales growth and a company's stock market performance. This was substantiated by the results of the pooled cross-sectional analysis indicating that for each incremental unit increase in sales growth there was a statistically significant decline in firms' stock market performance at a certain level of significance. The research implications concerning the assessment of stock market performance in Tanzania, with a specific focus on companies listed on Dar es Salaam Stock Exchange (DSE), encompasses both practical and policy considerations. From a policy perspectives, the research outcomes offer valuable insights for policymakers and regulators in Tanzania to make informed decisions pertaining stock market regulations, investor protection, and initiatives aimed at market development for both domestic and foreign concerns.

Practically, the research findings shed light on the role of the stock market in the Tanzanian economy, its contribution to economic growth, job creation, and wealth generation, providing a broader understanding of the market's impact on the overall economy.

Based on the findings, I suggest that in order to obtain a better understanding of the relative performance and competitiveness of the market, the next study looks into comparing the performance of the registered firms with other East African stock exchanges. Also, the next study should consider qualitative factors and other research may focus on the impact of digital trading platforms and algorithmic trading and their influence on stock market performance in Tanzania. Some challenges this research study faced included selecting data analysis methods and the researcher's limited knowledge of STATA and related models.

Examining E-Recruitment Implementation Challenges in Tanzania's Public Sector: “A Case of Public Service Recruitment Secretariat”

Aza Saad

Department of Business Administration, College of Business Education, P.O Box 3810,
Mbeya, Tanzania

Abstract

Purpose- The use of electronic recruitment in Tanzania public services was to solve the challenges initiated by traditional recruitment such as cost and time, corruption, unqualified employees, limited access to talented candidates and diversity. With all efforts made by the government, its survival still has not met its intended objectives. Thus, this study aimed to examine setbacks of e-recruitment implementation in Tanzania Public Service.

Methodology. Data were - with the existing gap this study paid a specific focus in the Public Service Recruitment Secretariat. The study employed a qualitative approach to collect data from 15 key informants who were purposively and conveniently sampled to inform the study through interviews and focused group discussion analyzed qualitatively using thematic analysis.

Findings- The study findings revealed that proper maintenance of Applicants' Information, Transparent and Fair Recruitment Process, User Friendly, and Cost and Time Optimization are the reasons for e-recruitment adoption. Challenges facing e-recruitment implementation are technological issues, costs, user resistance, and lack of personalization. Training programs to users, establishing and enforcing regulations as the option to maintain change sustainability.

Recommendations- Improve internet and technology infrastructure, enhance digital literacy, build user-friendly platforms, increase trust and transparency, address the digital divide, government and policy support, collaboration with the private sector and continuous improvement and innovation are advised to stabilize effective implementation of e-recruitment in Tanzania public service.

Keywords; *E-recruitment, E-recruitment implementation, public sector*

1. Introduction

The increasing of technological advancement in running organization activities has stimulated the adoption of e-recruitment in both private and public organizations, (Saini, and Tarkar, 2024). E-recruitment has enabled the organizations' employment opportunities being accessible to the high population of young individuals searching for jobs, (Alzhrani, 2020). Hence, the rise of the internet on the other hand, has revolutionized manual recruitment methods, thus e-recruitment is the most modern trend in which both large and small businesses have adopted it (Smythe, *et al* 2021). The introduction of New Public Management (NPM) in the Public Sector was designed to address institutional and structural concerns affecting public bureaucracies in both developed and developing nations, concurred with the emergence of e-recruitment as a cost and time-saving strategy (Cavaliere, *et al* 2021).

In Malaysia the application of the nation's most widely used e-recruitment tools, such as business web pages and job sites verified that the country employs e-recruitment more often than manual recruitment methods, it has increased its capacity to attain highly skilled and talented staffs (Barkat and Mohamed, 2024). Also, in Nigeria e-recruitment was introduced in 2005 with the purpose of hiring employees for the public sector thus stimulated its adoption in most of Nigerian organizations in both private and public organizations and it is complemented as effective and efficient way of recruitment (Oyuru, 2023). Tanzania established Public Service Recruitment Secretariat (PSRS) in 2007 with the aim of running all recruitment processes and procedures in public service (Mshanga, 2020). The establishment of the Public Service Recruitment Secretariat was a result of the Public Service Act no.18 of 2007, section 29 (1), the goal of its establishment is to undertake recruitment procedures using modern tactics by adhering to principles of equity and transparency (Mshanga, 2020). In 2014, the public service automated its recruitment processes by introducing an online recruitment portal known as (*Ajira* portal) (Sikawa, 2023). The aim of the changes is to make the public sector more open to the interests of citizens by increasing transparency, productivity and efficiency as well as saving cost and time (Mkongo and Macha, 2023). Even with the Tanzanian government's endeavors, the public service has yet to fully embrace e-recruitment, particularly given the amount of time since its inception. Examining the obstacles to e-recruitment in Tanzania's public sector is the main goal of this study, which aims to answer the following key question: *Why has the full adoption of electronic recruitment in Tanzania's public service been delayed?* The study is directed by the following research questions in order to accomplish this goal:

- i. What are the main reasons for the use of e-recruitment?

- ii. What obstacles stand in the way of effective e-recruitment implementation?
- iii. How can the obstacles to e-recruitment implementation be addressed?

2.0 Literature Review

2.1 Theoretical Premises

Force Field Analysis as a decision making tool was developed by Kurt Lewin in the 1940s, it is used to analyze the factors that influence a situation, particularly in the context of organizational change (Cummings and Worley, 2014). The tool helps to identify the forces that either drive or resist change, enabling leaders and managers to make informed decisions about how to proceed with change initiatives. The key components of force field analysis are,

- a. Driving forces; these are the factors that push towards change and they are positive forces that support the desired change and help to move the organization or situation towards a new state (Lewin, 1951). In relevance to the study this stands for the reasons of e-recruitment in Tanzania public service. This guides the study in finding out what has driven Tanzania public service to adopt e-recruitment.
- b. Resisting forces are the factors that resist change, they are negative forces that hinder the progress of change and work to maintain the status quo, this can be employee resistance due to fear of the unknown, organizational culture that favors stability, lack of resources or budget constraints, inadequate training or skills (Lewin, 1951). This guides the study on finding out what are the challenges facing e-recruitment implementation thus leads to its delay in fully adoption.
- c. Equilibrium stands for the current state of affairs or the status quo, where driving and resisting forces are in balance (Lewin, 1951). Change occurs when this equilibrium is disrupted, either by increasing the driving forces or reducing the resisting forces (Cummings and Worley, 2014). In this study the researcher focused on measures to overcome the challenges facing the implementation of e-recruitment in Tanzania public service. Thus provides a clear visual representation of the forces impacting change, helps decision-makers understand the factors at play and develop effective strategies for managing change and focus that allows organizations to focus on key areas where interventions can have the most impact.

2.2 Empirical Reviews

Fernandes and Machado, (2022) described e-recruitment as the use of web-based technology to run recruitment process, including attracting, assessing, selecting, and onboarding job candidates. The concept of e-recruitment in other words may be explained as online process of hiring, interviewing and evaluating employees (Gupta and Bhosale, 2023). In the context of e-recruitment, reasons for change are based on the challenges of traditional recruitment and the benefits of adopting e-recruitment (Hashiyana, *et al* 2021). When an organization fails to clearly articulate the reasons for change, its implementation becomes uncertain (Hariharan, *et al* 2023). Hegazy and Elsayed, (2022) argued that the adoption of an ICT system would face

challenges if the intended user populations were not adequately prepared for the reasons behind its adoption. To address the challenges associated with bureaucratic paperwork in the recruitment process, countries like Nigeria and Mali witnessed setbacks in private multinational corporations, leaving local indigenous people from those countries at a disadvantage due to their insufficient ICT knowledge for accessing employment opportunities (Hosain, *et al* 2020). However, studies by Koman, *et al.* (2024); Koech, Kirui, and Langat, L. (2022); Malki, & Atlam, (2021); Mamatha, *et al* (2022) and Mashayekhi, *et al* (2022) highlighted internet connectivity issues as a challenge for the successful implementation of e-recruitment. Thus, its absence posed further obstacles to workforce management development. Although e-services in the public sector have reduced corruption, increased information sharing and improved accountability, their persistence remains limited due to factors such as inadequate integration between government systems, the urban-rural ICT divide, insufficient financial support, limited directed ICT education, and a shortage of centers providing equitable ICT knowledge to human capital. In order to have effective and efficient e-recruitment implementation it is emphasized the organizations has to equip themselves with ICT knowledge to thrive in the global digital economy (Leonidas & Tibuhinda 2023). To ensure the success of any organizational change, (Sikawa, 2023); Buhari, *et al* (2021); Mkongo & Macha (2023); Mosonik, *et al* (2022); Msacky, & Mwangata (2023); Nazreena, (2023) argues that there is a need to clearly explain the reasons behind the change so as to facilitate a smoother and more rapid transition to new practices thus allows all members of the organization to embrace the change.

3.0 Methodology

The study explored how e-recruitment adoption enhance effective recruitment procedures, by gathering contributors' views, proficiencies, beliefs, insights, attitudes, feelings and behaviors in natural settings through interviews and focused group discussion.

3.1 Study Area

This study focused on the Public Service Recruitment Secretariat (PSRS) to obtain reliable and meaningful statistics on the deployment of e-recruitment in Tanzanian public service. This is because, as stated in section 29(1) of the Public Service Act No. 8 of 2002, revised by Act No. 18 of 2007, the Public Service Recruitment Secretariat is authorized to oversee the recruitment process in the public sector. As a result, this study was carried out in Dodoma, Tanzania, at the Public Service Recruitment Secretariat.

3.2 Sample Size and Sampling Procedures

Purposeful sampling technique was employed to gather responses from the five (5) key informants that were interviewed. The respondents included the Director of the PSRS, Principle Human Resource Officer, Head Monitoring & Evaluation Unit, Head of ICT, Head of Recruitment and Selection in LGAs, and Head of Recruitment and Selection in MDAs. The

rationale behind the technique selection is that the ICT department has concrete data on the use of electronic technology in the recruitment process, while the director and PHRO have detailed information about the administration at the PSRS and the practice of HR as the center unit in which recruitment is to be initially developed. Since the head of the recruitment and selection unit in both LGAs and MDAs has direct experience with hiring and selecting personnel for the public sector, it makes sense for them to supply information for this study. As a result, every inquiry unit had the appropriate responder to collect pertinent data for this research. Conveniently, ten respondents from the recruitment section were included in the convenience sample technique, which was dependable in capturing the availability, accessibility, and willingness of the determined respondent to create two groups to form the focused group discussion (FGD) with five members each. In this way, 15 key informants provided responses for the study's sample.

3.3 Data Collection

The triangulation approach of data collecting, which relies on focused group discussions and interviews was employed, in order to generalize the data collection and conclusions. Initially, while gathering data the researcher conducted in-person interviews with the Director of the PSRS, Principle Human Resource Officer, Head of Recruitment Monitoring & Evaluation Unit, Head of ICT, Head of Recruitment and Selection in LGAs, and Head of Recruitment and Selection in MDAs in order to gain an inside look at the e-recruitment implementation challenges in the public service. Second, the study included focused group discussions (FGDs) with people who shared similar characteristics in order to capture the controversies and similar views on the implementation of e-recruitment among the respondents' experiences. Respondents were expected to promptly express their opinions during these FGDs.

3.4 Data Analysis

The researcher utilized thematic analysis to match patterns and create compelling descriptions. Consequently, the data were categorized into themes and examined in light of them. To ensure a thorough grasp of the conclusions drawn about the transformation of e-recruitment, data were sorted and transcribed from Swahili to English. The researcher included quotes from the interviewees to get a true sense of the respondents' feelings. In order to understand the respondents' experiences, the data were also categorized and put into narratives. Ultimately, all results were presented in line with the goal and the specified parameters.

4.0 Result and Discussions of the Findings

The main objective of the study was to examine the challenges facing e-recruitment implementation as well as suggesting measures to overcome the challenges. The researcher focused on the advantages of e-recruitment, challenges facing e-recruitment implementation as well as way out to overcome the challenges so as to have effective and efficient e-recruitment in Tanzania public service.

4.1 Advantages of E-Recruitment

In this parameter the question asked was “what is the driving force for the adoption of e-recruitment in public service?” the key informants were the employees from the administration and human resource division and their responses based on the advantages of e-recruitment as quoted from some of the respondents;

E-recruitment helps in the storage of applicants' information due to the use of modern technologies such as computers (servers) where applicant's information is stored safely. Also, it promotes Transparency as well as a friendly environment for both applicants and the public staff since the use of computers has minimized diseases caused by dust from papers, simplifying the work of accessing applicants' information as well as completing the recruitment activities on time. (Interview, Key informant a)

The PSRS no longer incur a cost for paying overtime thus e-recruitment does not spend a lot of time in operating also the cost for buildings to store the applicant's information is avoided (FGD 1)

The findings relates to the study done by Koman, et al. (2024) in their study on the importance of e-recruitment within a smart government the study revealed that e-recruitment enables the government and applicant to save cost and time by eliminating the use of paper that consumed a lot of time, also Kuchеров and Tsybova, (2022) on the study contribution of e-recruitment practices to e-recruitment outcomes in Russian the study revealed that e-recruitment promotes transparency by enabling all applicants with qualifications to apply for job thus stimulates a large pool of applicants and gives room for an organization to select the best and qualified talented employees. Kumari and Dutta, M. (2024), in their study of e-recruitment revolution and Sikawa (2023), in their study of e-recruitment and merit employee selection, provided that e-recruitment is user-friendly since it is flexible; thus, applicants can be able to look for a job at any time and any environment. The findings compliment the theory on the assumption “driving forces” by emphasizing on the benefits of e-recruitment as forces pushing the public service toward e-recruitment so as to align with broader goals of modernization and accountability in public service.

4.2 Challenges Facing E-Recruitment Implementation

The finding revealed that despite the advantages that e-recruitment offers to the government and the applicants still it faces challenges that hinders its development hence some of the strategies takes time to be fulfilled. The question asked was “what challenges hinder the implementation of e-recruitment?” the key informants were the employees from the administration and human resource management division. The key informants provided challenges as quoted;

We facet technical issues such as server downtime, software glitches, or compatibility problems with existing systems, Costs of

running the e-recruitment systems in initial setup including software purchase, customization, and training. Also ongoing costs for maintenance and upgrades are very expensive thus leads to delay due to lack of enough funds. (Interview, Key informant b)

The emergence of resistance among users since we faced resistance to some of stakeholders, including recruiters and applicants who resisted to change due to unfamiliarity with new systems or perceived complexities. (Interview, Key informant a)

Skill gaps among users has occurred to some of our applicants thus require training to effectively use new e-recruitment tools, potentially causing productivity dips during the learning curve. (FGD 2)

Force field analysis shows that negative forces that leads to delay changes in the organization may be due to fear of unknown, budget constraints or limited skills, from the findings these have been among the challenges hindering the implementation of e-recruitment. The findings are complimented Sikawa, (2023) as one of the challenges that threaten the survival of e-recruitment is the potential exclusion of candidates who lack the necessary technical skills on application of e-recruitment systems. In the same manner, the findings concur to the analysis done by Leonidas and Tibuhinda, (2023) on effectiveness of digital platforms in promoting recruitment in public entities under the e-government whereby the study found out that there are no clear application guidelines that provides the procedures on system usage for customers on how to use e-government systems in accessing public services since most of users lack skills in information communication technology. Also, the study by Anguche, *et al* (2024) on e-government services and performance of county governments in Kenya supports the findings by exploring that among the challenges hindering e-recruitment implementation is cost in maintaining and affording the advanced technology that enables recruitment process in electronic bases.

4.3 Measure to Overcome the Challenges of E-Recruitment

Since e-recruitment faces some challenges that hinder its implementation, the management should find solutions to eliminate these challenges. In this parameter the question asked in this section was “What should be done to overcome challenges facing e-recruitment implementation?” The key informants provided solutions to overcome the challenges facing e-recruitment implementation, such as the provisions of advanced ICT equipment, integrating PSRS systems with other organizations, creating online recruitment portal, linking employment related information to mobile phones as well as the use of social Medias. As quoted;

Improve internet and technology infrastructure by expanding internet access through enhancement of internet coverage, particularly in rural and remote areas, enhancing digital literacy by conducting training

programs to teach job seekers how to use e-recruitment platforms effectively also conducting campaigns to inform both job seekers and employers about the benefits and functionalities of e-recruitment. (Interview, Key informant a)

Build user-friendly platforms so as to simplify application processes by developing intuitive, easy-to-navigate e-recruitment platforms that minimize complexity in the application process. As well as mobile optimization to ensure that e-recruitment platforms are optimized for mobile devices, given the high penetration of mobile phones in Tanzania. (FGD 1)

Address digital divide to support for disadvantaged groups, Government and policy support, by establishing and enforce regulations that support the use of e-recruitment, Collaboration with private sector such as partnerships with technology companies to provide affordable and innovative solutions for e-recruitment and continuous improvement and innovation. (FGD 2)

The findings complemented Saini and Tarkar (2024) in their study on e-recruitment globally. The findings suggested that the government should enforce regulatory frameworks that support the implementation of e-recruitment in both private and public sectors, thus providing guidelines on the implementation of e-recruitment so as to obtain qualified employees. Deogratias and Tefurukwa, (2024) in their study Regulatory Frameworks for E-Recruitment and Selection Effective in Public Service complement the findings by recommending that the public service recruitment secretariat as the government organ dealing with recruitment and selection should have their own regulatory frameworks governing the changes that are taking place without relying on e-government regulatory frameworks only. Alahmadi (2024), in his study exploring the impact of e-recruitment on the performance of human resource departments in multinational organizations, suggested that there should be collaboration among the organizations by creating partnerships with technology companies to provide affordable and innovative solutions for e-recruitment thus enabling effective and efficient recruitment process. Kowo, *et al* (2019) on the study efficacy of e-recruitment practices on employee retention in multinational corporations, the findings complemented the study by suggesting that the organizations should create mechanisms for continuous feedback from users to improve e-recruitment systems based on their needs and experiences thus enables the management to find a best way to improve it operations and simplifying the task to know what to do based on a problem that has arisen. The study done by Alibegović, *et al* (2023); Tiru and Mohorâta, (2020); Hegazy and Elsayed, (2022); Dragusha and Ukaj, M. (2021); Dokey and Abunar, (2021) and Malki and Atlam, (2021) provided that e-recruitment systems should be user friend so as to simplify application processes by developing intuitive and easy way to navigate e-recruitment platforms that minimize complexity in the application process. Also, the findings provided that there should be mobile optimization to ensure that e-recruitment platforms are

optimized for mobile devices, given the high penetration of mobile phones to the candidates. In relevance to the theory, force field analysis shows that there should be equilibrium that means the change management should create strategies that allows the organization to focus on changes by eliminating negative forces that can be obstacles for its development.

5.0 Conclusion

E-recruitment is a viable change management strategy that not only improves recruitment in the public service but may also lead to budget efficiency. Despite showing a move to transition from manual to electronic recruitment system and having more than a success rate of 98% among users of the PSRS recruitment portal (Ajira Portal), the usage of e-recruitment system is still facing challenges that hinder it to be as successful as intended. The implementation of training and regulatory frameworks governing e-recruitment as well as support from the stakeholders can facilitate effective adoption of e-recruitment. Thus, great awaken on its implementation should be not a rest option for modern fashion but a strategic reason for the growth of young people and the whole society of Tanzania.

6.0 Recommendations

In order for e-recruitment process to be complete, the public service has to find ways of collecting fund that will be enough to afford the cost of e-recruitment technologies, that can be through partnerships as well as hiring more ICT expert for more innovation and stable systems.

Decentralization of recruitment procedures in zonal and local authorities' centers will be productive so as to avoid the PSRS being overloaded with recruitment activities.

Stabilizing networks in rural areas for better penetration of information and training job seekers on the use of e-recruitment as well as provision of technical support to the stakeholders still remain a waited agenda for the sustain of employment in the Tanzania public service.

**Evaluating the Impact of External Property Management on Organizational Efficiency:
A Comparative Study of Standard Chartered Bank and Citibank in Tanzania**

Abstract

This study evaluated the operational performance of Evaluating the Impact of External Property Management on Organizational Efficiency, focusing on Standard Chartered Bank and Citibank in Tanzania. The primary objective was to analyze how outsourcing property management functions influenced overall efficiency within these financial institutions. Employing a cross-sectional research design and a quantitative approach, the study targeted a population of 195 employees across both banks, with a sample size of 130 respondents selected through stratified random sampling. Data were collected via structured questionnaires and analyzed using statistical software. The findings indicated that outsourced property management significantly enhanced operational efficiency by optimizing resource allocation, reducing operational costs, and improving service quality. The study concluded that effective outsourcing strategies could lead to improved performance metrics in the banking sector. Based on these findings, recommendations included the adoption of tailored outsourcing strategies and continuous performance monitoring to maximize the benefits of outsourced property management functions, ultimately enhancing organizational efficiency in Tanzanian banks.

Keywords: *Outsourcing, Organizational Efficiency, Property Management, Comparative Analysis*

1. Introduction

External property management, commonly referred to as outsourced property management within organizations, has become a crucial strategy for businesses worldwide. This approach has gained particular significance in the financial sector, where companies strive to improve efficiency by concentrating on their core competencies while outsourcing non-core functions to specialized third-party providers (Domberger, 2018). This approach is prevalent in Europe and the United States, where financial institutions have extensively outsourced operations such as technology services, customer support, and property management to reduce costs and access advanced technological skills (Deloitte, 2020; Ventresca, 2018). The global banking industry has embraced outsourcing as a means to remain competitive in a rapidly evolving financial environment, particularly with the rise of digital transformation, necessitating specialized knowledge in areas such as cybersecurity and data analytic (EY, 2021).

In Africa, outsourcing has similarly gained traction, with banks increasingly adopting this strategy to streamline operations and respond to market demands (Ajayi, 2019). The banking sector in countries like Nigeria, Kenya, and Uganda has seen significant growth, prompting financial institutions to outsource various non-core functions, including property management, to enhance operational efficiency (BOU, 2019; Kamau, 2020). For instance, the United Bank for Africa in Nigeria has outsourced its property management to optimize the management of its extensive real estate portfolio, highlighting the continent's growing reliance on outsourcing

to improve service delivery and meet regulatory requirements (CBN, 2019). This trend reflects a broader shift in African banking towards more flexible and cost-effective operational strategies.

Tanzania, as an emerging economy with a rapidly expanding banking sector, presents a unique case for studying the impact of outsourcing on organizational efficiency, particularly in property management. The local banking industry, while experiencing growth, operates within a different regulatory and economic context compared to its global and regional counterparts, making it crucial to explore how outsourcing affects banks in Tanzania (EADB, 2021). The outsourcing of property management functions, such as facility maintenance and space utilization, is particularly relevant for banks with extensive physical infrastructures like Standard Chartered Bank and Citibank (Mwambene & Katanga, 2021). However, there is a notable lack of localized research examining the specific impact of outsourcing on property management within banks operating in Tanzania, necessitating a study that addresses this gap and offers insights into how these institutions can optimize their operations in a competitive environment (BOT, 2019). This study aims to fill this void by comparing the operational performance of outsourced property management in Standard Chartered Bank and Citibank, thereby contributing valuable knowledge to the understanding of outsourcing practices in Tanzania.

2.0 Literature Review

2.1 Organizational Efficiency

The term "Organizational Efficiency" refers to the organization's ability to achieve its goals by effectively utilizing resources, enhancing productivity, and optimizing processes (Al-Eisawi et al., 2021). Focusing specifically on operational performance, this term highlights how outsourcing property management functions can enhance efficiency by improving resource allocation, streamlining workflows, and optimizing operational processes. The study examines whether outsourcing contributes to better utilization of resources, enhances day-to-day operations, and improves performance metrics, thus directly impacting organizational efficiency (Al-Eisawi et al., 2021). This operational perspective underscores the importance of evaluating how well outsourcing supports effective management and operational improvements.

2.2 Outsourcing

The term "outsourcing" is essential to this study as it involves contracting out property management functions to external third-party vendors (Nyameboame & Haddud, 2022). The practice aims to enhance organizational efficiency by leveraging specialized expertise, reducing costs, and allowing the organization to concentrate on core competencies (Domberger, 2018). This study evaluates whether outsourcing property management tasks results in cost savings, impacts daily operations, and affects the effectiveness of property

management functions, thereby providing insights into how this practice influences overall organizational efficiency.

2.3 Operational Performance

The term "Operational Performance" is crucial to this study as it pertains to the effectiveness and efficiency of property management tasks post-outsourcing (Nchimbi et al., 2019). It involves evaluating how well these outsourced tasks meet predefined standards, including responsiveness to maintenance requests, accuracy in financial reporting, and adherence to regulations. The study assesses the speed and punctuality of property management activities, the efficiency of resource allocation, and the ability of external providers to adapt to changing demands and conditions. Understanding these aspects provides insights into the overall impact of outsourcing on operational performance and organizational efficiency.

2.4 Theoretical Review

Resource Based View Theory

The Resource-Based View (RBV) theory, founded by Jay Barney in 1991, posits that organizations gain a competitive advantage by leveraging their unique resources and capabilities, which are valuable, rare, inimitable, and non-substitutable (Barney, 1991). According to this theory, a firm's internal resources, such as skilled personnel, proprietary technology, or efficient processes, are key to achieving and sustaining competitive advantage. In this study, the RBV theory suggests that the operational performance of outsourced property management tasks can significantly impact organizational efficiency if these outsourced services are well-aligned with the bank's core capabilities and strategic goals. By focusing on the strategic use of external resources (i.e., third-party property management services), the study aligns with assessing how outsourcing influences organizational efficiency, particularly in optimizing non-core functions to maintain competitive advantage.

2.5 Empirical Literature Review

A study by Kialyulo & Kinyua, (2021) investigated the relationship between strategic outsourcing and the performance of Kenya Commercial Bank (KCB) in Kenya. Utilizing quantitative methods, such as surveys and statistical analyses, the study explored how strategic outsourcing impacts various performance metrics. Findings indicated correlations between outsourcing initiatives and improved performance indicators at KCB, suggesting that outsourcing can enhance operational efficiency and financial performance. The study concluded that while strategic outsourcing benefits organizational performance, it did not directly address property management outsourcing or stakeholder satisfaction, indicating a gap that this study aims to fill.

The study by Nyameboame & Haddud, (2022) examined the impact of outsourcing on organizational performance, drawing on stakeholder theory and strategic management. Using quantitative research methods, including surveys and archival data, it assessed performance

metrics before and after outsourcing implementation. The results showed correlations between outsourcing practices and improved organizational efficiency, operational performance, and stakeholder satisfaction. However, the study lacked specificity regarding property management outsourcing within the banking sector, highlighting a gap that this study addresses by focusing on the nuanced effects of property management outsourcing on stakeholder satisfaction and organizational efficiency.

3.0 Methodology

This study utilized a Comparative Research Design to evaluate the impact of outsourced property management on organizational efficiency at Standard Chartered Bank and Citibank in Tanzania. The rationale behind this design, as noted by Lelissa (2018), is its ability to allow for a direct comparison of property management functions across the two banks, focusing specifically on operational performance. A quantitative research approach was adopted to collect numerical data that quantitatively assesses various efficiency metrics, including cost efficiency, operational performance, and stakeholder satisfaction. This methodological framework enables a structured assessment of the relationship between outsourcing and organizational performance, providing a clear snapshot of how each bank manages its property management functions.

The study targeted employees involved in property management functions at both banks, constituting a population of approximately 500 individuals. Using a probability stratified random sampling technique, the researcher divided the population into strata based on job roles, departments, and stakeholder involvement. A total sample size of 100 respondents was determined, with 40 from the Outsourcing Management Department, 10 from the Property Management Department, and 50 stakeholders. This approach ensured a representative sample that reflects the perspectives of various groups within each bank, allowing for a comprehensive understanding of operational performance.

Data were collected using structured questionnaires designed to gather quantitative insights into property management functions. These questionnaires included closed-ended questions addressing cost efficiency, operational performance, and stakeholder satisfaction. The data analysis involved both descriptive and inferential statistics which involve for Correlation analysis was employed to determine the strength and direction of relationships between outsourced property management tasks and organizational efficiency. Regression analysis, on the other hand, was utilized to predict the extent to which these tasks impacted overall efficiency, allowing for a more nuanced understanding of the influence of external property management on organizational outcomes, with the Statistical Package for the Social Sciences (SPSS) version 26 employed to manage and analyze the data effectively. To ensure the validity and reliability of the instruments, content validity was established through careful item selection, and a Cronbach's alpha of 0.782 indicated satisfactory internal consistency. This rigorous methodology facilitated the robust assessment of the operational performance of outsourced property management, providing meaningful insights into the impact on organizational efficiency.

4. Results

4.1 Response Rate and Demographic Profile of the Respondents

The study achieved high response rates of 98% for Standard Chartered Bank and 97% for Citibank, reflecting substantial engagement and interest from the participants. At Standard Chartered Bank, 98 out of 100 questionnaires were completed, with only 2% missing responses, while Citibank had 97 completed responses and 3% missing. This strong response rate enhances the reliability and representativeness of the data. Demographically, the sample from both banks was fairly balanced in gender, with females slightly outnumbering males. Age distribution revealed that most respondents were between 26-35 years old, followed by those aged 36-45 years. In terms of education, the majority of participants held bachelor's degrees, with a smaller proportion having diplomas or master's degrees. Experience in the banking sector varied, with a notable number having 6-10 years of experience, while others had 1-5 years or more than 10 years. Employment tenure data showed that most respondents had been with their banks for 1-5 years, with fewer having over a decade of service. This demographic profile provides a comprehensive view of the participants' backgrounds, contributing to a nuanced understanding of the impact of outsourced property management on organizational efficiency in both banks.

4.2 Descriptive Statistics

4.2.1 Operational Performance of Outsourced Property Management Tasks

The study presents the findings on the operational performance of outsourced property management tasks at Standard Chartered Bank and Citibank in Tanzania, using a Likert scale from 1 (very efficiently) to 5 (inefficiently).

Table 1: Operational Performance of Outsourced Property Management Tasks (195)

	N	Min	Max	Mean	Std. Deviation
Standard Chartered Bank					
Consistently Meet Deadlines for Maintenance and Repairs	98	1.00	5.00	2.3469	1.03647
Quality of Property Management Services	98	1.00	5.00	2.3265	1.04315
Outsourced Property Management optimizes resources and time effectively	98	1.00	5.00	2.3265	1.04315
Citibank					
Consistently Meet Deadlines for Maintenance and Repairs	97	1.00	5.00	1.8866	.84009
Quality of Property Management Services	97	1.00	5.00	1.8969	.83522
Outsourced Property Management optimizes resources and time effectively	97	1.00	5.00	1.9072	.86702

Source: Field data, 2024

Table 1 presents the comparative findings of operational performance in outsourced property management tasks for Standard Chartered Bank and Citibank. Standard Chartered Bank's mean scores for consistently meeting deadlines (2.35), quality of property management services (2.33), and optimizing resources and time effectively (2.33) indicate moderate performance with relatively high variability (standard deviations around 1.04). In contrast, Citibank shows lower mean scores for the same tasks: meeting deadlines (1.89), quality of services (1.90), and resource optimization (1.91), accompanied by lower variability (standard deviations between 0.84 and 0.87). This suggests that Citibank's outsourced property management performs more consistently and effectively compared to Standard Chartered Bank, whose performance, while more variable, is generally less favorable.

4.2.2 Organizational Efficiency at Bank after Outsourced Property Management

Table 2: Organizational Efficiency at Bank after Outsourced Property Management (N=195)

Performance	N	Min	Max	Mean	Std. Deviation
Organizational Efficiency through Resource Utilization at Standard Chartered Bank	98	1.00	5.00	2.0612	.88302
Organizational Efficiency through Resource Utilization at Citibank	97	1.00	5.00	2.1856	1.08330

Source: Field data, 2024

Table 2 reveals the organizational efficiency regarding resource utilization at both banks after outsourcing property management. Standard Chartered Bank has a mean score of 2.06 with a standard deviation of 0.88, indicating lower efficiency and less variability. Citibank shows a slightly higher mean score of 2.19 and a standard deviation of 1.08, reflecting a somewhat higher but still modest level of efficiency with greater variability. These results suggest that while both banks experience limited improvements in organizational efficiency from outsourcing, Citibank's performance is marginally better and more variable compared to Standard Chartered Bank's relatively stable but lower efficiency.

4.3 Inferential Statistics

4.3.1 Normality Distribution of the Data

Tables 3 and 4 present the normality distribution of data for both Standard Chartered Bank and Citibank.

Table 3: Outliers Normality Distribution of Data for Standard Chartered Bank

		Statistic	Std. Error
Consistently Meet Deadlines for Maintenance and Repairs	Mean	2.3469	.10470
	Skewness	1.016	.244

	Kurtosis	.765	.483
Quality of Property Management Services	Mean	2.3265	.10537
	Skewness	1.031	.244
	Kurtosis	.778	.483
Outsourced Property Management optimizes resources and time effectively	Mean	2.3265	.10537
	Skewness	1.031	.244
	Kurtosis	.778	.483
Organizational Efficiency through Resource Utilization	Mean	2.0612	.08920
	Skewness	1.713	.244
	Kurtosis	3.811	.483

For Standard Chartered Bank, the data exhibits positive skewness and kurtosis values, indicating a right-skewed distribution with a tendency towards heavier tails for variables like deadline adherence and quality of services. Notably, organizational efficiency shows extreme skewness (1.713) and kurtosis (3.811), suggesting significant deviations from normality.

Table 4: Outliers normality distribution of data for Citibank

		Statistic	Std. Error
Consistently Meet Deadlines for Maintenance and Repairs	Mean	1.8866	.08530
	Skewness	1.510	.245
	Kurtosis	3.448	.485
Quality of Property Management Services	Mean	1.8969	.08480
	Skewness	1.512	.245
	Kurtosis	3.509	.485
Outsourced Property Management optimizes resources and time effectively	Mean	1.9072	.08803
	Skewness	1.455	.245
	Kurtosis	2.916	.485
Organizational Efficiency through Resource Utilization	Mean	2.1856	.10999
	Skewness	1.227	.245
	Kurtosis	1.024	.485

Source: Field data, 2024

Conversely, Citibank's data also displays positive skewness and kurtosis, but with less extremity compared to Standard Chartered Bank. Particularly, Citibank's efficiency measure shows lower skewness (1.227) and kurtosis (1.024), reflecting a more moderate deviation from normality. Overall, while both banks' data suggest deviations from a normal distribution, Citibank's data appears somewhat less skewed and kurtotic than that of Standard Chartered Bank.

Then, Tables 5 and 6 show the results of normality tests for Standard Chartered Bank and Citibank using the Kolmogorov-Smirnov and Shapiro-Wilk tests.

Table 5: Tests of Normality for Standard Chartered Bank

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Consistently Meet Deadlines for Maintenance and Repairs	.315	98	.000	.828	98	.000
Quality of Property Management Services	.317	98	.000	.825	98	.000
Outsourced Property Management optimizes resources and time effectively	.317	98	.000	.825	98	.000
Organizational Efficiency through Resource Utilization	.395	98	.000	.687	98	.000

a. Lilliefors Significance Correction

For both banks, the Kolmogorov-Smirnov and Shapiro-Wilk tests yield significant results ($p < 0.05$) across all variables, indicating that the data for all measures significantly deviates from a normal distribution. Standard Chartered Bank's statistics reveal high p-values for all measures, suggesting non-normal distributions. Similarly, Citibank shows significant deviations from normality, though slightly less pronounced.

Table 6: Tests of Normality for Citibank

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Consistently Meet Deadlines for Maintenance and Repairs	.333	97	.000	.736	97	.000
Quality of Property Management Services	.337	97	.000	.734	97	.000
Outsourced Property Management optimizes resources and time effectively	.334	97	.000	.745	97	.000
Organizational Efficiency through Resource Utilization	.352	97	.000	.779	97	.000

a. Lilliefors Significance Correction

Given these results, which indicate non-normality in the data for both banks, the study undergoes non-parametric tests (Mann-Whitney U Test) for more appropriate for analyzing the data. These tests do not assume a normal distribution and would provide more reliable results in this context.

4.3.2 Non-Parametric Test

Table 7 presents the Mann-Whitney U test results for Standard Chartered Bank as reveal that the performance metrics related to meeting deadlines for maintenance and repairs, quality of property management services, and the effectiveness of optimizing resources and time all have the same test statistics: Mann-Whitney U = 24.000, Wilcoxon W = 214.000, and Z = -1.339. The asymptotic significance (2-tailed) for each measure is 0.180, and the exact significance is 0.286.

Table 7: Mann-Whitney U test for Standard Chartered Bank^a

	Consistently Meet Deadlines for Maintenance and Repairs	Quality of Property Management Services	Outsourced Property Management Team Optimizes Resources and Time Effectively
Mann-Whitney U	24.000	24.000	24.000
Wilcoxon W	214.000	214.000	214.000
Z	-1.339	-1.339	-1.339
Asymp. Sig. (2-tailed)	.180	.180	.180
Exact Sig. [2*(1-tailed Sig.)]	.286 ^b	.286 ^b	.286 ^b

a. Grouping Variable: Organizational Efficiency through Resource Utilization

b. Not corrected for ties.

These results indicate that there is no statistically significant difference between the groups based on the measures of organizational efficiency. Specifically, the p-values (both 0.180 and 0.286) exceed the common alpha level of 0.05, suggesting that the differences in performance metrics are not significant. This implies that, within the Standard Chartered Bank, the outsourced property management tasks are perceived similarly across the different metrics tested, and there is no significant difference in their effectiveness or quality as perceived by respondents.

Table 8 presents the Mann-Whitney U test results for Citibank indicate that the performance metrics regarding the consistency in meeting deadlines for maintenance and repairs, the quality of property management services, and the optimization of resources and time by the outsourced property management team show similar statistics: Mann-Whitney U values are 55.500, 55.500, and 55.000, with Wilcoxon W values of 331.500, 331.500, and 331.000, respectively. The Z-scores are -0.824, -0.824, and -0.834, and the asymptotic significance (2-tailed) values are 0.410, 0.410, and 0.404. The exact significance values are 0.477 for all tests.

Table 8: Mann-Whitney U test for Citibank

	Consistently Meet Deadlines for Maintenance and Repairs	Quality of Property Management Services	The Outsourced Property Management Team Optimizes Resources and Time Effectively
Mann-Whitney U	55.500	55.500	55.000
Wilcoxon W	331.500	331.500	331.000
Z	-.824	-.824	-.834
Asymp. Sig. (2-tailed)	.410	.410	.404
Exact Sig. [2*(1-tailed Sig.)]	.477 ^b	.477 ^b	.477 ^b
a. Grouping Variable: Organizational Efficiency through Resource Utilization			
b. Not corrected for ties.			

These results suggest that there are no significant differences between the groups based on the three metrics in Citibank. The p-values (all greater than 0.05) indicate that the perceived performance of outsourced property management tasks is consistent across the metrics tested. Thus, within Citibank, the outsourced property management team's effectiveness and quality are viewed similarly, with no statistically significant differences in their performance as perceived by the respondents.

4.3.3. Correlation Analysis

The correlation analysis for Standard Chartered Bank and Citibank, Tables 9 and 10, highlights distinct patterns in the relationship between outsourced property management tasks and organizational efficiency.

Table 9: Correlation Analysis for Standard Chartered Bank

		Consistently Meet Deadlines for Maintenance and Repairs	Quality of Property Management Services	The Outsourced Property Management Team Optimizes Resources and Time Effectively	Organizational Efficiency through Resource Utilization
Consistently Meet Deadlines	Pearson Correlation	1	.991**	.991**	-.001

for Maintenance and Repairs	Sig. (2- tailed)		.000	.000	.993
	N	98	98	98	98
Quality of Property Management Servicess	Pearson Correlation	.991**	1	1.000**	.000
	Sig. (2- tailed)	.000		.000	.996
	N	98	98	98	98
The Outsourced Property Management Team Optimizes Resources and Time Effectively	Pearson Correlation	.991**	1.000**	1	.000
	Sig. (2- tailed)	.000	.000		.996
	N	98	98	98	98
Organizational Efficiency through Resource Utilization	Pearson Correlation	-.001	.000	.000	1
	Sig. (2- tailed)	.993	.996	.996	
	N	98	98	98	98

** . Correlation is significant at the 0.01 level (2-tailed).

For Standard Chartered Bank (Table 9), the performance metrics related to meeting deadlines, service quality, and resource optimization are all highly correlated with each other ($r \approx 0.991$), yet none show a significant relationship with organizational efficiency ($r \approx -0.001$). Similarly, for Citibank (Table 10), while there are high correlations among performance metrics ($r \approx 0.993$ to 0.965), the correlation with organizational efficiency remains very low ($r \approx 0.023$ to 0.007). These findings suggest that while the outsourced property management tasks are closely related to each other, they do not significantly impact organizational efficiency in either bank.

Table 10: Correlation Analysis for Citibank

Consistently Meet Deadlines for Maintenance and Repairs	Quality of Property Management Services	The Outsourced Property Management Team Optimizes	Organizational Efficiency through Resource Utilization
---	--	--	--

				Resources and Time Effectively	
Consistently Meet Deadlines for Maintenance and Repairs	Pearson Correlation	1	.993**	.958**	.023
	Sig. (2-tailed)		.000	.000	.820
	N	97	97	97	97
Quality of Property Management Services	Pearson Correlation	.993**	1	.965**	.021
	Sig. (2-tailed)	.000		.000	.835
	N	97	97	97	97
The Outsourced Property Management Team Optimizes Resources and Time Effectively	Pearson Correlation	.958**	.965**	1	.007
	Sig. (2-tailed)	.000	.000		.942
	N	97	97	97	97
Organizational Efficiency through Resource Utilization	Pearson Correlation	.023	.021	.007	1
	Sig. (2-tailed)	.820	.835	.942	
	N	97	97	97	97

** . Correlation is significant at the 0.01 level (2-tailed).

4.3.4 Regression Analysis

Table 11 presents the model summary for regression analyses conducted for Standard Chartered Bank and Citibank.

Table 11: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.010 ^a	.000	-.021	.89222
2	.057 ^a	.003	-.029	1.09882

a. Predictors: (Constant), The Outsourced Property Management Team Optimizes Resources and Time Effectively, Consistently Meet Deadlines for Maintenance and Repairs. 1=Standard Chartered Bank, 2=Citibank

For Standard Chartered Bank, the model has an R-square of 0.000, indicating that the outsourced property management metrics do not explain any variance in organizational efficiency. Similarly, Citibank's model shows a slightly higher R-square of 0.003, but it still suggests that the outsourced property management performance metrics have minimal explanatory power regarding organizational efficiency. The negative adjusted R-square values further confirm that the models do not fit the data well, indicating that other factors might be influencing organizational efficiency.

4.3.5 Analysis for Variance

Tables 12 presents the ANOVA results for Standard Chartered Bank and Citibank, respectively.

Table 12: ANOVA

	Model	Sum of Squares	df	Mean Square	F	Sig.
1	Regression	.008	2	.004	.005	.995 ^b
	Residual	75.625	95	.796		
	Total	75.633	97			
2	Regression	.371	3	.124	.103	.958 ^b
	Residual	112.288	93	1.207		
	Total	112.660	96			

a. Dependent Variable: Organizational Efficiency through Resource Utilization

b. Predictors: (Constant), The Outsourced Property Management Team Optimizes Resources and Time Effectively, Consistently Meet Deadlines for Maintenance and Repairs

1. Model for Standard Chartered Bank; 2. Model for Citibank

From table 12 presents ANOVA For Standard Chartered Bank, the F-value of 0.005 with a significance level of 0.995 indicates that the regression model is not significant, suggesting that the predictors (outsourced property management team effectiveness and meeting deadlines) do not significantly contribute to explaining organizational efficiency through resource utilization.

Similarly, Citibank's ANOVA results show an F-value of 0.103 with a significance of 0.958, further indicating that the model, which includes additional predictors like quality of property management services, also does not significantly explain variations in organizational efficiency. These findings highlight that outsourced property management metrics have a negligible impact on organizational efficiency in both banks.

4.3.6 Coefficient Analysis

Table 13 presents the coefficient analysis for Standard Chartered Bank and Citibank, respectively.

Table 13: Coefficient Analysis for Standard Chartered Bank

	Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.064	.224		9.205	.000
	Consistently Meet Deadlines for Maintenance and Repairs	-.063	.642	-.074	-.098	.922
	The Outsourced Property Management Team Optimizes Resources and Time Effectively	.062	.638	.074	.098	.922
2	(Constant)	2.136	.278		7.678	.000
	Consistently Meet Deadlines for Maintenance and Repairs	.193	1.105	.150	.175	.862
	The Outsourced Property Management Team Optimizes Resources and Time Effectively	-.239	.492	-.191	-.485	.629
a. Dependent Variable: Organizational Efficiency through Resource Utilization						
1. Standard Chartered Bank; 2. Citibank						

For Standard Chartered Bank, the coefficient analysis shows that the variable "Consistently Meet Deadlines for Maintenance and Repairs" has an unstandardized coefficient of -0.063, with a t-value of -0.098 and a significance level of 0.922, indicating no significant impact on organizational efficiency. Likewise, "The Outsourced Property Management Team Optimizes Resources and Time Effectively" has a positive coefficient (0.062), but it is also statistically insignificant, with a t-value of 0.098 and a significance of 0.922. These results suggest that both variables do not have a meaningful influence on the bank's organizational efficiency.

For Citibank, the variable "Consistently Meet Deadlines for Maintenance and Repairs" shows a positive coefficient (0.193), but it remains statistically insignificant, with a t-value of 0.175 and a significance of 0.862. Similarly, "The Outsourced Property Management Team Optimizes Resources and Time Effectively" has a negative coefficient (-0.239) with a t-value of -0.485 and a significance level of 0.629, also indicating no significant contribution to organizational efficiency through resource utilization. These findings are in line with those observed at Standard Chartered Bank.

5.0 Discussion of the Findings

5.1 Finding for Cost Efficiency of Outsourced Property Management Functions

The results indicate that cost efficiency from outsourcing property management functions has shown a marginal impact on organizational efficiency at both Standard Chartered and Citibank. According to the Transaction Cost Theory (TCT), outsourcing is expected to reduce operational costs by minimizing transaction costs such as search, negotiation, and monitoring expenses. However, the findings suggest that the cost advantages anticipated through outsourcing were

not fully realized. This aligns with the empirical study by Muo and Ochieng (2023), which found that while outsourcing can improve cost efficiency, the impact varies depending on the alignment of the outsourced services with the firm's internal processes. Contrarily, a study by Mabonesho (2022), which focused on Tanzania's public sector, reported significant cost reductions due to outsourcing, highlighting a potential sectoral difference. These variances could be attributed to the complexities in monitoring costs associated with external property management, as emphasized by TCT, or differences in the internal cost structures of the banks.

5.2 Findings for the Operational Performance of Outsourced Property Management Tasks

The analysis shows that the operational performance of outsourced property management functions has not substantially improved organizational efficiency in either bank. According to the Resource-Based View (RBV), firms can achieve superior performance by leveraging unique resources and capabilities. In this case, the limited improvement suggests that the outsourced services may not have fully integrated with the firm's internal capabilities, as posited by the RBV. This is consistent with the study by Nyameboame and Haddud (2022), which found that outsourcing only enhances operational performance when external services complement the firm's core competencies. However, Kialyulo and Kinyua (2021) presented a different outcome, finding that outsourcing led to significant operational improvements in Kenya Commercial Bank, likely due to better alignment with the firm's internal processes. The difference in findings may stem from the varying expertise of the external service providers, or how well the outsourced tasks were adapted to the banks' internal workflows.

5.3 Findings for Stakeholder Satisfaction with Outsourced Property Management Services

Stakeholder satisfaction with outsourced property management services showed mixed results, with neither bank reporting significant increases in satisfaction. According to Stakeholder Theory, considering and addressing the needs of all stakeholders is crucial for organizational success. The findings suggest that the outsourced services may not have fully met stakeholder expectations, resulting in moderate satisfaction levels. This aligns with Johnson and Smith (2021), who found that while outsourcing in the Nigerian banking sector enhanced some aspects of organizational efficiency, it did not consistently improve stakeholder satisfaction. Conversely, the study by Chen and Wang (2022) in the Chinese real estate sector indicated that stakeholder satisfaction increased significantly with outsourcing, potentially due to more specialized and tailored services. The differing outcomes could be attributed to the nature of the services being outsourced and the stakeholders' expectations, which may vary across industries and regions. This highlights the importance of ensuring that external service providers can deliver services that align with both operational goals and stakeholder needs, as emphasized by Stakeholder Theory.

6.0 Conclusion and Recommendation

6.1 Conclusions

The study aimed to investigate the impact of outsourcing on organizational efficiency by comparing property management functions at Standard Chartered Bank and Citibank in Dar es Salaam. The findings reveal that outsourcing property management tasks does not significantly correlate with enhanced organizational efficiency in either bank. For Standard Chartered Bank, there were no significant relationships between the efficiency of outsourced property management tasks and organizational performance. Similarly, at Citibank, while there were slight positive correlations in some areas, the relationships were not statistically significant. The results indicate that the operational performance of outsourced property management tasks did not substantially impact organizational efficiency in the banks studied. Therefore, the effectiveness of outsourcing property management in improving organizational efficiency appears limited based on the data collected from these two institutions.

6.2 Recommendations

Based on the findings, it is recommended that both Standard Chartered Bank and Citibank reassess their outsourcing strategies for property management. Emphasizing better alignment of outsourced services with organizational goals and monitoring performance metrics more closely could enhance efficiency. Both banks should also consider more robust evaluation criteria and periodic reviews to ensure that outsourced property management tasks contribute meaningfully to overall operational effectiveness. Additionally, exploring alternative outsourcing partners or adjusting service agreements may help in achieving the desired improvements in organizational efficiency.

Email mwalukasabon@gmail.com

Abstract

Despite the importance of the Supplier Relationship Management strategy MSD still faces challenges. According to the Controller and Auditor General (CAG) report of 2020/ 2021), MSD had expired drugs worth TZS 4.43 billion the figure represents 3.4 percent of the cost of sale, which is higher than the acceptable ratio of 1 percent highlighting inefficiencies in MSD's procurement and supplies management practices in terms of communication, and coordination between MSD and its suppliers, which ultimately affect the performance of the organization. The persistent issue of excess expired drugs not only strains the department's financial resources but also affects the availability of medical supplies, potentially endangering public health. Supplier relationship management strategy is one of the crucial mechanisms in which both public and private organizations strive to improve performance, this study is going to assess the effect of Supplier relationship management strategy on organizational performance at MSD Head quarter. The study used Relational Governance Theory to explain the significance of Supplier relationship management strategy on performance of MSD. Mixed research approach was used, a cross-sectional research design was employed, and a stratified random sampling was used to obtain a sample of 87 respondents from MSD headquarters staff, questionnaire and interview methods were used to collect data. Descriptive analysis was carried out using mean and multiple linear regressions were adopted to analyze the effects of supplier relationship management on organization performance. The findings revealed that the supplier relationship management have a positive significant influence on organizational performance at MSD headquarters this shows that trade discount, Specification of a product/service, Joint Problem-solving and Information sharing is a significant component of supplier relationship management affecting the organization's performance. The researcher recommends that the Government should put more emphasis on the application of Supplier Relationship management strategy in procurement, in conclusion MSD should emphasize the implementation of Supplier Relationship management strategy in public procurement by formulating the policies and regulations that allow easy implementation on developing and managing suppliers in the public organizations while working on improving its weak points that affect the performance. Also, MSD should work in hand with government to enact policies that put more emphasis on the application of Supplier Relationship Management strategy

Keywords; *Supplier Relationship Management Strategy, organization performance, procurement,*

1.0 Introduction

One way to improve organizational performance is to identify the major categories of corporate expenditures and devise strategies to enhance value through procurement processes (Emon M, Khan T & Siam S 2024). This can be achieved by selecting and negotiating with suppliers, as well as by selecting and evaluating vendors in accordance with the business's current spending and procurement requirements (Mburu D, Karanja P & Ali F, 2021).

(Emon et al., 2024), a basic component of supplier relationship management (SRMS) is the development and management of significant suppliers, the internal functioning of the procurement function and the synchronization of purchasing with other company operations, to fulfill or surpass consumer expectations. Among many advantages of SRMS are lower costs, more operational effectiveness, easier access to dependable suppliers, higher-quality products and services, and the sharing of best practices. It is considered to be one of the most significant organizational functions. (Kimario & Mwangike, 2021). Supply chain management has received more attention than ever before because of the enormous potential for improvement in establishing a Supplier Relationship management strategy, thus obtaining a competitive advantage and lowering costs while improving the performance of products and services (Sadiqeen, 2023).

In industrial organizations, SRM is crucial for cost reduction and performance optimization? cite. There hasn't been a significant shift on what?? in the healthcare industry despite massive investments in innovation (Kuwawenaruwa A, Mkawia S & Manzi F, 2022) However, health service providers will be forced to optimize cost structures as well as the efficacy and efficiency of business interactions due to growing market dynamics and the application of economic principles (Emon et al., 2024), several studies have demonstrated that the presence of buyer-supplier interactions greatly improves the flow of corporate operations by mitigating a variety of uncertainties (Mburu Kiarie et al., 2021). Organizations can reduce their supplier base, improve delivery performance, accurately estimate demand, and achieve higher levels of organizational excellence by establishing buyer-supplier relationships (Mushi et al., 2021). It is noteworthy that associations with suppliers facilitate the acquisition of accompanying inventory and enhance an organization's operational capability if other suppliers are unable to fulfill their obligations (Kisinga et al., 2024). Procurement strategies that are strategic are essential for the public sector as well as for all other economic sectors, this is because spending on procurement has a big financial impact and needs to be properly managed (Ismail & Chagalima, 2022).

In Africa, almost every public organization needs to procure work, consultancy, non-consultancy services, or goods competitively for its operations (Ivambi, 2016). Supplier relationship management remains the main criterion in the performance of the organization (Mburu Kiarie et al., 2021).

In Tanzania Supplier Relationship Management can be a tool for improving social outcomes and promoting social responsibility (Mu & Wang, 2022). For the company to achieve its goals, there should be a SRMS that matches the organization's objectives and procurement plan

(Changalima et al., 2020). In most public institutions, implementing Supplier Relationship management has become an important approach given the increasing tendency for organizations to acquire supplies and other vital items (Maagi & Mwakalobo, 2023). Effective Supplier Relationship Management (SRM) is crucial for ensuring the performance of public organizations, particularly in sectors like healthcare, where timely and accurate procurement of essential goods such as medicines is critical (Mburu Kiarie et al., 2021).

1.1 Statement of the Problem

SRMS help organization to maximize its performance through attainment of the right materials or products at the right price, quality, quantity and at the right time through information sharing, joint problem solving, assistance on specification from the developed or managed supplier (Sadiqeen, 2023). Despite the importance of the Supplier Relationship Management strategy MSD still faces challenges. According to the Controller and Auditor General (CAG) report of 2020/ 2021), MSD had expired drugs worth TZS 4.43 billion the figure represents 3.4 percent of the cost of sale, which is higher than the acceptable ratio of 1 percent highlighting inefficiencies in MSD's procurement and supplies management practices in terms of communication, and coordination between MSD and its suppliers, which ultimately affect the performance of the organization The persistent issue of excess expired drugs not only strains the department's financial resources but also affects the availability of medical supplies, potentially endangering public health(Meyer et al., 2021). Therefore, the study seeks to examine the effects of Supplier Relationship Management strategy on performance at MSD, with the aim of identifying areas for improvement to enhance operational efficiency and service delivery.

1.2 General Research Objective

This study investigates the effects of the Supplier Relationship Management Strategy on public organizations' performance in Tanzania at MSD.

1.3 Null Hypothesis

Ho: Supplier relationship management has a positive significant effect on public organization performance at MSD headquarters.

2.0 Theoretical Literature Review

2.1 Definition of Key Terms

2.1.1 Procurement

A procuring entity may lease, buy, rent, or acquire works, goods, and services in any other way. This process is known as procurement, and it includes all activities related to obtaining works, goods, and services, such as narrating requirements, preparing, selecting, and inviting tenders, awarding contracts, and managing them (URT, 2019). Procurement, according to (Chenini et al., 2021), is the process of locating, deciding upon, and obtaining goods and

services from an outside source authorized by pertinent directives. This study is an acquisition of medical items through procedures without affecting the intended objective including economy, efficiency, and effectiveness.

2.1.2 Supplier Relationship Management Strategy

Supplier Relationship Management is a thorough method of handling how a company deals with the companies that provide the goods and services it needs (Mushi et al., 2021). A company's supplier relationship management is the process that establishes the terms of their interactions with suppliers. Supplier relationship management refers to setting up the supplier management system and designing strategic and operational procurement processes using sourcing policies (Kisinga et al., 2024). In order to continuously lower total ownership costs, manage risks, and improve performance (quality, responsiveness, reliability, and flexibility). purchasing and supply management is defined as a strategic, enterprise-wide, long-term, multi-functional, dynamic approach to choosing suppliers of goods and services and managing them as well as the entire value network from raw materials to final customer use and disposal (Okong'o Nichodemus Nyabuto, 2016)

2.1.3 Organization Performance

A more specific definition of procurement performance is an idea related to resource allocation in connection to the achievement of some expected output values (Matto & Nsimbila, (2021). On the other hand (Matto et al., 2021) assert that a qualitative and quantitative evaluation of the resource's use and management is conducted in addition to a breakdown of the values obtained and the costs of the inputs. Thus, apart from the acquisition price or expenditure (economic efficiency), procurement performance depends on the transaction's maximum efficiency and effectiveness. (Sadiqueen, 2023). In addition to the purchase price/cost. Procurement performance in this study refers to the deliverables related to procurement, such as economy, effectiveness, and efficiency (Kiplel, 2018).

2.2 Relational Governance Theory

The Relational Governance Theory (RGT) is a method developed as a specific form of interorganizational strategy that is distinct from traditional modes of markets and hierarchies, according to A Zaheer & N Venkatraman (1995). Although it also incorporates elements from other literary works, the relational governance paradigm presented here is mostly grounded in traditional Chinese philosophy. It has three main pillars or dimensions that are drawn from Confucianism: relationship, morality, and trust, which are to understand the factors pertaining to inter-organizational interactions in determining organizational performance, relational governance theory was implemented. The majority of business transactions include embodied interpersonal connections. (Mushi et al., 2021). Relational governance promotes exchange based on the preexisting relationships between suppliers and buyers as they collaborate to achieve mutual benefits. (Changalima et al., 2020) The current interaction between buyers and suppliers toward reciprocal advantages is connected to the buyer-supplier relationship. One

relational tool utilized in relational governance theory, for example, has been thought to be information exchange. (Grandia & Warsen, 2023) In order to further clarify the interactions between buyers and suppliers, further techniques might be information sharing, supply base reduction, and cooperative issue resolution cite. This implies that companies who have linked better with their suppliers could generate a more sustainable competitive advantage cite. In general, public procurement policies are associated with discriminatory actions that impede the opening up of domestic markets, restrict entry to international markets, increase the expense of the budget, and eventually reduce the competitiveness of the national economy (Bayo, 2021).

2.3 Empirical Review

Rany et al, (2018) investigated the actual link between organizational success in East Java, Indonesia, and strategic purchasing. The outcome shows that the relationship between the buyer and supplier as well as negotiating approach influence the effect of strategic purchasing on the productivity of a company. Furthermore, there is a clear correlation between strategic purchasing and organizational performance. Additionally, a company's performance is affected by its negotiation strategy as well as the relationship between its suppliers and buyers, with the former having a greater effect than the latter.

Salema (2019), on her study investigated the relationship between purchasing companies and function integration, buyer-supplier integration, logistics effectiveness in buyer-supplier relationships, and the impact of buyer-supplier integration on Tanzania's healthcare sector's logistic performance. Strong buyer-supplier integration is shown to dramatically improve performance through empirical analysis. The results also assert that a purchasing company's deep cross-functional integration creates an administrative framework that enhances the success of the company's deep supplier-buyer integration.

Due to the effects of globalization and heightened competition in commercial ventures, numerous companies have turned to enhancing their product delivery capabilities, enhancing quality and responsiveness to clients, and cutting costs (Mushi et al., 2021) In order to achieve a competitive edge, organizations must collaborate in order to reap the benefits of reduced competition, combined strategic resources, increased resource availability, and increased creativity and innovation. Finally, the enterprises will perform better by generating greater major profit (Mburu Kiarie et al., 2021).

Strategic procurement includes supplier relationship management as one of its constituents practices when the supplier relationship is well established and managed well it increases and improves the quality of services provided by the organization also it reduces cost overruns hence the organization to operate while cost saving, and improve the quality of service provided but when the relationship is not well established and managed the organization costs might increase, longer lead time might occurs during the provision of services also the poor quality of service might occur (Kisinga et al., 2024)

3.0 Research Methodology

3.1 Research Approach

The study examined the impact of Supplier Relationship management strategy on the performance of procurement at MSD by using a mixed research design to look on Procedures, elements from both qualitative and quantitative research are combined into a single study in a mixed-approach research study Harrison R, Reilly T & Creswell J, (2020).. Combining quantitative and qualitative methodologies can counter balance their respective limitations. It might provide stronger evidence and increase confidence in judgments and it can give results that are more accurate

3.2 Research Design

The research design serves as the framework or methodology for the study, acting as a sort of glue to hold all the necessary components of the research thesis together and provide the researcher with a tangible report (Saunders et al., 2017.). A cross-sectional research design was used for this case study in order to describe the current condition of affairs. This type of study design can be applied to gather data on people's beliefs, behaviors, attitudes, or any number of social or educational concerns at a single point of view.

3.3 Area of the Study

This study assesses the effects of Supplier Relationship Management strategy as a procurement practice on organization performance case of MSD Headquarters, Medical Store Department (MSD) as a case study, which is a government organization involved in a significant amount of procurement transactions (PPRA 2022-23) Therefore, MSD used as the area of this study so as to get valid information. Hence, MSD headquarters function as a useful criterion for this investigation improve

3.4 Population of the Study

Cooper and Schindler, (2014) describe the individuals, occasions, or documents that can provide the necessary data and provide answers to the research questions as the study population. The Medical Store Department (MSD), which employs a management team and an estimated 124 procurement professional specialists, was the site of this investigation (URT, 2023).

3.5 Sample and Sample Size

3.5.1 Sample

A sample is the number of representatives under which the groups of people or events are selected to represent the population as a whole. This is the small group of people where a researcher collects the required information for the intended study (Saunders et al., 2017.) The researcher selected a sample that was able to provide intended data as a representation of the

population of a relevant study. Under this study, a sample was comprised of heads of departments, managers, PMU members, and other staff who implemented the formulated strategies.

3.5.2 Unit of Analysis

The unit of analysis in this study was individuals who are 124 workers of the Medical Store Department (MSD), such as procurement professionals.

3.5.3 Sample Size

A sample is a subset of the intended population that the researcher will examine in order to draw broad conclusions about the population (Harrison et al., 2020), (Creswell, 2012). The number of components in a sample drawn from a big population is referred to as the sample size (Chileshe et al., 2023; Harrison et al., 2020). Every member of the selected sample should have an equal chance of getting chosen for this matter. The Yamane (1967) formula is used to determine the study's sample size.

$$n = N / \{1 + N(e)^2\}$$

Where:

n = Sample size

N = Population = 124

e = error estimates = 0.05

$$n = 124 / \{1 + 124(0.05)^2\} = 95$$

Therefore, the sufficient sample size for this study will be 95 respondents hence the provision of accurate information or data to the research study. In this study 18 staffs from the Procurement management unit, 9 staff from the Planning and coordination Unit, 9 warehouse keeper, 9 finance and accounting, 20 ICT department, 20 user department and the last 10 were drawn from the contract compliance unit. Also, the study comprises 10 head of departments as the key informants who were interviewed in this study.

3.6 Sampling Procedures

(Saunders et al., 2017.) Sampling procedures are the steps involved in selecting a sample to represent additional elements with comparable characteristics from the target population. As mentioned by, selecting a predetermined number of individuals to represent a particular group is known as sampling (Harrison et al., 2020).

3.6.1 Stratified Sampling

Selecting a sample to represent additional elements with comparable characteristics from the target population. As mentioned by, selecting a predetermined number of individuals to represent a particular group is known as sampling (Kothari, 2014). By analyzing the data separately for each stratum, researchers can identify unique trends, preferences, or behaviors that may exist within demographic or behavioral segments. Therefore, the study used stratified random sampling in order to distribute departments to get equal representation.

3.6.2 Purposive Sampling Techniques

It is also known as Judgmental or (Purposive) sampling. This is the method which requires the researcher to use their own rational judgments in selecting the kind of respondents depending on the research study and the nature of the data required. Under this research study researcher selected respondent's base on his own rational. Judgments mean that the chosen respondent was suitable to provide the preferred data, researcher respondents were coming from PMU and Head of departments and other related departments.

3.7.1 Primary Data

These are the data that was collected fresh from the field and for the first time, the researcher collected the primary data through semi-structured questionnaires, unstructured questionnaires, and interviews (Kothari, 2014)

3.7.2 Secondary Data

This is the kind of data that was collected based on the information obtained in the organization's textbooks, magazines, encyclopedias, articles, professional journals, trade journals, reports, and other information. (Kothari, 2014) said these are previously collected data that have already undergone statistical analysis by another party. They are kept on the office premises as a means of achieving a wide range of information.

3.8 Data Collection Methods

For the findings to be obtained data must be accumulated to provide the required information, to confirm or deny a claim, precise information must be gathered, a process known as data collection (Harrison et al., 2020). The research involved commonly primary data. The basic data are raw facts that are gathered from the field for the first time, they are also referred as "Original data" since they are not copied from any other sources of information, as per this study primary data were collected through questionnaires and interview.

3.8.1 Questionnaire

The benefits of this strategy include avoiding interviewer bias and making it convenient to meet with respondents who are difficult to contact (Harrison et al., 2020)(Kothari, 2019). The study

reduces the possibility of interviewer bias by using a self-administered survey including a Likert scale of one to five points. It also offers respondents convenience.

In this study, 87 respondents were given the questionnaires. Participants can independently and objectively rate their agreement or disagreement with each claim, guaranteeing more objective and precise data gathering. Additionally, the self-administered questionnaire format permits flexibility in data collection, which facilitates communication with and accommodation of respondents who might have restricted availability or schedule conflicts. Through the integration of these advantages into the research framework, the investigation seeks to optimize involvement, uphold impartiality, and get significant perspectives from the intended participants (Gupta and Gupta, 2011).

3.7.2 Structured Interview

The interview is a method of collecting data in which communication emphasizes questions and answers (Kothari, 2014). One-on-one interview with the researcher was conducted by the identified respondents of PMU departments and heads of other departments according to the sample from the population. The interview guide was used to guide the interviewer systematically. This technique was adopted due to its flexibility in investigating in-depth detail from the respondent. A sample of the interview guide (Appendix II). The approach allowed for systematic data gathering and facilitated the comparison and analysis of responses. By focusing on structured interviews, the study aims to gather valuable insights.

3.9 Data Analysis

The data analysis for this study included both qualitative and quantitative techniques. The quantitative information from the questionnaire was evaluated using multiple regression analysis and descriptive statistics. Although the associations between the variables were analyzed and their predictive ability evaluated using multiple regressions, descriptive statistics provide a summary of the results.

On the other hand, content analysis was used to examine the qualitative information gathered from the interview. This approach involves organizing, evaluating, classifying, and recoding the information gathered from the respondents to identify and explain themes or patterns. Content analysis enabled the researchers to derive meaningful insights and interpretations from the qualitative data.

Data analysis, according to (Lyimo & Mrema, 2022) is the act of organizing and cleansing data so that it may be readily understood and utilized to assist in decision-making. In order to guarantee proper interpretation and generate reliable results, the researchers in this study adhered to a strict data analysis procedure.

In order to examine the associations between the variables, the study also developed an equation model for regression analysis. This model was beneficial assess the impact of different

factors on the implementation of audit recommendations and contributed to a deeper understanding of the research topic.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon$$

Where:

Y = Organization Performance

X₁ = Supplier Relationship Management

X₂ = Electronic Procurement

X₃ = Outsourcing strategy

ε = error term or residual

The coefficients β_0 , β_1 , β_2 , and β_3 represent the intercept and the slopes associated with each predictor variable.

3.10 Reliability and Validity of Data

3.10.1 Reliability

(Kothari, 2014) suggests that a study should demonstrate consistent findings if it were replicated with a similar group of participants in a comparable setting. To assess reliability, the researcher used Cronbach's alpha, a widely used reliability coefficient. According to (Lyimo & Mrema, 2022) Cronbach's alpha evaluates internal consistency by examining the relationships between individual test items and the overall test (internal coherence of data). A Cronbach's alpha coefficient above 0.9 is considered very good, above 0.8 is good, above 0.7 is tolerable, above .6 is uncertain, below 0.5 is poor, and below 0.5 is unacceptable. In this study, the Cronbach's alpha coefficient, ranging from 0 to 1, was used to assess reliability. The closer the coefficient is to 1.0, the higher the internal consistency of the scale's items.

3.10.2 Validity

The validity of a research study refers to how well the results among the study participants represent true findings among similar individuals outside the study (Harrison et al., 2020). To ensure the validity of the research instrument for assessing the effect of strategic procurement on achieving performance in Public Organizations specifically at the Medical Store Department, a pilot test was conducted with a selected group of staff members from MSD. Participants provided feedback on the questionnaires, allowing for necessary adjustments to improve content validity. This process enhanced the instrument's alignment with factors specific to MSD and contributes to the overall validity of the study's findings.

3.11 Ethical Consideration

The researcher prioritized the respect for respondents' autonomy by allowing them to decide when to participate in the study and obtaining informed consent before their voluntary participation. The confidentiality of the participants was strictly upheld during and after the research activity. Additionally, the researcher is committed to providing feedback to all stakeholders regarding the findings of the study, ensuring transparency and sharing valuable insights with the involved parties.

4.0 Findings and Discussion

4.1 The Effects of Supplier Relationship Management on Organization Performance at MSD Headquarters

Mean and standard deviation calculations were made as part of the descriptive statistics used in the investigation. Table 3 below displays the distribution of the outcomes for each item related to supplier relationship management.

The results in Table 3 indicate that the overall results for means score for all items included in supplier relationship management are above 3.00. This implies that, trade discount, product specification, problem solving and information sharing are important factors that can affect the organization execution. The findings are in harmony with those of are consistent with ours, which discloses that a supplier and buyer's relationship acts as a mediator between strategic purchasing and organizational success. Additionally, strategic purchasing has a direct impact on organizational performance. These conclusions were corroborated by qualitative research showing:

“...To enable real-time adjustments, the supplier's performance as well as the strategy's performance in preserving the supplier relationship are regularly assessed. As a result, in MSD, we developed KPIs and certain success measures to compare performance. Nevertheless, given the current state of the supply chain disruptions, port traffic, chip shortages, geopolitical concerns, and other supply chain stresses, the requirement for efficient supplier relationship management may be higher than ever...”(Key Informant Interview).

... At our institution, Supplier Relationship strategy enhances organizational performance by streamlining procedures, promoting the integration with supplier throughout the entire procurement process, and so on. For example, Supplier Relationship management enhances the effectiveness of the procurement process, management, and strategies development by collaborating with supplier from the initiation stage to finalizing the contract... (Key Informant Interview)

Table 4:1 Mean & SD of Supplier Relationship Management

Statement	N	Mean	Std. Deviation
Effective supplier relationship helps in trading discounts to a wholesaler or retailer	87	3.89	1.185
The supplier relationship helps the supplier and clients towards the specification of a product/service	87	3.71	1.130
The buyer-supplier relationship enables problem-solving arriving during procurement processes and negotiations	87	3.94	.969
Through the buyer-supplier relationship, there is a sharing of information between buyers and suppliers about strategic procurement	87	3.95	.975
Valid N (listwise)	87		

4.2 Inferential Statistics

The Effects of Supplier Relationship Management on Organization Performance At MSD Headquarters

The multiple regression analysis was used to show the effect of supplier relationship management on organization performance in MSD headquarters. Trade discount, product specification, problem solving, and information sharing were used as the variables to predict the supplier relationship management in organization performance at MSD headquarters.

4.2.1 Regression Model Goodness of Fit

Table 6 shows that the explained variation from the overall variance is shown by the coefficient of determination (R square), which is 0.749 (74.9%). Based on the explained variation exceeding the unexplained variation from the total variation, these results imply that the model has a strong match.

Table 4:2 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.865 ^a	.749	.736	.38084

Additionally, the analysis showed a residual of 11.893 and a regression of 35.397, as shown in Table 4.3below. These findings show that the model fits data well, which explains why regression results outperform residual data.

Table 4:3 ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	35.397	4	8.849	61.011	.000 ^b

Residual	11.893	82	.145
Total	47.290	86	

4.2.2 Variables in Equation

Inferential statistics were used to analyze the effect of supplier relationship management on organization performance in MSD headquarters. Hence the dependent variable (organization performance) is continuous variable the study adopted a multiple regression. Table 8 presents the information which is drawn in the following below mathematical equation of the multiple regression models.

$$Y = 0.911 + 0.262X_1 + 0.300X_2 + 0.303X_3 - 0.050X_4 + \varepsilon$$

Where:

X_1 = Trade discounts

X_2 = Specification of a product/service

X_3 = Problem-solving

X_4 = Information sharing

ε = Error term

Y = Organization performance

Table 4:4 Effects of supplier relationship on organization performance

Model	B	Std. Error	Beta	T	Sig.
(Constant)	.911	.284		3.211	.002
Trading discounts	.262	.036	.418	7.304	.000
Specification of a product/service	.300	.039	.457	7.768	.000
Problem-solving	.303	.045	.396	6.795	.000
Information Sharing	-.050	.043	-.065	-1.143	.256

The results in Table 4.4 reveal that trade discount has the p-value of 0.000. Since the p-value is below the significance level of 0.05, it can be revealed that trade discount is a significant component of supplier relationship management affecting the organization performance in MSD headquarters. Further, the trade discount has a positive regression coefficient (B=0.262) which implies that improvement in the trade discount will result in an increase in the performance of MSD The findings align with those of (Rany et al., (2018).) who demonstrated that both negotiation strategy and the buyer-supplier relationship have an impact on

organization performance. However, negotiation strategy has a greater influence on performance than the buyer-supplier relationship cite.

The results in Table 4.4 reveal that the specification of a product/service has the p-value of 0.000. Since the p-value is below the significance level of 0.05, it can be revealed that the specification of a product/service is a significant component of supplier relationship management affecting the organization performance in MSD headquarters. Further, the specification of a product/service has a positive regression coefficient ($B=0.300$) which implies that improvement in the specification of a product/service will result to an increase in the performance of MSD. The findings align with those of (Maranga & Nyambura, 2019) who demonstrated that there is a statistically significant positive relationship between tender document specification and procurement performance.

The results in Table 4.4 reveal that problem-solving has the p-value of 0.000. Since the p-value is below the significance level of 0.05, it can be revealed that problem-solving is a significant component of supplier relationship management affecting the organization's performance in MSD headquarters. Further, the problem-solving has a positive regression coefficient ($B=0.303$), which implies that improvement in joint problem-solving will result in an increase in the performance of MSD. These results were in harmony with those of (Kiplel, 2018) who revealed that procurement planning as a problem-solving technique encourages suppliers' performance in procurement processes.

The results in Table 4.4 reveal that information sharing has a p-value of 0.256. Since the p-value is above the significance level of 0.05, it can be revealed that information sharing is not a significant component of supplier relationship management affecting the organization's performance in MSD headquarters. Further, the information sharing has a negative regression coefficient ($B= -0.050$) which implies that improvement in the information sharing will result in a decrease in the performance of MSD by 5.0%. These results were supported by those of (Kimario & Mwangike, 2021) since too much sharing of information could lead to delays in the implementation of the contracts

5.0 Conclusion and Recommendation

5.1 Conclusion

A successful supplier relationship management facilitates the exchange of discounts to a retailer or wholesaler, which enhances organizational performance. The buyer-supplier relationship facilitates problem-solving during procurement processes and negotiations, which influences organizational performance. The supplier-client relationship aids in the specification of a good or service hence MSD to procure right medication and medical tools hence the performance to improve. Through joint problem solving between MSD and suppliers the solutions of the problems can be early obtain hence the performance of the organization to be improved. The exchange of information regarding strategic procurement between buyers and suppliers does impact the performance of the business through the buyer-supplier relationship.

Through strategic procurement, purchasing and disposal expenses are reduced, improving organizational performance.

5.2 Recommendations

The study's conclusions demonstrated the urgent need for MSD headquarters to enhance its performance through the Supplier Relationship Management Strategy, as indicated by the respondents' assessments of the role that Supplier Relationship management strategy plays in improving organizational performance. Procurement performance may be influenced by factors other than only supplier relationship management strategy, but since it has a direct impact on procurement performance, MSD head office must thoroughly examine their current procurement systems to find any weak points and make the necessary corrections. The following recommendations are made in light of the findings.

5.2.1 The Government

The report suggests that the government should prioritize the use of supplier relationship management strategy practices in the public sectors.

5.2.2 Policy Markers

The study suggests that more focus should be placed on the public sectors' use of supplier relationship management strategy by policy makers through the implementation of policies.

5.2.3 To the Organization

The MSD headquarters should set up a unit to assess its supplier relationship management strategy and the difficulties in putting them into practice in order to devise appropriate solutions. The unit should be staffed by qualified, experienced, and knowledgeable individuals who will lead the supplier relationship management strategy operations and streamline the majority of the current flaws in supplier relationship management strategy controls.

Market capability analysis ought to be a component of MSD headquarters' procurement management process. As a result, MSD headquarters will be able to evaluate the market's capacity to provide the goods and services it needs in the appropriate amounts, at the appropriate rates, and of the appropriate quality.

Additionally, MSD headquarters should focus on securing trustworthy suppliers with reasonable delivery dates that meet MSD headquarters' specifications. This will reduce the need for emergency purchases, which are typically costly and have a detrimental effect on MSD headquarters' performance.

6.0 Areas for Further Studies

The Effects of Supplier Relationship Management Strategy towards organizational performance at the MSD headquarters was examined in this study. The researchers recommend that more research be done on the evaluation of the challenges in implementing Supplier Relationship Management Strategy practices in the public sectors

Economic Synergies of Conditional Cash Transfers and Public Works Programs: Evaluating their Combined Impact on Household Resilience

Fides Emmanuel

College of Business Education, Mwanza, Tanzania; emafides@gmail.com

Abstract:

Rural poor communities often face frequent economic shocks, prompting them to adopt various coping strategies. Safety net programs like Tanzania's Productive Social Safety Net (PSSN) can mitigate these impacts and build resilience. However, a baseline report showed that many households in the Conditional Cash Transfers (CCTs) and Public Works (PWs) programs still used negative coping strategies. This study intended to evaluate whether the Integration of both CCTs and PWs reduced the impacts of economic shocks and reduced negative coping strategies among poor households under the program. With the use of the Propensity Matching method (PSM) to estimate the program impacts, households increased resilience by reducing food shortage, health shocks, dwelling problems, distraction of crops and other miscellaneous shocks. Also, the programs reduced negative coping strategies, most of the households under the programs used their savings (mostly engaged in saving groups) to overcome the arisen shocks. However, the impact of the programs on economic shock management is very small; poor households use the little saved to insure themselves, hence disturbing investments for future consumption. Boosting households' self-insurance against economic shocks may require continuous participation in the program over multiple years.

Keywords: *CCTs and PWs programs, economics shocks, coping strategies, poor households, PSM*

1. Introduction

Poor people in rural communities tend to be exposed to a broad array of shocks. Poor rural households particularly are vulnerable to economic shocks because they rely on low returns economic activities, such as farming, casual labour, petty business, for which their returns are also highly variable and uncertain (Börner et al., 2015; Madzivhandila & Niyimbanira, 2020; Tiwari et al., 2022). Natural shocks such as droughts, floods, and earthquakes affect incomes from economic activities, either directly in self-employment, or indirectly as workers in activities (Bakhtiar & Rabbani, 2022; Macours et al., 2022). Climate change presents significant shocks, resulting in crop failures and declining agricultural productivity, which in turn worsens poverty and unemployment (Madzivhandila & Niyimbanira, 2020). Moreover, unemployment and illness of an adult member can imply loss of income (Cirillo and Tebaidi, 2016; Maluccio, 2010; Zhou, et al., 2023). It is true especially in rural areas that, illness or death of any family member requires unexpected expenditures. Economic shocks affect the extremely poor households particularly in rural areas. They result into consumption fluctuations (food shortage) hence deteriorates the household welfare, which necessitate the appropriate coping strategies (Abay et al., 2022).

However, households opt for coping strategies relevant to the occurred economic shocks (Yang et al., 2021). Reduction of household members by sending them away to other relatives and other people in the community or reducing number of meals, have been the major coping strategy for shortage of food. Social safety nets also help build household strength to economic shocks through increased savings and investments in productive assets, especially livestock holdings (Andrews et al., 2018). They also limit unfavorable coping strategies among households, including the use of child labor (Berdegue et al., 2024). Households tend to accumulate savings and assets in order to safeguard against economic shocks. However, coping strategies against economic shocks through sales of assets could deplete the household's already scant resources and future reduces their earnings capacity and productivity (Anderson, 2010; Ferreira & Schady, 2009). Asset depletion includes selling farming tools (e.g. Farm animals used in agricultural production), livestock, seeds, reserved food, harvesting premature crops, renting out land and other assets, as well as spending savings (Börner et al., 2015). Asset depletion is a very serious problem if the shocks re-occur, after a vast period it becomes difficult to rebuilt the asset levels and thus affect future savings and investment. Assets take the role of self-insurance and households with high asset wealth tend to cope with shocks in a more proactive way than those with low average asset wealth (Berdegue et al., 2024; Kassaw & Worku, 2023; Tadesse & Gebremedhin Zeleke, 2022). Therefore, the protection of assets and the use of non-negative coping strategies for poor households are important, necessitating government interventions through safety nets.

Safety net programs among welfare protecting programs have been found to mitigate the negative effects of economic shocks on households. These programs aim to protect the poor and vulnerable populations during periods of economic difficulties (Abay et al., 2022; Bowen et al., 2020; Kiendrebeogo et al., 2017). In Sub-Saharan Africa, agricultural and weather shocks were found to have a negative impact on household welfare status, highlighting the need for targeted policies to address these specific shocks (Amolegbe et al., 2022). Similarly, in the United States, more generous social welfare programs were associated with better administrative performance in delivering benefits to families in need, indicating that the capacity of public organizations to provide economic security is important (Compton, 2021). In South Africa, government social protection interventions, such as COVID-19 grants and unemployment insurance, were found to significantly reduce the likelihood of a decrease in household income or consumption, demonstrating the effectiveness of these programs as safety nets for low-income groups (Zhou et al., 2023). In Ethiopia, participation in the Productive Safety Net Program (PSNP) offset the adverse impacts of the COVID-19 pandemic on household food and nutrition security, highlighting the protective role of social protection programs, particularly for poorer households (Abay et al., 2023). In Niger, social transfers were found to be effective in dampening the impact of shocks on household consumption and vulnerability, contradicting the notion that social assistance is a disincentive for households to engage in coping strategies (Amolegbe et al., 2022). Economic shocks threatening Nigerian household sustenance include Agricultural and weather shocks which negatively affects household welfare. Additionally, social protection programs can enhance resilience against

shocks, as seen in the case of Ethiopia's Productive Safety Net Program, which reduced the adverse impact of drought shocks on household food security (Abay et al., 2022).

Safety nets are delivered to the target household either through conditional cash transfers (CCTs) or public works programs (PWs) while, in some programs both are integrated. Both CCTs and PWs are implemented as safety nets programs helping extremely poor household improve their living standard and reduce poverty, while attaining the sustainable development goals 2030 (SDGs). Many governments in the World have been implementing safety net programs, executed through various programs and systems including cash transfers intending to provide support to individuals or groups who are extremely in need (Amolegbe et al., 2022; Andrews et al., 2018; Bowen et al., 2020). The purpose of safety nets is to ensure that people have access to basic necessities, such as food, shelter, healthcare and financial assistance when they are unable to meet these needs on their own.

Tanzania's social safety net programs, particularly the Productive Social Safety Nets (PSSN), are essential in building household resilience against poverty and food insecurity. While the PSSN has been effective in reducing household vulnerability to poverty by 13.4%, a notable 13.9% of participants remain highly vulnerable (Msuha & Kissoly, 2024). Households affected by shocks, such as climate change and rising food prices, often resort to harmful coping mechanisms like child labor, which negatively impacts children's educational outcomes (Kauky, 2024). Although social safety nets can alleviate these pressures, combining them with productive investments has shown greater potential for resilience by helping households diversify income sources and better manage climatic variability (Emmanuel & Hepelwa, 2024; Macours et al., 2022). Additionally, the integration of land tenure formalization with PSSN participation has significantly improved farm productivity and food security, suggesting that standalone programs may be less effective than integrated approaches (Msangi et al., 2024). However, persistent challenges highlight the need for ongoing research to explore how best to adapt and integrate complementary strategies to maximize the effectiveness of social safety nets in addressing household vulnerability. Therefore, provision of both CCTs and PWs to the poor households one would expect not to trade off self –insurance but rather strengthen them (World Bank, 2020).

This study is built on the hypothesis that, integrated CCTs and PWs program has strengthened the self – insurance among the poor households along with smoothening consumption through non-negative coping strategies. Although there is limited evidence of the impact of the integrated programs in Tanzania, specifically linking the programs and the economic shocks as well as the opted coping strategies. Whereas, evidence from the baseline report for the Productive Social Safety Net (PSSN) program in Tanzania; identified that, a large proportion of households under the CCTs and PWs program were using negative coping strategies (NBS, 2016). Moreover, some studies show the impact of safety nets on social economics issues including education, health, gender and youth issues (Chzhen et al., 2021; Myamba & Grimard, 2017). Moreover, most of the studies have analysed the impacts of the programs separately (CCTs or PWs), leaving aside the integrated programs. This study intended to evaluate whether

Integration of both CCTs and PWs reduced the impacts of economics shocks and reduced negative coping strategies among poor households under the program.

After this introductory section, the remainder of the paper is structured as follows. Section two briefly reviews both theoretical and empirical evidences on impacts of CCTs and PWs programs in linkage to economic shocks management. Section three presents the methodology of this study; section four provides the estimated results and discussion of the findings. Section five provides conclusion in policy implication of this study.

2.0 Literature Review

2.1 Theoretical Framework for Economic Shocks and Coping Strategies

The Economic Theory of Risk and Insurance suggests that risk impedes capital accumulation because as capital increases, the marginal productivity and reward per unit diminish (Walleit, 2016). To mitigate risk, individuals save as a form of self-insurance, balancing the sacrifice of saving against its rewards. This saving continues until the perceived sacrifice equals the benefit, at which point saving halts. Reducing risk encourages higher savings and investment. Insurance transfers risk, reducing uncertainty, thus fostering capital accumulation and economic growth. Only the portion of accumulated funds meant to cover uncertain losses is included in insurance funds (Willett, 1951; Walleit, 2016). Government safety nets, such as CCTs and PWs programs, act as forms of insurance due to market failures that make household consumption smoothing inefficient (Gruber, 2016). However, the economic theory of “safety net expenditure allocation” posits that these programs should provide marginal benefits, such as improving equity, enhancing household welfare through investment, or improving risk management (Grosh et al., 2008). CCTs and PWs insure poor households against food insecurity, and health and education costs. However, these programs can lead to moral hazard, where individuals covered by unemployment benefits may be less motivated to seek new jobs. This can result in reduced self-insurance, lower labor supply, and decreased productivity, as fewer goods are produced (Willett, 1951). Despite this, it is hypothesized that CCTs and PWs strengthen self-insurance among poor households by helping them save, accumulate assets, and balance labor supply. Savings from these programs provide a financial buffer during difficult times, such as food shortages or illness (Liu & Hu, 2013), and can be measured in assets or cash held by households.

2.2 Empirical Evidence for CCTS and PWS Impacts on Economic Shocks and Coping Strategies

Recent empirical studies emphasize the vital role of safety nets in reducing food insecurity and enhancing resilience, especially among vulnerable populations and coping strategies. These programs have been particularly effective during economic shocks and crises, such as the COVID-19 pandemic globally. In developing countries, Ethiopia’s Productive Safety Net Program (PSNP) has also been effective in reducing seasonal hunger (Berhane et al., 2020). Cash transfers in Malawi have improved household food access, particularly during lean

seasons (Devereux & Sabates-Wheeler, 2021). Brazil's emergency cash transfers during the COVID-19 pandemic prevented large-scale food insecurity (Barbier et al., 2021) and also in Philippines (Guirindola et al., 2024). In Kenya, national cash transfers-maintained household food consumption levels during pandemic disruptions (Egger et al., 2021). These programs also improve diet quality. In Niger, cash transfers increased dietary diversity and children's micronutrient intake (Aker et al., 2020). School feeding programs in Ghana enhanced both food security and nutrition for students and their families (Aurino et al., 2020). Programs targeting women, such as Mexico's PROGRESA, improved child nutrition and household food consumption (Skoufias et al., 2019). Similarly, cash transfers in sub-Saharan Africa have been linked to increased household food security and dietary diversity (Slater & Holmes, 2020). In Malawi, Safety nets significantly enhance household resilience by increasing reliance on assistance from friends and family, reducing food consumption, and decreasing reliance on savings during economic shocks. Safety nets in Zimbabwe prevented the dissolving of savings (Manyanga et al., 2022). Graduation programs combining short-term safety nets with long-term livelihood support have significantly reduced poverty and improved resilience in countries like Ethiopia and India (Banerjee et al., 2019). Research in sub-Saharan Africa has consistently found that safety nets reduce the need for negative coping strategies, such as selling off productive assets or cutting back on meals. In Zambia, a study reported that cash transfer programs allowed households to maintain food security without resorting to harmful strategies, thereby improving their long-term resilience (Chiwona-Karlton et al., 2021). These programs demonstrate that safety nets can be a powerful tool not only for immediate food security but also for fostering long-term economic stability and resilience.

However, the effectiveness of safety nets on resilience is associated with other factors. (Macours et al., 2022) suggested that, safety nets combined with productive interventions can enhance household resilience by facilitating income diversification, smoothing and better protections against climatic shocks. Other scholars revealed that wealth level determined by asset ownership significantly impacts food security and coping strategies for rural households facing various shocks, including economic uncertainties (Berdegúe et al., 2024). Safety net programs in Bangladesh improved access to basic needs, thereby enhancing economic resilience, although the amounts provided were often insufficient for significant long-term impacts (Hasan et al., 2018). Similarly, in sub-Saharan Africa, targeting women through cash transfers has been linked to increased food security and household dietary diversity (Slater & Holmes, 2020). (Emmanuel & Hepelwa, 2024). Whereas, in Ethiopia, Participation in the PSNP is positively associated with household resilience, particularly when transfers are substantial and sustained over time. Continuous participation enhances resilience more effectively than sporadic support (Abay et al., 2022). Safety nets significantly improved food security and asset accumulation (Tadesse & Gebremedhin Zeleke, 2022) and increased income diversification (Emmanuel & Hepelwa, 2024). Boosting asset accumulation and income generation through diverse farming practices and better dietary diversity enhances household resilience (Manyanga et al., 2022).

Empirical findings from Tanzania demonstrate that Safety Nets have a significant positive impact on reducing household vulnerability. The Productive Social Safety Net (PSSN) program, for example, has successfully reduced household vulnerability to poverty by 13.4% (Msuha et al., 2024). Additionally, the combination of Conditional Cash Transfers (CCT) and Public Works (PW) programs has shown an even greater impact, further protecting households from economic shocks. Despite these successes, 13.9% of households remain highly vulnerable to poverty, and 20.6% are highly vulnerable to food insecurity (Msuha & Kissoly, 2024). These findings highlight the need for more comprehensive evaluations to better understand and address persistent gaps in reducing vulnerability to poverty and food insecurity. Research from Rwanda indicates that cash transfers do provide benefits to households in response to economic risks, although they may not succeed in lifting them above national poverty lines (Nirere, 2022). This highlights the ongoing need for research to elucidate the effectiveness of safety net programs in mitigating the adverse impacts of economic shocks on vulnerable households.

The previous studies provide comprehensive insights into the coping strategies employed by households facing economic shocks and the role of safety net programs in mitigating their adverse effects. Studies reveal that households' resort to various coping mechanisms, including reducing consumption, reallocating labor, seeking outside help, and employing child labor, particularly in rural areas (Bellon et al., 2020; Cirillo & Tebaldi, 2016). In India, poor rural households rely on government help during shocks (Pradhan & Mukherjee, 2018). CCTs and public works programs, have emerged as vital tools in enhancing households' resilience to shocks by smoothing consumption, reducing negative coping strategies, and improving financial stability (Daidone et al., 2019; Kabeer & Waddington, 2015; Zimmermann, 2023). However, the effectiveness of these programs hinges on factors such as program design, implementation, and individual characteristics (Green, 2021; Yang et al., 2021). Furthermore, studies emphasize the importance of social spending in reducing poverty during financial crises, highlighting the need for expanded social protection programs to strengthen household welfare and resilience (Chishimba et al., 2021; Kiendrebeogo et al., 2017; Premand & Stoeffler, 2022). Adaptive social protection programs have also been proposed as a means to address idiosyncratic shocks by providing targeted support to affected individuals or households, aiding in their recovery and building resilience (Bowen et al., 2020; Yang et al., 2021).

The literature extensively explores the vulnerability of poor rural households to economic shocks and their coping strategies, yet gaps persist in understanding the long-term efficacy and sustainability of safety net programs, particularly in mitigating shock impacts on household welfare. While acknowledging the short-term benefits of programs like CCTs and public works, research is limited on their lasting impacts on poverty graduation and resilience building. Moreover, challenges in program design and implementation are recognized, but further investigation into factors influencing effectiveness, including community dynamics and targeting strategies, is needed in Tanzania (Green, 2021; Msuha et al., 2024; Msuha & Kissoly, 2024). Understanding how these programs interact with socioeconomic factors to influence long-term household welfare is also crucial for informed policy decisions aimed at supporting vulnerable households in the face of economic shocks. This study had to deeply explain the

impact of the combined CCTs and PWs program on both the economic shocks and the coping strategies at household level. Previous studies on the impact of safety nets and resilience have employed various evaluation approaches, including randomized controlled trials (RCTs), quasi-experimental designs, and longitudinal surveys. RCTs, such as those used in evaluations of cash transfer programs, provide robust evidence of causality by comparing outcomes between treated and control groups (Egger et al., 2021). Quasi-experimental methods, like propensity score matching and difference-in-differences, have been frequently applied in contexts where randomized assignment is not feasible, helping to estimate the effect of programs such as Ethiopia's PSNP (Berhane et al., 2020).

3. 0 Methods for Data Analysis

3.1 Propensity Score Matching (PSM) Approach

Using PSM approach we examined whether households under CCTs and PWs programs experience different economic shocks (health, food shortage, dwelling, distraction of crops and death of livestock) from those of control households. We also assessed whether program beneficiaries' households opted non negative coping strategies or whether they relied more on borrowing or selling assets for financing the shocks compared to control households. The variables used here were adopted from the Coping Strategy Index (CSI) model. The CSI is a tool developed in Uganda, Ghana, and Kenya but has now been used for early warning and food security monitoring and assessment in at least nine other African countries and several in the Middle East and Asia (Anderson, 2010). The basic idea is to measure the frequency of these coping behaviors (how often is the coping strategy used?)

PSM comprises a two-stage process: in first stage, propensity scores for the treated and control samples are estimated using pre-treatment covariates in a logit model. In the second stage, treated households are matched to control households with similar propensity scores using a matching algorithm. For balance checking, for each covariate used in the regression model that generated the propensity scores, we compared the means between the treated households and matched control households using t-test. We performed analysis by using STATA software.

3.2 Measures of Treatment Variables

We consider households that benefited from both CCTs and PW programs as treated and non-beneficiaries to be control households. The Matching variables used to construct propensity scores included; Age (in age groups), indicator of sex (1 if respondent was female, 0 otherwise), indicator of marital status (1 if respondent is currently married, 0 otherwise) and multiple indicators for education of the respondent (1 if primary school completed, 0 otherwise; 1 if secondary school completed, 0 otherwise; 1 if high school completed, 0 otherwise; and 1 if college completed, 0 otherwise). Also, the social economic variable recorded before launch of the programs were household size, multiple indicators for living conditions were also used: improved drinking water sources (1 if the household had access to water from piped sources, 0 otherwise) and improved toilets (1 if the household has toilet facilities with flush or piped sewage system, or flush to septic tank, or poor flush latrine, 0 otherwise), lighting energy (1 if the household used solar or electricity, 0 otherwise); improved cooking stove (1 if the

household used open fire/stove with chimney or hood, or closed stove with chimney, 0 otherwise); floor type (1 if the floor of the household was hard floor such as tile, cement, brick or wood, 0 otherwise); and wall type (1 if the wall of the household residence was cement, brick, stone or wood, 0 otherwise).

3.3 Robustness Checks

Multiple matching algorithms were used, including nearest neighbour, stratification, radius and kernel matching, to compare outcomes for CCTs and PWs-treated households and controls.

3.4 Impact Results and Discussion

Challenges experienced in the study area included death of livestock, crop losses, destruction of dwellings, shortage of food, climatic issues (including drought and floods), health problems among household members and other miscellaneous shocks. Table 1 indicated the frequency of the shocks between the two groups, program beneficiaries against non-beneficiaries.

Livestock keeping, farming and labour mainly determine the economy of households in rural area. Looking at all the activities mentioned, they are subjected to economic risks. Table 1 indicates the distribution of economic shocks experienced by households of both Treated and control groups in the CCTs and PWs programs under TASAF in the study area. Both groups seem to suffer from the same shocks but with different magnitude. However, both groups responded to the occurrence of shortage of food 49.71 percent and 62.86 percent by treated and control respectively. Although the problem is high on the control group compared to the treated, but both faced high magnitude centrally the objective of the program. CCTs and PWs are carried out with main objective smoothening consumption, the study findings expected to measure the difference between the two groups. There is evidence of the positive impact for the safety nets on solving the problem of food shortage among the beneficiaries (Bastagli et al, 2016), also seen in this study findings, however the magnitude of the problem between the two groups is high. Next shock shown is health problem, which included, sickness of household members as well as death. However, the shocks affected both groups with only a small pace between the two groups. The CCTs and PWs program beneficiaries are expected to get access to healthcare services compared to the control group (Palermo et al., 2018). Therefore, there should be a big difference in terms of the response to health risks. However, table 1 indicates that, treated group responded by 41.71 percent to 49.14 percent responded by the households in the control group. The difference is very small compared to the expectation of the study as the program puts more emphasize on health issues by even getting them insurance cards (Mussa et al., 2022).

Table 1: Frequently Experienced Economic Shocks at Household Level

Economic shocks	Treated group (Percent %)	Control group (Percent %)
Death of livestock	15.43	3.43
Crops losses	22.26	25.14
Dwells destroyed	8	12.57
Shortage of food	49.71	62.86

Climate challenges	9.14	13.71
Health problems	41.71	49.14
Other challenges	1.71	3.43

The differences are well illustrated on Figure 1, Households under the program were in better position to reduce the hit of economic shocks compared to non beneficiaries. This could be attributed to the impact of the programs as they receive cash and get access to services like medical care, buy food and pesticides for crop production. The earning received from the programs helped beneficiaries to build improved houses compared to mad houses, which were easily destroyed. These impacts also could be supported by the results in previous empirical chapters that, program beneficiaries allocated they earnings on building materials.

3.5 Econometric Results for the Impacts of CCTS And Pws On Economic Shocks

The PSM results, the ATT were derived from the nearest neighbor Matching logarithm (NNM). ATT coefficients are used to interpret the impact of the CCTs and PWs programs on household experienced shocks within six months. Table 2 shows the ATT results after PSM, that to some shocks there is a significant difference between the households under the program compared to households not in the program, while the programs did not affect other shocks. The CCTs and PWs programs significantly reduced the incidence of dwelling shocks by 11.1% to the households under the program. It also, very important to note that, PWs beneficiaries are paid lump sum amount of cash as wages, which allow them to buy housing materials like, bricks, iron sheets and cement while CCTs provides consumables such as food, clothes, health and education facilities. Thus, most of program beneficiaries owns improved houses compared to non beneficiaries.

Livestock death has been termed as a serious shock, that program beneficiaries reported many cases (14.9%) compared to non-beneficiaries. These results, although they are significant

indicating that CCTs and PWs programs increased the incidence of livestock death, it was due to the fact that, households under the programs owned more livestock compared to non-beneficiaries. However, it is true that, a household might overcome more than one shock in a period of six months. Households under the program significantly experienced differences in combined shocks compared to non-beneficiaries. Table 3, shows a decrease of 24.2% of both crop distraction and livestock death at 10% level of significance; Both shortage of food and crop distraction shocks decreased by 17.1%; health and food shortage shocks decreased by 10.8%; dwelling and food shortage shocks decreased by 27.8%; while food shortage and livestock death decreased by 25.8% all at 10% level of significance. For the economic theory of risks and insurance, both CCTs and PWs have impacted significantly on some risks such as dwellings, food shortage and distraction of crops and other shocks. These results support the theory behind the goals of the CCTs and PWs programs.

Table 2: Differences in Shocks Between Treated and Control Groups

Economic shocks	ATT	t-test
Shortage of food (%)	-0.9	0.10
Health shocks (%)	-2.3	0.27
Dwelling shocks (%)	-11.1*	1.95
Distraction of crops (%)	-5.1	0.72
Livestock death (%)	14.9**	4.64
Whether shocks (%)	-2.1	0.59
Both foods shortage and distraction of crops (%)	-17.1*	1.97
Both food shortage and health shocks (%)	-10.8*	1.52
Both food shortage and dwelling shocks (%)	-27.8*	2.22
Both food shortage and livestock death (%)	-25.8*	2.10
Both food shortage and whether shocks (%)	2.6	0.18
Both health and crops distraction shocks (%)	3.3	0.38
Both health and livestock death shocks (%)	6.1	0.48
Both health and whether shocks (%)	4.3	0.30
Crops distraction and livestock death shocks (%)	-24.2*	2.24
Both crops distraction and whether shocks (%)	-17.1*	1.59
Both crops distraction and dwelling shocks (%)	-11.1*	1.95

3.6 Impacts of CCTs And PWs on Coping Strategies

Descriptive findings of response to shocks by different coping strategies are shown in Table 3. There is small difference in the coping strategies opted between the treated and control groups under the CCTs and PWs programs. The study was done on several coping strategies including selling of durable assets, renting out land, use of savings made in terms of cash, drop out of children from school, child labour, borrowings, reducing the number of meals, selling livestock, sell of crops and seeking for help from either friend/neighbour/ organization. The

results on the response presented in Table 3 indicated that treated 22.29 percent of households use more of savings to solve economics shocks compared to 8.57 percent of households in the control group.

Table 3: Descriptive Results on Responses to Coping Strategies

Response to Coping strategies	Treated group (%)	Control group (%)	P-value	Mean diff (%)
Selling of Asset	0.001	2.29	0.02	-2.3**
Renting land	1.71	2.86	0.23	1.1
Use of savings	22.29	8.57	0.00	13.7***
Drop out of school	5.14	6.29	0.32	1.1
Sending children away	0.01	1.71	0.04	-1.7**
Borrowing	45.14	37.71	0.07	7.4*
Reduced meals	13.71	11.43	0.26	2.3
Sell livestock	4.57	1.71	0.06	2.9*
Sell crops	1.14	1.14	0	0
Seek for help	12	49.71	0.00	-37.7***

Author's findings using t-test; Note: * P<0.1 **P<0.05 ***P<0.001

This has made possible because most of the households (70%) in the program are involved in “the group savings” compared to around 6 percent of households in the control group (Table 3). Therefore, it is easier for the household member in the saving group to borrow some cash and solve the shocks occurred at that particular moment in time. Moreover, 45.14% of households in the CCTs and PWs program used borrowing as a coping strategy compared to 37.71 percent of non-beneficiaries in the control group. This has made possible because, program beneficiaries gained credibility to pay back their loans when they receive program payments (Daidone et al, 2015). Nonetheless, CCTs and PWs programs have reduced the strategy of begging for help, which is more seen among households in the control group scoring 49.71 percent response compared to 12 percent in the treated group.

3.7 Econometric Results of the Impacts of CCTs and PWs on Coping Strategies

PSM model was applied to assess impacts of the programs on the coping strategies opted by the poor households to overcome the occurred shocks. The Nearest Neighbor Matching (NNM) algorithm was used to match the response of households in the treatment and control groups. After matching the two household groups (Treated and Control), limited impacts were found compared to the impacts presented in the baseline study. Table 4 shows that households under CCTs and PWs significantly have increased the use of savings (10.6%) to solve the shocks. The use of savings as insurance to manage the economic shocks have implied on the theory of risks and insurance (Liu and Hu, 2013). The use of savings is not among the negative coping strategies as stated by the life cycle theory. More savings are of interest to create self-insurance during economic difficulties also supported by results of safety nets in Malawi (Andrews et al., 2018). Furthermore, the results show that CCTs and PWs have reduced sending children away (4.6%) during the shocks compared to non-beneficiaries at 10% level of significance also revealed in the review study (Andrews et al., 2018). This impact of the programs on

maintaining children at school during economic shocks is very important for human capital creation. One of the achievements expected by the program planners is increasing children enrollment to schools while smoothing consumption. It is believed that, education to children creates human capital as along term impact for future welfare improvement (URT 2013). Furthermore, the CCTs and PWs programs have helped the poor household from the problem of begging and seeking for help by 35.7% compared to non-beneficiary households.

Table 4: PSM Results on Coping Strategies

Response to coping strategy (%)	ATT	Unmatched (mean difference)
Selling of durable assets (%)	-2.3 (1.377)	-2.3** (0.02)
Selling of land (%)	0.6 (0.296)	1.1 (0.23)
Use of savings (%)	10.6* (1.86)	13.7*** (0.00)
Drop out of school (%)	2.3 (0.62)	1.1 (0.32)
Sending children away (%)	-4.6* (1.61)	-1.7** (0.04)
Borrowings (%)	8.6 (1.073)	7.4* (0.07)

3.8 The Results Discussion

Comparing the findings to the baseline results whereby households under the program used the negative coping strategies including reducing meals to elders, and some skipped meals for the whole day. The programs strengthen household resilience by reducing exposure to some shocks such as crop destruction and destruction of dwellings. Although, to the large extent, results of this study some indicators (children drop out from school, sending children away from home, reducing number of meals) are not significant to tell the difference between treated and non-treated households. Therefore, the results imply that, both households (treated and control) remained almost exposed to the same shocks. The gap is very small, implying a need of

continuous participation in the two programs, also revealed in Ethiopia (Abay, et al., 2022). Again, the results implied that, both groups almost use the same coping strategies with small difference. Treated group used more of savings rather than begging strategy, observed in the control group. However, despite the insignificant differences of some coping strategies between treated and control groups, beneficiaries remained advantaged in some coping strategies. Some households used their savings and others used their savings to overcome economic shocks. More importantly, beneficiaries reduced selling assets during shocks instead they sold crops and income earned from petty business. Results on the effectiveness of CCTs and PWs programs on asset ownership in chapter five, households under the programs owned more assets compared to non-beneficiaries. This could be because beneficiaries had alternative means to overcome the shocks at disposal compared to non-beneficiaries. It is the expectation of the program, that safety nets boost insurance and resilience during shocks, which was revealed by other scholars (Abay et al., 2022, 2023; Bowen et al., 2020; Kiendrebeogo et al., 2017).

4. Conclusion

Households under the program presented somehow a relief on the economic shocks and coping strategies compared to households in the control group. Therefore, the implementation of both CCTs and PWs in the poor household increases their ability not to be exposed to economic shocks such as food shortages, health shocks, dwelling problems, the distraction of crops and other miscellaneous shocks. Moreover, CCTs and PWs have helped the beneficiaries to overcome the shocks by enhancing the poor household to use non-negative coping strategies. The findings presented that; most of the households under the programs used their savings (mostly engaged in saving groups) to overcome the arisen shocks. While the programs have reduced the negative coping strategies of dropping children from school and begging or seeking help. However, the impact of the program toward economic shocks management is very small, which indicates that, much of the CCTs and PWs earnings are spent on overcoming shocks such as health issues, dwelling, food and climatic effects. Spending on all these shocks reduces savings and productive investment, which in long run could provide for future consumption and cover future shocks. Encouraging long-term participation in CCTs and PWs, along with promoting financial literacy and access to savings groups, can strengthen household resilience by enhancing self-insurance and enabling better cash flow management for unexpected expenses.

Abstract

This study investigated the impact of Single Customs Territory (SCT) on Foreign Direct Investment (FDI) in selected countries of Sub-Saharan Africa (SSA). The study employed quantitative methods using the Difference in Difference (DID) econometric technique to establish empirical evidence. The treatment and control groups were the East African Community (EAC) member states, and the control group was the randomly selected Sub-Saharan African countries, respectively. The time series data set from the World Development Indicators (WDI) for the period of 2000 to 2019 was used. The main findings demonstrate that EAC Single Customs Territory has a significant and positive impact on Foreign Direct Inflow

(FDI). The study implies that SSA should embrace a joint effort through SCT in order to increase the market size and boost their level of economic performance through FDI inflow, cost reduction and cross-border procedures during the broader transport of goods. Also, EAC governments should invest in strengthening their cooperation by working closely to mitigate challenges in the implementation of SCT so as to reap its maximum goals.

Keywords: *Foreign Direct Investment and Single Custom Territory.*

1. Introduction

For the past quarter of a century, globalization has shown an impressive rise in global Foreign Direct Investment (FDI). Despite such growth in global FDI, Sub-Saharan Africa has recorded a declining share of global FDI from 5.1 per cent in 2009 to 3 per cent in 2012, as compared to 26.0 per cent for Asia and 11.9 per cent for Central and South America (Darley, 2012). When compared to GDP levels, this figure is far less because the regional share is just 2.44 per cent of global GDP (Juma, 2012).

Some efforts have been put forth by SSA countries to attract FDI, including creating special investment zones and Export Processing Zones (EPZs) by providing investment incentives such as tax holidays that allow for duty-free imports of capital goods, production materials, and equipment. However, despite these efforts, SSA did not benefit from FDI from the 1980s to the 1990s. For example, it received only \$256 million in 1980 and \$9 billion in 1999, whereas the other developing countries attracted FDI inflows of \$7 billion in 1980 and \$216 billion in 1999 (Ideue, 2018).

Figure 1.1: Trends of FDI inflow in SSA by sub region from 2009 to 2015(in '0' US \$ Billion)

Source: UNECA (2016)

In addressing the challenges of inadequate FDI inflows in Sub Saharan Africa some countries have embarked on joint initiatives while others continued to act independently. In 2014 for instance, the East African Community (EAC); Tanzania, Kenya, Rwanda, Uganda, and Burundi signed the treaty to implement a *Single Customs Territory (SCT)* by its member states. In a short period SCT has been impactful by the removal of restrictive regulations and minimization of internal border restrictions on goods moving between the member states with an ultimate realization of free circulation of goods.

Figure 1.2: Trends of FDI inflows in EAC by country from 2007 to 2023(in % of GDP)

Source: WDI (2024)

Despite such initiatives put forth by EAC, some of the remaining states in SSA have not embraced such an approach and continue to act individually on their own perspectives in improving trade and investment inflows. This study, therefore, examines the impact of SCT on FDI inflows to countries which have adopted SCT against countries which have not adopted SCT based on EAC as a treatment case.

1.1 Objectives

1.1.1 General Objective

To explore the impact of single custom territory on Foreign Direct Investment in selected countries in SSA.

1.1.2 Specific Objectives

- i. To examine the effect of SCT adopted by EAC on FDI inflows compared to similar effects on countries which did not adopt SCT in SSA.
- ii. To examine the differences in FDI inflows to the EAC member states which adopted SCT based on market size compared to countries which did not adopt SCT in SSA; and

- iii. To examine the differences in FDI inflows to the EAC member states that adopted SCT based on access to seaports compared to countries that did not adopt SCT in SSA.

1.2 Rationale of the Study

The contribution of this proposed study stems on a novel idea on a comparative study between countries (in this case East African member states) which adopted an impactful SCT and other economies which did not in Sub Saharan Africa. SCT is believed to have increased business and investment inflows to EAC within a short period after being implemented. The achievements include but not limited to removal of hurdles to investment inflows in EAC through an agreed and recognized snap shot documentation at borders that is accepted by the rest of the members states regardless of which country approved the documents at entry point (Darley, 2012). Knowing the importance of SCT may encourage other countries to benchmark on the best practice of EAC on SCT to revamp the sluggish pace of economic development through FDI attraction especially in SSA region which experiences inadequate FDI inflows.

2.0 Related Literature

2.1 OLI Electric Theory of Market Seeking FDI

The theory underpinning this study is OLI Electric Theory of Market Seeking FDI. Dunning (1988) defined OLI as Ownership advantage, Location advantage, and Internationalization. The emphasis in the study is given to Internationalization in which; countries of FDI origin would wish to land their investments by taking advantage of the existing market niches of its prospective goods and services to be manufactured in the host countries. He further explained that internalization is preceded by realizing Ownership advantage through ownership of monopoly power, technology and economies of scale. The second to ownership is Locational advantage postulating economic, social and political advantages within the host countries which are necessary for investment decision.

The SCT implies a unified system of member states as one market; the united EAC sub-region, based on SCT terms, provides a conducive market through free movement and seamless movement of products just after entry to one of the member states border without border restrictions to other sovereign states. This removal of restrictions provides an attractive environment for Multinational Companies to invest in EAC by taking advantage of the existing market boosted by the border movement of partner state members.

2.2 Summary of Empirical Review

Little is known on the impact of single custom territory on foreign direct investment in Africa. This is because most of the studies conducted by various researchers, such as Kamau and Odongo (2020), Mbwapbo (2020), and Mpakaniye (2017), mainly focused on the SCT's effect on trade. This study explores the impact of SCT on FDI in SSA countries, which has not been conducted in the existing literature, and, therefore, gives recommendations in accordance with the revelation of the study. The study focuses on SSA states which adopted an SCT, based

on the comparative Difference in Difference (DID) approach, to provide a comparative finding between SSA countries which adopted SCT as a treatment group and SSA countries which have not adopted SCT as a control group.

3. Methodology

3.1 Research Approach

The study will employ the quantitative research approach and experimental strategy which seeks to determine if a specific treatment influences an outcome /impact by providing a specific treatment to one group and withholding it from another (Control Group), as the enquiry strategy for the study.

3.2 Econometric Model and Specification

The study employs Difference in Difference (DID) econometric technique that provides a comparative analysis between a treatment and control groups based on before and after time demarcations. Consider an experiment set to evaluate the impact of exogenous interventional shock such as policy that requires outcomes comparison between the effected/treatment group to an unaffected /control group, supported by time bound before and after the shock. In the same manner let's assume that there are two regions A and B subject to before and after shock context. Both regions are equally exposed to a shock free environment before a shock. The intervention time provides a cut off line into before and after periods. Assuming that region B is suddenly subject to shock intervention and exposed to after effects that result into a notable difference of group B relative to group A. The difference may be due to the shock intervention, but also might be due to other key characteristics that varies between the two groups which also determines the outcome differences, e.g. region A might be subject to different weather condition relative to region B which might be a contributing factor to the outcome difference in the level of business performance for instance. If the outcome is sales volume which also depends on whether that varies in the two regions, a favorable weather in region B relative to region A might also contribute to a better performance of group B apart from a shock intervention exposed to group B that needs to be evaluated. A better remedy for this overlapping is to evaluate the impact of the intervention by controlling for other characteristic difference between the two regions. It's difficult to control for unobservable characteristics, even if we have enough data to control observable ones.

However, apart from the difference in characteristics that might contribute positive changes experienced by region B, it might also be contributed by other changes in a course of intervention apart from the shock that cannot be captured. Now consider a double approach that comprises of after and before associated with the treatment and control group comparative approach.

Figure 1.1: Difference in Differences Illustration

Source: Researchers' Own Construction

If the after and before difference in the control group emanates from the same difference in the treatment group, then if other changes that occur over time are also present in the control group, then these factors are controlled for when the control group after and before difference is netted out from the impact estimate.

Also, if there are important characteristics that are determinants of outcomes and that differ between the treatment and control groups, then, as long as these treatment and control group differences are constant over time, their influence is eliminated by studying changes over time so is for any time invariant unobservable characteristics which are also netted out.

Alternatively, the following mathematical equations elucidate the above pictorial presentation. Let us consider a two-group scenario $\{G=1, 2\}$ in two different periods $\{T=1, 2\}$. Initially at T_1 , both groups are exposed to control status. At T_2 is when only G_2 is exposed to treatment status, let $T_g=1$ represents a dummy variable capturing group 2 observations at T_2 while $P_t=1$ represents a dummy variable capturing treatment period 2 observations. In the two periods two groups DID, the treatment variable is simply the product of these two dummy variables: $D_{gt} = T_g \times P_t$. This is because $D_{gt} = 0$ is when both groups are exposed to the first period because $P_t=0$ and $T_g=0$; and $D_{gt} = 1$ only happens when the second group is exposed to the treatment because this is when both T_g and P_t dummies are equal to 1. Let's further assume that untreated expected outcome is given by

$$Y_{0gt} = 0 + 1T_g + 2P_t + gt \dots \dots \dots (1).$$

Before and shock intervention, the expected outcome in the first group is 0 in the first period while in the second period is $0+1$. The expected untreated outcome in the second group is equal to $0+1$ while in the second period is $0+1+2$. We assume a common trend applies where the coefficient on T_g provides a time-invariant difference in expected outcomes between the two groups. The group coefficient includes the combined effects of all the constant differences between the two groups and during the study period. Likewise, the coefficient P_t captures the changing combined effects between the two periods which also affect outcomes similarly in both cases. Practically, 1 is termed as the group effect and 2 the time trend. Basically, the model for the expected treatment outcome is the sum of untreated outcome and treatment effect, which is usually constant across observations:

$$Y(1)_{gt} = Y(0)_{gt} + 3 \dots \dots \dots (2)$$

Thus, generally the overall outcome is expressed as;

$$Y_{gt} = Y(0)_{gt} + D \{Y(1)_{gt} - Y(0)_{gt}\} \dots \dots \dots (3)$$

Replacing the outcomes notations with the model specification it gives;

$$Y_{gt} = 0 + 1T_g + 1P_t + g_t + Dg_t Y(0)_{gt} + 3 - Y(0)_{gt} \dots \dots \dots (4)$$

In the two-group two-period model, $Dg_t = T_g \times P_t$, which implies that after cancelling the $Y(0)_{gt}$ terms we to obtain the standard DID estimation equation:

$$Y_{gt} = 0 + 1T_g + 2P_t + 3T_g \times P_t + g_t \dots \dots \dots (5)$$

3.3 Identification Strategy and Estimation Technique

The DID econometric estimation technique was directly adopted from the aforesaid theoretical model as follows;

$$Y_{gt} = 0 + 1T_g + 2P_t + 3T_g \times P_t + g_t \dots \dots \dots (6)$$

where; Y_{gt} treatment outcome in this case FDI inflows while, 0, 1, 2 are constant terms for group and period coefficients respectively where 3 is DID coefficient. T_g is a group dummy 1 if is in treatment (firms which opted for SCT) and 0 otherwise, P_t is period dummy 1 if is after treatment period and 0 otherwise, $T_g \times P_t$ is a composite interaction term of the treatment effect while g_t is a composite error term. The model was executed under other key assumptions of DID model including the common trend parallel assumption, time invariant group characters and period time-variant attributes and strictly exogenous policy intervention.

3.4 Data and Data Source

The study employed data from a reliable source; the World Development Indicators (WDI) which provides FDI data for the countries worldwide. The FDI inflows data from 2003 to 2019 was considered the time period before the implementation of SCT by EAC member states which is from year 2000 to 2013, and the time period after implementation of SCT which is from year 2014 to 2019.

Table 3.1: The List of Member States Included in the Sample

S/N	Country	Group	Location
1	Tanzania	Treatment group	East Africa
2	Kenya	Treatment group	East Africa
3	Burundi	Treatment group	East Africa
4	Rwanda	Treatment group	East Africa
5	Uganda	Treatment group	East Africa
6	South Sudan	Control group	East Africa
7	Malawi	Control group	Central Africa
8	Mozambique	Control group	South East Africa
9	Mali	Control group	West Africa
10	Cameroon	Control group	West Africa
11	Ethiopia	Control group	East Africa
12	Djibouti	Control group	Horn of Africa
13	Zambia	Control group	Central Africa
14	Eritrea	Control group	East Africa
15	Somalia	Control group	East Africa

Source: WDI (2023)

Treatment group is the EAC member states which adopted SCT while the control group was remaining countries in SSA which adopted SCT strategy. The list of countries involved in the study is indicated in Table 3.1

4.0 Empirical Results

This section presents a discussion of the results obtained from the research. After a pre-estimation test for a common trend parallel assumption comes the baseline and primary results of the investigation. In the end, it discusses the robustness analyses that were done in order to evaluate the baseline findings on FDI based on SCT shocks to the EAC in comparison to the benchmark group that are non- EAC.

4.1 Baseline Results

Hypothesis (i): *There is no significant difference between countries that adopted a single custom territory and those that did not in terms of FDI inflow.* This null hypothesis was tested using the Difference-in-Difference econometric technique. The result indicates the proportion of variance in the dependent variable that is explained by the model's coefficient for the treatment variable, which is SCT proxied by DID. The findings presented in Table 4.1 indicate

that the DID variable is positive and statistically significant at one percent significance level. Therefore, the null hypothesis (H_0) was rejected and the alternative hypothesis (H_1) accepted. This suggests that there is a substantial difference in FDI inflow between countries in SSA that adopted SCT and those which did not. Based on estimation (1) on average, EAC member states that adopted SCT experienced a 6.5270 increase in FDI inflows compared to selected SSA member states that did not adopt SCT. The reason for relatively higher FDI to the EAC could be attributed by the availability of unified large market and investment catchment area as a result of SCT initiative of the EAC. Based on FDI theory by Dunning (1993) larger markets are more likely to attract FDI than smaller markets.

Table 4.1: Baseline Model on the Impact of SCT on FDI Inflows to EAC which Adopted SCT

VARIABLES	(1) FDI	(2) FDI	(3) FDI	(4) FDI
DID	6.5270*** (2.347)	7.8917*** (2.219)	6.6283*** (2.213)	6.5270*** (2.347)

4.2 Robustness Checks

4.2.1 Market Size

Hypothesis (ii): *There is no significant difference in the Impact of SCT on FDI Inflow between large and small market economies within EAC compared to economies which did not adopt SCT in SSA.* This null hypothesis was also tested using a difference-in-difference econometric technique and a comparative analysis between countries in the treatment group between EAC member states with large market size and EAC member states with small market size to determine if there were differences in FDI inflows. Korsak (2017) analyzed the economies of the East African Community by defining their population size, therefore in this study, Tanzania, Kenya and Uganda were termed as large market economies with the population of more than 30 million people, while Rwanda and Burundi as small market economies, with the population of less than 30 million people. The first row of Table 4.2 displays the coefficient magnitudes of EAC member states with large and small market sizes respectively.

The estimates of the key variable DID for small and large market economies are positive and statistically significant by at least five per cent significance level. The null hypothesis (H_0) was therefore rejected, and the alternative hypothesis (H_1) was accepted. Based on estimation (1)

and (3), the coefficients for large and small markets are 6.3513 and 6.6021, respectively. This implies that even though EAC enjoys marketing seeking FDI inflows explained by Dunning (1993), the asymmetrical inflow of FDI is evident between large and small economies in EAC. It is very interesting that even small market economies indicate higher affinity to attracting FDI versus large market economies {6.6021:6.3513}. The probable reason could be unutilized opportunities within small economies due to the fact that priority for market seeking FDI investors is normally given to large market economies meaning that small countries come next after depletion of investment opportunities in large economies. Given the FDI inflow pace in African countries which gained momentum in 1980's, it is more likely that if from the beginning investors priority was given to large market economies in EAC, to date most of investors must have shifted their interest to small market economies other things being equal.

Table 4.2 Impact of SCT on FDI Inflow for EAC Based on Market Size

VARIABLES	Large Market		Small Market	
	(1)	(2)	(3)	(4)
	FDI	FDI	FDI	FDI
DID	6.3513*** (2.374)	6.5046*** (2.222)	7.3864*** (2.666)	8.7833*** (2.374)
Treatment	-8.5604*** (2.348)	-12.5587*** (1.505)	-15.4894*** (4.608)	-10.4470*** (1.602)
Time	-5.1793 (5.535)	-2.5232 (2.434)	-7.3006*** (2.061)	-6.5250*** (1.845)
Constant	9.6131*** (3.319)	12.3896*** (3.858)	22.4121*** (3.892)	12.8146*** (1.214)
Year Dummy	Yes	Yes	No	No
Country Dummy	Yes	No	Yes	No
Observations	159	159	145	145

Robust standard errors in parentheses *** p<0.01, ** p<0.05, * p<0.1

4.3 Location

Hypothesis (iii): *There is no significant difference in the Impact of SCT on FDI Inflow between landlocked and close to seaport economies within EAC compared to economies which did not adopt SCT in SSA.* This null hypothesis was also tested using DID econometric technique and a comparative analysis between countries within EAC member states which are landlocked and EAC member states which have access to seaports in order to determine if there were differences in FDI inflows based on such locational differences. The first row of Table 4.3 (across column 1&2 and 3&4) displays the coefficient magnitudes of EAC member states which are landlocked and EAC member states which have access to seaports respectively.

The estimates of the key variable DID for landlocked and seaports access economies are positive and statistically significant by at least five per cent significance level. The null hypothesis (H_0) was therefore rejected, and the alternative hypothesis (H^1) was accepted. Based on estimation (1) and (3), the coefficients for landlocked and seaport access are 7.1994 and

5.6589, respectively. Landlocked economies indicate higher affinity to attracting FDI versus seaport access economies (7.1994:5.6589). The probable reason for relatively higher inflow level of FDI to landlocked could also be unutilized opportunities within landlocked economies due to the fact that before SCT priority was given to seaport access economies meaning that landlocked countries come next after depletion of investment opportunities in close to seaport access economies. It is more likely that from the beginning investors priority was given to close to seaport access economies in EAC due to geographical bottlenecks such as long distances to markets and higher transaction costs which characterize landlocked countries. Due to establishment of SCT some of the obstacles have been reduced and therefore, most of investors must have shifted their inflows to landlocked economies.

Table 4.3 Impact of SCT on FDI Inflow for EAC Based on Location

VARIABLES	Landlocked		Seaport Access	
	(1) FDI	(2) FDI	(3) FDI	(4) FDI
DID	7.1994*** (2.350)	8.0584*** (2.159)	5.6589** (2.554)	6.2673** (2.446)
Treatment	-15.3772*** (4.444)	-10.7591*** (1.398)	-8.3924*** (2.367)	-12.7672*** (1.582)

5.0 Conclusion and Policy Implication

This study was conducted with the intention of investigating the impact that SCT has on FDI inflows based on market seeking theory. The study used the DID econometric model to establish empirical evidence. It adopted the quantitative research approach as its method of investigation. The treatment group consisted of the member states of the EAC, and the control group was randomly chosen countries from the SSA. In order to reveal empirical evidence, we utilized the time series data set that was compiled by the WDI and covered the period from 2000 to 2019. The findings revealed that EAC SCT have a significant impact on FDI inflows to EAC economies.

The findings indicate that due to the implementation of SCT, even small market economies have relatively attracted more FDI compared to large market economies. This may be due to the fact that before SCT, small market economies were unable to attract significant FDI due to

their market size as FDI is concerned with the size of the market in developing countries (Dunning 1988). Countries with large markets have a higher potential for FDI inflows than those with small markets not on a per capita basis, but rather in aggregate size (Akin, 2009). Due to SCT, the size of the market of small market economies has increased in aggregate.

Furthermore, the findings have established that due to SCT land-locked nations have experienced more FDI inflow compared to countries in close access to seaports. This may be due to the fact that initially the bottlenecks experienced by such countries and issues with high transport costs, complicated cross-border procedures, long distances and isolation from the global market mainly caused by limited access to the seaport which impeded such countries from attracting significant FDI inflows. However, with SCT, the cost of transportation and cross-border procedures have been reduced, hence more investments.

The study recommends that SSA countries embrace a joint effort through SCT to increase their market size, which will boost their economic performance and reduce costs and cross-border procedures during goods transportation.

Corresponding Author: alfred.assenga@yahoo.com

Abstract: Although financial inclusion is a critical factor in fostering socio-economic development, rural youth entrepreneurs often face unique barriers that hinder their participation in both formal and informal financial systems. This study explores the awareness and barriers to financial inclusion among rural youth entrepreneurs. Data for the study was collected from 618 rural youth entrepreneurs across seven selected wards in Iramba District, Tanzania, using a cross-sectional survey. Descriptive statistics were used to analyze the data. The results reveal that the majority of surveyed rural youth are aware of various formal and informal financial services, including mobile money, community savings groups, support from family and friends, commercial banking, savings and credit cooperative societies (SACCOs), microfinance services, informal money lenders, and insurance products. Despite the significant awareness, actual usage remains low, particularly for formal financial products like bank savings accounts, insurance, and commercial banking services. The prime obstacles to greater financial inclusion include unreliable income, stringent collateral requirements, limited financial literacy, and high transaction costs. Additionally, factors such as religious beliefs and the distance to financial institutions further exacerbate exclusion. The findings highlight the need for tailored financial products and policies that accommodate the unique economic and social conditions of rural youth entrepreneurs, thereby fostering their financial inclusion and, ultimately, their socio-economic empowerment.

Keywords: *Financial inclusion, financial awareness, barriers to financial services, rural youth entrepreneurs, rural entrepreneurial activities.*

1. Introduction

Financial inclusion has become a critical driver of socio-economic development, particularly for youth entrepreneurs in rural communities. Defined as the access to and use of financial services by individuals and businesses, financial inclusion has the potential to empower rural youth by enabling them to invest in businesses, save, manage financial risks, and afford social services (Mishra et al., 2024; Solanki and Chhikara, 2024). Various types of financial services are integral to financial inclusion, broadly categorized into formal and informal services. Formal financial services are typically regulated and offered by recognized institutions, including banks, microfinance institutions, mobile money providers, and savings and credit cooperative societies (SACCOS) (Ozili et al., 2023; Sethy et al., 2023). These services encompass basic savings accounts, capital markets, government subsidies, credit facilities, insurance products, social security schemes, financial literacy initiatives, and digital payment systems. In contrast, informal financial services are community-based, unregulated, and often serve as an alternative means of financial support (Forkuoh et al., 2015 Yami et al., 2019). These include community savings groups, rotating savings and credit associations (ROSCAs),

informal lending circles, and financial support from family or friend networks. Informal financial services provide a flexible and accessible form of support tailored to local needs, especially where formal services are limited. However, such arrangements lack the security, scalability, and legitimacy found in formal institutions (Schreiner, 2000; Singh and Singh, 2023).

Rural youth entrepreneurs, particularly in emerging economies, primarily engage in agriculture, small-scale trade, and artisanal businesses, which form the backbone of rural economies. About 16% of the global population, amounting to 1.2 billion people, are young individuals aged 15 to 24 (UNESCO, 2020), with 67% of this population (nearly 800 million) residing in rural or semi-urban areas (United Nations, 2021). Given this significant population, access to financial services, such as credit, savings accounts, insurance, social security schemes, financial literacy programs, and transaction systems, is essential for advancing rural socio-economic development. Research indicates that financial inclusion fosters economic resilience, enhances asset accumulation, and promotes social stability (Nandi et al., 2022; Ndanshau and Njau, 2021), all of which are crucial for rural youth who face limited economic opportunities. Access to financial services helps finance start-up capital and operational costs, enables investments in micro-enterprises and small-scale agriculture, and scaling their operations. Insurance products, in particular, provide a safety net against business risks. Over time, these processes help rural youth entrepreneurs generate income, create job opportunities, enhance economic stability, and afford education and health services, ultimately improving their overall standard of living. Despite these potential benefits, evidence shows that rural youth often struggle to break free from poverty, with 93.6% engaged in vulnerable employment (Finscope, 2023). Moreover, the socio-economic activities of rural youth are often constrained by limited access to adequate financing options (Panakaje et al., 2023; Abdelghaffar et al., 2023).

Considering the potential of rural youth entrepreneurs in driving socio-economic development, the government of Tanzania, in collaboration with financial institutions, has spurred supportive policies and initiatives aimed at empowering rural youth entrepreneurs through financial inclusion. Key among these initiatives is the National Financial Inclusion Framework 2023-2028, which seeks to expand access to affordable financial services and products across all societal segments, including rural youth (Finscope, 2023). Besides, the Youth Enterprise Development Fund (YEDF), was established in 1994 to provide financial assistance and support to young entrepreneurs. Through YEDF, Tanzanian youth can access loans, grants, and business development services to start and expand their ventures (Mori, 2019). In conjunction with these efforts, various financial literacy programmes educate youth on key financial concepts, banking services, budgeting, and savings. More importantly, agent banking, point-of-sale systems, stand-alone ATMs, and mobile money services such as M-Pesa, Airtel Money, and Tigo Pesa have significantly enhanced FNI among Tanzanian youth, allowing them to engage in business activities and connect to wider markets (Dar and Ahmed, 2021; Lotto, 2018). These services and programs are empowering youth by providing essential financial skills and accessible solutions, including mobile banking, social security schemes, money

transfers, and bill payments. These initiatives have the potential to transform the financial landscape in rural areas, making it easier for youth entrepreneurs to access services and participate in the economy.

Despite the efforts and initiatives in place, however, achieving financial inclusion remains a complex challenge, particularly in rural areas where youth entrepreneurship holds the promise of driving local economies and fostering innovation. Statistics indicate that rural youth are among the most financially excluded groups in Tanzania. A survey by the Alliance for Financial Inclusion (2022) revealed that approximately 51% of rural youth lack access to both formal and informal financial services, with only 8% relying on informal sources. This is notably lower than the 76% FNI rate observed among the adult population (Finscope, 2023). This exclusion perpetuates socio-economic disadvantages in rural area, prompts urban migration, and limits pathways for upward socio-economic mobility. Without access to formal financial services, rural youth face significant obstacles in starting or expanding businesses, which restricts income generation and hinders economic growth. This exclusion exacerbates poverty, reinforces cycles of economic dependency, and increases vulnerability by limiting the ability to afford health services or invest in education ((Dar and Ahmed, 2021). Consequently, this makes rural youth rely on unstable income sources, such as subsistence farming or casual labour, which perpetuates their socio-economic challenges (Kuada, 2021; Lotto, 2018).

While considerable attention has been given to financial inclusion in general (Ahmed and Jianguo, 2014; Chakraborty and Abraham, 2021), there remains a gap in understanding the specific barriers and awareness among rural youth entrepreneurs. Much of the existing literature focuses on adult populations or urban youth (Ahmed and Jianguo, 2014; Mohammed et al., 2020). Ndanshau and Njau, 2021), often overlooking the unique barriers and perspectives of rural youth in accessing financial services. This gap highlights the need for targeted studies that investigate the barriers and awareness specific to rural youth on their path to financial inclusion. Drawing on this contextual gap, the present study provides novel insights by conducting a comprehensive survey of the awareness and barriers faced by rural youth entrepreneurs regarding financial inclusion. The study offers valuable policy implications and intervention strategies for policymakers, financial institutions, and development agencies to help bridge the financial inclusion gap and empower rural youth entrepreneurs. Furthermore, the study's findings highlight areas for tailored financial products and services that align with the needs of rural youth, thus contributing to the broader goal of inclusive socio-economic development.

2. Research Methods

2.1. Research Design and Study Area

A cross-sectional descriptive research design was employed in this study to capture the prevalent patterns of awareness and barriers to financial inclusion among rural youth entrepreneurs in Iramba District, located in Tanzania's Singida region. A cross-sectional descriptive design is ideal for studies aiming to provide a snapshot of and systematically describe and interpret existing conditions or behaviours without manipulating variables, at a

single point in time (Mugenda & Mugenda, 2003). It is well-suited for understanding 'what' is happening in a particular context. This design was particularly suitable for this study, as it enabled a timely assessment of the current state of financial inclusion awareness and the barriers faced by youth in rural areas. Iramba District was selected for this study for two main reasons. First, the district represents a rural context where youth entrepreneurship is gaining prominence, and financial inclusion initiatives are becoming increasingly important (Finscope, 2023). Second, Iramba has a comparatively high youth population, accounting for 24% of its total population, which is substantial relative to other districts in the region (URT, 2022). Besides that, the Singida region as a whole has the lowest level of financial inclusion in the country (53%), compared to other regions (Finscope, 2023). These factors make Iramba District a particularly relevant area for studying the awareness and barrier to financial inclusion among rural youth entrepreneurs.

2.2. Sampling and Data Collection

The present study employed a multi-stage sampling approach, combining purposive and random sampling, to select the study area and primary unit of observation. In the first stage, purposive sampling was used to select the Singida region, one of Tanzania's 31 administrative regions, as the study area due to its notably low level of financial inclusion (Finscope, 2023). In the second stage, Iramba District, one of the seven administrative districts of Singida region was chosen based on its relatively high youth population (URT, 2022). In the third stage, seven wards were randomly selected from the 20 wards within Iramba District. These were Mgongo, Mtekente, Mtoa, Ndago, Ntwike, Shelui and Urughu. Finally, in the fourth stage, a simple random sampling method was applied to select individual participants (rural youth entrepreneurs) for the survey. During this stage, a structured questionnaire was physically and proportionally distributed to 689 rural youth, drawn from a list of 32,501 rural youth across the selected seven wards in Iramba District, between June and September 2024. This approach ensured a representative sample of rural youth, allowing for the capture of diverse perspectives on their awareness of and barriers to financial inclusion. Out of the 689 questionnaires distributed, 648 were returned, yielding a response rate of 94.05%, which is sufficient for data analysis and enhances the validity of the study's findings.

2.3. Data Analysis

In this study, descriptive statistical analysis, specifically frequency and percentage distribution, was used to analyse quantitative data on the awareness and barriers to financial inclusion among rural youth entrepreneurs. Frequencies and percentages are particularly useful for describing and interpreting categorical and nominal data (Mugenda & Mugenda, 2003), providing a clear and straightforward view of response distributions. In this study, descriptive statistical analysis (frequency and percentage) facilitated the identification of prevalent patterns and trends within the data, offering an accurate and interpretable snapshot of financial inclusion awareness and barriers among rural youth entrepreneurs in the study area.

3. Research Findings

3.1. Sample Characteristics

Table 1 presents the sample profile of youth entrepreneurs included in the survey. Among the sampled rural youth entrepreneurs, approximately 54% were male, while the remaining 46% were female. The average age of the sample population was 23.79 years, aligning with the study's focus on rural youth entrepreneurs. The analysis also reveals that 74% of the rural youth entrepreneurs were married, whereas 26% were either single or divorced. In terms of geographic distribution, the majority of respondents (14.97%, n=97) were from the Mtekente ward, followed by Ndago (14.81%, n=96) and Urughu (14.66%, n=95) wards. Mtoa and Ntwike wards were represented by 13.58% (n=88) and 13.73% (n=89) of the rural youth entrepreneurs, respectively. Regarding education levels, about 29.01% (n=188) of the respondents had completed secondary school, followed by 27.47% (n=178) with primary education. Only 10.19% (n=66) of the sampled rural youth entrepreneurs held at least a bachelor's degree. Lastly, the analysis highlights that a significant majority, 91.67% (n=594), of the respondents engage in both agriculture and livestock activities, while 49.07% (n=318) are involved solely in crop farming. Additionally, 47.69% (n=309) were traders of non-agricultural products, and 45.83% (n=297) traded in agricultural products. Formal sector salaried rural youth accounted for the smallest proportion of the sample, representing only 14.35% (n=93).

Table 1. Summary Statistics of Sampled Respondents (N = 648).

Variables	Mean	Std. Dev.
Age (Years)	23.79	11.03
Gender (Male = 1, Female = 0)	0.54	0.24
Marital status (married = 1; otherwise = 0)	0.74	0.18
Wards (%):		
Mgongo	93 (14.35%)	
Mtekente	97 (14.97%)	
Mtoa	88 (13.58%)	
Ndago	96 (14.81%)	
Ntwike	89 (13.73%)	
Shelui	90 (13.89%)	
Urughu	95 (14.66%)	
Level of Education (%):		
Primary Education	178(27.47%)	
Secondary School	188(29.01%)	
Diploma	123(19.98%)	
Tertiary education	93(14.35%)	
Bachelor Degree +	66(10.19%)	
Revenue generating activity (%):		
Crop farming	318 (49.07%)	
Agriculture and livestock	594 (91.67%)	
Casual labor	203 (31.33%)	

Traders - non-agricultural products	309 (47.69%)
Traders - agricultural products	297 (45.83%)
Service providers	186 (28.70%)
Formal sector salaried	93 (14.35%)
Others	179 (27.62%)

3.2. Sources of Finance for Rural youth Entrepreneurs

Figure 1 illustrates the primary sources of finance for rural youth entrepreneurs in the study area. A substantial proportion of rural youth entrepreneurs, accounting for 50.46%, obtain funds to support their socio-economic and entrepreneurial activities from informal money lenders. This is followed by financial support from family or friends (32.87%), community saving groups (31.48%), and rural credit fund associations (30.56%). These findings align with empirical research by Obiora and Nwokorie (2018) and Panakaje et al. (2023), which identify informal financial services as the main sources of finance for the majority of the rural population, including rural youth entrepreneurs. The study further revealed a limited number of rural youth entrepreneurs with access to formal financial services. For example, bank loans accounted for the least significant source of finance, at only 6.94%, followed by government subsidies (8.33%) and funding from microfinance institutions (12.19%). Other sources included cooperatives or SACCOS (15.28%), religious organizations (13.27%), mobile money (21.45%), salaries from employers (27.16%), and alternative sources (11.11%). Overall, the results indicate limited access to formal financial services for most rural youth entrepreneurs. This state of affairs can be attributed to challenges related to financial inclusion in rural areas, such as restricted access to formal financial services, financial illiteracy, and stringent documentation requirements, as highlighted by Finscope (2023) and Lotto (2018).

Figure 1. Sources of finance for rural youth entrepreneurs (n = 648).

Source(s): Figure by the author.

3.3 Awareness and Use of Financial Services among Rural youth Entrepreneurs

Among its key objectives, the study examines the awareness and use of financial services among rural youth entrepreneurs. Table 2 presents the results of a multiple-response survey conducted to assess this awareness and the usage of both formal and informal financial services. The findings reveal that 100% of the sampled rural youth entrepreneurs are aware of mobile money services and financial assistance from family or friends. However, despite this high level of awareness, only 87.50% of rural youth entrepreneurs effectively use mobile money services, and 59.72% receive financial assistance from family and friends. Furthermore, the results indicate that approximately 96.14% of rural youth entrepreneurs are aware of bank savings accounts, 90.43% are aware of insurance services, 96.91% know about commercial bank services, and 83.02% are aware of community saving groups. Yet, the actual usage of these services is low: only 8.64% use bank savings accounts, 9.41% utilize insurance services, 13.43% use commercial bank services, and 27.01% are members of community saving groups.

Moreover, the findings demonstrate substantial awareness of saving and cooperative societies (SACCOS) at 63.58%, with 36.57% actively using these service, and informal money lenders, where awareness stands at 74.38% and usage at 73.77%. Three financial services were reported both low awareness and low usage. These are capital markets (19.75% awareness and 1.08% usage), prepaid cards (58.02% awareness and 3.55% usage), and online banking services (42.90% awareness and 2.47% usage). Overall, the findings suggest that while the majority of rural youth entrepreneurs are aware of the availability of both formal and informal financial services in their area, a limited number effectively utilize these services. These findings are consistent with reports from Finscope (2023), which also noted the low usage of financial services among rural youth. This situation can be attributed to several factors, including high costs and fees associated with accessing financial services, low income among rural youth, financial illiteracy, cultural and social norms, and a lack of trust in financial institutions, which hinder both awareness and effective use of financial services (Seno and Manda, 2021; Nandi et al., 2022).

Table 2. Awareness and Use-Wise of Financial Services among Rural youth Entrepreneurs (N=648).

Types of financial product/services	Awareness		Use	
	Count	Percent (%)	Count	Percent (%)
Mobile money services	648	100.00	567	87.50
Bank savings account	623	96.14	56	8.64
Insurance services	586	90.43	61	9.41
Pension services	498	76.85	122	18.83
Credit card	387	59.72	52	8.02
Commercial bank services	628	96.91	87	13.43
Prepaid card	376	58.02	23	3.55

Microfinance/microlender services	268	41.36	98	15.12
Online banking service	278	42.90	16	2.47
Capital markets	128	19.75	7	1.08
Business loans	487	75.15	75	11.57
Vehicle/motorcycle loans	437	67.44	86	13.27
Saving and cooperative/SACCOS	412	63.58	237	36.57
Government subsidies	167	25.77	63	9.72
Education loans	366	56.48	103	15.90

3.5 Barriers to Financial Inclusion among Rural youth Entrepreneurs

The study further examines the barriers to financial inclusion faced by rural youth entrepreneurs, identifying eight critical obstacles that impede their effective access to financial services (see Table 3). Among these, unreliable income and irregular cash flow were identified as the top barriers, accounting for 63.63% (n=411) of responses. This was followed by a lack of collateral (59.88%, n=388), ranked second, and lack of trust (58.02%, n=376), ranked third. These findings imply that irregular income streams and stringent collateral requirements pose significant challenges for rural youth entrepreneurs attempting to meet the financial institutions' requirements for loans. Studies by Forkuoh et al. (2015) and Senou and Manda (2021) support these findings, revealing that rural areas are often more susceptible to economic downturns and trust issues, making it riskier for financial institutions to offer services in these areas. In addition, most rural youth rely on unstable income sources, such as small-scale farming, informal trade, and casual labor, which provide minimal financial security (Ahmed et al., 2014; Solanki and Chhikara, 2024).

High costs and fees for securing and repaying loans were ranked fifth, cited by 55.40% (n=359) of the respondents, while documentation requirements ranked fourth, with 56.79% (n=368) of responses. Financial literacy was identified as a barrier by 48.77% (n=316), placing it sixth among critical barriers to financial inclusion. These findings suggest that limited financial knowledge, stringent documentation requirements, and high processing and repayment costs make it difficult for rural youth entrepreneurs to access financial services, especially due to high interest rates on loans. In support of these findings, studies by Lotto (2018) and Kandari et al. (2021) revealed that lacking proper identification documents and proof of address can prevent rural youth from opening bank accounts or accessing financial services. Moreover, high account maintenance fees, transaction charges, and loan interest rates discourage rural youth from utilizing formal financial services, especially when their resources are limited (Mohammed et al., 2020; Ndanshau and Njau, 2021).

Lastly, distance to financial services and religious reasons were identified by 45.99% (n=298) and 42.44% (n=275) of respondents, ranking seventh and eighth, respectively. These findings suggest that financial decision-making among rural youth entrepreneurs is influenced by religious beliefs and limited access to financial services infrastructure. Religious beliefs, in particular, can restrict the financial autonomy of youth entrepreneurs. On the other hand, the lack of physical banking infrastructure forces or otherwise limit rural youth to travel long distances to access financial services. Supporting these findings, Kuada (2021) and Guzman et al. (2020) argue that isolated rural communities often lack connectivity and access to services like mobile or internet banking, making it challenging to access and utilize digital financial tools.

Table 3. Barriers to Financial Inclusion among Rural youth Entrepreneur (N = 648)

Perceived barriers	Count	Percent (%)	Ranking
Distance	298	45.99	7
High costs and fee	359	55.40	5
Document requirement	368	56.79	4
Lack of trust	376	58.02	3
Religious reasons	275	42.44	8
Financial literacy	316	48.77	6
Unreliable income and irregular cash flow	411	63.43	1
Limited collateral	388	59.88	2

Source(s): Table by the author

4. Conclusion and Managerial Implications

This study provides valuable insights into the awareness of and barriers to financial inclusion among rural youth entrepreneurs, highlighting factors that hinder their access to both formal and informal financial services. The findings reveal a high level of awareness among rural youth of financial services such as mobile money, support from family or friends, community savings groups, commercial banking, savings and credit cooperative societies (SACCOs), microfinance services, informal money lenders, and insurance. Despite this awareness, however, actual usage remains low, particularly for formal financial products like bank savings accounts, insurance, and commercial banking services. Key obstacles include unreliable income, stringent collateral requirements, limited financial literacy, and high transaction costs, all of which contribute to the low financial inclusion rate among rural youth entrepreneurs. Additionally, cultural factors such as religious beliefs and the distance to financial institutions further restrict access to essential financial services. These findings underscore the need for tailored financial products and policies that address the unique economic and social conditions of rural youth entrepreneurs, promoting their financial empowerment and, ultimately, their socio-economic development.

In light of the study findings, this research offers actionable insights for financial institutions and policymakers on designing financial services that are more accessible and tailored to the

needs of rural youth entrepreneurs. Specifically, it recommends that financial institutions and policymakers design products with reduced documentation requirements, flexible collateral options, and low transaction costs to encourage greater youth engagement. Offering flexible repayment schedules, lower interest rates, and reduced fees could enhance accessibility and usage of financial services. Moreover, enforcing awareness campaigns focused on improving financial literacy would empower rural youth to make informed decisions about financial products, addressing barriers such as financial illiteracy, awareness gaps, and misconceptions about formal financial services. Furthermore, the government could support the establishment of community-based financial infrastructure or incentivize financial institutions to open branches in underserved regions and provide mobile banking solutions for rural communities. This could be complemented by partnerships with local organizations to build trust in formal financial institutions and align products with cultural norms, enhancing acceptance. Enforcing these insights allows financial institutions to unlock the potential of rural youth entrepreneurs, thereby fostering economic growth and contributing to a more inclusive financial ecosystem.

Apprenticeship Programme on Information Technology Education in Tanzania Higher Education – Training the Trainers

Anna Kayandanda¹ & Mariam Tambwe²

¹College of Business Education, Dar es Salaam, Tanzania

Mariam Tambwe

²College of Business Education, Dar es Salaam, Tanzania

Executive Summary

Background: In Tanzanian higher education institutions (HEIs), trainers play a crucial role in delivering high-quality IT education, which is essential for producing competent graduates. As Information Technology (IT) is a driving force behind national economic development, it is vital to ensure that IT education meets the evolving needs of the modern industry. Effective training for IT educators is key to achieving this goal.

Objective: This study investigates the perspectives of IT education trainers on using apprenticeship programs to enhance their teaching competence within the context of Tanzanian HEIs. It aims to understand how such programs can improve trainers' skills and contribute to more effective IT education.

Methodology: The study employed quantitative research methods to gather comprehensive insights into the perceptions and attitudes of IT education trainers regarding apprenticeship programs in Tanzanian higher education institutions (HEIs). A survey was conducted. Participants in the study were IT education trainers from various Tanzanian HEIs, representing different academic ranks, including Assistant Lecturers, Lecturers, Senior Lecturers, and Professors.

Results: This study noted many IT trainers perceive the current integration of apprenticeship programs as insufficient. There is a notable variation in how well these programs are embedded in the institutions, with some trainers feeling that they are poorly integrated or not present at all. Trainers generally express enthusiasm for participating in apprenticeship programs. Key challenges identified include balancing program participation with existing responsibilities, ensuring program quality and credibility, and addressing financial concerns.

Implications of the study: The study emphasizes the importance of leveraging apprenticeship programs to build a skilled IT workforce, which is crucial for national economic development. The insights gained will help guide the development of more effective and impactful apprenticeship programs in Tanzanian HEIs, ultimately fostering a stronger IT education ecosystem and contributing to economic growth.

1.0 Background

The use of Information Technology (IT) is currently considered as one of the key factors in national economic development (Solomon & Klyton, 2020; Magomedov et al., 2020). Due to

the importance of education to economic growth, it is necessary to make sure that good IT education is provided to meet the needs of the modern industry (Donou-Adonsou, 2019). Based on the National Five-Year Development Plan 2021/22 – 2025/26 (FYDP), the training institutions needs to focus on providing better education so as to provide competent experts which can go along with the national motto; *“Realising Competitiveness and Industrialisation for Human Development”*.

Trainers are the main key on providing a better IT education in the Tanzanian higher education institutions (HEIs). Having well trained trainers is one of the factors to have competent graduates in any profession (Triplett et al., 2020; Hartanti, Yoto, & Nurhadi, 2022). It is therefore important to find out how the IT education trainers in Tanzanian HEIs can be made better on bridging the gap between teaching and practice in IT education so as to provide better experts to support the government in the industrial revolution process.

Different professions have been using the training of trainers’ programmes to have their trainers get better understanding of the real world based on their fields (Olayo et al., 2019). The same can be applied to the IT education in Tanzanian HEIs through the use of apprenticeship programmes. As trainers get equipped with the latest knowledge, skills, and pedagogical methods can more effectively impart quality education, ensuring that graduates are not only knowledgeable but also skilled and ready for the market demands of their chosen fields. The purpose of apprenticeship programmes is to produce practically oriented graduates that meet the job-related competencies required in the labour market, and therefore, the same can be applied to the IT education trainers to make them get updated to the needs of the labour market for better graduate production.

1.1 Statement of the Problem

IT is known to change within a very short time and therefore trainers may get obsolete within a very short time too. According to Suyitno et al. (2022), quality trainers are important for competent graduates and therefore having outdated IT education trainers may become a problem on the production of competent IT experts.

The use of apprenticeship programmes in creating competent trainers has been discussed by different literature (Suyitno et al., 2022), and hence, apprenticeship programmes may also be helpful in ensuring quality IT education trainers in Tanzanian HEIs. Apart from the noted literature on the use of apprenticeship programmes, limited studies exist that examine the use of apprenticeship programmes to improve the competence of IT education trainers in Tanzanian HEIs, and therefore, this study is found important to fill this gap.

This study aims on examining the IT education trainers’ perspectives on the use of apprenticeship programme on improving their competence for better IT teaching process in Tanzanian HEIs context. Specifically, the study aimed at fulfilling the following objectives:

1. To determine the perceptions of the IT education trainers on being trained through the apprenticeship programme for better IT teaching process in Tanzanian HEIs context.
2. To determine the attitude of the IT education trainers towards the training through the apprenticeship programme for better IT teaching process in Tanzanian HEIs context.

This study is found to be very important in finding out the IT education trainers' perceptions and attitudes on the use of apprenticeship programmes to improve their competence and also get their views on how better the programme can be implemented to benefit them. Understanding these can be helpful in creating a better way to provide the IT education trainers with up-to-date knowledge and skills necessary for the production of graduates who can meet the current labour market.

2.0 Literature Review

Waddell, Robinson & Wehbi (2018) proved that there is a need to focus on experimental learning techniques and skills so as to help students become better prepared to overcome the increasingly complex nature of community-based practice settings as they move from their studies to their workplace. But do the IT education trainers have enough skills to train their students to face the reality of the quickly changing complex working environment? According to Mavhunga and Merwe (2020), teachers also need to practice what they theoretically teach in the class so as to know how to better plan and teach their subjects so as to provide the students who will meet the industrial requirements. A study by Kinyaduka (2017) showed clearly that a gap between theory and practice is still a problem in Tanzania, which can be the same as IT education, and hence, a need for more research is required to ensure better production of IT experts.

The use of apprenticeship programmes to bridge the gap between theory and practice through training the trainers is discussed in the literature (Alias, Sofyan, & Triyono, 2020). It is also shown that practice makes perfect (Brady et al., 2018; Mohseni, 2019; Mislan, Wright & Shrewsbury, 2021), which is very important to both IT graduates and IT trainers. The use of an apprenticeship programme to improve IT trainer's competence is important to improve the production of competent IT graduates, as practice makes perfect. Based on the noted importance of the apprenticeship programme in improving IT trainer's competence, this study is important as studies on the use of apprenticeship on Tanzanian HEIs IT trainers are scarce.

3.0 Methodology

3.1 General Research Strategy

The study employed quantitative research methods to gather comprehensive insights into the perceptions and attitudes of IT education trainers regarding apprenticeship programs in Tanzanian Higher Education Institutions (HEIs). A structured survey was used as the primary data collection tool, allowing for the systematic quantification of participants' responses. A sample of 62 Tanzanian IT education trainers was reached. The selection of the participants based on their willingness and ability to participate on the study (Cresswell, 2014; Denscombe, 2010).

3.2 Data Collection

A well structured questionnaire was used. The survey included a range of closed-ended questions designed to assess various aspects of the trainers' perceptions on the apprenticeship

programs, including their perceived value, impact on professional development, and attitudes toward participation. Participants in the study were IT education trainers from various Tanzanian HEIs, representing different academic ranks, including Assistant Lecturers (28), Lecturers (16), Senior Lecturers (15), and Professors (3). The selection of participants aimed to capture a diverse cross-section of educators at different stages of their careers, providing a broad perspective on how apprenticeship programs are perceived across different levels of experience and expertise.

A face to face administration of the questionnaires was done for some respondents while at some point an online questionnaire was used for the distant respondents. A snow ball technique was used to find the relevant respondents.

3.3 Data Analysis

The quantitative data was analysed using SPSS statistical software. Data analysis involved the use of statistical methods to identify trends, compare responses across different academic ranks, and draw conclusions about the overall perceptions on the apprenticeship programs. This approach enabled the study to provide a quantitative assessment of the extent to which these programs are valued by IT educators and their potential impact on teaching effectiveness and professional development.

4.0 Results and Discussion

The study explored the role of apprenticeship programs in IT education within Tanzanian higher education institutions (HEIs), focusing on the perceptions and attitudes of the IT education trainers. The findings provide insights into how different academic positions and career stages influence views on apprenticeship programs.

The results obtained are from the responses collected from a sample of 62 ICT trainers from different Tanzanian HEIs. Table 1 presents the demographic data for the respondents.

Table 1. Demographic data based on Age and Current Position

	Under 30	31-40	41-50	Above 50
Assistant Lecturer	6	13	9	0
Lecturer	0	3	10	3
Senior Lecturer	0	2	8	5
Professor	0	0	0	3

The data reflects a typical academic career progression with younger individuals in junior roles and older individuals in more senior positions.

Assistant lecturers: Mostly in their 30s, with a few in their 40s, indicating they are in the early to mid-career stages. The Assistant Lecturer role includes younger individuals, predominantly

in their 30s, which aligns with the expectation that this role is often filled by those in the early to mid-career stage.

Lecturers: Predominantly in their 40s, with some above 50, reflecting mid- to late-career stages.

Senior lecturers: Most are in their 40s, with a notable number above 50, which may represent more experienced professionals. Lecturers and Senior Lecturers are primarily in their 40s, with some in their 50s, indicating that these roles are held by individuals who have accumulated significant experience.

Professors: All are above 50, which can be considered consistent with the high level of experience required for this role.

In answering the first question on the perceptions of the IT education trainers on being trained through the apprenticeship programme for better IT teaching process in Tanzanian HEIs context, the researchers looked at:

- i. Respondents' perception on the current integration of apprenticeship programs in IT education at respective HEI
- ii. Respondents' perception on the benefits of apprenticeship program for enhancing the IT teaching process
- iii. Respondents' belief on improving their teaching effectiveness in IT through participating in an apprenticeship program.

4.1 Respondents' Perception on the Current Integration of Apprenticeship Programs in IT Education at Respective HEI

The findings reveal a spectrum of views among trainers, reflecting varying degrees of satisfaction and concern about the integration and effectiveness of apprenticeship programs in enhancing IT education. The data indicates a generally negative perception of the current integration of apprenticeship programs into IT education. A significant majority of trainers, across all academic ranks, perceive the programs as either poorly integrated or not integrated at all. For instance, 23 out of 28 Assistant Lecturers and 8 out of 16 Lecturers feel that the integration is poor, while some trainers, particularly Lecturers and Senior Lecturers, believe that these programs are entirely absent from the curriculum. This widespread dissatisfaction suggests that trainers see a disconnect between the potential benefits of apprenticeship programs and their actual implementation within the HEIs. Table 2 represent the obtained results.

Table 2. Perception on the Current Integration of Apprenticeship Programs in IT Education

	Well-integrated	Moderately integrated	Poorly integrated	Not integrated
Assistant Lecturer	0	2	23	3

Lecturer	0	1	8	7
Senior Lecturer	0	1	8	6
Professor	0	0	2	1

The perceived lack of integration of apprenticeship programs has important implications for the IT teaching process in Tanzanian HEIs. Apprenticeship programs are designed to bridge the gap between theoretical knowledge and practical skills, providing trainers with hands-on experience that can be passed on to students. However, the perception that these programs are not well-integrated suggests that trainers may not be fully equipped to deliver practical, industry-relevant IT education. This could hinder the development of a skilled IT workforce in Tanzania, as students may graduate without the necessary practical competencies.

4.2 Respondents' Perception of the Benefits of Apprenticeship Program for Enhancing the IT Teaching Process

The study's findings on the perceptions of IT education trainers regarding the benefits of apprenticeship programs for enhancing the IT teaching process in Tanzanian HEIs reveal varied opinions across different academic ranks. While the overall view is generally positive, the perceived value of these programs appears to diminish with increasing academic rank, suggesting differing needs and expectations among educators at various stages of their careers. Table 3 represent the obtained results.

Table 3 Perception on the Benefits of Apprenticeship Program for Enhancing the IT Teaching Process

	Very beneficial	Beneficial	Slightly beneficial	Not beneficial
Assistant Lecturer	17	10	1	0
Lecturer	8	6	2	0
Senior Lecturer	5	5	5	0
Professor	0	0	2	1

The findings show that, the Assistant Lecturers, who are typically at the early stages of their academic careers, overwhelmingly view apprenticeship programs as highly beneficial. With 17 out of 28 Assistant Lecturers rating these programs as “very beneficial” and another 10 considering them “beneficial,” there is a clear consensus that apprenticeship programs play a crucial role in their professional development. These educators likely value the hands-on experience and practical skills that apprenticeship programs offer, which are essential for building their teaching capabilities and bridging the gap between academic knowledge and industry practice.

Furthermore, while Lecturers and Senior Lecturers still recognize the value of apprenticeship programs, their responses suggest that the basic training offered by these programs may no longer fully meet their professional development needs. Lecturers and Senior Lecturers display more varied perceptions of the benefits of apprenticeship programs. Among Lecturers, 8 out of 16 view the programs as “very beneficial,” and 6 consider them “beneficial”, while a small number (2) see them as only “slightly beneficial”. Senior Lecturers, on the other hand, are evenly split, with 5 finding the programs “very beneficial”, 5 considering them “beneficial”, and another 5 perceiving them as “slightly beneficial”. These mixed perceptions may reflect the evolving needs of educators as they gain more experience and move up the academic ladder. This may imply that, this group might benefit more from advanced or specialized training opportunities that build on the foundational skills gained through apprenticeships.

Moreover, looking on the Professors which is the most senior group of educators, express the least enthusiasm for apprenticeship programs. None of the Professors consider these programs “very beneficial”, and only 2 out of 3 see them as “slightly beneficial”, with 1 viewing them as “not beneficial”. This finding may imply that, the fact that Professors, who are often at the peak of their academic careers, have already accumulated significant practical experience and may feel that apprenticeship programs offer little additional value.

The findings suggest that while apprenticeship programs are generally well-regarded, especially by less experienced educators, there is a need for a more differentiated approach to professional development in Tanzanian HEIs. Institutions should consider tailoring professional development opportunities to the specific needs of educators at different career stages.

4.4 Respondents’ Belief in Improving their Teaching Effectiveness in IT through Participating in an Apprenticeship Program

The data reveals that IT educators in Tanzanian HEIs generally believe that participating in apprenticeship programs would improve their teaching effectiveness. However, the strength of this belief varies across different academic ranks, reflecting the diverse needs and expectations at different career stages. Table 4 represent the obtained results.

Table 4 Belief on improving their teaching effectiveness in IT through participating in an apprenticeship program

	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
Assistant Lecturer	12	15	1	0	0
Lecturer	6	10	0	0	0
Senior Lecturer	6	5	4	0	0

Professor	0	3	0	0	0
-----------	---	---	---	---	---

Assistant Lecturers and Lecturers demonstrate strong support for the idea that apprenticeship programs could enhance their teaching effectiveness. Specifically, 12 out of 28 Assistant Lecturers “strongly agree”, and 15 “agree” with the statement. Similarly, 6 out of 16 Lecturers “strongly agree”, while 10 “agree”.

While Lecturers acknowledge the potential benefits of apprenticeship programs, it may be considered that their more extensive experience in teaching may lead them to consider additional factors, such as the relevance and applicability of these programs to their advanced level of expertise. Among them, 6 “strongly agree”, 5 “agree”, and 4 remain ‘neutral’. The neutrality among some Senior Lecturers may indicate that while they see some value in apprenticeship programs, they might also believe that these programs need to be more tailored to the specific challenges and complexities they face in their teaching roles.

Despite the extensive experience of the Professors, they still recognize the potential benefits of apprenticeship programs, with 3 out of 3 agreeing that such programs could enhance teaching effectiveness. However, none “strongly agree,” which suggests that while they see the value, they do not view these programs as essential to their professional growth.

Generally, the findings reveal that IT education trainers in Tanzanian HEIs generally perceive apprenticeship programs positively, particularly in terms of improving teaching effectiveness. However, their perceptions vary significantly based on their academic rank which indicate that while apprenticeship programs are valued, their impact varies depending on the career stage of the educators.

To answer the second question on the attitude of the IT education trainers towards the training through the apprenticeship programme for better IT teaching process in Tanzanian HEIs context, the researchers looked on:

- i. Respondents’ feelings about participating in an apprenticeship program to enhance their IT teaching skills
 - ii. The extent to which the respondents think an apprenticeship program can contribute to their professional development as IT educators
- I. Respondents’ feelings about participating in an apprenticeship program to enhance their IT teaching skills

The findings of this study reveal varying attitudes among IT educators in Tanzanian HEIs towards participating in apprenticeship programs aimed at enhancing their teaching skills. These attitudes are largely influenced by the educators' academic ranks and levels of experience, highlighting the need for differentiated approaches to

professional development within higher education institutions. Table 5 shows the results.

Table 5 Feelings about Participating in an Apprenticeship Program to Enhance their IT Teaching Skills

	Very enthusiastic	Enthusiastic	Neutral	Unenthusiastic	Strongly opposed
Assistant Lecturer	5	15	5	3	0
Lecturer	0	3	3	7	3
Senior Lecturer	0	1	6	4	4
Professor	0	0	0	0	3

The findings noted that Assistant Lecturers show the highest level of enthusiasm for participating in apprenticeship programs. Out of 28 Assistant Lecturers, 5 are “very enthusiastic,” 15 are “enthusiastic,” and only 3 are “unenthusiastic.” None of the Assistant Lecturers strongly oppose participation.

This strong positive response indicates that Assistant Lecturers view apprenticeship programs as valuable opportunities to develop the practical teaching skills they need to be effective educators. Given their relatively limited experience, they are likely seeking structured support to bridge the gap between theoretical knowledge and practical application in the classroom. The high level of enthusiasm suggests that apprenticeship programs should be prioritized for this group, as they are eager to engage in professional development activities that can significantly impact their teaching effectiveness.

However, Lecturers who are generally more experienced than Assistant Lecturers, present a more varied set of attitudes towards apprenticeship programs. Among the 16 Lecturers surveyed, none are “very enthusiastic”, only 3 are “enthusiastic”, while 3 are “neutral”, 7 are “unenthusiastic”, and 3 are “strongly opposed”. The lack of enthusiasm might indicate that while they recognize the value of professional development, they feel that apprenticeship programs do not adequately address the specific challenges they face at this stage of their careers.

Moreover, Senior Lecturers show even less enthusiasm for participating in apprenticeship programs. Of the 15 Senior Lecturers surveyed, only 1 is “enthusiastic”, while the majority are either “neutral” (6), “unenthusiastic” (4), or “strongly opposed” (4). This trend of growing disinterest with increasing academic rank suggests that as educators gain more experience, they perceive less value in participating in apprenticeship programs designed for general skill enhancement as also noted on the first question on their perception.

As for the Professors, all 3 of them “strongly opposed” to participating, indicating a complete disengagement from these programs.

The findings reveal that while there is general recognition of the potential value of apprenticeship programs, the enthusiasm for participating in such programs decreases with increasing academic rank and experience.

II. The extent to which the respondents think an apprenticeship program can contribute to their professional development as an IT educators

The findings from this study highlight diverse perceptions among IT educators in Tanzanian HEIs regarding the extent to which apprenticeship programs can contribute to their professional development. The variation in responses is largely influenced by the academic rank and experience level of the respondents, revealing how these programs are valued across different stages of an academic career. Table 6 shows the results.

Table 6 The Extent to which the Respondents Think an Apprenticeship Program Can Contribute to their Professional Development

	To a great extent	To some extent	To a limited extent	Not at all
Assistant Lecturer	18	10	0	0
Lecturer	4	7	5	0
Senior Lecturer	4	7	4	0
Professor	0	3	0	0

Assistant Lecturers exhibit the most confidence in the value of apprenticeship programs, with 18 out of 28 respondents indicating that these programs can contribute “to a great extent” to their professional development. The remaining 10 Assistant Lecturers believe the programs can contribute “to some extent”, with none perceiving them as having only limited or no value. This strong positive perception underscores the crucial role apprenticeship programs play for early-career educators. Assistant Lecturers, being relatively new to the teaching profession, are likely seeking opportunities to develop foundational teaching skills, gain practical experience, and apply theoretical knowledge in real-world settings. For them, apprenticeship programs represent a structured pathway to acquire the competencies necessary to excel in their roles.

Lecturers, who are typically more experienced than Assistant Lecturers, show a more varied response. Among the 16 Lecturers surveyed, 4 believe the programs contribute “to a great extent”, 7 believe they contribute “to some extent”, and 5 believe they contribute “to a limited extent”. The mixed perceptions among Lecturers may reflect a

transitional stage in their careers where the relevance of general apprenticeship programs may be diminishing.

Senior Lecturers demonstrate a balanced yet cautious optimism towards the contribution of apprenticeship programs. Of the 15 Senior Lecturers surveyed, 4 believe the programs contribute “to a great extent”, 7 believe they contribute “to some extent”, and 4 believe they contribute “to a limited extent”. Senior Lecturers, who are often well-established in their academic careers, may perceive the benefits of apprenticeship programs as less significant compared to earlier stages in their careers. While some still find value in these opportunities, others may see them as less critical to their ongoing development.

Professors, who represent the most senior group of educators, exhibit the least enthusiasm for apprenticeship programs. Among the 3 Professors surveyed, none believe the programs contribute “to a great extent”, though 3 believe they contribute “to some extent”. The limited perceived value of apprenticeship programs among Professors suggests that these educators, who have already achieved a high level of expertise and professional accomplishment, may not see apprenticeship programs as significantly contributing to their further development.

5.0 Conclusion and Future Work

The design and implementation of an apprenticeship program for IT trainers in Tanzanian higher education institutions (HEIs) offer significant potential for enhancing the quality of IT education.

The varying perceptions across different academic ranks highlight the need for a differentiated approach to apprenticeship programs within Tanzanian HEIs.

For Early-Career Educators: The strong belief in the value of apprenticeship programs among Assistant Lecturers suggests that these programs are vital for helping early-career educators to build a solid foundation in teaching. HEIs should continue to invest in and expand these programs to support the professional development of Assistant Lecturers, ensuring that they receive the practical training necessary to become effective educators.

For Mid-Career educators: The mixed responses from Lecturers and Senior Lecturers indicate a need for more advanced and specialized apprenticeship programs. HEIs should consider developing programs that cater to the specific needs of mid-career educators, focusing on areas such as curriculum innovation, advanced pedagogical techniques, and leadership development.

For Senior educators: The limited enthusiasm among Professors suggests that apprenticeship programs, in their current form, may not meet the needs of the most experienced educators. HEIs should explore alternative professional development opportunities for Professors, focusing on roles that leverage their expertise, such as research leadership, mentoring, and strategic contributions to the institution.

More studies are invited to improve the findings. For future work, it is essential to conduct longitudinal studies to assess the long-term impact of apprenticeship programs on teaching effectiveness and career progression of IT trainers. Pilot programs should be implemented to test and refine the apprenticeship model, and ongoing partnerships with industry stakeholders should be established to keep the programs aligned with current technological and workplace trends. Additionally, exploring advanced technologies and integrating career development support will further enhance the effectiveness and sustainability of these programs. Furthermore, a study would use a mixed-methods, longitudinal design with stratified sampling and triangulation is important. The addition of qualitative data, contextual analysis, and a clarified sampling strategy will address the current study's limitations, providing a deeper, more representative understanding of the research topic. This approach will not only enhance the richness of the data but also strengthens the validity and applicability of the findings.

The study emphasizes the importance of leveraging apprenticeship programs to build a skilled IT workforce, which is crucial for national economic development. The insights gained will help guide the development of more effective and impactful apprenticeship programs in Tanzanian HEIs, ultimately fostering a stronger IT education ecosystem and contributing to economic growth.

Abstract

The study aims to analyze the influence of gender diversity in top-level management (including women directors, women in audit committees, and women in executive management) on the financial performance, measured by Return on Assets (ROA), of 17 financial firms listed on the Nairobi Securities Exchange (NSE) in Nairobi, Kenya. The secondary data, sourced from annual reports and audited financial statements covering seven years (2016-2022), resulted in a balanced panel dataset of 119 firm-year observations. The research utilized fixed effect panel regression to test hypotheses and employed the Two-stage Least Squares method for robust testing. The results reveal that both women in audit committees and in executive management had a significant negative impact on ROA. These results indicate that higher representation of women in audit committees and executive management positions decreased the financial performance of listed financial firms in Kenya.

Keywords: *Gender diversity, financial performance, agency theory, upper echelons theory*

1.0 Introduction

Gender diversity within a firm's leadership and governance structures has gained significant attention due to its impact on key performance metrics such as Return on Equity (ROE) and Return on Assets (ROA). The effect of board diversity on organizational performance has continued to be scrutinized by policymakers, non-governmental agencies, and academic communities (Singh et al., 2023; Wang, 2020)

Globally, the relationship between gender diversity and firm performance has produced mixed results, reflecting the complexities of this issue across various contexts. Studies suggest that having women on corporate boards can lead to improved financial outcomes. For example, Alvarado et al. (2017) found that gender-diverse boards positively affect ROE and ROA through enhanced risk management and governance practices in Spain. McGuinness et al. (2017) reported that board gender diversity in China improves Corporate Social Responsibility

(CSR), which in turn positively influences financial performance. Similarly, Mvita and Du Toit (2024) in South Africa and Owen and Judit (2018) in Europe found positive correlations between board diversity and financial performance metrics such as ROE and ROA. However, a systematic review by Herrera-cano et al. (2019) across 28 countries found no significant correlation between board gender diversity and financial performance, indicating that the impact of female directors may be influenced by additional factors such as firm size and industry type.

The influence of women in audit committees also shows notable positive effects on financial performance. Ahmed et al. (2024) in Egypt demonstrated that gender diversity within audit committees positively impacts ROA and ROE, and Al Lawati et al. (2021) found that women in audit committees enhance the quality of financial disclosure. Research by Ibrahim et al. (2019) in Kenya and Wang (2020) in Taiwan supports these findings, showing that female audit committee members contribute to better corporate governance and financial performance through increased transparency and accountability. In terms of executive management, Flabbi et al. (2019) found that female executives in European banks foster inclusivity and collaboration, leading to improved ROE and ROA. Leyva-townsend et al. (2021) observed that women in executive roles in Latin America implement sustainability and CSR strategies that enhance ROE and ROA. However, studies such as Hamdani et al. (2022) and Buchdadi et al. (2023) found no significant or even negative effects of female executives on bank performance, suggesting that outcomes can vary significantly across different contexts.

In the African context, the impact of gender diversity on bank performance shows a blend of positive and inconclusive results. Research in Nigeria by Onyekwere et al. (2019) found that women in executive roles positively impact ROE and ROA through improved risk management and strategic initiatives. Similarly, Assenga et al. (2018) reported that gender diversity positively influences financial performance in Tanzanian firms. However, Magoma and Ernest (2023) observed that while women directors had a positive effect on financial performance, this impact was statistically insignificant for ROE and ROA, highlighting the complexity of these relationships in the banking sector.

The role of women in audit committees in Africa mirrors the positive impacts seen globally. Ibrahim et al. (2019) found that female audit committee members in Kenya strengthen internal controls and reduce financial misstatements, thereby improving ROE and ROA. These findings align with those from other regions, suggesting that gender diversity in audit committees could also be beneficial for African banks. In executive management, the positive effects of gender diversity are evident. Delgado-márquez and Castro (2017) in Colombia and Moreno-g et al. (2018) in Brazil found that women in executive management roles positively impact firms' performance. This aligns with findings from other regions, indicating that female executives can contribute positively to firm performance.

Despite extensive research on the importance of gender diversity in corporate leadership, the impact of such diversity on financial performance remains inconclusive and varies across different countries. While some studies have reported positive correlations between gender

diversity and financial metrics like Return on Equity (ROE) and Return on Assets (ROA) (Alvarado et al., 2017; McGuinness et al., 2017), others have observed negligible or even negative effects (Buchdadi et al., 2023; Hamdani et al., 2022). In the African financial sector, this evidence is equally mixed. (Assenga et al., 2018; Ibrahim et al., 2019; Magoma and Ernest, 2023; Onyekwere et al., 2019). This variability highlights the complexity of the relationship between gender diversity and financial performance and suggests that regional, cultural, and organizational factors may significantly influence these outcomes.

Given the importance of gender diversity initiatives and their potential impact on financial performance, there is a critical need for a thorough examination of these dynamics within the African context. The existing literature lacks comprehensive studies specifically addressing the impact of gender diversity on the financial performance of listed financial firms in Kenya. In an emerging economy like Kenya where socio-economic and cultural factors may shape the opportunities available to women and the dynamics within corporate leadership, understanding how gender diversity influences firm performance is essential. The absence of targeted research hinders policymakers and financial institutions from making informed decisions that could enhance both inclusivity and profitability in the sector. This paper aims to address this gap by analyzing the effect of gender diversity at the top management level (board of directors, audit committee, and senior management team) on the financial performance of 17 listed financial firms at the Nairobi Securities Exchange from 2016 to 2022. This study will provide a comprehensive assessment of how the presence of women in these key leadership roles impacts the ROA of listed financial firms in Kenya.

This paper contributes to advancing knowledge on the relationship between gender diversity and financial performance, particularly in under-researched contexts in the wider geographical scope of Kenyan-listed financial firms over seven years (2016-2022). This paper fills a critical gap in the existing literature by focusing on the impact of gender diversity in key leadership roles on the financial performance of listed financial firms in Kenya. While global research has extensively documented the positive effects of gender diversity on corporate performance, there is a scarcity of studies that examine these dynamics within the specific socio-economic and cultural contexts of African countries such as Kenya. By providing empirical evidence from seven years (2016-2022), this research will offer new insights into how gender diversity influences Return on Assets (ROA) in Kenya. These insights will enrich the global discourse on gender diversity in corporate governance by introducing an African perspective, which is often underrepresented in existing studies. Furthermore, the paper used a multi-theoretical approach by utilizing two theories namely the Agency Theory (AT) and the Upper Echelons Theory (UET). Finally, a robust test was done by using a Two-stage least square (2SLS) method. The latter method was used to address the issue of endogeneity present in the panel dataset.

1.2 Agency and upper-Echelon Theories

Agency theory (AT) explores the relationship between principals (e.g., shareholders) and agents (e.g., firm executives) and emphasizes the need for effective oversight to ensure that

agents act in the best interests of the principals. (Jensen and Meckling, 1976). In the context of financial firms, where governance challenges may be more pronounced due to various socio-economic factors, the introduction of gender diversity in leadership can play a crucial role in mitigating agency problems (Adams and Ferreira, 2009). Women directors and executives are often seen as bringing fresh perspectives and a heightened sense of responsibility, which can lead to more rigorous monitoring of management and better alignment of the firm's actions with shareholder interests. This enhanced governance can result in improved financial performance, as evidenced by higher ROE and ROA (Adams and Ferreira, 2009).

Upper echelons theory (UET) posits that the characteristics of top-level executives—such as their cognitive abilities, values, and experiences—significantly influence strategic decisions and organizational outcomes. (Hambrick and Mason, 1984). In the financial sector, where markets are often characterized by volatility and rapid change, the presence of women in leadership roles can add valuable diversity of thought and approach. This diversity can lead to more innovative strategies, better risk management, and a deeper understanding of customer needs, all of which are crucial for maintaining and improving financial performance (Post and Byron, 2015). The unique challenges faced by financial firms, including regulatory environments, market dynamics, and cultural factors, make the inclusion of diverse perspectives particularly beneficial. The diverse executive teams can develop more effective strategies to navigate these challenges, ultimately contributing to better organizational performance.

1.3 Women in Executive Management and Firm Performance

According to a study conducted in India by Gupta and Mahakud (2020) there are relatively few women in top positions, which might be attributed to the perception that women are inadequate for managing complex institutions like financial firms. However, the study by Moreno-g, et al. (2018) found that gender diversity in top management teams positively impacts the business performance of Colombian public companies, particularly when measured using ROA. Similarly, previous research conducted in Colombia by Delgado-márquez and Castro (2017) and in Brazil by (Moreno-g et al. (2018) indicated that women in executive management roles positively influence firms' performance. Other studies revealed a positive relationship between women in executive management and firm performance (Cambrea et al., 2018; Flabbi et al., 2019; Leyva-townsend et al., 2021). On the contrary, a study conducted in Indonesia revealed that women in executive positions exerted a negative and significant influence on ROA (Hamdani et al., 2022). According to Magoma and Ernest (2023), they found that women in executive positions in Tanzania exhibited a negative and statistically significant impact on ROA and ROE as financial performance metrics.

H1: Women in executive management negatively influence the firm's performance

1.4 Women in Audit Committees and Firm Performance

It has been established that an audit committee plays a crucial role in safeguarding shareholders' wealth and protecting the rights of other stakeholders. The study by Ahmed et al. (2024) in Egypt revealed that gender diversity within audit committees has a significant positive impact on financial performance metrics such as Return on Assets (ROA) and Return on Equity (ROE). Additionally, the study found that when gender diversity is used as a moderating variable, it generally enhances the positive relationship between audit committee characteristics and financial performance. Similarly, Al Lawati et al. (2021) found that the presence of women in audit committees improves the quality of financial disclosure. The findings of Ashari and Krismiaji (2020), also indicated a positive relationship between female directors on audit committees and firm performance, highlighting the influence of gender diversity on organizational success.

Additionally, other empirical studies support the notion, that women on the audit committee play a pivotal role in enhancing firm performance (Ashari and Krismiaji, 2020; Elbahar et al., 2021). A study conducted in Kenya demonstrated that the inclusion of women in audit committees strengthens internal controls and reduces financial misstatements, thereby improving both ROE and ROA (Ibrahim et al., 2019). Similarly, another study observed that women in the audit committees enhance corporate governance and financial performance leading to improved ROE and ROA through increased transparency and accountability. (Wang, 2020). Empirical studies have revealed that gender diversity within oversight committees like the audit committee can provide a broader perspective, improve the quality of supervision, and positively influence the corporate decision-making process (Aldamen et al., 2018; Mustapha et al., 2020)

H2: Women in the audit committee negatively influence the firm's performance

1.5 Women Directors and Firm Performance

Studies consistently demonstrate that the presence of women on corporate boards is linked to improved financial outcomes. Diverse boardrooms are better equipped to develop comprehensive corporate strategies, effectively implement governance practices, and manage a variety of risks that companies may face (Song et al., 2020). For instance, a study conducted in Colombia involving 45 companies listed on the Colombia Stock Exchange utilized panel data regressions to reveal that the participation and presence of at least one woman on the board of directors positively influence the financial performance of listed companies, as measured by Return on Equity (ROE) (Leyva-townsend et al., 2021).

Similarly, other empirical studies have shown that board gender diversity significantly and positively impacts firm performance. (Brahma et al., 2020; Kabara et al., 2022; Yilmaz et al., 2021). Another study argued that gender-diverse boards positively affect ROE and ROA through improved risk management and ethical considerations (Alvarado et al., 2017). Furthermore, other empirical studies conducted in China and Australia revealed that the presence of women in the boardroom is positively linked to corporate social responsibility (CSR), and CSR is positively linked to firm performance as measured by ROE (Galbreath,

2018; McGuinness et al., 2017). The latter studies suggest an indirect effect of the presence of women directors on board and firm performance.

In contrast, a study conducted in Tanzania revealed that the presence of women directors had a positive influence on firm performance, the effect was statistically insignificant as measured by ROA and ROE. (Magoma and Ernest, 2023). The relationship between board gender diversity and firm performance is complex and influenced by both internal and external factors. A systematic review and meta-analysis conducted across 28 different countries found no significant correlation between the number of women in the boardroom and firm performance. (Herrera-cano et al., 2019). Other empirical studies showed women directors on board did not impact the firm performance (Alshirah et al., 2022; Singh et al., 2023)

H3: Women directors positively influence the firm's performance

2. Methods

2.1 Data and Sample

The research is based on quantitative methodology mainly focusing on archival research and the technique of documental analysis similar to a previous study conducted by (Ribeiro et al., 2024). The study targets listed financial firms at the NSE as the study population. NSE was purposively selected as it is the largest stock market in East Africa and ranked 8th in Africa with a market capitalization of \$9.57 billion as of December 2023 (Olujinmi, 2023). The study period spans from 2016 until 2022 (7 years period). The study period was ideal since it was in 2015 that the Sustainable Development Goals (SDGs) were agreed upon amongst the world leaders in the quest to create a better, fairer world by 2030 (Magoma et al., 2024). This study focuses on SDG goal 5 (gender equality) by analyzing the impact of women in executive management, women directors, and women in audit committees on financial performance as measured by the ROA of 17 listed financial firms at NSE. Table 1 shows the sample selection.

Table 1: Sample of Listed financial firms

Description	Number of Listed Firms
Total number of Firms listed on the NSE	67
Non-financial sector	(43)
Incomplete annual reports	(7)
Final Sample	17
Period (2016-2022)	7 years
Firm-year observations	119

2.2 Data Source

Secondary data were obtained from annual reports and audited financial statements from listed financial firm's official websites.

2.3 Variable measurement and operationalization

Table 2: Variable summary and measurement

Variables	Acronym	Variable type	Measurement	Previous studies	Source
Corporate performance	ROA	Response (RV)	Net Income/ Total Assets	(Benaguid et al., 2023; Nuber and Velte, 2021; Roziq and Ilma Ahmad, 2024)	Financial statements

2.4 Specification of the Regression Model

This study adopted a balanced panel data regression model. The panel data technique involves selecting a suitable estimation method between fixed effect and random effects; thus, the study used the Hausman test to choose between the fixed and random effect models. A correlation matrix was used to test the existence of multicollinearity between variables.

The panel regression model is seen below;

$$CP_{it} = \beta_0 + \beta_1 EV_{it} + \beta_2 FCV_{it} + \beta_3 BCV_{it} + \beta_4 ICV_{it} + \varepsilon_{it} \dots \dots \dots \text{Eqn 1}$$

Whereby the study has one response variable (RV)

- CP_{it} represents corporate performance as measured at a t time (ROA)

The explanatory variables (EVs) are women in executive positions, women in the audit committee, and women directors measured at a t time

Finally, the control variables (CVs) are classified into three categories;

- Board control variables (BCVs) represented by the board size, board meetings, audit committee size, and audit committee meetings measured at a t time.
- Firm control variables (FCVs) represented by capital adequacy, leverage, and firm size measured at a t time.
- Industry control variables (ICVs) represented by inflation rate and GDP measured at a t time.

β_0 = constant term

ε_{it} = Error term

3. Results

3.1 Descriptive Statistics and Multicollinearity Phenomenon

Table 3 presents the descriptive statistics and multicollinearity phenomenon for a sample of 17 listed financial firms at NSE in Kenya for seven years, from 2016 to 2022. The study analyzed the impact of women in top management and firm performance as measured by ROA. The descriptive statistics revealed the minimum value, maximum value, mean, and standard deviation of variables such as ROA, women directors, women in audit committees, women in executive management, board size, board meetings, firm size, leverage, capital adequacy, inflation, Gross Domestic Product, audit committee size, and audit committee meetings. These statistics were collected to understand the variation and distribution of different variables used in this study.

Additionally, the multicollinearity problem was absent from the data as the variance inflation factor (VIF) value was below 10 and the tolerance (1/VIF) value was above 0.1 as suggested by (Chu, 2020). A similar approach for testing the multicollinearity phenomenon was done by studies such as (Kimario and Mwagike, 2023; Magoma et al, 2024; Magoma et al., 2022; Magoma et al., 2022; Mwakyeja and Kimario, 2024)

3.2 Correlation analysis

Table 4 presents the correlation matrix of the study. The response variable (ROA) is negatively related to women directors, women in audit committees, women in executive management, board size, leverage, inflation, and audit committee size. Furthermore, ROA is positively related to board meetings, audit committee meetings, firm size, capital adequacy, and GDP.

3.3 Panel regression results

Table 5 presents the regression results of the study. The Hausman test results reveal that the chi-square value is 11.49 and the p-value less than 5% suggesting that the fixed effect model is the best option over the random effect model. Additionally, the R-square value is 43% and the probability of F-statistics is 0.001798 less than 5% suggesting that the model is fit and statistically significant. The test of autocorrelation reveals that the data were free from autocorrelation as the Durbin-Watson test value was 2.11. Data were free from autocorrelation if the Durbin-Watson value is above 1.5 and less than 2.5 as suggested by other empirical studies (Magoma et al., 2024; Magoma et al., 2022; Nuber and Velte, 2021).

Furthermore, the results reveal that the coefficients of WEM and WAC are negative -0.998 and -1.1072 respectively both with significant impact on ROA. WD exerted a positive coefficient (0.368) with an insignificant impact on ROA. Other variables exerted an insignificant impact on ROA with negative and positive coefficients such as CA (-0.081), ACS (-0.057), ACM (2.031), BM (-0.048), FS (-0.05365), BSIZE (-0.8568), GDP (0.1069), INFL (-0.3744), LEV (-0.075).

3.4 Robustness analysis

Two Stage Least Square Method (2SLS) was used for robust testing. The results reveal that FE and 2SLS methods yield the same results (see Table 5). Reliability and validity of data are ensured if different analysis methods are used yielding similar results (Hordofa, 2023). Thus, the study results reveal that the reliability and validity of the sourced data are ensured.

4.0 Discussion of the Findings

4.1 Women in Executive Management

The proportion of women in executive management exhibited a negative and significant influence on firm performance as measured by ROA. Thus, H1 is accepted. The results are consistent with a study conducted in Indonesia (Hamdani et al., 2022) and contrary to other empirical studies that showed women in executive positions exerted a positive and significant influence (Cambrea et al., 2018; Flabbi et al., 2019; Leyva-townsend et al., 2021). Agency theorists argue that women in top management bring fresh perspectives to the decision-making process and this leads to more rigorous monitoring of management behavior resulting in improved financial performance (Adams and Ferreira, 2009). Additionally, Upper echelons theory posits that women at top management levels possess cognitive abilities, values, and experiences that play a pivotal role in influencing a firm's strategic directions and organizational performance (Hambrick and Mason, 1984). From this premise, it is obvious that the results are contrary to what has been advocated by the agency and upper echelons theories.

4.1.2 Women in Audit Committee

Women in audit committee play a vital role in safeguarding shareholder's interest but the study results reveal that the proportion of women in the audit committee had a negative and significant impact on financial performance as measured by ROA. Thus, H2 is accepted. The results are contrary to the results from other empirical studies such as (Al Lawati et al., 2021; Ashari and Krismiaji, 2020). The results are inconsistent with agency and upper echelons theories that argue that the presence of women on the audit committee improves a firm's financial performance. Thus, the results imply that the proportion of women in the audit committee decreased firm performance as the variable exerted a negative and significant effect on listed financial firms' performance.

4.1.3 Women directors

The study reveals that the proportion of women directors positively and insignificantly impacted ROA. Thus, H3 is rejected. The results are inconsistent with other empirical studies (Brahma et al., 2020; Kabara et al., 2022; Yilmaz et al., 2021). Both agency and upper-echelon theories contend that women directors on the board improve the firm's financial performance. Thus, the results are inconsistent with both agency and upper echelons theories.

4.2 Limitations of the study and areas for further studies

This study has some visible limitations. First and foremost, the data used in this study were sourced from 17 listed financial firms at NSE. Thus, it is difficult to generalize the findings of this study. The researcher suggest that future studies should use a mixed approach

incorporating both quantitative and qualitative research methods. The study only focused on influence of women on board, audit committee, and senior positions of 17 listed financial firms in Kenya. Future studies should assess the impact of women in the firm's committees such as audit and risk committee, nomination committee, and remuneration committee and firm performance across listed financial firms in East African stock markets. Lastly, the study used only one accounting metric for measuring performance (ROA). Future studies can examine the impact of women in top management positions and the financial performance of listed banks across the African stock markets by using market-based financial metrics (Tobin's Q).

5. Conclusion, implications, and area for further studies

5.1 Conclusion

The study aimed to assess the impact of gender diversity on top-level management and financial performance of 17 listed financial firms at NSE. The results reveal that both women in audit committees and in executive management had a significant negative impact on ROA. These results indicate that higher representation of women in audit committees and executive management positions decreased the financial performance of listed financial firms in Kenya.

5.2 Implication of the study

The implication of this study affects both the academia and the practitioners. Academics such as researchers can use the findings of this research to do more research related to the impact of women on board and those on senior management on corporate outcomes such as financial performance. To the practitioners, these findings can serve as a wake-up call on what affects the financial performance viewed from a corporate angle.

¹College of Business Education, Mbeya Campus

²College of Business Education, Mwanza Campus

Abstract

In a digitally evolving and competitive business environment, start-up micro, small, and medium-sized enterprises (MSMEs) encounter various dynamics that shape their profitability and sustainability. This research synthesises existing literature published between 2010 and 2023 to explore and identify the key dynamic skills that drive start-up MSMEs' profitability and long-term sustainability. A comprehensive search was conducted across Scopus, Web of Science, Google Scholar, and Emerald databases. Selected articles were categorised, and the key themes related to dynamic skills were extracted and analysed. The review identifies nine

key dynamic skills essential for start-up MSMEs' profitability and long-term sustainability. These include sales and marketing, customer service, networking and industrial relationships, negotiation, financial management, cross-cultural communication, leadership and problem-solving, digital fluency, and entrepreneurial skills. These competencies enable MSMEs to navigate the challenges of the digital era, maintain a competitive advantage, and achieve long-term sustainability. The study findings provide valuable insights for entrepreneurs, policymakers, and support organisations. By focusing on developing dynamic skills, start-up MSMEs can enhance their resilience and adaptability in a rapidly changing and competitive business environment. Policymakers and support organisations can also use these results to design programs that address the specific needs of MSMEs. Empirically, the study contributes to the existing literature by offering a comprehensive understanding of the skill sets required for the sustainable growth and success of MSMEs. It also provides a foundation for future research and practice in this research domain.

Keywords: *dynamic skills, profitability, competitiveness, sustainability, MSMEs.*

1. Introduction

The entrepreneurship landscape has undergone significant transformation in recent years, with the rise of micro, small, and medium enterprises (MSMEs) playing a pivotal role in driving economic growth and development. MSMEs are crucial to global economies, contributing to job creation, fostering innovation, and diversifying economies (Aggarwal and Joshi, 2024; Krishnan et al., 2020). According to the World Bank (2022), MSMEs comprise approximately 90% of global businesses and account for about 50% of global employment. In emerging economies, particularly in Sub-Saharan Africa, MSMEs comprise 95% of formal companies, accounting for 65% of employment and contributing up to 50% of gross domestic product (GDP) (World Trade Organization (WTO), 2020; World Bank, 2022). Despite their agility, innovative approaches, and dynamic nature, MSMEs face several challenges, including intense competition, limited access to financial resources and initial capital, and market reach. Other challenges include stringent regulatory and compliance requirements, economic volatility, lack of access to expertise and skilled personnel, and difficulties in keeping pace with rapidly evolving technologies and market conditions (Ama & Okurut, 2017; Israel and Kazungu, 2019; Harvie, 2019). These obstacles not only hinder the economic and operational performance of MSMEs but also constrain their ability to leverage their capabilities for sustainable and inclusive growth.

Given the crucial roles that MSMEs play in economies and the challenges they face, various initiatives have been implemented across different countries to support the growth of start-up MSMEs. These initiatives involve a combination of regulatory and policy reforms, financial support and access to credit, capacity-building programs, strategic partnerships, and market access facilitation (Nzumbi and Misungwi, 2019; Wu et al., 2020). Among these initiatives, the North American Free Trade Agreement (NAFTA), the African Continental Free Trade Area (AfCFTA), and the European Union's single market provide MSMEs with access to larger markets and more opportunities for cross-border trade by reducing trade barriers and nurturing

strategic partnerships among member countries. Similarly, countries like China, Vietnam, Japan, Kenya, Tanzania, Nigeria, and South Africa have established industrial parks and special economic zones, such as export processing zones (EPZs) to enhance MSME operations. These parks offer MSMEs tax incentives, logistical support, market information, networking opportunities, and financial and technical assistance (Kumburu et al., 2021; Wu et al., 2020). Other initiatives include the establishment of small business development agencies such as the Small Industries Development Organization (SIDO) in Tanzania, the Small Business Administration (SBA) in the United States, and the Micro Units Development and Refinance Agency (MUDRA) in India. These agencies are tasked with providing entrepreneurship education, mentorship, and advisory services, and helping MSMEs access financial services (Nag and Das, 2015; Israel, 2022).

One of the primary objectives of start-up MSMEs, aligned with various support programs and initiatives, is to achieve profitability and ensure long-term growth amidst fierce competition and evolving market changes (Kawira et al., 2019; Sitaniapessy et al., 2022). However, despite these clear objectives and initiatives, the financial performance and sustainability of MSMEs, particularly start-ups, remain far from flawless. Many MSMEs exhibit significant deficiencies related to their operational, economic, and financial sustainability. A survey by the World Bank (2022) reveals that only 40% of start-up MSMEs are financially stable enough to manage and meet their financial liabilities. Consequently, the remaining 60% face financial crises, struggle to meet their financial obligations and often experience a decline within six months of establishment. These shortcomings result in job losses, economic stagnation, and persistent poverty. Given these encounters, it is evident that achieving profitability and long-term growth requires more than just innovative strategies; it also depends on the dynamic capabilities of managers and employees. This underscores the critical need to cultivate and apply dynamic skills that empower entrepreneurs to anticipate and respond effectively to market dynamics, capitalize on emerging opportunities, overcome challenges, and drive the profitability and long-term growth of start-up MSMEs (Nehete et al., 2011; Palakshappa & Ellen, 2007).

Essentially, dynamic skills encompass a broad range of competencies, including adaptability, innovation, problem-solving, strategic agility, and resilience, all of which are essential for navigating the complexities of the modern business environment. Other critical skills include fluency in financial management, negotiation, digital technologies, and cross-cultural communication. While there is substantial empirical research on the firm and industry dynamics necessary for the success of MSMEs (Odhiambo, 2013; Sreenivasan et al., 2023; Utama et al., 2024; Zamora, 2010), there remains a notable gap in comprehensive systematic literature reviews that specifically examine the dynamic skills driving the profitability and long-term sustainability of start-up MSMEs. This study addresses this gap by systematically reviewing and synthesizing existing literature to identify and evaluate the critical dynamic skills that influence both the profitability and long-term sustainability of start-up MSMEs. In doing so, this study contributes to the existing literature by offering a comprehensive understanding of the specific skill sets essential for MSME success in an increasingly digital and competitive environment. In addition, the study provides practical recommendations for

entrepreneurs, policymakers, and support organizations on how start-up MSMEs can leverage their dynamic skills to navigate and thrive in a rapidly evolving business environment. More importantly, the study identifies potential areas for future research, encouraging more targeted studies on the relationship between dynamic skills and MSME performance in various global contexts.

2. Literature Review

2.1. Start-up MSMEs

Start-up MSMEs are newly established businesses that fall within specific thresholds related to their workforce, revenue, or asset base. These thresholds vary depending on the country, region, geographical location, or industry. For example, in the USA, the Small Business Administration (SBA) defines MSMEs as businesses with employees fewer than 500 (Crane, 2020). In India, MSMEs are companies with up to 200 employees, investing in plant and machinery or equipment not exceeding INR 50 crore (approximately \$6.75 million), and having an annual turnover of less than INR 250 crore (approximately \$33.75 million) (Singh, 2019). In the EU, MSMEs are defined as businesses with less than 250 employees and an annual turnover of no more than €50 million or a balance sheet total of no more than €43 million (Ancarani et al., 2019). In many African countries, particularly in Tanzania, Ghana, and Kenya, MSMEs are defined as businesses with up to 99 employees, with varying annual revenue thresholds depending on the country (Kawira et al., 2019). In South Africa, MSMEs are companies with up to 250 employees and an annual revenue of up to R220 million. In Latin America, particularly in Brazil, MSMEs are defined as businesses with annual revenue between R\$4.8 million and R\$30 million (approximately \$930,000 to \$5.8 million) (Flores et al., 2022). These variations in the definitions of MSMEs across countries and regions reflect the different economic conditions and policy objectives of each country.

2.2. Key Dynamics for Profitability and Long-Term Sustainability of Start-ups MSMEs

Across the globe, MSMEs face various dynamics that either facilitate or impede their economic success and sustainability. Among these dynamic factors, Harvie (2019) and Odhiambo (2013) opine that access to finance and capital, including loans and grants, is essential for start-up MSMEs to invest in growth opportunities, manage cash flow, and scale their operations. Conversely, limited access to finance can constrain a start-up's ability to expand, negatively affecting both profitability and long-term sustainability. Other studies by Taleb et al. (2023) and Ama and Okurut (2017) highlight the critical role of innovation in driving the growth and sustainability of businesses over time. Continuous innovation enables MSMEs to create novel products, services, or processes, allowing them to differentiate themselves in the market, stay ahead of competitors, and meet evolving customer needs. Furthermore, nurturing strong industry relationships can provide start-up MSMEs with valuable resources, knowledge, and opportunities that are essential for immediate profitability and future growth (Ghauri and Elg, 2018; Fjeldstad et al., 2012). Also, Mwenda et al. (2023) emphasize the importance of compliance with legal and regulatory requirements, such as taxation, labour laws, industry standards, and environmental practices, in supporting the long-term sustainability of start-ups.

Compliance ensures that the business operates within the legal framework, avoiding penalties and reputational damage.

Moreover, the ability to proactively identify, assess, and mitigate risks can help start-ups maintain stable operations, contributing to long-term sustainability and consistent profitability (Das, 2015). Apart from this, empirical studies by Zamora (2010) and Abaddi (2024) emphasise the importance of leveraging technological advancements to enhance efficiency, expand market reach, and improve customer interactions. This not only boosts profitability but also positions the business to remain competitive and sustainable over time. Furthermore, Israel (2022) argued that the profitability and long-term sustainability of start-up MSMEs are heavily influenced by the level of competition in the industry. High competition can drive MSMEs to innovate, improve quality, and reduce prices. For start-up MSMEs, intense competition can squeeze profit margins and challenge sustainability, especially due to their limited resources (Sari and Sari, 2022). Similarly, the ability to reach and serve wider target markets, both locally and internationally, is crucial for the growth of start-up MSMEs (Jeong and Chung, 2023; Kawira et al., 2019). Expanding market access drives sales and business expansion. On the contrary, limited market access, attributed to geographic diversity, logistical and communication challenges, regulatory barriers, or economic downturns can restrict growth opportunities and negatively impact long-term sustainability. By addressing and optimizing these dynamic factors, start-up MSMEs can build a strong foundation for enduring success in a competitive and digitally evolving business environment.

2. Review Methodology

This study employed a systematic literature review (SLR) to identify, analyse, and synthesise existing research on the dynamic skills essential for start-up MSMEs' profitability and long-term sustainability. To achieve the objectives of the review, data were collected from peer-reviewed journal articles. The articles selected for review were extracted from online databases, including Scopus, Web of Science, Google Scholar, and Emerald. These databases were chosen because they are highly regarded scientific resources, offering a wide range of peer-reviewed articles (Chhatoi et al., 2021). The review focused on relevant articles published between 2010 and 2023, following pre-determined inclusion and exclusion criteria (see Table 1) to ensure an emphasis on recent developments in digital transformation and the evolving competitive business environment.

Table 1. Parameters for inclusion and exclusion criteria

S/N.	Parameters	Inclusion criteria	Exclusion criteria
1	Focus	Articles that focus on skills relevant to MSMEs, their profitability and sustainability	Studies that do not focus on dynamic skills or are unrelated to MSMEs, profitability, and sustainability
2	Period	Articles must have been published between the year 2010 and 2023	Articles published before 2010 or after 2023

3	Types of articles	Peer-reviewed journal articles, conference papers, review articles, book chapters, reports, and policy briefs	Non-peer-reviewed articles, opinion pieces, editorials, or non-academic publications.
4	Language	Articles must be available in English	Articles not published in English.

To ensure comprehensive coverage of relevant articles, the search string was formulated using Boolean operators with combinations of keywords related to dynamic skills, MSMEs, profitability, sustainability, the digital era, and the competitive business landscape. The complete search string used in Scopus, Web of Science, Google Scholar, and Emerald was: ("dynamic skills" OR "dynamic capabilities") AND ("profitability" OR "long-term sustainability" OR "competitive advantage" OR "business growth") AND ("start-up" OR "MSMEs" OR "small and medium enterprises" OR "micro-enterprises") AND ("digital era" OR "digital transformation" OR "technology adoption" AND "competitive business landscape" OR "profitability" OR "sustainability" OR "business growth" OR "competitive advantage" OR "long-term sustainability"). Based on this search, 4,654 articles were identified. Of these, 46 articles met the inclusion criteria and were included in the review. The search was conducted between 20th and 25th February 2024. Figure 1 presents a flow diagram that visualizes the process of selecting articles for inclusion in this review.

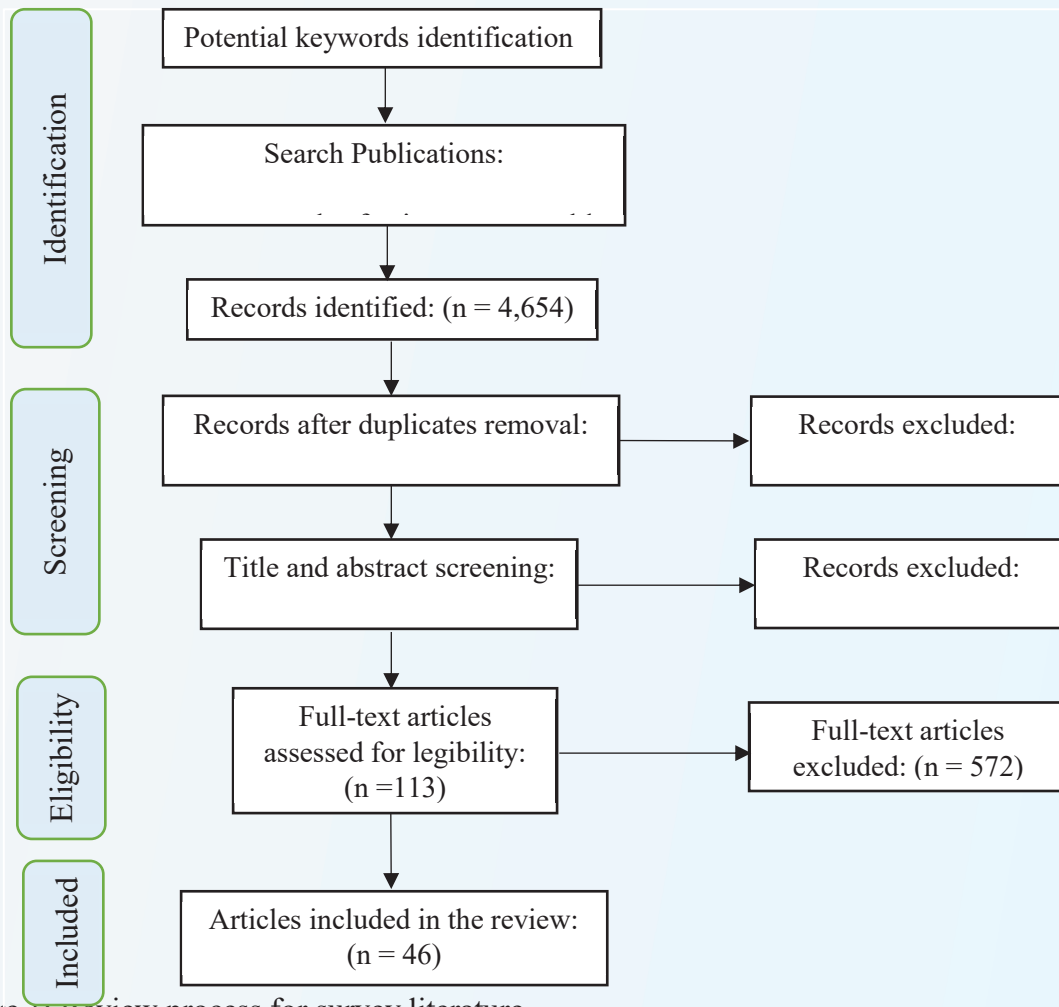

Figure 1: Review process for survey literature

4. Results and Discussion

4.1. Descriptive Analysis of Reviewed Articles

This section provides a summary of the review findings on the dynamic skills essential for the profitability and long-term sustainability of start-up MSMEs. It provides an overview of the distribution of the reviewed journal articles, categorized by journal publishers, yearly publication trends, publication countries, key sectors in which MSMEs operate, and the recurring themes related to dynamic skills that emerged from the reviewed articles.

4.1.1. Journal Category

Table 2 enlists the major journals in the field of dynamic skills for MSME profitability and long-term sustainability. The World Journal of Entrepreneurship, Management and Sustainable Development, Benchmarking: An International Journal, Journal of Small Business and Enterprise Development, and Asia Pacific Journal of Marketing and Logistics are highlighted as leading journals in this domain, each featuring four articles. Other journals, such as Critical Perspectives on International Business, Journal of Business & Industrial Marketing, E-Journal

of Humanities, Arts and Social Sciences, Continuity & Resilience Review, and Journal of Technology Management & Innovation, also contribute multiple articles on MSME profitability and sustainability. Thus, these journals are regarded as relevant sources of information on the performance and sustainability of start-up MSMEs.

Table 2. Distribution of reviewed articles by journal

Journal name	Frequency
International Journal of Commerce and Management	2
Critical Perspectives on International Business	3
Journal of Small Business and Enterprise Development,	4
Management & Sustainability: An Arab Review	2
Benchmarking: An International Journal	4
Management Research Review	2
Journal of Scientometric Research	3

E-Journal of Humanities, Arts and Social Sciences	3
Asia Pacific Journal of Marketing and Logistics	4
IIM Ranchi Journal of Management Studies	1
Continuity & Resilience Review	3
Journal of technology management & innovation,	3
Aslib Journal of Information Management	2
Journal of Innovation and Knowledge	1

4.1.2. Trends in publication

Figure 2 demonstrates the trend of publications in the sphere of start-up MSMEs' performance and sustainability from 2010 to 2023. The trend reveals a significant increase in publications in 2023, with six articles, followed by 2012, 2014, and 2016, each with four articles. The years 2013, 2017, and 2019 had the least number of articles on start-up MSMEs' profitability and sustainability.

Figure 2. Year-wise analysis of journal articles

4.1.3. Publication Country

Figure 3 provides an overview of the country-wise distribution of publications on start-up MSMEs' profitability, performance, and long-term sustainability. India stands out with the highest number of studies in this domain, featuring six articles. Additionally, the United States, Kenya, the Philippines, Tanzania, Jordan, Indonesia, and Uganda have also demonstrated a strong research focus on topics related to the performance and long-term sustainability of start-up MSMEs.

Figure 3. Country-wise analysis of journal articles

4.1.4. Recurring Dynamic Skills for MSMEs' Profitability and Sustainability

The analysis of the reviewed articles reveals a range of dynamic skills essential for the profitability and long-term sustainability of start-up MSMEs (see Table 3). Entrepreneurial and financial management skills are highlighted as essential for achieving profitability and

sustaining long-term success. Furthermore, the studies underscore the significant roles of sales, marketing, and customer service skills, negotiation skills, leadership and problem-solving skills, and digital fluency as key factors for the profitability and long-term sustainability of start-up MSMEs in the digital era and competitive business landscape.

Table 3. Prominent skills for MSMEs' profitability and sustainability

Relevant skills	Frequency
Sales, marketing and customer service skills	5
Networking and collaborative relationships	4
Negotiation skills	5
Financial management skills	8
Cross-cultural communication skills	4
Leadership and problem-solving skills	5
Digital fluency	6
Entrepreneurial skills	9

4.1.5. Key operating sectors for start-up MSMEs

Figure 4 presents the results of the analysis conducted to determine the dominant sectors in which MSMEs operate. The manufacturing sector is identified as the most dominant, being reported by 11 of the surveyed articles. This is followed by the retail and wholesale trade sector, with 8 articles, and the textiles and apparel sector, with 7 articles. Overall, MSMEs operate across various sectors of the economy, extending to agriculture and agribusiness, construction, services, real estate, tourism and travel.

Figure 4. Sector-wise analysis of operating MSMEs

4.2. Dynamic Skills for Profitability and Long-Term Sustainability of MSMEs

Based on the literature review, we identified, synthesized, and summarized nine key dynamic skills essential for start-up MSMEs' profitability and long-term sustainability in the digital era and competitive business landscape. Table 5 provides a precise summary of these dynamic skills, which are discussed in detail in this section.

4.2.1. Sales and Marketing Skills

Reviewed studies reveal that in an increasingly competitive business landscape, sales and marketing skills are critical to the profitability and long-term sustainability of business firms, particularly start-up MSMEs (Ehrensperger et al., 2022; Høgevold et al., 2024). Specifically, strong sales skills help in persuading potential customers to purchase products or services and in building and maintaining customer relationships. Effective marketing strategies, on the other hand, help MSMEs build strong brand awareness, understand customer needs, develop persuasive sales pitches, and close deals efficiently. Based on this, it is argued that both sales skills and marketing strategies impact the ability of start-up MSMEs to attract new customers and secure a steady stream of income, which is crucial for growth, profitability, and sustainability (Abu-ELSamen et al., 2011; Pelham, 2006). Overall, sales and marketing skills enable start-up MSMEs to build a strong customer base, enhance brand reputation, and foster adaptability in a competitive business environment.

4.2.2. Customer Service Skills

In a crowded market, excellent customer service can differentiate a start-up MSME from its competitors. Customer service skills, assessed in terms of the firm's ability to effectively handle customer feedback and complaints, build strong relationships with customers, communicate effectively, and provide support, are integral to enhancing the firm's profitability

and sustainability (Pholphirul et al., 2022; Sheth et al., 2020). High-quality customer service ensures that customers are satisfied with their purchases and experiences with the company. Such satisfied customers are more likely to become repeat buyers and recommend the business to others, which, according to Lelo and Israel (2024), is vital for long-term growth and sustainability. Consistently good customer service helps build a strong, positive brand reputation, leading to a competitive advantage and increased market share. Conversely, poor customer service skills can damage a brand's reputation and lead to lost business (Sheth et al., 2020; Pholphirul et al., 2022). In essence, customer service skills serve as a bedrock for the profitability and long-term sustainability of start-up MSMEs. They help in building a loyal customer base, allowing MSMEs to differentiate themselves from competitors.

4.2.3. Networking and Collaborative Relationships

Networking and collaborative relationships are essential for gaining a competitive edge, achieving profitability, and ensuring the long-term sustainability of start-up MSMEs. By forming partnerships with other businesses, mentors, or industry experts, start-ups can access valuable knowledge and expertise, helping them make informed decisions and avoid common pitfalls (Eyaa et al., 2010; Palakshappa and Ellen, 2007). It provides opportunities for start-ups to access and share resources such as technology, capital, and human resources, which might otherwise be out of reach, at reduced costs. According to Jeong and Chung (2023) and Ghauri and Elg (2018), sharing resources through collaborative relationships enables MSMEs to achieve economies of scale in areas such as marketing, R&D, and logistics, thereby reducing operational costs and enhancing profitability. Furthermore, partnerships with established firms or networks keep start-ups informed about the latest technological advancements, market trends, and customer preferences, enabling them to quickly adapt to changes in the business environment and secure long-term sustainability. In essence, collaborating and networking open doors to new markets, customer bases, and distribution channels, all of which are crucial for growth, long-term sustainability, and profitability (Israel, 2022; Saleh et al., 2020; Utama et al., 2024).

4.2.4. Negotiation Skills

In a competitive business environment, maintaining strong negotiation skills with suppliers, customers, and investors is key to the success and long-term sustainability of business firms (Fernandez-Malpartida & Dextre-Beteta, 2023; Vojvodić et al., 2020). Specifically, effective negotiation with suppliers can lead to better pricing, favourable payment terms, and discounts, directly reducing operational costs, which can translate into higher profit margins. In addition, skilful negotiation with customers can help start-ups secure contracts with advantageous terms, such as higher pricing, recurring orders, or extended service contracts. This contributes to steady revenue streams and improved cash flow, which are vital for the long-term sustainability and growth of start-up MSMEs (Ortigueira-Sánchez & Stein, 2022). Moreover, negotiating terms that allow for sustainable sourcing, production, and distribution can attract

environmentally-conscious customers and investors. Synthesized literature provides sufficient evidence to argue that negotiation skills are pivotal for MSMEs in navigating the competitive business environment. They influence the profitability and long-term sustainability of start-ups by optimizing costs, fostering strategic relationships, and maintaining a steady revenue stream (Vojvodić et al., 2020; Fernandez-Malpartida & Dextre-Beteta, 2023).

4.2.5. Financial Management Skills

Financial literacy is essential for effectively managing the financial aspects of a business, diversifying income streams, and ensuring that it remains profitable, compliant, and sustainable in the long term (Anshika & Singla, 2022; Susan, 2020). Skills related to budgeting, for instance, enable start-up MSMEs to create accurate budgets and financial forecasts, ensuring that resources are allocated efficiently. This helps avoid over-expenditure and underfunding, which can be detrimental to profitability (Buyondo, 2024). Moreover, the ability to understand and control costs is essential for maintaining proper cash flow, ensuring that start-ups have enough liquidity to meet their short-term obligations, such as paying suppliers, employees, and other operational costs. This is crucial for avoiding financial crises that could jeopardize the long-term sustainability and reputation of the business (Nassuna et al., 2023). In addition, skills in analysing financial data are vital for start-ups to accurately identify the most profitable services and make informed reinvestment decisions, whether through new technologies, marketing, or business diversification. Furthermore, reviewed studies suggest that financial literacy ensures that start-ups comply with tax laws and regulations (Talip & Wasiuzzaman, 2024; Alalawi et al., 2023), thereby helping to avoid legal penalties that could harm profitability and reputation.

4.2.6. Cross-Cultural Communication Skills

Literature provides sufficient evidence of a positive relationship between cross-cultural communication skills, long-term sustainability, and profitability in start-up MSMEs (Peng and Zhou, 2021; Charoensukmongkol, 2015). Based on the reviewed articles, we establish that a culturally sensitive start-up enhances its ability to adapt to and navigate the cultural and communication barriers in different markets, enabling it to thrive over time. Effective cross-cultural communication skills allow start-ups to tailor their products, services, negotiation styles, and marketing strategies to align with diverse cultural markets and preferences (Guedes et al., 2023; Sitaniapessy et al., 2022). This approach can attract a broader customer base, including socially conscious consumers. Moreover, understanding and respecting cultural differences builds a positive brand reputation and fosters strong relationships with international partners, suppliers, and customers. These factors, as opined by Abugre (2018), contribute to increased sales and profitability, leading to the long-term viability of start-ups in diverse global markets. In addition, understanding the cultural differences of international clients, suppliers, or partners during negotiations can result in more favourable deals, cost savings, and higher profit margins, all of which are critical for the profitability and long-term sustainability of start-ups (Peng and Zhou, 2021; Charoensukmongkol, 2015).

Table 5: Dynamic skills for profitability and long-term sustainability of MSMEs

Key dynamic skills	Indicators	References
Sales and marketing skills	Expertise in: (1) identifying market needs (2) market research and analysis (3) promoting products or services (4) branding and positioning (5) sales strategy and customer acquisition (6) managing customer relationship	Kawira et al (2019), Adewole (2018), Guedes et al. (2023)
Customer service skills	The capability to: (1) provide excellent service (2) build strong customer relationships (3) handle customer feedback and complaints effectively (4) communicate effectively and provide support to customers	Pholphirul et al. (2022), Sheth et al. (2020), Mwaanga (2014)
Networking and collaborative relationships	The ability to: (1) leverage relationships with key players in the industry (2) build connections and maintain relationships with key players in the industry (3) exchange information and resources with key players in the industry	Lim (2017), Kenny and Fahy (2011), Wang et al. (2014)
Negotiation skills	The ability to: (1) negotiate favourable terms with suppliers, customers and investors (2) resolve conflicts and reach compromises (3) build and maintain business relationship	Fernandez-Malpartida & Dextre-Beteta (2023), Ortigueira-Sánchez & Stein (2022)
Financial management skills	Proficiency in: (1) budgeting and financial planning (2) cash flow management (3) investment analysis and financial forecasting	Susan (2020), Talip and Wasiuzzaman (2024), Legaspi (2012)

Key dynamic skills	Indicators	References
Cross-cultural communication skills	The ability to: <ul style="list-style-type: none"> (1) understand and appreciate differences and similarities between cultures (2) be attuned to non-verbal communication (3) adapt communication styles and approaches across different culture 	Abugre (2018), Harvie (2019), Odhiambo (2013)
Leadership and problem-solving skills	The ability to: <ul style="list-style-type: none"> (1) guide and motivates teams (2) make rational decision and solve problems (3) the ability to think critically and analyse effectively (4) provide visionary and inspirational leadership (5) maintain adaptability and resilience 	Lathabhavan and Kuppusamy (2023), Razzaque et al. (2024), Malewar & Nair (2014)
Digital fluency	Proficiency in: <ul style="list-style-type: none"> (1) using digital tools, platforms, and technologies (2) online marketing and e-commerce (3) data analysis and digital analytics 	Zamora (2010), Lathabhavan and Kuppusamy (2023)
Entrepreneurial skills	The ability to: <ul style="list-style-type: none"> (1) innovate (2) take calculated risks (3) effectively identify and seize opportunities (4) challenge competitors and pursue market share (5) make strategic decisions and take actions 	Nehete et al. (2011), Das (2015), Panigrahi (2016), Al Mamun et al. (2019)

4.2.7. Leadership and Problem-solving skills

Leadership and problem-solving skills serve as the foundation for steering start-up MSMEs toward profitability and ensuring their long-term sustainability. MSME managers who inspire and encourage a culture of continuous learning, make informed and inclusive decisions, and guide their teams foster a culture of accountability and innovation, essential traits for navigating competitive markets (Subramanian and Suresh, 2024; Razzaque et al., 2024). Such leadership approach creates a positive work environment, which drives employee satisfaction, retention, productivity, and ultimately, profitability and sustainability. Similarly, MSME managers with strong problem-solving skills can quickly identify issues, evaluate alternatives, and implement creative solutions that minimize costs, manage unforeseen risks, and maximize

opportunities (Sreen et al., 2024). With effective problem-solving skills, start-ups can identify market inefficiencies and develop innovative products, services, and processes that distinguish them from competitors, thereby driving profitability and sustainability. It ensures that start-ups are adaptable and resilient, enabling them to pivot when necessary to meet changing customer demands or leverage new technologies (Priyaadarshini and Jena, 2024; Razzaque et al., 2024). In essence, leadership and problem-solving skills empower MSMEs to continuously refine their business models and value propositions, ensuring that they remain resilient and competitive.

4.2.8. Digital Fluency

Digital fluency is key to enhancing operational efficiency, customer engagement, innovation, cost management, and expanding market access for start-up MSMEs (Rutainurwa et al., 2024; Albannai et al., 2024). Proficiency in digital marketing, for example, enables MSMEs to promote their products or services and collaborate with both internal and international partners. This allows start-up MSMEs to engage with customers and suppliers through various platforms, such as social media and email marketing, reaching a broader market and accessing resources more efficiently and cost-effectively than through traditional marketing and sourcing methods. Digital fluency enables MSMEs to sell products and services globally through online platforms, expanding their market reach and boosting revenue potential, which contributes to their growth and long-term sustainability (Lathabhavan and Kuppusamy, 2023; Singh, 2019). The resulting cost savings and increased efficiency also allow businesses to allocate resources more effectively. Furthermore, digital fluency opens up opportunities for start-up MSMEs to explore innovative business models, such as e-commerce, subscription services, or digital products (Faugoo and Onaga, 2022). These models can increase revenue streams, help MSMEs meet emerging customer needs, and maintain competitiveness and sustainability in markets.

4.2.9. Entrepreneurial Skills

Empirical studies highlight the crucial role of entrepreneurial skills in building resilient businesses in competitive environments characterized by rapidly changing technology and market demands (Franco et al., 2021; Sari and Sari, 2022). In essence, the innovative posture inherent in entrepreneurial ventures enables start-ups to develop novel products, services, and business models. According to Taleb et al. (2023) and Kyal et al. (2022), this innovative approach allows MSMEs to offer unique value propositions, attract customers, and create new revenue streams, thereby boosting profitability. Besides, MSMEs that are adaptable and proactive in volatile market conditions are better positioned to pivot their strategies, embrace new technologies, and respond to market shifts. Such adaptability is key to remaining relevant and competitive over the long term (Biswas, 2024; Kryeziu et al., 2024). Moreover, entrepreneurs who are skilled at assessing, managing, and mitigating risks, and making informed decisions, are more likely to build resilience in competitive and volatile business environments. Drawing on the reviewed literature, it can be argued that entrepreneurial skills serve as a foundation that empowers start-up MSMEs to navigate the complexities of the business environment, capitalize on opportunities, avoid costly mistakes, and ensure long-term sustainability in a competitive and volatile market.

5. Conclusion and Managerial Implications

In the digital era and an increasingly competitive business landscape, the profitability and long-term sustainability of start-up MSMEs hinge on a dynamic set of skills that empower entrepreneurs to navigate complex challenges and seize emerging opportunities. This review underscores the critical importance of key skills, including cross-cultural communication, leadership and problem-solving, negotiation, and financial literacy, in driving the profitability, growth, and resilience of start-up MSMEs. In addition, the ability to leverage digital tools, maintain a customer-centric approach, foster strong networks and collaborations, and apply entrepreneurial skills further enhances an MSME's capacity to thrive amidst rapid technological changes and volatile market conditions. Ultimately, these dynamic skills form the bedrock upon which start-up MSMEs can build sustainable and profitable ventures, ensuring their continued success in an ever-evolving global marketplace. As digitalization continues to reshape industries, the ongoing development and application of these skills will be pivotal in determining the future trajectory of MSMEs.

Based on the review results, this study offers several managerial implications to guide entrepreneurs, policymakers, and support organizations in fostering the growth and success of start-up MSMEs. For start-up MSMEs, the study emphasizes the importance of investing in digital tools and platforms that enhance market research, customer engagement, and networking. Entrepreneurs are encouraged to adopt technologies such as customer relationship management (CRM) and supplier relationship management (SRM) systems, electronic data interchange (EDI), and enterprise resource planning (ERP) solutions. In addition, entrepreneurs should actively engage in industry networks, business associations, and digital platforms to connect with potential partners, mentors, and investors. To support this, policymakers are advised to promote public-private partnerships that facilitate MSMEs' integration into larger supply chains, with business incubators and accelerators playing a pivotal role in fostering these connections. For business support organizations, the study recommends developing targeted training programs that equip aspiring entrepreneurs with essential skills such as leadership, problem-solving, digital fluency, financial literacy, negotiation, cross-cultural communication, and entrepreneurship. These skills are crucial for creating flexible business models capable of quickly responding to market changes or disruptions. Lastly, policymakers can further support start-ups by offering subsidies or grants for skills development, enhancing start-ups' ability to maintain profitability and long-term operational resilience. Scopus, Web of Science, Google Scholar, and Emerald

6. Limitations and Direction for Further Studies

This study primarily focuses on reviewing and synthesising existing literature from three research databases: Emerald, Scopus, Google Scholar, and Web of Science, specifically examining research journal articles published between 2000 and 2023. Due to the selection bias inherent in this publication period, the review process may not fully capture relevant studies or

the complete range of dynamics that influence the profitability and long-term sustainability of start-up MSMEs, particularly in the rapidly evolving digital and competitive landscape before 2010 or after 2023. Moreover, the findings of the reviewed articles are drawn from various geographical contexts and industries, which limits the generalizability and applicability of these findings to specific sectors or regions. Therefore, further studies could explore the relevance and effectiveness of dynamic skills for start-ups' profitability and long-term sustainability within specific sector and geographic contexts. In addition, the reviewed articles primarily focused on the firm's dynamic skills, with less emphasis on external factors such as economic conditions, regulatory changes, market dynamics, or technological disruptions, which can also significantly impact the profitability and sustainability of start-up MSMEs. Given this, future research could expand its focus to examine how these external factors interact with a firm's dynamic skills to influence the financial success and sustainability of start-up MSMEs. These research directions could help build a more comprehensive understanding of the internal and external dynamics that contribute to the profitability and sustainability of start-up MSMEs in the competitive business environment and digital era.

Assessing the Factors Affecting Implementation of Effective Information Security Measures at the College of Business Education (CBE) Dar es salaam – Tanzania

Eliabu Munyugu John

Department of Library, College of Business Education

Abstract

Information security issues that have been occurring in some of HLIs in Tanzania made the researcher to be curious to investigate on the factors affecting effectiveness of information security measures. The main objective of this study was to assess the effectiveness of information security measures at the College of Business Education (CBE) - Tanzania. Specifically, the study assessed the level of effectiveness and identified factors affecting implementation of information security measures (as described by ISO and literatures) at the College of Business Education (CBE). Descriptive research design and mixed methods approaches were employed to achieve study objectives. Questionnaires were distributed to a randomly selected sample of 136 college employees. Descriptive statistics was employed in the analysis of data using SPSS. Chi-Square Test and Correlation analysis were used to determine association and nature of relationship between variables respectively. Interview guide was used to gather in-depth information from key informants to add insight on the quantitative findings. The study findings revealed that the level of effectiveness of information security measures was moderate. Furthermore, the study findings realized several common factors affecting the implementation of information security measures as human, environmental, technical, and financial factors. The study recommendations were that investments should be made in improving information security management and participatory implementation of information security measures in all information systems used by the college.

Keywords: *Information, Information security, information systems and Risk management.*

Introduction

Information security has pushed itself into publicity as the favored technique to protect the organization's information assets. All these issues called the researcher curiosity on investigating the adoption of information security measures at the College of Business Education (CBE). Basically, the topic of this study was focused on the awareness of information security measures, the level of effectiveness of information security measures and factors affecting the embracing of information security measures in higher learning institution in Tanzania with specific reference to the College of Business Education (CBE) Dar es Salaam. In Tanzania, the website of Open University of Tanzania was hacked on 2017, University of Arusha and Tumaini University Makumira also experienced the same problem (Kundy and Lyimo, 2019). About information security vulnerabilities and the emerging computer related offenses, the government of the United Republic of Tanzania established the Cybercrimes Act of 2015 to address various related issues, by mentioning few are illegal access, illegal interception, illegal data interference, data espionage, illegal system interference, computer related forgery as well as computer fraud. The College of Business Education (CBE), like other institutions of higher education in developing countries, is not invulnerable to the effects of the global advancement of ICTs that are associated with information security breaches. For instance, the college has employed different information management systems including students' registration systems, financial management system, library management system, staff e-mailing, etc. All these information systems are in danger of being misused due to inadequate information security as stipulated in the CBE (2018) ICT policy. Dzazali and Zolait (2012) argued that organizations have been focusing on technological side of information security and neglect other components of information security risks such as people, processes and business objectives that support the technology with the regard that human element (e.g., social factors) embraces the highest information security risk to organizational information. From this ground, if an organization fails to manage its information system effectively people may interrupt and share or block the flow of information and hence lack of confidentiality and integrity of the information. In order to protect information and other related properties, institutions may employ a set of information security measures suggested by international standards and frameworks widely recognized by professionals and organizations around the world (Junior and Santos, 2015). According to Dzazali and Zolait (2012), public organizations also encounter the challenge of protecting their information since they operate in an environment characterized by increasing complexity, interconnections, uncertainties, and reliance on technology. They not only need to carry out their respective missions but also adhere to the standards and procedures of central government agencies. These organizations also need to guarantee the confidentiality of citizens' information, availability, and integrity and community accessibility for the continuity of public services, many of which are intervened by technology. Higher learning institutions should ensure information confidentiality and integrity for both administrative and learning facilitations. Junior and Santos (2015) argued that some organizations possess information as significant or tactical assets and, therefore, they invest much effort to protect it. Implementation of information security measures should be based on needs identified by the Information Security Governance structure of each institute, even though it may be influenced by the institutional environment in which organizations are

implanted. ISO 27001 and different literatures have proposed the measures to help public and private institutions to effectively protect their information. In that view, the government of the United Republic of Tanzania has set several frameworks to facilitate information protection including the Tanzania Cybercrimes Act of 2015 and Information Act of 2018. A Report from the National Audit Office of Tanzania (2020) on the information systems evaluation in Higher Learning Institutions of Tanzania from 2017 to 2019 discovered extreme information security threats that might be taken as an advantage by intruders to attack the systems. Thus, the problem of insufficient implementation of effective information security measures against information security vulnerabilities among higher learning institutions is not adequately addressed in ensuring confidentiality, availability, integrity, and accessibility of information in the organizations. This was the reason why this study was pursued to assess the implementation of information security measures at the College of Business Education (CBE).

Literature Review

Effectiveness of Information Security Measures

Effective information security is promoted by wide-ranging approaches that consider various areas within and outside of information system (Nieles and Dempsey, 2017). In other description, effectiveness of information security measures is ensured by relevant settings of the measures in a particular area. Organizations need to have a wide range of approaches in accordance with its environment to tackle a particular information security issue. One information security measure can be appropriate to a certain security risk but not to another risk. The study of (Mishra and Chasalow, 2011) found a significant relationship between information security policies and effectiveness of information security measures. Their study also revealed many that research literatures on information security suggests that clearness in policy, audit and control systems and practices of preventing information leverage practices ensure corporate information security effectiveness. The uses of technology such as software to detect information breaches, security policy, physical and environmental security are what can ensure effective information security measures in an organization (Hagen, 2013). Effective implementation of security measures is direct proportional to vulnerability analysis where by potential threats are identified and evaluated to determine their probable seriousness in order to select an appropriate approach to mitigate them (UNICRI, 2015). For an organization to improve the level of information security there must be effective risk assessment on its information systems to figure out any possible danger or threats so that they can be mitigated accordingly. Hagen, Albrechtsen and Hovden (2008) found that many researches were addressing effectiveness of information security measures in a technological point of view but in their study effectiveness of information security measures was addressed to be possible under a combination of various components. This means that technical measures are not enough to guarantee information security rather, an organization and individuals must embrace information security measures awareness (Rezgui and Marks, 2008). According to Mugarza, Flores and Montero (2020), updating information security tools especially software updates is very important in the world of ICTs. Anderson (2017) argued that effectiveness of information security measures results from frequent monitoring and risks assessment. This means that, there

is significant relationship between implementation process of information security measures and effectiveness of information security measures. Hagen, Albrechtsen and Hovden (2008) found an inverse relationship between implementation of information security measures and effectiveness of the measures which means that the measures can be implemented but not effectively. Rahman and Widyarto (2013) conducted a study to explore whether information security in an organization abide by what has been addressed in the code of conduct in human resource management, the findings discovered that the effectiveness of security measures can be ensured by minimizing the risks of human error through confidentiality agreements, terms and conditions of employment as well as information security education and training. Thus, HLIs need to have a human resources code of conducts which are strongly address information security measures and regulate the employees to follow the measures. Mamade and Dabala (2022) study depicted that respondents' protection measures were significantly associated to and influenced by education level and cyber-security measures. The College of Business Education (CBE) must be aware of information security measures so that they can be able to implement the measures with effective impact. Khan et al (2011) revealed also that awareness of information security measures is what guarantees an effectiveness of information security measures through founding a fundamental part of any organizations' general information security managing strategy.

Factors Affecting Implementation of Information Security Measures

Despite the increase in the number of cases of information security violations, information users in institutions still fail to comply with information security guidelines, and leads to negative consequences (Ahlan, Lubis and Lubis, 2015). It indicates that information systems users are the most likely factor to pose danger to an institution's information security. Human elements (e.g., social factors) bear the highest information security risk to organizational information (Dzazali and Zolait, 2012). Kumah (2022) discovered that human resource management activities cause the problem of human-oriented factors in managing information security in the sense that if employees are motivated and guided to engage in safe security behavior, an organization will be able to effectively implement the security measures through monitoring changing environment, induction trainings, recruitment, etc. Institutions should pay much attention to information security by considering human relation factors for the safety accommodation of information systems as their impact on security is significant (Hagen, 2013). Hook Security (2021) argued that the biggest weakness in any information security system is the human factor in the context of their habits and belief in an organization. Staff and students have different backgrounds and the nature of the society they live in affects their attitude in performance and brings important issues to influence security (Al-Rawas and Millmore, 2002). Rezgui and Marks (2008) argued that thoroughness, traditional beliefs and societal circumstances are among the factors that affect higher learning institutions' staff behavior and perception towards their working performance in general and information security awareness in specific. Semlambo, Mkude, and Lubua, (2021) conducted a desk review of various literatures on the factors affecting information security, seven (7) literatures out of forty revealed that human factors like employee's behavior and understanding in relation to institutional IS security are key factors affecting the security of information system. Fourteen

(14) literatures out of forty revealed that work environment is among the key factors affecting the implementation of information security measures in an organization. This is to insist that much attention should be paid on the users and other surroundings of the information systems in an organization in relation to information security measures proposed by the organization. Yeo, Rahim and Miri (n.d) revealed in their study that management support in terms of financial and technical assistance are serious factors which affect risk assessment and awareness building on information security. Manneback and Padyab (2021) in their study, found four factors affecting the implementation of information security measures as technical security (technologies and experts), rules and policies, employee's awareness of security concerns as well as changing of working environment. Baino (2016) conducted a safety risk assessment survey on information systems and revealed that a large proportion of information system breaches result from system managers not updating software. Generally, mismanagement of information systems to insecurities can be caused by financial, technical, and technological deficiency.

2.3 Theoretical Perspective

The study used the Diffusion of Innovation Theory (DIT) and Risk Management Theory (RMT). These theories were selected because they are related to the study.

2.3.1 Diffusion of Innovation Theory

Rogers (2003) prescribes diffusion of innovation as a dynamic process by which an idea or product is communicated or spread over time through people as part of social system, adoption of new idea and new performance. Adoption means doing something differently unlike the way it has used to be done previously. The diffusion of innovation theory holds adoption as part of the spread of technology and therefore, for an institution to ensure information security system it needs to be aware on the security measures to extend the level of its information system security for instance purchasing and installing new software to strengthen authenticity, acquiring new knowledge through trainings on information security issues for new performance of the people in an organization for effectiveness on all issues relating to information security concerns. The use of new technology or approach in an organizational information management reduces the risks of information security and lead to achieving an organizational anticipated outcome as Rogers (2003) stipulates that "a technology is a design for instrument action that reduces the uncertainty in the cause- effect relationships involved in achieving a desired outcome". The theory also commends that awareness of the need for an innovation is one of the stages that makes adoption possible but also it further stipulates the use of technology to design and implement new ideas. From this ground, the adoption of information security measures in an organization starts with the level of awareness on the measures among people in an organization as part of the organization system but also the availability of experts of information technology to design and implement information security measures. The strength of the theory is the clear and acceptable link between adoption and awareness since adaptability is influenced by awareness. Although, the theory has described the advantage of awareness towards adoption but also the theory does not consider risk

management throughout the adoption process. This is why only one variable was taken from this theory that is 'awareness'.

2.3.2 Risk Management Theory

The theory advocates that an organization should view uncertainties in variability surroundings by which the range of consequences that can be caused by the occurrence of a risk must be evaluated. The analysis should be built based on both individual and the entire organization to be knowledgeable on various possible threats to their assets as the matter of fact that uncertainty is a result of lack of knowledge on a specific situation (Spikin, 2013). The theory further promotes the role of an organization to make analysis and evaluation on its information assets against various threats or vulnerabilities to plan for implementation of information security requirements as well as its risks control measures. The main purpose is to ensure availability, reliability, and validity of the information in an organization. About information security, risk management refers to a process of reducing threats to institutional operations, assets, individuals, other institutions as well as the nation which may be resulted from the operation of information system. The managing process includes assessing the risks by analyzing all possible threats within the context of an organization (Nieles and Dempsey, 2017). The FFIEC (2006) defined Information Security Risk Assessment as a process of detecting and evaluating every kind of threats, weaknesses, attacks in terms of chances of their occurrence and outcomes against information systems. The FFIEC (2006) further states that every organization must optimally determine exactly all kinds of threats or vulnerabilities to be addressed in accordance with a specific organization's context through a process called risk assessment and the resulting details must be used to design and improve strategies or technique to mitigate those threats. The FFIEC (2016) states that, "Management should implement controls that align security with the nature of the institution's operations and strategic direction. Based on the institution's risk assessment, the controls should include, but not be limited to, path management, asset and configuration management, vulnerability scanning and penetration testing, end-point security, resilience controls, logging and monitoring, and secure software development (including third-party software development)" p.16. From the ground of Risk Management Theory, the adoption of effective security measures is direct proportional to the process of risks assessment which helps an institution to be aware on several threats so that they can select and implement appropriate measures for security alleviation. The same applied in the context of information security; an institution should firstly be aware on various possible threats to their information assets, planning for the risk control measures and implement the measures. Therefore, the level of information security risk assessment of an organization determines the level of effectiveness of security measure to protect their information against frauds, denial of services attacks and other damages. The strength of the theory is the description of the relationship between effective security and threats analysis towards selection of appropriate measures. The weakness of the theory is the exclusion of institutional capacity of implementing security measures. Thus, this study has focused on one variable from this theory which is 'implementation of effective measures or effectiveness of information security measures.

2.4 Conceptual Framework

The variables integrated in this conceptual framework were taken from the two theories and reviewed literatures. Where by awareness was taken from the Diffusion of Innovation Theory whereas effectiveness was taken from the Risk Management Theory and factors affecting implementation of effective information security measures was from the literature.

Awareness of information security measures is independent variable while effectiveness of information security measure is dependent variable and factors affecting the effectiveness as intervening variable. This can be illustrated by the conceptual framework below (see Figure 2.1):

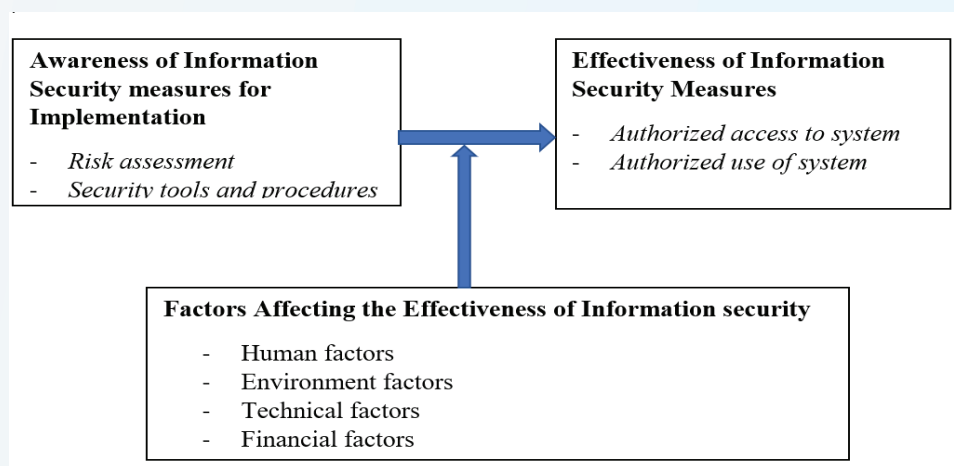

Figure 2.30: Conceptual Framework on the Effectiveness of Information Security Measures

Source: Researcher own construction (2024)

From the conceptual framework above, awareness is independent variable determining information security measures' effectiveness. If people and an entire organization are aware of information security measures, then it is possible to implement effective information security measures. The effectiveness of information security measures depends on the awareness of an organization to implement information security measures or standards as an organization does risk assessment and planning to determine appropriate measures to be implemented for possible threat mitigation. Furthermore, factors affecting the effectiveness are intervening variables between the independent and dependent variables designated into four categories, which are human, environmental, technical, and financial factors. These factors influence the effectiveness of information security measures in the sense that organization awareness on the standards can be affected by the human element in terms of habits and belief, environmental factor in terms of irrelevant settings for learning and practicing information security measures in an organization, technical aspect in terms of procedurals and experts in technological support as well as financial support in terms of a fund to facilitate awareness building programs and latest measures installation. Generally, the effectiveness of information security measures can be determined by the independent variable explained above under the influence of intervening variables positively or negatively.

Material and Methods

Research Design

This study adopted a descriptive research design to investigate factors affecting the effectiveness of effective information security measures at the College of Business Education (CBE). The design was judged suitable because it is relevant to the research objectives and questions, as the aims primarily were to explore and understand the effectiveness of information security measures at CBE.

3.1.1 Research Approaches

In this study a mixed methods (quantitative and qualitative) approach was judged suitable for the research. The quantitative approach was judged ideal because it is relevant to the research design of this study, and it is used to measure variables, describing frequencies and correlations. Additionally, under this approach, researchers are not the inner part of the research rather than being the outsiders (Kumar, 2005). Thus, this approach minimized the researcher bias during data analysis and interpretation as the study findings were obtained from the natural understanding of the respondents on the research questions. Moreover, it also enables the researcher to gather data quickly over a large population. The qualitative approach allowed the researcher to explore the genuineness of the problem to complement the quantitative data collected. The rationale for using mixed method research design was to avoid the biases of each single method and to facilitate triangulation as it allowed the researcher to use more than one method of data collection to ensure cross-justification of research findings.

3.2 Area of the Study.

This study was conducted at the College of Business Education Dar es Salaam Campus. The College of Business Education was established in 1965 by the Act of Parliament and officially opened in January of the same year by the first president of the United Republic of Tanzania, the late J. K. Nyerere. The college is located at Bibi Titi Mohammed Street in Dar es Salaam. The study area was selected due to three main reasons. Firstly, it is among the few oldest higher learning institutions in Tanzania, established by the government in 1965. It is experienced various information technological revolutions for many years, as it is agreed in the CBE (2018) ICT policy. Secondly, the college has recently changed some of its information management systems such, as the student registration system and the procurement management system, to improve information security management. Therefore, this study expected more knowledge through the college experience on implementing information security control measures. Lastly, the college has never explicitly researched in terms of the implementation of information security measures compared to other oldest higher learning institutions in Tanzania, like the University of Dar es Salaam.

3.3 Study Population and Sampling Frame

In this study, population involved the College of Business Education staff from Dar es Salaam campus. The sampling frame involved the total number of 205 staff from the complete list of all CBE staff that was obtained from the Director of Human Resources Management (DHRM). The population involved general staff including systems administrators to capture the variety of activities executed in different professions in relation to information security management practices.

3.4 Sample Size, Sampling Techniques/ Procedures

Sampling size and sampling procedures reflected research approaches and types of data that were collected i.e. quantitative and qualitative data.

3.4.1 Sample Size

Then a statistical formula was used to determine minimum sample size that guided the selection of individuals from the 205 general staff as following:

$$n = \frac{N}{1+N(e)^2} \quad \text{Where:} \quad n = \text{Sample size to be studied}$$

N = Population Size and e = margin of error

$$\text{Thus, for the case of this study; } n = \frac{205}{1+205(0.05)^2}$$

$$n = 135.5 \approx 136$$

From the above formula, the required sample for this study was not supposed to be less than 136 for representativeness.

3.4.2 Sampling Techniques and Procedures

The study employed both probability and non-probability sampling techniques. Simple random and purposive sampling techniques were used to select the sample size. This study employed simple random sampling due to several reasons; total population size was known (limited population) that could be easily sampled as the list of the organization employees was available and lack of biasness. The study aimed at assessing the level of effectiveness of information security through the general members of the organization as the unit of analysis without biasness. Therefore, the study used simple random sampling procedures to select respondents from employees working at CBE main campus where by sampling frame was organized to accomplish this. A complete list of the staff members was generated into pieces of paper shaken in a container and randomly picked 136 representatives. Purposive sampling technique was used to select key informants for interviews. Key informants were drawn from ICT department whereby six (6) information system administrators were selected to substantiate data. The researcher purposively selected the system administrators since they experience day to day

information systems operations as well as according to the roles they play as key decision makers, planners and implementers of the information security measures. So, they are much comprehensive in what goes on in the organization and the factors affecting the implementation of effective information security management practices. The essence of purposive sampling technique is that it is relevant within qualitative research designs. However, purposive sampling can provide the researcher with a comprehensive understanding to generalize from the sample of the study (Etikan, Musa and Alkassim, 2016).

3.5 Data Collection Methods

This study used both primary and secondary sources of data. A combination of methods was applied to gather both qualitative and quantitative data for this study. Secondary data refer to the information which have already gathered, analyzed, and published by other people (Kothari and Garg, 2014). In this study secondary data was collected through documentary review of researchers' publications, reports and publications of different organizations associated with information security management, publications of foreign governments and international bodies as well as the United Republic of Tanzania publications connected with information security measures. Primary data are information collected afresh based on research variables to meet the purpose of the study (Kothari, 2004). In this study, primary data was collected using survey and interview methods.

3.5.1 Survey Method

This study applied survey method for primary data collection since this method lends itself to the collection of quantitative data. The advantages of questionnaire surveys are low cost and wide geographical spread, free from the bias of interviewer, adequate time for a respondent to give correct opinions as well as its suitability for larger number of people (Kothari, 2004). Although, one of the disadvantages of this method was that, there might be differences in understanding and interpreting some questions but the researcher's contacts were written in the questionnaire guide for clarification but also the research was providing preliminary explanations on the structure of the questionnaire to the respondents before answering the questions. In this study structured questionnaire designed with open and closed-ended questions was used as main instrument to collect quantitative data. The questionnaires were distributed to 136 general staff. The questionnaires were self-administered where by a standardized set of questions on papers were given to respondents to fill at their own space and time. All questionnaires were completed and returned (see Table 2). This was made possible due to the reason that respondents were available at their duty station in every working day within the period of data collection of this study. Furthermore, the researcher contacted the respondents both physically and electronically (via phone) to easier the accomplishment of the questionnaires.

3.5.2 Interview Method and Guide

Six (6) respondents (system administrators) were sampled for key informant interviews, whereby all of them participated. Interviews were used to explore attitudes, readiness, and opinions of information systems administrators regarding implementation of information security measures in the organization. In-depth information about individual feelings and willingness to implement information security measures sometimes cannot be captured by questionnaires. Thus, a semi-structured interview guide was the preferred instrument because of its flexibility and permitted the researcher to explain issues to get more details whenever needed. The interview sessions were conducted through face-to-face interaction with individual system administrator staff to capture their opinions on the implementation of information security measures in the organization. A tape recorder was used based on the participants' prior consent to record the responses where by NVivo Software used for transcription.

3.6 Data Analysis and Presentation

In this research, both quantitative and qualitative data were analyzed and presented. Quantitative data were analyzed by SPSS 26. Analysis of data after tabulation were scrutinized in terms of percentage, frequencies, and coefficients. The study results were presented, arranged, and summarized according to the specific objectives. The study used Pearson's correlation analysis to assess statistically corresponding relationship between independent variables and dependent variable. The strength of the correlation among variables was determined by using Pearson's Correlation Coefficient or Pearson's r where by a positive relationship was specified by a value of 1.0, negative correlation is specified by a value of -1.0 while zero correlation was specified by a value of 0.0 (Formplus, 2022). In other words, the correlation coefficient values are found between 1.0 to -1.0. Moreover, the researcher employed Chi-Square Test to find whether there is an association between intervening variable and independent variables. Correlation was used to support the relationship between variables hypothesized in the conceptual framework of this study without manipulation or interference by the research. Furthermore, the Chi-Square Test was used to strengthen clarification of associations within variables wherever necessary. Qualitative data transcribed by using "f4" software, and then categorized into subjects associated with the key questions of the study and analyzed by using NVivo Software. The study employed the combined approach to report both quantitative and qualitative findings in the sense that both quantitative and qualitative results were reported simultaneously. Quantitative results were reported first and instantly followed by qualitative results to provide comprehensive understanding of quantitative findings.

4.0 Findings and Discussion

Respondents Demographic Characteristics

This part describes the respondents' demographic information. Respondents' demographic information was meant to determine the nature and characteristics of the study population. The

demographic data included were sex, age, level of education, job role, and years of working experience with information systems.

4.1.1 Distribution of respondents by gender

Concerning gender balance, the researcher wanted to define the comparison of male and female respondents involved in the study. The results indicated that more than half, 77 (56.6%) respondents were male, as shown in Figure 4.1.

Figure 4.1: Distribution of respondents by gender

Source: Field Data (2022)

The study findings in Figure 4.2 reflect the fact that there were more male employees in higher-learning institutions than female. The difference between males and females was attributed to a few numbers of female staff employed in the college. The results furthermore show that the study was gender sensitive as all gender reasonably participated in giving information about the implementation of information security.

4.1.2 Respondents Level of Education

The respondents were asked to indicate their level of education. This was important as an indicator of the respondents' range of understanding to offer reliable information in relation to information security management practices. The analysis results show that most of the respondents have bachelor degree or above. The results are shown in Figure 4.2.

Figure 2: Respondents' Level of Education

Source: Field Data (2022)

The results in Figure 4.2 show that larger number of respondents had attained higher education. This can be associated with the nature of the organization as it offers higher education programs and services which must be facilitated by higher educated facilitators. Respondents' level of education indicated that respondents had reasonable education qualification and wide range of understanding to provide reliable information about the implementation of information security measures at the College of Business Education in Tanzania

4.1.3 Distribution of Respondents by Working Department and Unit

The respondents were asked to specify their working department and or unit. This was considered to be important as an indicator of the respondents' responsibilities in relation to information security management practices. The study findings indicated that the largest group of respondents was Finance (including internal auditors and accountants) which accounts for 24 (17.6%) followed by ICT (including IT technicians and teaching staff) with 21 (15.4%) and Administration (including members of management team) with 16 (11.8%). The results are shown in Table 4.2.

Table 4.2: Distribution of Respondents by Working Department and Unit

Unit	Frequency	%	Unit	Frequency	%
Registry	8	5.9	Library	9	6.6
Accountancy	9	6.6	Marketing	11	8.1
Administration	16	11.8	Planning	7	5.1
Admission	7	5.1	Procurement	9	6.6
Business administration	6	4.4	Records	2	1.5
Finance	24	17.6	Student welfare	3	2.2
HR	4	2.9	Total	136	100.0
ICT	21	15.4			

Source: Field Data (2022)

The results show that the respondents represented at most every department/ unit of the organization to cover a wide range of experience of information security management practices. The largest proportions of the respondents (finance, ICT and Administration) were expected by the study to be the foremost groups encountered with information systems security

risks because financial software packages are most used for fiscal management followed by application of ICTs in configuration of organization systems as well as administrative systems. Pallangyo (2020) also realized that most of commercial transactions are conducted electronically especially online where most hackers' threats roaming frequently. Since information systems intruders are mostly looking for financial theft and administrative intervention, the study results indicated that these groups (Finance, ICT and Administration) were fairly represented in the study.

Research Question 1: What is the level of effectiveness of information security measures at the College of Business Education (CBE)?

The researcher was interested to know if information security measures which are implemented in the organization are effective against information security threats.

4.2 Effectiveness of Information Security Measures

The respondents were asked to give their opinions on the organization' level of effectiveness of information security measures affiliated with its related aspects. In order to reach a practical account of the findings, strongly agree and agree were combined to form "Agree" while disagree and strongly disagree were combined to form "Disagree". The results indicate that, 61 (44.9%) respondents were neutral to agree or disagree on the effectiveness of information security measures in the organization. The results show that 63 (46.3%) respondents were also neutral to specify whether the information security tools used in the organization are updated or not. The results indicate that 62 (45.6%) respondents agreed that there is information security policy at CBE. The results show that 59 (43.4%) respondents disagreed that there is information security risks assessment report in their office for reference during implementation. The results indicate that 57 (41.9%) respondents agreed that at CBE, employees behave according to a code of conduct of human resource to protect information confidentiality. The results show that 53 (39%) respondents disagreed with the statement that physical environment of CBE is protective enough against intruders. The results indicate that 66 (48.5%) respondents were neutral to agree or disagree if they are aware of information security measures. The results are shown in Table 4.8.

Table 4.8: Effectiveness of Information Security Measures

Variables	Agree		Neutral		Disagree	
	F	%	F	%	F	%
Effectiveness of the measures.	36	26.5	61	44.9	39	28.7

Availability of risk assessment report.	12	16.1	55	40.4	59	43.4
Individual awareness of the measures	45	33	66	48.5	25	18.4

Source: Data Field (2022)

The results shown in Table 4.8 suggest that the level of effectiveness of information security measures in the organization is moderate because most of the respondents were neutral to agree or disagree with the statement that information security measures used by their organization are effective to prevent information fraud. Hence, the study findings answer the research question on the level of effectiveness of information security measures.

The study findings indicated that while the level of effectiveness of information security measures is moderate, most of the respondents disagreed with the statement that there is information security risk assessment report in their office. This implies that either the organization does not communicate the risk assessment report to its members or there is no regular information security risk assessment in the organization. The researcher was interested to know if there is any significant association between availability of information security risk assessment report in the respondents' offices and effectiveness of information security measures. The Chi-Square test employed to determine association between availability of information security risk assessment report in the respondents' offices and effectiveness of the security measures. The results are shown in Table 4.11.

Table 4.11: Chi-Square Test of Association between Availability of Information Security Risk Assessment Report and Effectiveness of Information Security Measures

Category	Availability of Security Risk Assessment Report		
	Value	Df	Asymp. Sig. (2 sided)
Pearson Chi-Square	107.938 ^a	16	0.000
Likelihood Ratio	86.316	16	0.000
Linear-by-Linear Association	46.724	1	0.000
N of Valid Cases	136		

Source: Data Field (2022)

Table 4.11 shows that availability of information security risk assessment reports is associated with effectiveness of information security measures. The *P*-value (0.000) was less than 0.05; meaning that there is significant association between availability of information security risk

assessment reports and effectiveness of information security measures. This result is reflecting the study of Hagen (2013) that effectiveness of information security measures is associated with risk assessment. In other words, the effective implementation of information security measures is the result of a sound risk analysis in order to determine appropriate measures for a particular risk. Anderson (2017) also argued that frequent monitoring and risk assessment is what brings effective measures of information security. Thus, a detailed information security risk assessment report is the best reference for the effective implementation of information security measures.

The respondents were asked if they are aware of information security measures implemented by the organization. The researcher was interested to know if there is any significant individual awareness of information security measures and effectiveness of information security measures. The Chi-Square test employed to determine association between individual awareness of information security measures and effectiveness of the security measures. The results are shown in Table 4.14.

Table 4.14: Chi-Square Test of Association between Individual Awareness of Information Security Measures and Effectiveness of Information Security Measures

Category	Individual Awareness of Security Measures		
	Value	Df	Asymp. Sig.(2 sided)
Pearson Chi-Square	113.596 ^a	16	0.000
Likelihood Ratio	89.479	16	0.000
Linear-by-Linear Association	59.013	1	0.000
N of Valid Cases	136		

Source: Data Field (2022)

Table 4.14 shows that individual awareness of information security measures is associated with effectiveness of information security measures. The *P*-value (0.000) was less than 0.05; meaning that there is significant association between individual awareness of information security measures and effectiveness of information security measures. Since the level of effectiveness of information security measures is moderate, the results indicate that there is a significant association between individual awareness and effectiveness of information security measures. This can be partly attributed to the fact that awareness of information security measures is a foundation of implementing effective measures of information security. Khan *et al* (2011) noted the importance of awareness in enhancing the effectiveness of information security measures based on organizations' information security management plan. Thus, lack of awareness of information security measures tends to limit its

implementation and involvement of employees in the information security management programs.

The assumption in the conceptual framework of this study was that the level of effectiveness of information security measures is influenced by the level of awareness of information security measures. The researcher was interested to know if there is any significant relationships between effectiveness of information security measures and awareness of information security measures. Correlation coefficient was employed to assess a linear relationship between effectiveness of information security measures and awareness of information security measures. The Pearson correlation coefficient used to test the nature of relationship of the variables (positive, negative or zero relationship) and p-value (2-tailed test) was used to determine if the variables have a statistically significant relationship. The results indicated that the Pearson Correlation coefficient between awareness of information security measures and effectiveness of information security measures is 0.206. Additionally, the p-value associated with the Pearson correlation coefficient for awareness of information security measures and effectiveness of information security measures is 0.016. Results of the analysis are reported in Table 4.15

Table 4.15: Correlation between Effectiveness of Information Security Measures and Awareness of Information Security Measures

Awareness	Category	Awareness	Effectiveness
	Pearson Correlation	1	.206*
	Sig. (2-tailed)		.016
	N	136	136
Effectiveness	Pearson Correlation	.206*	1
	Sig. (2-tailed)	.016	
	N	136	136

Source: Field Data (2022)

The results in Table 4.15 indicate that the Pearson Correlation coefficient (0.206) is positive; it means that these two variables have a positive relationship. This implies that the increase of awareness of information security measures is direct proportional with the increase of effectiveness of information security measures. Since the p-value (0.016) is less than 0.05, the two variables have a statistically significant relationship. Thus, the results comparatively support the relationship hypothesized in the conceptual framework of this study. This can be partly supporting the fact that awareness of information security measures was attributed to the

effective measures of information security. When the user of the information system (s) is aware of the measures to control information security, it becomes easier to ensure the effective use of those measures, thus leading to the effectiveness of information security measures. Ahlan, Lubis and Lubis, (2015) noted awareness as the road of the user to fully adhere to the information security rules and regulation. Khan *et al* (2011) also recognized awareness of information security measures as the main attribute of the effectiveness of information security measures.

Generally, the results reveal that effectiveness of information security measures is unsettled as it is facing a lot of challenges which marks it to remain moderate. These results tally with what have been noted during interview sessions conducted by the researcher to the key informants (i.e., systems administrators). For instance, one of the respondents said:

Actually, the measures are somehow effective and we are continuing to our best level to improve according to the required standards. The college has invested much efforts to ensure effective implementation of the measures though we are still facing some challenges in terms of the end users of these measures I mean general staff. For example, you may find that staff are not able to install anti-virus software in their office computer (s) because they lack ICT security knowledge.

Another key informant lamented:

Our organization has been adopting various technological tools for information security tools though there is underutilization of these tools bad enough we have ICT policy but employees are not complying with it so tis make difficulties to have effective security.

These narratives suggest that the level of effectiveness of information security measures is moderate due to lack of consistency and readiness of employees to comply with formalized procedures and tools to implement information security measures. Thus, the results indicates that the effectiveness of the measures is disturbed by a lot of hesitation in implementing policies and other security guidelines.

4.3 Factors Affecting the Implementation of Information Security Measures

The respondents were asked on the factors affecting the implementation of effective information security measures in the organization as hypothesized in the conceptual framework of this study. The assumption was that there are factors affecting awareness and effectiveness of information security measures. The researcher was interested to know if there is significant association between the factors and awareness and implementation of information security measures. The Chi-Square Test was used to analyze the association between each factor and awareness and implementation of information security.

4.3.1 Human Resources Factor

The respondents were asked on human resources factor in terms of employees' preparedness or readiness to be aware of information security measures. The researcher was interested to find out if there is any significant association between employees' preparedness and awareness and effectiveness of information security measures. The Chi-Square Test was used to analyze the association. The results are shown in Table 4.17.

Table 4.17: Chi-Square Test of Association between Employees Preparedness and Awareness and effectiveness of Information Security Measures

Category	Awareness			Category	Effectiveness		
	Value	Df	Asymp. Sig.		Value	Df	Asymp. Sig.
Pearson Chi-Square	26.564 ^a	16	.047	Pearson Chi-Square	57.517 ^a	16	0.000
Likelihood Ratio	26.394	16	.049	Likelihood Ratio	51.603	16	0.000
Linear-by-Linear Association	1.830	1	.176	Linear-by-Linear Association	27.186	1	0.000
N of Valid Cases	136			N of Valid Cases	136		

Source: Field Data (2022)

The research findings in Table 4.17 indicate that employees' preparedness is associated with both awareness and effectiveness of information security measures. The *P* value (0.047) for awareness of information security measures and the *P* value (0.000) for effectiveness of security measures were less than 0.05; meaning that there is significant association between employees' readiness to adopt information security measures and the level of awareness and effectiveness of information security measures whether in a positive or negative effect(s). That is also to say if employees are not ready to be aware it will be difficult to effectively implement the measures. Kumah (2022) also argued that if employees are interested and steered to engage in more safe information security behavior, an organization will be able to implement the security measures efficiently. Likewise, the results moderately support the relationship hypothesized in the conceptual framework of this study that awareness and effectiveness of information security measures are influenced by human factor.

The respondents were asked to give their opinions on the level of dedication of the college in facilitating information security awareness programs as well as their level of awareness on

information security measures. Responses on the organization commitment to conduct information security awareness programs and the level of awareness of information security measures were cross-tabulated accompanied by Chi-Square Test to confirm the association between both. The study findings indicated that the majority of respondents 58 (42.6%) were not able to specify whether CBE is dedicated to conduct information security awareness programs or not. The same applied to the level of awareness of information security measures as 61 (44.9%) respondents were neutral to specify whether they are familiar with the measures or not. The results are shown in Table 4.18.

Table 4.18: Cross-tabulation between CBE Commitment to Conduct Security Awareness Programs and Awareness of Information Security Measures

CBE dedicated to conduct awareness programs	Awareness of Information Security Measures					Total
	Strongly agree	Agree	Neutral	Disagree	Strongly disagree	
Strongly agree	2	4	2	3	0	11
Agree	2	26	11	4	1	44
Neutral	4	7	42	4	1	58
Disagree	0	1	3	7	2	13
Strongly disagree	0	0	3	1	6	10
Total	8	38	61	19	10	136

Source: Field Data (2022)

The study findings indicate neutral position of most of the respondents on the organization commitment to conduct security awareness programs. This imply that the respondents were either not satisfied with the efforts put by the organization on building awareness of information security or they were not conscious of the information security awareness programs that have been conducted by the organization due to less involvement. Hanus and Wu (2016) also found that effective awareness is an outcome of users' involvement in awareness building programs. In this incidents, one respondent said:

When it comes to training and development with this issue of ICT training programs and security and whatever, priority is not much given. You may find the college is facilitating many trainings concerning other matters apart from information security. But when it comes to the issue of conducting information security training, they say the budget is not enough.

This indicates that the issue of conducting information security awareness programs at CBE is not given much priority. Other respondents said:

I have never attended any information security awareness programs but the college has been conducting these trainings frequently for ICT coordinators though there is no periodic security training for general staff members. I think the college is currently not financially good to conduct frequent trainings to all staff.

This implies that the trainings had been conducted but an individual did not attend though still the general staff have been not given much priority in terms of attending information security awareness programs due to financial constraints. This indicates less involvement of staff in the programs which may also affects the level of awareness

Furthermore, the study findings suggested that the level of awareness of information security measures in the organization is moderate since most of the respondents through questionnaire were neutral to agree or disagree whether they are familiar with information security measures or not. In this incidents, one respondent said:

The level of awareness I can say moderate, yes moderate; not high not low because staff members have ABC about this information security systems. So, they are not much competent in understanding information security measures and their applicability. Of course, we need to find a way out to fix this for example through conducting awareness trainings for all employees.

The issue here is that HLIs must find way to build awareness on information security management among staff members and maintain high level of information security management practices.

Given the challenges above, the researcher was also interested to find out if there is any significant relationship between conducting awareness program and level of awareness. The study analysis results on the relationship between conducting information security awareness program and awareness of information security measures are summarized in Table 4.19.

Table 4.19: Chi-Square Test: Association between Commitment of Conducting Information Security Awareness Programs and Awareness of Information Security Measures

Category	Value	Df	Asymptotic Sig.
Pearson Chi-Square	110.025 ^a	16	.000
Likelihood Ratio	84.886	16	.000
Linear-by-Linear Association	35.103	1	.000
N of Valid Cases	136		

Source: Field Data (2022)

The results in Table 4.19 show that commitment of conducting information security awareness programs is associated with awareness of information security measures. The p value (0.000) was less than 0.05; meaning that there is significant relationship between conducting information security awareness programs and awareness of information security measures. This can be also presumed that if the members of the organization get trained then they are highly expected to be aware of information security measures. Hammarstrand and Fu (2015) also found untrained respondents being not aware of the security measures compared to the trained respondents.

4.3.2 Environmental Factors

The respondents were asked on the environmental factor in terms of physical environment security in relation to implementation of information security measures. The Chi-Square Test was used to analyze if there is significant association between physical environment security and awareness and effectiveness of information security measures. The results are shown in Table 4.20.

Table 4.20: Chi-Square Test of Association between Physical Environment Security and Awareness and effectiveness of Information Security Measures

Category	Awareness			Category	Effectiveness		
	Value	Df	Asymp. Sig.		Value	Df	Asymp. Sig.
Pearson Chi-Square	51.896 ^a	16	.000	Pearson Chi-Square	53.443 ^a	16	0.000
Likelihood Ratio	42.319	16	.000	Likelihood Ratio	54.253	16	0.000
Linear-by-Linear Association	3.607	1	.058	Linear-by-Linear Association	19.116	1	0.000
N of Valid Cases	136			N of Valid Cases	136		

Source: Field Data (2022)

The results in Table 4.20 show that physical environment security is associated with both awareness and effectiveness of information security measures. The P value (0.000) for awareness of information security measures and the P value (0.000) for effectiveness of security measures were less than 0.05; meaning that there is significant association between

physical environment security and the level of awareness and effectiveness of information security measures whether in a positive or negative outcome(s). Similarly, the results relatively support the relationship hypothesized in the conceptual framework of this study that environmental factors are associated with awareness and effectiveness of information security measures. Semlambo, Mkude, and Lubua, (2021) desk review study on the factors affecting information security, found that fourteen (14) literatures out of forty argued that work environment is among the key factors influencing the implementation of effective information security measures in an organization.

4.3.3 Technical Factors

The respondents were asked on the technical factor in terms of technical personnel, procedural actions (policies) and technologies (ICTs) towards implementation of information security measures in the organization. The researcher was interested to find out if there is any significant association between technical factors and awareness and effectiveness of information security measures. The Chi-Square Test was used to analyze the association. The analysis findings indicated that there is significant association between availability of ICTs personnel and awareness and effectiveness of information measures. The results are shown in Table 4.21.

Table 4.21: Chi-Square Test of Association between Availability of ICTs Personnel and Awareness and effectiveness of Information Security Measures

Category	Awareness			Category	Effectiveness		
	Value	Df	Asymp. Sig.		Value	Df	Asymp. Sig.
Pearson Chi-Square	37.979 ^a	16	.002	Pearson Chi-Square	55.369 ^a	16	.000
Likelihood Ratio	40.089	16	.001	Likelihood Ratio	57.626	16	.000
Linear-by-Linear Association	8.252	1	.004	Linear-by-Linear Association	8.717	1	.003
N of Valid Cases	136			N of Valid Cases	136		

Source: Field Data (2022)

The results in Table 4.21 show that availability of ICTs experts is associated with both awareness and Effectiveness of information security measures. The *P* value (0.002) for awareness of information security measures and the *P* value (.000) for effectiveness of security

measures were less than 0.05; meaning that there is significant association between availability of ICTs experts and the level of awareness and effectiveness of security measures whether in a positive or negative effect(s). Likewise, the results partly support the relationship hypothesized in the conceptual framework of this study that technical factors are associated with awareness and effectiveness of information security measures in terms of availability of experts for technological support to information system users. ICTs experts play a big role in helping other users with limited knowledge of information security management in an organization in terms of fixing the complex information security issues and building awareness to their co-workers on information security measures.

Furthermore, the analysis findings indicated that there is significant association between availability of information security policies and awareness and effectiveness of information security measures. The results are shown in Table 4.22.

Table 4.22: Chi-Square Test of Association between Information Security Policies and Awareness and Effectiveness of Information Security Measures

Category	Awareness			Category	Effectiveness		
	Value	Df	Asymp. Sig.		Value	Df	Asymp. Sig.
Pearson Chi-Square	51.954 ^a	16	.000	Pearson Chi-Square	62.639 ^a	16	0.000
Likelihood Ratio	46.065	16	.000	Likelihood Ratio	58.572	16	0.000
Linear-by-Linear Association	7.942	1	.005	Linear-by-Linear Association	12.786	1	0.000
N of Valid Cases	136			N of Valid Cases	136		

Source: Field Data (2022)

The results in Table 4.22 show that information security policies are associated with both awareness and effectiveness of information security measures. The *P* value (0.000) for awareness and the *P* value (0.000) for effectiveness of security measures were less than 0.05; meaning that there is significant association between information security policies and the level of awareness and effectiveness of information security measures whether in a positive or negative effect(s). Likewise, the results partly support the relationship hypothesized in the conceptual framework of this study that technical factors are associated with awareness and effectiveness of information security measures in terms of availability of information security policy to regulate information security management practices. Therefore, availability of clear

and comprehended policies in addressing information security tools determines the level of awareness and effectiveness of information security measures as it was also found by Manneback and Padyab (2021) that rules and policies are among the factors affecting the effectiveness of security measures. Thus, information security policies determine the capacity of an organization to implement effective information security measures.

4.3.4 Financial Factors

The respondents were asked on the financial factor in terms of budget towards awareness and effectiveness of information security measures in the organization. The researcher was interested to find out if there is any significant association between financial factors and awareness and effectiveness of information security measures. The Chi-Square Test was used to analyze the association. The analysis findings indicated that there is significant association between budget and implementation of information measures. The results are shown in Table 4.24.

Table 4.24: Chi-Square Test of Association between Financial Support and Awareness and Effectiveness of Information Security Measures

Category	Awareness			Category	Effectiveness		
	Value	Df	Asymp. Sig.		Value	Df	Asymp. Sig.
Pearson Chi-Square	32.732 ^a	16	.008	Pearson Chi-Square	43.732 ^a	16	0.000
Likelihood Ratio	37.087	16	.002	Likelihood Ratio	47.304	16	0.000
Linear-by-Linear Association	4.588	1	.032	Linear-by-Linear Association	15.498	1	0.000
N of Valid Cases	136			N of Valid Cases	136		

Source: Field Data (2022)

The results in Table 4.24 show budget are associated with both awareness and effectiveness of information security measures. The *P* value (0.008) for awareness and the *P* value (0.000) for effectiveness of security measures were less than 0.05; meaning that there is significant association between financial support and the level of awareness and effectiveness of information security measures whether in a positive or negative effect(s). The results comparatively support the relationship hypothesized in the conceptual framework. Yeo, Rahim, and Miri (n.d) also revealed this association that the level of management support in terms of financial and technical assistance are serious factors which determine the level of information security risk assessment for implementation of effective measures as well as awareness building on information security measures. To gain more insight into factors

affecting information security management practices, the key informants were also asked to talk about challenges they encountered in implementing information security measures in accomplishing organizational objectives. Response to this question revealed that human resource, environmental, technological and financial factors are among the challenges which tends to hold back HLIs progress towards effectiveness of information security measures. For example, one of the respondents said:

We have few numbers of ICT experts and auxiliary police in our organization with the regard that our physical environment is not secured enough against unauthorized people to access sensitive organizational information. For instance, office keys are left to auxiliary police while computers and sensitive files within the office room are not locked. Therefore, if the police have access to office doors, they may also direct access the files and other sensitive information which are found in the room.

Another key informant commented:

One of the major ICT challenges that we are facing is the issue of system integration. Note that we were using SARIS students' management system. We are now using COSIS, data from the SARIS and COSIS to date still get a problem of mismatching. So, we have two different systems which are operating with the same functions. So, running these two systems that do not communicate to each other there is about loop hole sometimes for information leakage.

One more respondent lamented: *In terms of the budget, it is not specified in the college budget. So, you may not find a specific budget for information security exactly but there is a budget for several trainings on various issues concerning the college.*

All these testimonies show that HLIs are facing number of challenges which affect the effectiveness of information security measures. Taking into consideration that the quantitative results in this section revealed that there is positive relationship between these factors and effectiveness of security measures. Hence, the effectiveness of information security measures at the College of Business Education (CBE) is unsettled as the higher the challenges the higher the risks to information security management.

Conclusion and Recommendations

Conclusion

The effectiveness of information security measures is articulated by the required outcomes of the implementation guidelines like policies, reports and other frameworks. Despite this, most of the respondents could neither deny nor agree on the effectiveness of information security measures, while most of them agreed with the statement on the availability of information security policy in the organization. Most respondents disagreed with the statement on the availability of information security risk assessment reports in the organization. Based on these results, the study concludes that the effectiveness of information security measures is average.

Furthermore, the study concludes that although the staff in the organization are aware of the availability of information security policy, they need to become more familiar with the real situation of information security in the organization as they are not aware of the availability of information security risk assessment report. Therefore, this is a great fault in the efforts to implement effective information security measures. The study revealed common factors affecting implementation of information security measures in the organization in a positive or negative way. These factors are human resources, environmental, technical and financial factors. The four common factors may accompany each other to affect the effectiveness process or standing alone against each other. Therefore, recognition of these factors proves one of the assumptions in the conceptual framework of this study that there are factors affecting effectiveness of information security measures in the HLIs in Tanzania. Generally, awareness creation and capacity building should be effective to enable information system users to resist hackers in the changing environment of Information and Communication Technology.

Recommendations

The recommendations are based on the findings of this study on the way forward to improve implementation of information security measures at the College of Business Education (CBE) in Tanzania.

College of Business Education (CBE)

It is recommended that CBE should establish a specific and permanent team for information security risk assessment. The team should include staff members from different departments of the organization in order to make it participatory. Moreover, official and public platforms for members of organization to report information security incidents should be available and accessible such as suggestion box, official email and contact number. The study recommends that there is serious need for higher learning institutions to conduct departmental regular awareness building sessions on implementation of information security measures among employees as well as encouraging them to attend further studies. Hence, challenges facing each specific information security management activity such as technical and financial issues should be dealt with accordingly. It is further recommended that CBE should communicate their information security risk assessment report to the members of the organizations.

Government

It is recommended that government should formulate a national information security policy to guide HLIs and other private and public institutions. This may help to regulate information security management activities performed in the institutions by improving standards and procedures to effective information security measures among HLIs. The study recommends that there is a serious need for the government of the United Republic of Tanzania to establish public programs on information security awareness with a view to improve information security management practices among public and private employees and the general public as customers of the higher learning institutions.

²Department of Education, College of Business Education (CBE), Dar es salaam, Tanzania

Abstract

Coffee is the most traded commodity on the global market. Hence, the purpose of this paper is to examine the factors affecting Coffee Supply Chain Management (CSCM) in Ethiopia. Data for this study were gathered from 178 respondents as sample size and the main sources of data for this survey were primary data which were collected by using survey questionnaires. This data was analyzed using descriptive and inferential statistical techniques. The results of this study show that all independent variables have a significant effect on the dependent variables. According to the regression model results, R values (94.1%) clearly show a significant relationship between the dependent variable and the predictor variables, and an adjusted R-squared reveals that all predictor variables (such as economic factors, institutional factors, infrastructure factors and marketing factors) can predict the dependent variable (coffee supply chain management) by 88.3 %. However, economic-related factors have great effects (56.48%) on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch followed by institutional related factors which have (30.67%) effects on CSCM while infrastructural related factors and marketing related factors are the least important (10.47% and 2.38%) respectively. The study concludes that coffee supply chain management is unproductive because of corruption, lack of technology, lack of financing, insufficient training, and lack of managerial competency. Hence the study suggests that all stakeholders focus more on developing a policy for blending coffee supply chain which includes production, storage, and marketing, and preventing constraints such as corruption, poor management systems, and insufficient training to improve coffee supply chain management and marketing systems, particularly in Ethiopian Commodity Exchange at Jimma Branch.

Keywords: *Coffee, Coffee Supply Chain Management, Coffee Production, Marketing.*

1.0 Introduction

Coffee is an agricultural raw material widely traded on a global and regional scale (Bali et al., 2020, Wakjira, 2021). In today's global market, various commodities are available in the international market, with coffee being one of the most important commodities (Bali et al., 2020). Coffee is a vital production for development activities that provides a living for millions of people worldwide by generating financial returns in subsistence economies (Gebermedin & Tolera, 2015). Coffee production and harvesting in developing countries are labor-intensive, and it is a valuable source of rural employment for both men and women (Mutandwa et al., 2009). It is unique is that, coffee is grown in practically every non-arid tropical country. Over 50 countries produce considerable amounts of coffee, and the sources of their income are

largely based on coffee exports which are critical to the country's balance of payments (Chauhan et al., 2015; Gebermedin & Tolera, 2015). In the Ethiopian economy, agricultural products particularly coffee accounts for about half of Gross Domestic Product (GDP) (Lemecha, 2019). It is nearly accounts for about 47% of GDP, 80% of export revenues, and employment for 85% of the communities, and all of these made it the country's economic backbone (Nguni, 2016).

Multiple studies in Ethiopia show that coffee is one of the most essential commodities in international and local consumption and trade, which provides a significant source of income for several nations (Temesgen & Tufa, 2017; Aliyi, 2019, Asefa et al., 2016; Wakjira, 2021). This suggests that the expansion and development of the coffee business can have a major impact on national, regional, and household economic growth (Gebre, 2020; Kebede et al., 2021). However, the coffee value chain has not yet fully capitalized on its role as a supplier of most of the world's greatest coffees (Degaga, 2020).

Ethiopian coffee supply chain faces numerous problems due to a lack of market outlets, insufficient market information among participants, and limited investments in market linking activities (Amamo, 2014; Minten et al., 2019). As a result of these and other factors, the farmers' share of the present price has decreased and Ethiopia's government also recognized the issue and allowed coffee unions to sell their members' products directly to international markets, without any middlemen. However, while these cooperatives or unions may be able to shorten the coffee supply chain, they are having trouble in adding value to their members' products in terms of logistics, marketing, and institutional factors (Aliyi, 2019).

Currently, various literature and study have been conducted on CSCM in Ethiopia. For instance the study by Angula, 2010; Kabeta, 2021; Kassaye et al., 2018; Shumeta & D'Haeseb, 2016; Temesgen, 2020. In this regard, coffee supply chain analysis is an intriguing procedure that needs extra attention in this field of research. However, most of these studies did pay attention to determinants/factors affecting the coffee supply chain rather than the extent to which those factors impact CSCM. Therefore, the main objective of this research was to bridge this practical gap by examining the extent to which those factors impact CSCM of Ethiopian Commodity Exchange (ECX) at the Jimma Branch. Specifically, the study was to examine the extent of institutional, infrastructural, market, and economic factors impacts on the Ethiopia's CSCM. This study is significant to inform the Coffee Regulatory Authority in Ethiopia and other stakeholders in coffee industry about the level of impact of each factor and suggesting the appropriate measures.

2.0 Related Literatures

Coffee is one of the five main important commodities in the world markets (Ibrahim & Zailani, 2010). In today's dynamic economic environment, individual companies may begin to compete as distinct entities instead of as active participants in a bigger supply chain that encompasses a network of different businesses and partnerships. As a result, suppliers operate in an ever-changing environment and are vulnerable to a wide range of risks at all levels due to a constantly changing landscape caused by variety of factors (Ibrahim & Zailani, 2010). Many supply chains span large areas and are susceptible to a variety of global risks (Butner, 2010;

Christopher & Holweg, 2011). Customers are becoming increasingly demanding of product customization, pricing, and service level (Christopher & Holweg, 2011; Sayed et al., 2017).

Product variation is also continuing to increase as a result of high clock frequency in so many companies which leads to rapid technological changes and the ongoing launch of new technology to the market. Besides, the external environment is extremely vibrant leading to economic (energy costs, raw material prices, and availability, currency values), socioeconomic (civil disorder, changing customer needs), and natural events (Sayed et al., 2017). In such, businesses must be incredibly agile to stay alive in this complicated world, as well as build a large level of adaptability and mitigating risk skills, as well as a porous structure that allows for rapid response to these problems. According to Christopher & Holweg (2011), structural flexibility is the supply chain's ability to adjust to essential changes in the market. However, adaptability and perseverance come with a cost in the form of an extra resource base such as safety stock and extra space, as well as higher transaction costs (Christopher & Holweg, 2011).

Firms must have the greater profile of the entire supply chain, the essential speed to respond rapidly to changes, and effective coordination with vendors and distributors in terms of balancing the usually needed level of resilience and flexibility and the cost of achieving it (Christopher & Holweg, 2011). It is also critical in assisting supply chains in coping with the issues of an ever-changing environment and a plethora of risks at all stages. Supply chain interactions are being elevated to a new level, with the potential of human-to-thing interaction and independent cooperation between many 'things' while still being retained in an institution or transported between various supply chain organizations (Mulyati & Indrawan, 2021; Phyllis, 2014; Sarker, 2018). These new tools provide a huge opportunity for dealing with confronted more successfully. It enables new levels of logistics, flexibility, and versatility to deal with a variety of supply chain management challenges (Ellis et al., 2015). This will permit for a decrease in time among data collection and judgment, letting supply chains respond to events in real-time, enabling for levels of nimbleness and ability to respond never seen (Ellis et al., 2015).

Ethiopia's economy is mostly reliant on agriculture, which accounts for roughly 40% of GDP and 80% of exports (Sarker, 2018). Coffee in Ethiopia is most important agricultural export product, accounting for 65% of the country's foreign exchange revenues. In a country where a huge portion of the population lives in poverty, coffee farming is critical to the country's cultural and socioeconomic well-being.

According to a World Bank assessment, over 25% of Ethiopia's population is dependent on coffee cultivation, processing, and marketing, either directly or indirectly (Umaran et al., 2022). Ethiopia is noted for having a suitable environment for growing coffee, with a mix of optimum height, temperature, rainfall, and soil type, and Ethiopia is the source of Arabica coffee. For this Arabica coffee, the country has a diverse genetic background with significant variation. Ethiopia produces a variety of coffees and they have significant potential for specialty coffee sales (Sayed et al., 2017).

2.1. Factors Affecting Coffee Supply Chain Management in Ethiopia

While new markets emerge, many coffee-dependent poor countries, such as Ethiopia, are struggling to produce and export their coffee. Ethiopia is the world's fifth-largest coffee producer and the continent's leading producer. Most of the coffee is consumed in the country, and it has the highest domestic consumption rate on the African continent (Anwar & Nguyen, 2010).

Ethiopia is famous not only for being the birthplace of Arabica coffee but also for its high-quality coffee, which is prized for its aroma and flavor. Another appealing aspect of Ethiopian coffee is its variety of flavor and quality. There is widespread agreement that the five most significant marketing-related constraints confronting Africa's farmers revolve around five points: (1) high production and marketing costs, resulting in low profitability and a disincentive to produce for the market; (2) limited access to credit, particularly for small-scale farmers; (3) a scarcity of profitable new farm technologies to adopt and use sustainably; (4) price volatility; and (5) poor market access and competitiveness conditions (Jayne et al., 2014).

The primary goal of a coffee exchange value is to establish a fair, orderly, and efficient system for aligning supply and demand to enable "market pricing," or the true current value based on supply and demand conformity (Alam, 2020; Angula, 2010; Jima Degaga et al 2017). To attain this alignment, an exchange value can and must restrict market behavior through risk assessment equipment designed to ensure that market behavior adheres to the principles of a fair, orderly, and efficient marketing system. These tools include, among other things, limiting trading positions, trying to adjust the rate of return and other deposit prerequisites, and establishing price loop filtration to limit price swings, marketing factors, finances, government policies, and physical and human resources greatly affected coffee production (Catturani et al., 2008; Gathura, 2013; Issa & Chrysostome, 2015).

Ethiopia's export competitiveness is improved by first getting the domestic market in order, whereby three groups of problems in the commodity market are identified: 1) the lack of an integrated commodity marketing policy that addresses all processes involving transport, grading, storage, and information facilities for both producers and consumers; 2) the lack of a well-equipped institutional establishment capable of providing all marketing services to all market actors; and 3) the lack of private and public partnership in the commodity market (Alam, 2020; Angula, 2010; Gebermedin & Tolera, 2015). Thus, commodity exchanges are established for a variety of reasons, the most important of which is to address the and related challenges. Conversely, dissatisfaction with transportation and communications services; a lack of complete, accurate, and accessible global marketing information; a lack of adequate warehouses, grading, and sampling systems; and a higher premium cost for failing to pull back commodities from storage facilities on time were identified as some of the ECX difficulties for agriculture products export members (Abebaw, 2014; Shumeta et al., 2012; Shumeta & Haese, 2018).

Exchange rates can be useful throughout physical trade in emerging markets, including the financing of commodity inventories. They can lower the cost of physical exchange exploration and counterparties in deals with a number by providing a transparent, disciplined marketplace (Ngmenipuo & Issah, 2015). Commodities that work properly can encourage more efficient

and productive, storage, marketing, and agriculture sectors processing activities, as well as significantly improved agriculture sector effectiveness. (Apriyanti, 2020).

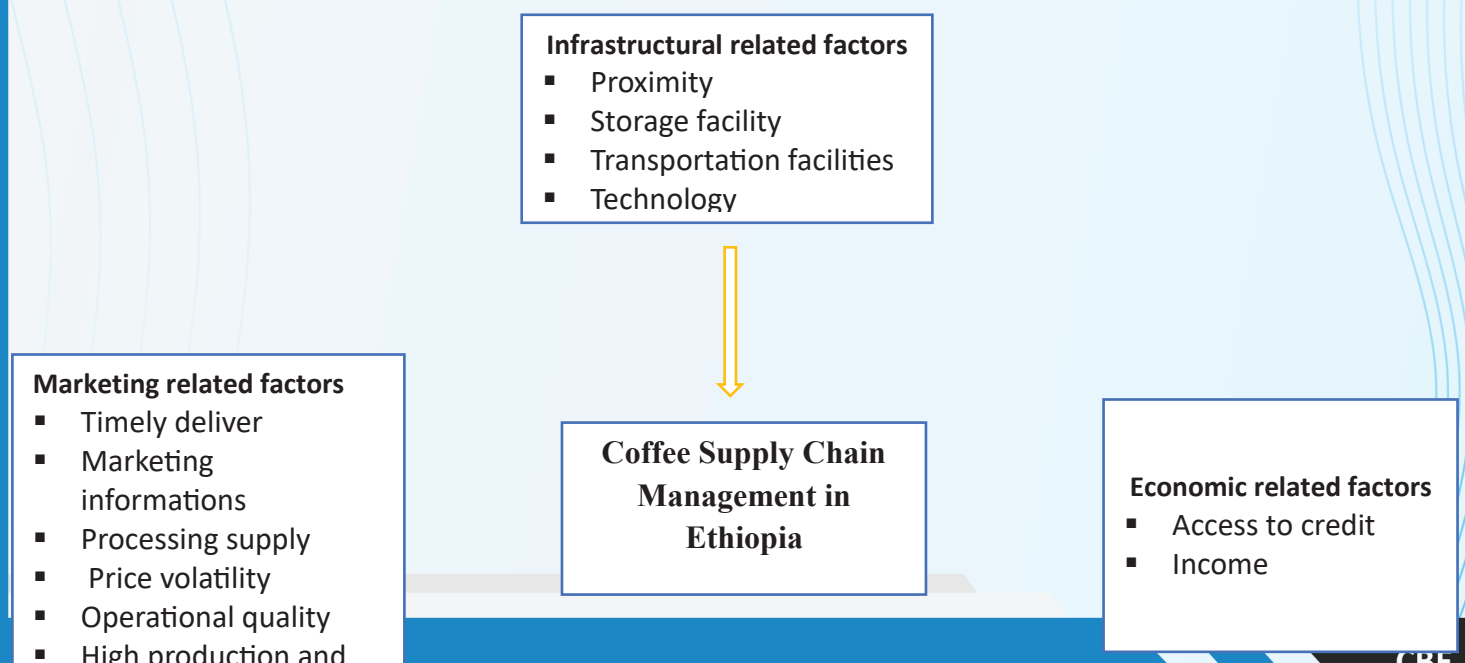

Small-scale farmers, privately held farmers, and state businesses are among the producers at this stage in Ethiopia's coffee supply chain (USDA, 2019). Producers, particularly large-scale private coffee plantations and state farms of coffee plantations, control the majority of the volume of goods mobilized, value-adding services, market share, and capital in the country's coffee value chain. Subsequently, the coffee is made and matured, those producers execute the following value-added operations in the value chain, gathering coffee chary and delivering it to processing regions (USDA, 2019)

A supply chain's primary complaint is to start producing value-added goods or services for a market location by improving an organization and utilizing infrastructure and services inside the possibility and restrictions of its institutional context. As a result, we believe that the restrictions to value progress are associated to access to the common market (municipal, geographic, and worldwide) and market alignment (Hernandez, 2015; Perdana et al., 2018; Sayed et al., 2017).

Despite its high quality, Ethiopian coffee is the least advertised and promoted on the global market. Evidence suggests that roasters are aware that Ethiopian coffee is superior, but they are unable to sell it because we have not approached them. That is, one of the problems with coffee marketing in Ethiopia is that there is insufficient effort to promote coffee and ensure trademark rights for the best and most well-known Ethiopian coffee varieties, the majority of which are motive and number one in the world. Furthermore, exporters lack experience and knowledge of the coffee market (Angula, 2010; Kabeta, 2021). However, to the best of the researcher's knowledge, none among the empirical study has been conducted in the Ethiopian Commodity Exchange (ECX) at Jimma Branch and most of these studies did pay attention to determinant/factors affecting the coffee supply chain rather than its contributions to economic growth or the extent to which those factors impacts the CSCM. Therefore, this study will be worthy of persuit to bridge this gap and add knowledge to the existing literature.

2.2 Conceptual Framework of the Study

Based on the aforementioned information and reviewed literature, the researchers presented the conceptual framework depicted in figure 1.

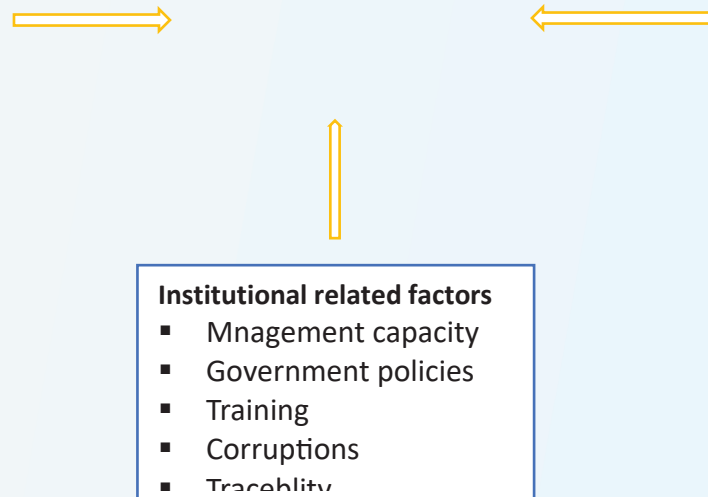

Figure 1: A Conceptual framework for factors affecting coffee supply chain management in Ethiopia

Source: Developed from reviewed literature

3.0 Methodology

3.1 Research Design

The study employed a cross-sectional survey design which incorporates both descriptive and explanatory research design to examine data and get enough information about the study's realities. The descriptive research design was used to describe the contributions and constraints of each determinant factor on coffee supply chain management and marketing system in Ethiopia at EXC of Jimma Branch. The study also used an explanatory research design to investigate the relationship between independent variables (institutional, infrastructural, marketing, and economic factors), and dependent variables (coffee supply chain management) because those variables have a cause-and-effect relationship.

3.2 Target Population and Sample Size

Agreeing to (Kothari, 2004), the "target population" refers to the intended population of a study in terms of age group and gender in a certain geographical area such as a country, region, or town. Accordingly, the study used 321 employees of the Ethiopian Commodity Exchange (ECX) of the Jimma branch as the target group of the study. Hence, the researchers selected a sample of responders among these employees. The study employed the (Yamane, 1969) sampling technique for determining sample size as shown in equation (1). Thus, the researcher chooses 178 employees as a sample size out of 321 employees.

The formula for sample determination is $n = \frac{N}{1+N(e^2)}$, whereby: n =sample size, N =Targeted population, e =Level of precision or sampling error which is 0.05.

$$\text{Thus, the sample employees of ECX, } n = \frac{321}{1+321(0.05^2)} = 178$$

3.3 Sources of Data

The main sources of information for this survey were primary data. Questionnaires and interviews were used to collect primary data. The questionnaires were created for the entire group of respondents, and it is the best and most important primary sources. The cross-section survey research method was used to collect data for this study because it is an appropriate method for measuring respondents' opinions and attitudes. The researchers had carefully crafted insightful interview questions in addition to the questionnaires. The interview was conducted under the assumption that the participants' perspectives are valuable, that they are knowledgeable in the field, that they can make accurate comments, and that their perspective influences the study's success.

3.4 Method of Data Analysis

Various statistical methods, including descriptive statistics such as mean and standard deviations, as well as inferential statistics (multiple regressions and the Automatic linear regressions model) were used to analyze the data. The study employed multiple linear regression analysis to analyze the strength of the relationship between the independent variable and various predictor variables, as well as the importance of each predictor to the relationship with the influence of other predictors. The data was then analyzed and interpreted in light of the information gathered from respondents. Accordingly, the general model for this specific study is as follows:

$$y = b + m_1x_1 + m_2x_2 + m_3x_3 + m_4x_4 + \varepsilon$$

Where,

y= The dependent variable of the regression which is coffee supply chain management (CSCM)

b= Constant or the y-intercept

m_1 = Regression coefficient of the first independent variable

x_1 = First independent variable of the regression which is Marketing related factors

m_2 = Regression coefficient of the second independent variable

x_2 = Second independent variable of the regression which is Infrastructural related factors

m_3 =Regression coefficient of the third independent variable

x_3 = Third independent variable of the regression which is Institutional related factors

m_4 = Regression coefficient of the fourth independent variable

x_4 = Fourth independent variable of the regression which is Economic related factors

ε = Model error

3.5 Validity and Reliability of the Study

Validity is a measurement trait that describes a research instrument's or tool's ability to measure what it was designed to measure. The validity of instruments is ensured in this study by using simple language when creating instruments so that respondents can understand them easily. The questionnaires were examined and checked by consultants and potential experts in quantitative research. Then were pre-tested to employees of ECX at Jimma branch who were not part of the study sample. Reliability is the degree to which a research mechanism produces reliable outcomes or data the same way each time it is used under the same condition with the

same subjects. The reliability of the study would be checked by using Cronbach alpha which was calculated by using SPSS software.

4.0 Results, and Discussion

This chapter discusses the presentation, interpretation, and analysis of the study's data. The variables in the study were the factors and their effects on CSCM. Descriptive statistical analysis, such as percentages and frequencies, was designed to present how these factors affect CSCMM. To assess the influencing factors on CSCM in Ethiopia, Multiple linear regression and automatic linear regressions were used to show the effects and importance of the predictors. To conclude, 178 questionnaires were distributed to respondents, and the collected data were presented and analyzed by using SPSS (version 26) statistical software to test the study's variables and the effects of the independent variables on the dependent variable.

4.1 Validity and Reliability of the Data

The study used Cronbach's alpha which is dealing with the amount to which item responses obtained at the same time are highly correlated with one another, and the widely accepted social science cut-off is that alpha should be greater than 0.70 for an agreed of items to be considered a scale (Field, 2009). Accordingly, the Cronbach's alpha test was performed by using SPSS 26 versions, and the results are summarized as shown in Table 1. The calculated coefficient of alpha for this study was 0.970 for all variables, which is greater than the required threshold of 0.70, indicating that the variables are internally reliable.

Table 1: Summarized Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
0.970	0.980	15

The inter-item correlation was also used to determine the correlation coefficients for items in the study's scale, to check and see if the items interrelated well. To be the inter-item correlation interrelated well, the threshold of the reliability test has to be greater than 0.3 (Field, 2009). This technique also shows that the survey data was statistically reliable. For all items that are inserted in the systems of Cronbach alpha, the value is greater than 0.3 which fits above the required standards. This shows the data used by the study is reliable and valid for analysis. (See below Table 2)

Table 2: The correlation coefficients for inter-item

Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
o Timely delivery	59.847	56.246	0.779	0.971
o Marketing information	59.3820	56.961	0.926	0.966
o Processing and supply	61.0112	60.870	0.918	0.968
o Price volatility	59.2022	55.835	0.839	0.969
o Operational quality	59.0112	60.870	0.918	0.968
o Proximity to cooperative society	59.2921	58.920	0.874	0.967
o Storage facilities	60.5730	50.777	0.951	0.970
o Transportation facilities	59.1966	61.560	0.797	0.969
o Technology	59.0112	60.870	0.918	0.968
o Management capacity	59.1067	60.955	0.875	0.968
o Government policies	59.0052	60.755	0.865	0.968
o Training	59.0112	60.870	0.918	0.968
o Corruptions	58.9663	61.276	0.889	0.968
o Access to credit	59.2865	62.691	0.674	0.971
o Income	59.1067	60.955	0.875	0.968

As shown in Table 2 above, the overall and inter-item Cronbach's alpha values of all dependent and independent variables in the study meet the minimum requirement of reliability analysis (i.e. $\alpha > .70$). As a result of this finding, the researcher concludes that the instrument's pilot test is reliable enough to use in the current study. Additionally, all the items contribute positively to yielding the highest Cronbach's alpha for the instrument.

4.2 Descriptive Analysis

The Descriptive analysis and interpretation are based on the respondent's responses and clear sentences to express obtained data by using the table of frequencies, percentage, mean and standard deviations; whereas the data collected through interviews were analyzed qualitatively to strengthen the analysis of the results from the study. The descriptive analysis mainly focuses on explaining the contributions of the independent variables such as Marketing related factors (Timely delivery, Marketing information, Processing and supply, Price volatility, and Operational quality), Institutional related factors (lack of management capacity, Inadequate training, and Corruptions), Infrastructural related factors (Proximity to cooperative society, Storage facilities, Transportation facilities, and Technology) and Economic related factors (Access to credit and Income) for dependent variables such as coffee supply chain management and marketing.

Descriptive analysis was used to summarize the results of each variable based on the response for each item and analyzed by comparing the "mean" and "standard deviation" scores of each

variable. According to Zaidaton & Bagheri (2009), the mean score below 3.39 was considered as low, the mean score from 3.40 up to 3.79 was considered moderate, and the mean score above 3.8 was considered as high as illustrated below. (*See below Table 3*)

Table 3: Comparison bases of the mean score of the five-point Likert scale instrument

Mean Score	Description
<3.39	Low
3.40 -3.79	Moderate
>3.80	High

Hence, based on the above table 3 descriptive statistics were employed to analyze the data that was calculated by using SPSS, and the interpretations of each descriptive statistic were presented in table 4. (*See below Table 4*)

Table 4: The descriptive results for each independent variable

	Descriptive Statistics		
	N	Mean	Std. Deviation
Marketing related factors	178	3.9506	0.64714
Infrastructural related factors	178	4.1222	0.64672
Institutional related factors	178	4.6278	0.45352
Economic related factors	178	4.4438	0.45060
Valid N (listwise)	178		

The results of above table 4 show the average mean and standard deviations of the predictor variables that have a significant effect on dependent variables. Hence the above table shows that Marketing related factors have a mean of 3.95 with standard deviations of 0.647, Infrastructural related factors have a mean of 4.122 with standard deviations of 0.646, Institutional related factors have a mean of 4.627 with standard deviations of 0.453, and Economic related factors has a mean of 4.443 with standard deviations of 0.450. According to Zaidaton & Bagheri (2009), the mean score below 3.39 was considered as low, the mean score from 3.40 up to 3.79 was considered moderate, and the mean score above 3.8 was considered as high. Based on this information all the above results are greater than the cutoff point or above the average which means that all independent variables (Marketing related factors, Infrastructural related factors, Institutional related factors, and Economic related factors) have greater effects on dependent variables (coffee supply chain management and marketing).

4.3 Inferential Statistics

The analysis and interpretation based on the respondent's responses were also interpreted by inferential statistics such as multiple regressions and automatic linear models to clearly state the relationships between each variable and their effects on (ECX) at Jimma Branch deeply disclosed according to the following (*See below Table 5*)

Table 5: Model Summary of relationships between variables of the study

Model Summary				Std. Error of the Estimate
Model	R	R Square	Adjusted R Square	
1	0.941 ^a	0.886	0.883	0.16688
a. Predictors: (Constant), Economic related factors, Marketing related factors, Institutional related factors, Infrastructural related factors				

The model summary is depicted in the above Table 5 shows, R which indicates a highly significant relationship between the dependent variable and the linear combination of the predictor variables is (0.941) which is the set of all independent variables explained 94.1%. R-squared, on the other hand, measures the proportion of the difference in the dependent variable that can be described by independent variables, irrespective of how well they are correlated with the dependent variable. Thus, the R Square value is (0.886) which indicates all independent variables explained 88.6% of the disparity in the dependent variables. However, this is not a desirable characteristic of goodness-fit of the results of the statistics. Hence, Adjusted R – squared, also provides an adjustment to the R-squared statistic, such as independent variables that correlate with the dependent variable. Accordingly, adjusted R-squared is preferable to R-squared for determining the model's success in the real world. Therefore, adjusted R-squared is the proportion of deviation described by the regression of the dependent variable on the combined effect of all predictor variables, which is 88.3%. Hence, the independent variables (such as economic, marketing, institutional, and infrastructure factors) can predict the dependent variable (coffee supply chain management) by 88.3 %.

Table 6: ANOVA results showing average amount of deviation described by the model and residual

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	37.300	4	9.325	334.852	0.000 ^b
	Residual	4.818	173	0.028		
	Total	42.118	177			
a. Dependent Variable: Coffee supply Chain Management						
b. Predictors: (Constant), Economic related factors, Marketing related factors, Institutional related factors, Infrastructural related factors						

The ANOVA (Analysis of variance) Table 6 above shows that, based on the total observation value (42.118), the regression model was explained by the majority of the observations (37.300). The remaining observation values (4.818) were explained by extraneous variables. The mean square of the model (regression) represents the average amount of deviation described by the model is 9.325; whereas the mean square of the residual is 0.028 and represents the average amount of deviation described by extraneous variables (the unsystematic variation). The F – ratio (334.852) is a degree of the percentage of deviation described by the model to variation explained by extraneous variables. Thus, the value of F is large enough to conclude that the model represents an actual practice of the business operators under study. The significant value in the model, also known as the P-Value ($p \leq 0.001$), indicates that the independent variables in the model explain the dependent variable. (*See below Table 7*)

Table 7: Regression coefficients results for related factors which predicts CSCM

Coefficients ^a					
Model		b	Std. Error	t	Sig.
1	(Constant)	1.717	0.220	7.794	0.000
	Marketing related factors	0.308	0.079	3.881	0.000
	Infrastructural related factors	0.432	0.116	3.730	0.000
	Institutional related factors	-0.732	0.079	-9.215	0.000
	Economic related factors	0.670	0.070	9.504	0.000
a. Dependent Variable: Coffee supply Chain Management					

The unstandardized coefficient of an independent variable (b) which is a constant or the y-intercept in the equation, measures the strength of its relationship with the performance of the dependent variable. Thus, the coefficient for marketing-related factors is 0.308, the coefficient for infrastructure-related factors is 0.432, the coefficient for institutional-related factors is -0.732, and the coefficient for economic-related factors is 0.670. Thus, marketing, infrastructure, institutional, and economic-related factors predict coffee supply chain management by 30.8%, 43.2%, and 73.2% and 67%, respectively.

Using the regression coefficients for independent variables and the constant term given under the column labeled b, the researchers constructed the regression equation for predicting a firm's performance as follows:

$$y = b + m_1x_1 + m_2x_2 + m_3x_3 + m_4x_4 + \varepsilon$$

$$\text{Therefore, } y = 1.717 + 0.308x_1 + 0.432x_2 + 0.732x_3 + 0.670x_4 + \varepsilon$$

Generally, the above finding implies that improving coffee marketing conditions, and enhancing infrastructural and institutional facilities were among the important factors to improve coffee supply chain and marketing, thereby improving the livelihoods of coffee producers in the study area.

Table 8: Automatic linear model results for predictors' performance/Importance on CSCM

Nodes	Importance	Importance	V4	V5
Marketing related factors transformed	0.0238	0.0238	Marketing related factors	0.0238
Infrastructural related factors transformed	0.1047	0.1047	Infrastructural related factors	0.1047
Institutional related factors transformed	0.3067	0.3067	Institutional related factors	0.3067
Economic related factors transformed	0.5648	0.5648	Economic related factors	0.5648

The results in the above table 8 were obtained by using automatic linear modeling which reveals that, the most important predictors for this study are economic-related factors such as farmer's or coffee producer's access to credit. Hence economic-related factors have great (56.48%) effects on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch followed by institutional related factors which have more (30.67%) effects on CSCM while infrastructural related factors and marketing related factors are the least important (10.47% and 2.38%) respectively. Hence, the finding of this study discloses that institutional related factors such as poor institutional managements system, absence of training, and corruption are among various factors which have a serious effect on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch next to economic related factors. In general, it was discovered that the majority of the respondents agreed on the coffee supply chain management and marketing are ineffective.

5.0 Conclusion and Recommendations

The purpose of this study was to examine the factors affecting Coffee Supply Chain Management in Ethiopia: the case of Ethiopian Commodity Exchange at Jimma branch. The descriptive and explanatory research analysis was used for the study. The finding of descriptive statistics show that all of the independent variables have an influence on dependent variables. The finding from the inferential statistics also shows that the model represents an actual practice of the business operators under study. The significant value in the model, also known as the P-Value ($p \leq 0.001$), indicates that the independent variables in the model explain the dependent variable. The adjusted R-squared shows the proportion of deviation described by the regression of the dependent variable on the combined effect of all predictor variables, which is 88.3%.

In general, it was discovered that coffee supply chain management is ineffective, whereby corruption, lack of technology, lack of access to credit, inadequate training, and management capacity are major important factors. Therefore, the study recommends that sufficient and

interest-free credit facilities should be made available to coffee producers and other actors or members on time. Microfinance institutions play an important role in this regard, and strategies should be developed to link microfinance with all actors further the government should give attention to formulate policies regarding all these factors. Moreover, corruptive practices should be reduced by raising awareness about the effects of corruption, dismissing corrupted committees, firing the corrupted employees in the unions and, care should be taken to consider their background and ethical standards while recruiting committee members and employees.

³Research Institute of Economics and Management, Southwestern University of Finance and Economics, Chengdu, China

Abstract

Enhancing total factor productivity (TFP) in enterprises is crucial for achieving high-quality economic development. This study empirically investigates the impact and underlying mechanisms of bank financial technology (fintech) development on TFP, using a variable based on bank-filed invention patents alongside manually collected micro-level lending data from 2012 to 2021. The findings indicate that the advancement of bank fintech significantly enhances TFP. The robustness of these results is confirmed through a series of robustness checks and endogeneity tests. This positive effect is particularly pronounced in the private sector, firms with a high degree of digital transformation, and those operating in regions with less marketization. Moreover, the study reveals that bank fintech development enhances TFP by increasing credit supply, mitigating maturity mismatch risks in enterprise financing, alleviating financing constraints, optimizing financial resource allocation, promoting the transition of enterprises from hypothetical activities to real activities, and fostering innovation. These insights provide valuable implications for strengthening the role of financial services in supporting the real economy, thereby driving high-quality economic development in China.

Keywords: *bank financial technology, total factor productivity, financing constraints, devirtualization, listed companies.*

I. Introduction

During China's critical economic transition, the traditional development model driven by capital and labor factors has exhibited diminishing marginal returns. Consequently, sustained economic growth now increasingly depends on improvements in total factor productivity (TFP) (Huang et al., 2019). Enterprises, as key market players and vital contributors to economic and social development, are instrumental in determining whether China can achieve high-quality growth through the effective enhancement of its TFP. As traditional economic growth models lose effectiveness, technological innovation, particularly the rapid development of financial technology (fintech), has become a key driver of economic growth by optimizing financial resource allocation and enhancing enterprise productivity. Consequently, understanding the role of fintech in improving firms' TFP has become a critical focus for both scholars and policymakers (Huang et al., 2019).

Since 2013, the widespread adoption of emerging technologies such as cloud computing, big data, artificial intelligence, and blockchain in the financial sector has rapidly reshaped the financial industry's landscape. Fintech has thus become a strategic priority for banks, leading to significant digital transformation efforts. According to the *China Fintech and Digital Inclusive Finance Development Report (2023)* and various bank annual reports, fintech investment and financing in China totaled 53.13 billion RMB across 184 transactions in the first three quarters of 2022. In 2021, 28 commercial banks collectively invested 176.623 billion RMB in fintech, representing a substantial 15.63% increase compared to 2020.

In this context, a critical question emerges: Can the development of bank fintech enhance firms' TFP and serve as a catalyst for improving the quality of financial services to the real economy? What are the underlying mechanisms? While existing research has predominantly focused on the impact of institutional reforms (Zhang et al., 2022; Zhang et al., 2023), local public debt (Zhu et al., 2022), and environmental regulations (Peng et al., 2021) on firms' TFP, there remains a lack of scholarly work exploring the influence of bank fintech development on firms' TFP and the mechanisms at play.

China's financial system is bank-dominated, with bank credit being the main source of external financing for enterprises in the real economy (Lin, 2011). As a result, the bank credit channel emerges as a crucial pathway for leveraging fintech to empower the real economy. Elucidating the relationship between bank fintech development and firms' TFP carries significant theoretical and practical implications for deepening banking sector reforms, enhancing the financial system's support to the real economy, and ultimately promoting high-quality economic development in China.

This paper constructs a novel variable representing the development level of bank financial technology (fintech) based on banks' patent applications and combines it with manually collected micro-level data on bank-enterprise lending from 2012 to 2021 to empirically investigate the impact of bank fintech development on firms' TFP and its underlying mechanisms. The findings reveal that the advancement of bank fintech significantly enhances firms' TFP, with the baseline results remaining robust across various robustness

checks. To address potential endogeneity concerns, the study employs the average time of the first application for fintech patents by each bank within the firm's loan portfolio as an instrumental variable. The results remain consistent and robust even after instrumental variable regression.

Furthermore, based on company ownership, the degree of firms' digital transformation, and the level of marketization in the firm's province, it demonstrates that the positive impact of bank fintech development on firms' TFP is particularly pronounced in non-state-owned enterprises, firms with a higher degree of digital transformation, and those in less market-oriented regions. Bank fintech fosters TFP growth by increasing credit supply, mitigating the risk of maturity mismatch in financing, and easing financing constraints. Additionally, it optimizes the allocation of financial resources, promotes financial rebalancing towards the real economy, and ultimately leads to substantial improvements in firms' TFP.

The marginal contributions of this paper are as follows:

Focusing on the Real Economy: This study perspective focusing on the impact of bank fintech on the real economy enriches and complements the literature in the field of fintech. Existing literature mainly studies the impact on small and micro enterprises' credit supply (Gopal and Schnabl, 2022) and corporate innovation (Ding et al. 2022) from the perspective of non-bank fintech. This paper uniquely examines the effects from the perspective of bank fintech—a relatively underexplored area. Although a few studies, such as Cheng and Qu (2022), utilize text mining and Baidu search engine data to construct a bank fintech index and link it to reduced credit risk in Chinese commercial banks, and Bian et al. (2024) employed machine learning to analyze fintech-related terms in banks' annual reports to assess bank performance, our research breaks new ground. It not only confirms that bank fintech development is a critical driver of firms' TFP but also delves into the mechanisms through which this occurs, offering deeper insights into the influence of bank fintech on firms' TFP.

Innovative Measurement Methodology: This paper introduces a novel approach to measure bank fintech. By identifying bank fintech patent information through the ICP classification number of bank invention patents, we construct a unique variable to represent the development level of bank fintech, which is a beneficial attempt in terms of research tools, offering a more precise and differentiated measure of bank fintech.

New Insights for Economic Transition: The study provides new insights into how the financial sector can better serve the real economy and promote high-quality economic development during China's crucial economic transition period. By examining the impact of bank fintech development on the banking system, we find that it enhances credit supply, reduces the risk of maturity mismatch, and alleviates financing constraints. Furthermore, it optimizes financial resource allocation, fostering a shift towards the real economy, and ultimately leads to substantial improvements in firms' TFP. These insights not only deepen our understanding of the relationship between fintech and economic growth but also offer practical implications for policymakers aiming to harness fintech for economic development.

II. Theoretical Analysis and Hypothesis Development

Bank Fintech Facilitating Bank Transformation and Enterprise Development

Since 2013, banks have accelerated their involvement in the fintech sector by establishing fintech subsidiaries, collaborating with leading internet and fintech companies, increasing investment in technological research and development, and recruiting specialized fintech talent. These efforts are aimed at generating endogenous growth momentum. The development of fintech has disrupted the traditional, homogeneous competitive landscape of the financial industry, compelling banks to reinvent their business processes, enhance service quality and efficiency, and innovate financial products (Elia et al., 2023). For example, banks have leveraged fintech to streamline the financing process for intellectual property pledges, expand the collateralization of intangible assets, and address issues in inclusive finance such as a lack of credit, information, and trust. Ultimately, these advancements have led to an increase in the quantity of bank credit supply and an improvement in the quality of financial resource allocation.

Information asymmetry is a major cause of credit risk (Liao et al., 2009). Ma et al. (2019) indicated that resolving the pain points of "difficult and expensive financing" for enterprises hinges on addressing the issue of information asymmetry between banks and enterprises. Banks, by adopting a "scenario + finance" model and relying on advanced technologies such as big data platforms, cloud computing, and blockchain, can achieve dynamic customer segmentation and precise enterprise profiling, thereby significantly reducing information asymmetry and enhancing banking efficiency (Lee et al., 2021). Additionally, bank fintech, through the digital transformation of credit approval processes, the application of big data credit evaluations, and intelligent risk control models, has been shown to reduce credit risk (Cheng and Qu, 2020) and increase banks' risk tolerance (Wu et al., 2023). New technologies enable banks to collect unstructured and dynamic customer information from multiple dimensions and at higher frequencies, allowing for automated continuous monitoring and intelligent identification of potential risk points and transmission paths. This enhances the proactiveness and foresight of risk management (Li et al., 2022).

These transformations brought about by bank fintech empower banks to promote enterprise development. Therefore, this paper proposes:

H1: The higher the level of bank fintech development, the higher the total factor productivity of enterprises.

Bank Fintech, Financing Constraints, and Firms' Total Factor Productivity

A significant body of research indicates that widespread financing constraints (Zhang, 2019; Wu and Huang, 2022) are a major factor leading to a decline in enterprise TFP. Short-term borrowing for long-term investments, often adopted by enterprises as a substitute strategy when facing external financing constraints, reflects the inadequacy of China's traditional

financial system in serving the real economy. Enterprises in the real economy are in urgent need of new financial service models (Leppänen et al., 2023). Banks, leveraging big data platforms and technologies, can collect unstructured and dynamic information from customers across more dimensions, thereby gaining timely, accurate, and comprehensive insights into business operations. This enables dynamic customer segmentation, precise enterprise profiling, and the mitigation of information asymmetry. Consequently, banks can increase credit supply, reduce the risk of maturity mismatch in financing, alleviate financing constraints, and ultimately enhance enterprise TFP. Based on this, the paper proposes:

H2: Bank fintech enhances banks' information screening capabilities, increases credit supply, reduces the risk of maturity mismatch in enterprise financing, and thereby alleviates financing constraints.

Bank Fintech, Devirtualization, and Enterprise Total Factor Productivity

In China, due to banks' "ownership preference" (Cao et al., 2023), there is a significant issue of credit misallocation (Weng et al., 2024). Many technology-driven and labor-intensive firms, lacking the collateral required by banks, often resort to holding their cash as financial assets as a form of "precautionary savings" to hedge against future financing uncertainties, thereby forming a risk-averse financialization motive (Zhong et al., 2023). Additionally, when returns from real economic activities are insufficient, some firms, driven by a profit-seeking bias and short-term profit maximization, shift towards higher-yielding financial investments (Chen et al., 2023A).

The development of bank fintech can provide "precise enhancement" in terms of quality, enhancing firms' access to credit and bringing inclusive financing effects. Improved financing stability and overall profitability support increased investment in research and development (R&D), thereby enhancing firms' core competitiveness. Based on this, we propose the following hypothesis:

H3: Bank fintech enhances Enterprise total factor productivity by optimizing the allocation of financial resources and promoting the devirtualization of enterprises.

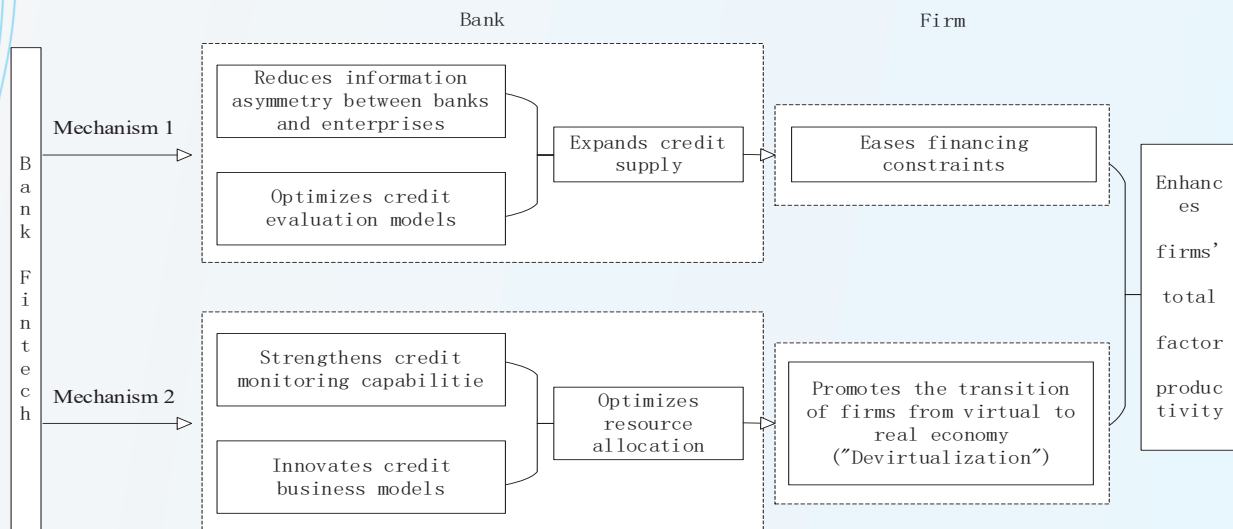

Figure 1. Mechanisms through which Bank Fintech Enhances Enterprise Total Factor Productivity

III. Research Design

Sample Selection and Data Sources

This study manually collected detailed data on loans issued by banks to listed companies, short-term commercial paper issuers, and bond issuers from 2012 to 2021, due to the availability of data. The data includes loan contracts with information such as the borrowing company, lending bank, loan interest rates, and loan terms. The borrowing information is obtained from sections in the annual reports of listed companies, such as "Top Five Long-term Loans Due within One Year," "Top Five Long-term Loans," "Details of Long-term Loans," "Details of Short-term Loans," and "Clarifications on Long-term Loan Classifications," as well as from the "Interest-bearing Liabilities" section of the short-term commercial paper and bond catalogues. Duplicate records were removed based on borrower, lending bank, loan year, loan amount, and loan term, resulting in a base dataset structured as "firm-year-lending bank-loan amount."

To construct a measure of bank fintech development, this paper utilizes banks' invention patent data, identified by the International Patent Classification (IPC) codes. The IPC system is an internationally accepted tool for the classification and retrieval of patent documents and is widely used in patent management and research. Using objective IPC codes for patent identification is relatively straightforward and has established applications in both industry and academia. For instance, the "2019 Global Fintech Invention Patent Rankings (TOP100)" jointly released by IPR daily and the incoPat Innovation Index Research Center, defines fintech-related patents using the IPC codes G06Q20, G06Q30, and G06Q40. Similarly, Lerner et al. (2021) use U.S. patent data and point out that the classification of bank fintech patents using G06Q20 and G06Q40 codes from the Cooperative Patent Classification (CPC) system has gained wide acceptance.

In this study, bank fintech patents are defined by the IPC codes G06Q20, G06Q30, G06Q40, G06N3, G06N20, G06K9, and G07F19 from the group of invention patents filed by banks. The specific IPC classification contents for bank fintech patents are detailed in Table 1.

Table 1. IPC Classification Contents for Bank Fintech Patents

International Patent Classification (IPC) Code	Content
G06Q20	Involving data processing systems or methods, related to payment system architectures, schemes, or protocols
G06Q30	Involving data processing systems or methods, related to e-commerce
G06Q40	Involving data processing systems or methods, related to finance, insurance, and tax strategies
G06N3	Computer systems involving specific computational models, related to biological models
G06N20	Computer systems involving specific computational models, related to machine learning.
G06K9	Involving data recognition, representation, and recording media, such as graphic signal conversion and speech recognition
G07F19	Involving coin-operated devices or similar devices, such as automated teller machines (ATMs)

Note: Data sourced from the International Patent Classification (IPC) system.

Following the methodology of Li et al. (2023), we used loan amounts as a connecting bridge to establish the relationship between banks and enterprises. The base dataset was matched with the annual number of fintech patents filed by each bank. These patent filings were then weighted by loan amounts and averaged at the firm level, resulting in a panel dataset of "firm-year-weighted bank fintech patent application information."

Financial and corporate governance data at the firm level were obtained from the China Stock Market & Accounting Research (CSMAR) database, while bank-level financial data were sourced from the Wind database. The initial sample underwent the following filtering procedures:

- 1.Exclude firms marked as ST (Special Treatment), *ST (Risk Warning), and PT (Particularly Transferable).
- 2.Exclude financial and insurance companies.

3.Exclude companies that have been listed for less than one year, delisted, or suspended from trading.

4.Remove firms with missing data.

After applying these filters, the final dataset comprised 4,104 firm-year observations. To mitigate the influence of outliers on the study's conclusions, continuous variables at the firm level were winsorized at the 1% and 99% levels.

Variable Definitions

Dependent Variable: Firms' Total Factor Productivity

Common methods for calculating total factor productivity (TFP) include the Levinsohn-Petrin (LP) method (Levinsohn & Petrin, 2003) and the Olley-Pakes (OP) method (Olley & Pakes, 1992). This study uses the LP method to estimate enterprise TFP and employs the OP method for robustness checks, denoting them as TFP_LP and TFP_OP, respectively. Addressi (2014) noted that the OP method requires that the proxy variable (investment) maintains a monotonic relationship with total output, meaning that TFP cannot be estimated for firms with zero investment. On the other hand, Beveren,V (2012) highlights that the OP method must account for firm entry and exit to construct an exit variable, which could introduce some bias in unbalanced panel data.

Independent Variable: Bank Fintech Development Level

Following Li et al. (2023), we use the loan relationship between banks and firms as a connection and consider the comprehensive nature of fintech patents. We calculate the bank fintech patent variable weighted by loan amount at the firm level. The specific formula is:

$$BFinTech2C_{it} = \sum_{b=1}^N \frac{loan_{ibt}}{loan_{it}} \times patent_{bt} \quad (1)$$

Where, $patent_{bt}$ represents the natural logarithm of the number of bank b 's fintech patents in year t , identified using International Patent Classification (IPC) codes, plus one. $loan_{ibt}$ indicates the loan amount received by enterprise i from bank b in year t . $loan_{it}$ denotes the total loan amount received by enterprise i in year t . By weighting the bank-level fintech patents by loan volume, we obtain the enterprise-level variable representing the development level of bank fintech ($BFinTech2C$). A key assumption here is that the influence of bank fintech on enterprise behavior is significantly and positively related to the scale of loans between banks and enterprises. Although this assumption aligns with economic intuition, to ensure the reliability of our results, we also conduct specific tests on the choice of weights in the robustness checks.

Control Variables

To minimize omitted variable bias, we control for various factors at both the firm and bank levels.

Firm-Level Control Variables:

- 1) Firm Size (Size): Natural logarithm of total assets.
 - 2) Leverage (Lev): Total liabilities divided by total assets.
 - 3) Return on Assets (ROA): Net income divided by total assets.
 - 4) Tobin's Q (TobinQ): Market value of the firm divided by total assets.
 - 5) Intangible Asset Ratio (IAR): Proportion of intangible assets to total assets.
 - 6) Cash Flow Level (Cash): Net cash flow from operating activities divided by total assets.
 - 7) Firm Age (Age): Natural logarithm of the firm's establishment year.
 - 8) State-Owned Enterprise (SOE): Indicator variable where 1 indicates a state-owned enterprise, and 0 indicates otherwise.
 - 9) Equity Balance (EQU): Ratio of the shareholding percentage of the second to fifth largest shareholders to that of the largest shareholder.
 - 10) Institutional Investor Shareholding Ratio (IISR): Proportion of shares held by institutional investors.
 - 11) Dual Role (Dual): Indicator variable where 1 indicates that the chairman also serves as the CEO, and 0 indicates otherwise.
 - 12) Bank-Level Control Variables:
 - 13) Bank Size (Size_b): Natural logarithm of total bank assets.
 - 14) Bank ROA (ROA_b): Net profit divided by total bank assets.
 - 15) Non-Performing Loan Ratio (NPL_b): Ratio of non-performing loans to total loans.
 - 16) Bank Age (Age_b): Natural logarithm of the bank's establishment year.
- The specific definitions of these variables are summarized in Table 2.

Table 2: Variable Definitions

Variables	Variable Description
<i>TFP_LP</i>	Total Factor Productivity of Enterprises Calculated by LP Method

<i>TFP_OP</i>	Total Factor Productivity of Enterprises Calculated by OP Method
<i>BFinTech2C</i>	The Bank Fintech development level. The fintech patents identified by the IPC classification number plus one and taking the natural logarithm ,weighted by loan amount at the firm level
<i>BFinTech2Cw</i>	Bank fintech development level. According to Li et al. (2023) bank fintech variable construction method, the custom fintech dictionary is used to identify bank fintech patents by searching patent applications/abstracts. The natural logarithm of the identified bank fintech patents is weighted by loan amount at the firm level
<i>Ptime</i>	Instrumental variable of bank fintech development level. In the loan bank portfolio corresponding to the enterprise, the average time of each bank's first application for a fintech patent is taken as the instrumental variable, where the difference between the current accounting deadline and the date of the bank's first application for a fintech patent is less than 0.
<i>KZ</i>	Financing Constraints, KZ Index (Kaplan and Zingales, 1997). The larger the value, the higher the financing constraint
<i>Loan</i>	Loan amount, which is in the natural logarithm
<i>SFLI</i>	Short term loan and long term investment mismatch. Calculated as ; Short term loan and long term investment= Cash outflows for fixed asset purchases and construction -(increase in long term loans +cash inflow from the sale of fixed assets).A higher value indicates greater mismatch risk.
<i>Finhold</i>	The financialization of enterprises. Proportion of financial assets to total assets, include trading financial assets, derivative financial assets, net amount of purchased financial assets, net available-for-sale financial assets, net amount of loans and advances, net amount of held-to-maturity investments, net amount of long-term equity investments and investment property net amount.
<i>PhyCI</i>	Physical capital investment. Physical capital investment =(net fixed assets + net intangible assets + net long-term investment + net construction in progress)/ total assets.
<i>RD</i>	Enterprise R&D investment. The value is the ratio of R&D expenditure to total assets
<i>Cdigit</i>	Enterprise Digital Transformation Index. The data sourced from CSMAR database.

<i>PEA</i>	Marketization Level. Ratio of private industrial enterprise revenue to revenue of large and medium-sized industrial enterprises in the firm's province
<i>Size</i>	Firm size. It's the natural logarithm of the bank's total assets.
<i>Lev</i>	Leverage ratio. Ratio of total liabilities to total assets.
<i>ROA</i>	Return on assets. Ratio of net profit to total assets.
<i>TobinQ</i>	Firm value. The ratio of the market value of an enterprise to its total assets.
<i>IAR</i>	Intangible assets Ratio.
<i>Cash</i>	Cash flow level. The ratio of net cash flow from operating activities to total assets.
<i>Age</i>	Firm Age. Natural logarithm of the Firm's establishment year
<i>SOE</i>	State-owned enterprise indicator. 1 For state-owned enterprises, 0 for others.
<i>Equ</i>	Equity balance. The ratio of shareholding percentage of the second to fifth largest shareholders to that of the largest shareholder.
<i>IISR</i>	Institutional investor shareholding ratio.
<i>Dual</i>	Dual role indicator. 1 if the Chairman also serves as the CEO, 0 for others.
<i>Size_b</i>	Bank size. The natural logarithm of a bank's total assets.
<i>ROA_b</i>	Return on assets. The ratio of the bank's net profit to its total assets.
<i>NPL_b</i>	Non-performing loan ratio of banks.
<i>Age_b</i>	Bank age. Natural logarithm of the Bank's establishments year.
<i>PKFIIC</i>	Peking University Financial Inclusion Index. Natural logarithm of the inclusive finance index of the city where the lending enterprise is located.
<i>GDP</i>	Regional Gross Domestic Product. Natural logarithm of the regional gross domestic product where the enterprise is located
<i>SecendR</i>	The proportion of secondary industry. The ratio of the secondary industry GDP to regional GDP in the city where the enterprise is located.
<i>MKT</i>	Fan Gang marketization index

Model Specification

Following Li et al. (2023), who designed a model to verify the impact of bank fintech on enterprise financialization, this study employs a two-way fixed effects model to investigate the effect of the development level of bank fintech on firms' total factor productivity.

$$TFP_{i,t} = \alpha_0 + \alpha_1 BF\text{intech}2C_{i,t} + \alpha Controls_{i,t} + \sigma_j + \mu_t + \varepsilon_{it} \quad (2)$$

Where $TFP_{i,t}$ is the total factor productivity of enterprise i in year t , measured using both the LP method and the OP method. $BF\text{intech}2C_{i,t}$ is the development level of bank fintech for enterprise i in year t . $Controls_{i,t}$ represents a set of control variables. σ_j and μ_t represent unobservable industry-level heterogeneity and year-level shocks, respectively. Li et al. (2023) point out that the main reason for controlling for industry rather than firm fixed effects is that whether banks apply for fintech patents is not directly related to individual enterprise characteristics. Instead, factors at the industry level influence banks' lending preferences toward enterprises, and there are significant differences in how improved bank fintech levels affect different industries. ε_{it} is the random disturbance term, α_1 is the core coefficient of interest, indicating the effect of the development level of bank fintech on firms' total factor productivity. If α_1 is significantly positive, it suggests that the development of bank fintech contributes to enhancing firms' total factor productivity.

Empirical Results and Analysis

Descriptive Statistics

The descriptive statistics for this study are shown in Table 3. During the sample period, the mean total factor productivity (TFP) calculated using the LP method is 8.80, slightly higher than the mean of 7.02 obtained using the OP method. The medians are 8.71 and 6.93, respectively, suggesting no obvious skewness in the data. The mean value of the bank fintech development level, weighted at the enterprise level, is 3.34, with a standard deviation of 1.83, indicating significant differences in the number of fintech patents applied for by different enterprises. The statistical information for other control variables is like previous studies.

Baseline Regression Analysis

Table 4 reports the regression results of the impact of the development level of bank fintech on firms' total factor productivity. Columns (1) and (2) have TFP_LP as the dependent variable, showing the regression results without and with control variables, respectively. The regression coefficient of BFinTech2C is significantly positive at the 5% level. Columns (3) and (4) have TFP_OP as the dependent variable, and the regression coefficient of BFinTech2C remains significantly positive, indicating that the development of bank fintech is conducive to improving enterprise TFP. In terms of economic effects, taking Column (2) as an example, a one-standard-deviation increase in the development level of bank fintech associated with an enterprise leads to a 4.36% (0.0239×1.8251) increase in enterprise TFP, which is equivalent to 0.50% ($4.36 / 8.7952$) of the sample mean. The results in Table 4 support Hypothesis H1, which posits that the development of bank fintech breaks through the limitations of traditional banking financial services, empowers enterprises, and is beneficial for enhancing enterprise TFP.

Addressing Endogeneity

While we have attempted to control factors that might simultaneously influence the development level of bank fintech and firms' total factor productivity, the empirical results could still be subject to unobserved factors. This omitted variable problem could result in biased estimates of the coefficient for the development level of bank fintech. To address potential endogeneity issues and ensure the reliability of our empirical results, we employ an instrumental variable (IV) approach.

Following Li et al. (2023), we use the average time of the first fintech patent application by banks in the loan bank portfolio corresponding to each enterprise (*APtime*) as an instrumental variable. On one hand, the earlier a bank applies for fintech patents, the more substantial its fintech technology reserved, which has a greater impact on the current development level of bank fintech, fulfilling the relevance requirement. On the other hand, the time of the first fintech patent application by banks does not have a direct impact on enterprise behavior, satisfying the exogeneity condition. Table 5 reports the instrumental variable regression results. Column (1) of Table 5 presents the first-stage estimation results, where the coefficient of *Ptime* is significantly positive at the 1% level, indicating that the earlier banks apply for fintech patents, the higher their subsequent development level of fintech. Column (2) shows the second-stage estimation results, where the positive effect of bank fintech development on enterprise TFP remains significant, consistent with the previous findings.

Notes:

1. Due to space constraints and to focus on the primary results, the regression results without control variables are presented here.

2. The values in parentheses are t-values, the values in brackets are P-values, and the values in curly braces are the critical values from the Stock-Yogo weak identification test at the 10% level.

Robustness Analysis

Effect of Weight Choice

We are particularly interested in how, given the bank-enterprise relationship, the development level of bank fintech affects enterprise total factor productivity. To establish the connection between bank fintech and enterprise TFP, we use loan amounts as a weighted bridge. We construct variables in the following ways to determine whether the estimated effect of *BFintech2C* on enterprise TFP is due to changes in loan weights or changes in fintech patents.

First, we fix the loan weights. We select the earliest lending bank for each enterprise in the sample and use its loan amount as a fixed weight, considering only changes in bank fintech patents, creating a new variable, *BFintech2Cp*. Second, we fix the number of fintech patents. We fix the number of fintech patents for the earliest lending bank for each enterprise in the sample and consider only changes in the proportion of loans from banks in the loan portfolio,

creating a new variable, BFinTech2Cd. If the regression coefficient of *BFinTech2Cp* is still significantly positive while the regression coefficient of *BFinTech2Cd* is not significant, then the conclusion that the development of bank fintech improves enterprise TFP in the baseline regression is due to changes in the number of fintech patents; if the regression coefficient of *BFinTech2Cp* is not significant, while the regression coefficient of *BFinTech2Cd* is significantly positive, then the improvement in enterprise TFP due to the development of bank fintech is mainly determined by the loan weights. Columns (1) and (2) in Table 6 report the estimation results for *BFinTech2Cp* and *BFinTech2Cd*, respectively. The study finds that *BFinTech2Cp* is significantly positive at the 5% level, while the estimation result for *BFinTech2Cd* is not significant, thus to some extent, excluding the effect of weight choice.

Variable Substitution, Adding Fixed Effects, and Control Variables

On one hand, to enhance the robustness of the explanatory variable, this study follows the variable construction method of Li et al. (2023). We use a self-built fintech dictionary to search the abstracts of each bank's patent applications. If the abstract contains fintech-related keywords, we classify the patent as a bank fintech patent. We take the natural logarithm of the identified bank fintech patents and weight them by loan amounts to form the enterprise-level variable BFinTech2Cw. The regression results are shown in Column (1) of Table 7. On the other hand, to reduce the impact of city-level heterogeneity and omitted variables, we add city fixed effects and city-level control variables in Columns (2) and (3) of Table 7 and re-estimate the model. The new test results are consistent with the baseline results.

Lagging Core Explanatory Variables and Control Variables

To mitigate the impact of reverse causality, this study lags the core explanatory variable and control variables by one period and re-estimates the model. The new regression results, shown in Table 8, remain consistent with the baseline results, indicating that the research conclusions are robust.

Table 8: Robustness - Lagged One Period

Heterogeneity Analysis

Heterogeneity Analysis Based on Enterprise Ownership Nature

State-owned enterprises (SOEs) in China enjoy unique advantages in the credit market (Gao et al., 2023), whereas non-state-owned enterprises (non-SOEs) face “size discrimination” and “ownership discrimination” in financing processes, often lacking effective financial support (Luo and Ying, 2014), which severely hinders the improvement of enterprise total factor productivity. The enhancement of bank fintech levels can improve banks’ ability to process soft information, increasing the availability of credit to enterprises (Kowalewski and Pisany, 2022), thereby alleviating the problems of lack of credit, information, and trust for non-SOEs, which in turn has a greater impact on their TFP.

We divide the research sample into SOEs and non-SOEs based on enterprise ownership nature. Table 9 presents the subgroup regression results. The study finds that the coefficient of BFinTech2C is significantly positive at the 5% level in the non-SOE sample (Column (2)), while the coefficient of BFinTech2C is not significant in the SOE sample (Column (1)). This indicates that the development of bank fintech primarily enhances the TFP of non-SOEs.

Heterogeneity Analysis Based on the Degree of Enterprise Digital Transformation

The extent to which bank fintech empowers enterprises is influenced by the quality of enterprise information. Enterprise digital transformation can effectively reduce information asymmetry (He et al., 2024) and improve the quality of enterprise information disclosure (Liu et al., 2022). The higher the synergy between bank fintech development and enterprise digital transformation, the easier it is for bank fintech to overcome the limitations faced by such enterprises in traditional financial services, and the more conducive it is to empowering high-quality enterprise development through bank fintech.

We calculate an enterprise digital transformation index based on six indicators: strategic leadership, technology-driven, organizational empowerment, environmental support, digital outcomes, and digital applications. We divide the research sample into two groups according to the mean value of this index: enterprises with a high degree of digital transformation and those with a low degree of digital transformation, and conduct separate regressions. Table 10 presents the heterogeneity regression results based on the degree of enterprise digital transformation. Column (1) represents the group with a high degree of digital transformation, where the regression coefficient of BFinTech2C is significant at the 5% level; Column (2) represents the group with a low degree of digital transformation, where the regression coefficient of BFinTech2C is not significant. This indicates that to fully leverage the empowering role of bank fintech in promoting high-quality enterprise development, both the real industry and the financial industry need to advance digitalization collaboratively.

Heterogeneity Analysis Based on the Degree of Marketization

In regions with a higher degree of marketization, financial intermediaries are more developed, information asymmetry is lower, and the efficiency of credit resource allocation is higher (Hui et al., 2023). As a result, the role that bank fintech can play in improving traditional financial services is relatively smaller in these cities. The private economy is a crucial component of China's economy, playing a vital role in job creation and technology introduction. In this study, we measure the degree of marketization (PEA) using the ratio of annual sales revenue of private industrial enterprises to the sales revenue of above-designated-size industrial enterprises. A higher value indicates a higher level of private enterprise activity and a higher degree of marketization in the province where the enterprise is located.

Table 11 reports the results of the heterogeneity analysis based on the degree of marketization. We divide PEA into two groups based on the mean value: a high degree of marketization group and a low degree of marketization group, and perform separate regressions. The regression results show that the development of bank fintech has improved

the total factor productivity (TFP) of enterprises in both groups. Through inter-group coefficient difference tests, we find that this enhancing effect is more pronounced in the low degree of marketization group, suggesting that the development of bank fintech complements regions with insufficient marketization progress.

Mechanism Analysis

Bank Fintech, Financing Constraints, and Firms' Total Factor Productivity

Widespread financing constraints (Zhang, 2019; Wu and Huang, 2022) are a primary cause of declines in enterprise total factor productivity (TFP). The development of bank fintech can alleviate information asymmetry, expand credit supply, reduce financing constraints, and lower the risk of term mismatch in corporate financing.

We use the KZ index to measure financing constraints, where a higher value indicates greater financing constraints. Table 12 reports the analysis results of the financing constraint mechanism. In Column (1) of the table, the interaction term between BFinTech2C and KZ is significantly negative at the 5% level, and the regression coefficient of BFinTech2C is significantly positive at the 1% level, indicating that easing financing constraints can promote the improvement of enterprise TFP. To further confirm that this easing effect stems from banks expanding credit scale, we use the natural logarithm of bank loan size at the enterprise-year level as the dependent variable for regression. The regression results are shown in Column (2) of the table, where the regression coefficient of BFinTech2C is significantly positive, indicating that the development of bank fintech promotes banks to expand credit supply. Short-term loans for long-term investment (SFLI) serve as an alternative strategy adopted by enterprises facing external financing constraints (Chen et al., 2023B). Following the method of Frank and Goyal (2004), we construct the SFLI variable, where a higher value indicates a higher risk of term mismatch in corporate financing. Column (3) of the table further examines whether the development of bank fintech helps to reduce the risk of term mismatch in corporate financing. The regression coefficient of BFinTech2C is significantly negative, indicating that the development of bank fintech has a restraining effect on the risk of term mismatch in corporate financing. The above regression results demonstrate that the development of bank fintech can alleviate financing constraints for enterprises, which in turn helps to enhance enterprise TFP.

Bank Fintech, "Moving from Virtual to Real," and Enterprise Total Factor Productivity

The development of bank fintech can optimize the allocation of financial resources, guiding financial resources toward industries and enterprises that align with national strategic development directions, providing stronger support for the rapid development of the real economy.

Table 13 reports the analysis results of the "moving from virtual to real" mechanism. We use the ratio of R&D investment to total assets as a proxy variable for corporate innovation and take it as the dependent variable. In Column (1) of the table, the regression coefficient of BFinTech2C is significantly positive, indicating that the development of bank fintech promotes corporate innovation. In Column (2), we use enterprise financialization (Finhold) as the dependent variable, and the regression coefficient of BFinTech2C is negative and significant at the 5% level; in Column (3) of the table, we take enterprise physical capital investment (PhyCI) as the dependent variable, and the regression coefficient of BFinTech2C is significantly positive at the 1% level. Together, these findings suggest that the development of bank fintech restrains the tendency of enterprises to become more financially oriented and promotes their physical capital investment. Based on the above regression results, our research finds that the development of bank fintech can optimize resource

allocation within enterprises, promote "moving from virtual to real," and thereby enhance enterprise total factor productivity.

Conclusion and Policy Implications

This study utilizes a novel variable derived from bank patent application data for fintech innovations, combined with manually collected micro-level lending data from 2012 to 2021, to empirically assess the impact of bank fintech development on enterprise TFP and its underlying mechanisms. Our findings demonstrate that the advancement of bank fintech significantly enhances enterprise TFP. The robustness of these results has been confirmed through a series of robustness tests and endogeneity checks. The positive impact of fintech development is particularly pronounced in non-state-owned enterprises, firms with a high degree of digital transformation, and in regions with lower levels of marketization. Further

analysis reveals that bank fintech development boosts enterprise TFP by increasing credit supply, mitigating maturity mismatch risks in corporate financing, alleviating financing constraints, optimizing the allocation of financial resources, and encouraging a shift from speculative finance to the real economy.

Based on these conclusions, the following policy implications are proposed:

Government Level: The government should deepen financial supply-side reforms and actively promote the development of a bank fintech system to enhance the role of fintech in boosting enterprise TFP. This can be achieved by gradually liberalizing financial industry regulations, optimizing the market environment, strengthening digital information infrastructure, and facilitating the orderly circulation of data elements. Additionally, the government should provide the necessary technical foundations and institutional support for financial institutions, including banks, to undergo digital transformations and better serve the real economy.

Bank Level: Banks should actively harness the potential of fintech to enhance enterprise TFP and address the issue of "moving from the real to the speculative." This can be achieved by promoting advanced applications such as smart risk control, "privacy computing + blockchain" architecture, and knowledge graphs to improve information identification capabilities. Furthermore, banks should strengthen supervision over the allocation of credit funds, increase the provision of long-term credit to enterprises aligned with national strategic development goals, and address funding allocation imbalances caused by credit discrimination. Utilizing advanced technologies such as big data can enable banks to accurately identify enterprise risks and build a comprehensive digital financial service system that offers both standardized and customized services, providing private enterprises with more equitable access to financial services.

Enterprise Level: Enterprises should capitalize on the synergistic effects of fintech by actively pursuing digital transformation, reshaping business processes, transforming business models, and optimizing organizational structures. To complement these efforts, they should enhance internal disclosure and control mechanisms, actively seek long-term credit funding from banks, and encourage entrepreneurs to focus on their core business rather than short-term gains. By doing so, they can maintain long-term competitiveness through craftsmanship and continuous innovation.

Long-Term Relationship between Deeper Investment Provisions and FDI Inflows in East African Community.

Peter E. Bagumhe,

Ministry of Foreign Affairs and East African Cooperation

ABSTRACT

The objective of this paper is to examine the relationship between deeper trade agreement and Foreign Direct Investment (FDI) flows into the East African Community (EAC). Data was collected from the World Development Indicators (WDI) from 1985 to 2022. applied Autoregressive Distributed Lag Model (ARDL) to determine long and short run equilibrium relationship between the FDI inflows and the multivariate variables applied in this study. Result of the ARDL test showered that equilibrium error correction coefficient (ECM) estimate of -0.79 is highly significant, with the correct sign. This implies a high speed of adjustment to equilibrium after a shock. Approximately 80 percent of disequilibria from the previous year's shock converge back to the long-run equilibrium in the current year. This suggests that approximately 80% of disequilibrium deviations of FDI inflows in East African Community from their optimal level are being corrected. The error correction term also suggests that with an adjustment rate of approximately 80 percent, the speed of adjustment of total FDI inflows in EAC towards long-run equilibrium is satisfying as it stands above 80 percent in the short run. This suggests that the EAC has satisfactory ability to restore the disequilibrium deviation of FDI inflows from their optimal level. However, the coefficient of the lagged error correction terms, and the adjusted speed to restore the equilibrium differ. For instance, while Tanzania, Kenya and Burundi are satisfactory at 57%, 81% and 73%, respectively, it is sufficient to restore the disequilibrium deviation of FDI inflows from their optimal level. This suggests that the three countries have more than 50% ability to restore the long-run disequilibrium of the FDI inflows annually. Uganda and Rwanda have lower than 50% adjustment speed, which means the ability of the two countries to restore the disequilibrium of the FDI inflows on an annual basis is below satisfactory. These imbalances need to be urgently addressed to ensure equitable distribution of benefit.

1.0 Introduction

The establishment of Preferential Trade Agreements (PTA) has become increasingly popular since the setting up of the World Trade Organization (WTO) in 1995. These spikes in PTAs have particularly been accompanied by the widespread establishment of a Regional Trade Agreements (RTA). According to WTO (2011) the number of PTA have increased from 50 in the early 1990's to 377 by the beginning of 2018. On average each WTO member have signed an average of 11 PTA. This change have also been associated with expansive sets of investments provisions which have implication on the investment admission, liberalization and protection and (Mattoo et al., 2020a). Similarly, the change is also meant to expand the scope of the PTA beyond trade cover issues which have been referred in the literatures as deeper trade agreements.

This change in the landscape of PTA, has also come with an increased interest in trying to understand the implications of the formation of PTAs for the inflow of Foreign Direct Investment (FDI) into the region as a whole and to each participating Member. One aspect of particular interest is its relationship to FDI inflows to participating members (Marszk, 2014b). Atsumi (2013) has also pointed out that no country can escape from the systemic effects of PTA with some having either a separate investment chapter like the one with NAFTA or investment provision embodied within the trade provision. The provisions cover for example services chapter, competition policy, intellectual property rights, dispute settlement and standards.

The inclusion of these chapters in the current PTAs indicates that the predominant drivers of these agreements extend well beyond trade objectives, thereby motivating this study to explore their implication on FDI inflows, with PTA often going beyond what countries have committed to the WTO. While tariff preferences are negotiated in all trade agreements, they matter much less today than they did 100 years ago. According to Horn *et al.* (2010), the major reason is that most favoured nations (MFN) have declined over time, with more than half of global merchandise trade having applied to MFN rates of zero. Secondly, more than tariffs, preferential trade agreements today are about regulatory measures and other so-called non-tariff measures that were once the exclusive domain of domestic policy-making.

The East African Community is not immune against this global move, the treat for the second wave of the East African Integration process was signed in year 2000, followed by the custom Union in 2005 and Common Market Protocol in 2009. The monetary Union which is the third pillar of the EAC was also endorsed in 2011. The endorsed of this milestone has made EAC to cross the bridge from shall into deeper integration process. Deeper integration process have been pursued by EAC Partner States as an alternative means to encourage FDI inflows among the participating members. The deeper integration issues have been associated with a sets of expansive investment provisions, which describe the manner in which the investment admission, promotion, and protection. Similarly DTA give signal to the deeper commitment made the EAC Partner States. Kennedy, (2014), integration have expanded with the reduction of investment barriers and inclusion of investment provision in the existing treaty and protocols, similarly investment issues have been covered in the services chapter indicated in

the common market protocol. Investment chapter laydown the mechanism investment promotion, admission and protection in the EAC.

However the impact of Deeper integrations provisions is less straightforward, trade and FDI can either compliment or substitute each other, depending on the investment motivation, the specific industry and on the way in which the FDI provisions are shaped in the PTA Schuman, R (2019) has suggested that horizontal FDI occurs when firms replicate domestic activities in a foreign country are associated with FDI substituting for trade. Hence in the presence of horizontal FDI, PTAs are expected to decreases FDI. On the other hand vertical FDI occurs when firms split activities between different geographical regions, create complimentary relationship between trade, PTA and FDI.

The objective of this paper is to investigate the extent to which the inclusions of the deeper integration issues in the PTA and its implication to FDI inflows to participating Countries. What effects will the DTA have from the perspective of a south- south FTA, how will it affects FDI inflows from the rest of the world? Should we expect to see winners and losers? More specifically the paper will employ Autoregressive Distributed Lag Model (ARDL) to examine the long-term relationship between the deeper integration issues in the East African Community and FDI inflows for the period 2000 to 2020 using data from the world development indicator (WDI).

2.1 Evolution of the Deeper Integration provisions in various PTA.

Table 1 below provides some of the investments provisions included in selected PTAs.

The comparison of figure 1 and 2, below, highlight that most of the DTA covered by the PTA involving developed Countries are also the topical policy issues covered in African PTAs. Which also suggest that this new landscape of the PTA have been the Global phenomenal.

Source: UNECA (2022)

According to figure 1 and 2 above, the majority of new agreements covered fewer than 10 policy areas. Since the 2000s, most new PTAs have covered between 10 and 20 policy areas, with some having even more than 20. A study by Horn et al. (2010) identified up to 52 policy areas that have been covered by at least one of the agreements. Agreements with broader coverage between 10 and 20 policy areas tend to include trade-related regulatory issues, such as subsidies or technical barriers to trade. Finally, agreements with more than 20 provisions often include policy areas that are not directly related to trade, such as labor, environment, and movement of people.

However a study by the Mattoo et al., (2020b) covered policy areas which are frequently covered by the new generation PTA which includes (a) a set of 18 policy areas that are covered in 20 percent or more of trade agreements notified to the WTO. (b) tariffs on industrial and agricultural goods, which are covered by all trade agreements; (c) customs and export taxes, which are regulated in more than 80 percent of PTAs; (d) services and movements of capital, which are regulated in roughly half of the PTAs; and (e) environmental and labor issues, which are covered by around 20 percent of all trade agreements. Other issues that are sometimes

(although infrequently) regulated in trade agreements, such as education, nuclear safety. Similarly DTAs also include policy areas that aim to support these economic integration rights by limiting government discretion. Actions by importing governments that limit international flows can be taken at the border and behind the border and are often of a regulatory nature. The policy areas that fall in this category are: (a) customs; (b) rules of origin; (c) trade remedies; (d) public procurement; (e) technical barriers to trade (TBT); (f) sanitary and phytosanitary measures (SPS); (g) state-owned enterprises (SOEs); (h) subsidies; and (i) competition policy.

Furthermore, DTAs cover policy areas that aim to enhance social or consumer welfare by regulating the behavior of exporters. Policy areas such as environment and labor impose obligations on exporters to further consumer or social interests in importing countries. Rules in areas such as competition, SOEs, and subsidies can have a dual aspect: in addition to regulating action that undermines economic integration rights, they can aim to address distortionary actions that lower economic efficiency, thus hurting consumer or social welfare.

The proliferation of the DTA in the second generation PTA have emerged with some difficulties at the empirical level on how the current setting of PTA would be estimated and measured. This difficulties arises from the fact that some policy areas are inherently more complex than others and their description requires a larger number of questions to reflect the more detailed provisions. While other policy areas focus primarily on substantive provisions: specific commitments on integration, such as market access commitments, and specific obligations such as harmonization of standards. Others tend to have a larger number of procedural provisions, such as transparency provisions and procedural requirements. As highlighted by Michele Ruta (2022) the heterogeneity across policy areas have also associated with methodological issues on the proper estimation of the DTAs.

2.0 The Link between Deeper Integration and FDI inflows

Literature has addresses the link between Deeper integration and FDI, in key main aspect, through horizontal and vertical integration. However a study by (Mulabdic et al., (2017) the inclusion of DTA issues tend to alter the macroeconomic environment where firm operate by strengthening fiscal discipline , macroeconomic stability and the rule of law in the host country which create a more favourable conditions for FDI. Similarly the World Bank et al., (2018) indicated that there are two channels through which regional integration through the formation of a Preferential Trade Area (PTA) could influence the inflow of FDI into the integrating region. The first channel is through economic liberalisation by dismantling barriers to free movement of goods, capital and services. The rationally behind this channel is that deeper integration process is associated with macroeconomic convergence, the idea is that once a countries enter into a free trade agreement, economic convergence among key macroeconomic variables will begin to occur due to the catch-up effect on technology transfers, increased labour and capital productivity among other factors. According to Solow (1956) growth model as quoted in (Solow, 2007) an economy will converge towards it steady state because of diminishing returns to investment in physical capital.

This channel is more effective in promoting FDI when the PTA integration process moves from a customs union to a single market and eventually to political federation and includes some provisions for capital movements. The second channel is through inclusion of a set of investment promotion provisions in the integrating treaties or outright treaties on investments to provide a predictable policy and regulatory frameworks for FDI inflows.

Therefore, the main link between FDI and PTAs is mainly derived from the effect of the agglomeration effects. The agglomeration tends to reduce trade cost, which, within the context of this study, has been referred to, and regarding reduction of the integration risk, the study has classified the integration risk into political risk, economic risk and financial risk. The reduction of these risks tends to broaden market access and improve economic and policy credibility to members participating in a PTA, hence the reduction risk tends to influence FDI inflows into the PTA as a whole and to a specific member in particular. This is one additional reason why further integration through the creation of a PTA is currently the key driver of FDI inflows to developing countries.

Evidence from UNCTAD (2013) demonstrates that FDI has a close relationship with the process of PTAs. PTA influences FDI by extending the effective size of the market through participating countries. Equally important, PTA tends to strengthen the investment climate for investors from outside the region. Anderson (2016) also argues that the major motivation for pursuing regional economic integration in the EU has been to facilitate restructuring or rationalisation of industry across the region on the most efficient basis for the purpose of reaping the economies of scale as well as strengthening the competitiveness of each country's industries. It follows that the formation of the single market in the EU has increased its share of the global FDI from nearly 30 percent in the 1980s to about 50 percent in the 1990s and has remained at that level. A sharp rise of FDI inflows has been prominent in Mexico since becoming a part of NAFTA, and the value of FDI inflows has increased from US \$ 12 billion per year in 1992 to 1993, to US \$ 54 billion during the period 2000 to 2002 (Akin & Kose, 2007).

Globerman and Shapiro (2008) have a different view with regard to the role of the market size following the formation of the PTA. They pointed that following accession, the individual member's market size may no longer be a limiting factor, since the PTA pact increases the size of the country and the entire PTA may be accessed from any member country. This postulation may be possible depending on the location advantage of the country in a PTA, and the quality of the institutional structure; for example, a landlocked country in a PTA like Rwanda in EAC. Consequently, a firm that has established itself in Rwanda will face many difficulties to access the entire EAC market, and this would be possible for Tanzania and Kenya.

Kawai and Naknoi (2015) studied aggregate FDI flows to Mexico and other Caribbean countries from 1980 to 2000 and used time series analysis of Mexican economic indicators as well as inter-sector, inter-regional and international comparisons. They found that the expectation of joining a PTA in the next two years is associated with a one-third increase in FDI flows. The study concluded that the NAFTA treaty has helped Mexico get closer to the levels of development of its NAFTA partners. The study suggested further that Mexico's global export would have been about 25% lower without NAFTA, and FDI would have been about

40% less without NAFTA. Additionally, the amount of time required for Mexican manufacturers to adopt US technological innovations was cut in half.

It follows that when a country enters into an RTA, trade and non-trade barriers are eliminated among the partner countries, which opens room for a tariff-jumping FDI to other parts of the world. But this outflow may not happen if the FDI is targeted to exploit intangible assets such as technological and marketing expertise present in the host country. The formation of PTA results in the aggregation of the market among the PTA members into a single market, which tends to attract large scale FDI inflows. This relationship is not straightforward as sometimes the formation of the single market could result in the reduction of FDI from outside the region if they are substitutes to each other.

When two countries agree to form FTA, a fall in trade cost benefits vertical FDI and there will be a less tariff-jumping incentive for horizontal FDI. The skill level in the RTA partners is a very important determinant of the FDI flows. FTA should have a positive effect on FDI where the difference in skill level among the member countries is large and should have a negative effect on FDI when the difference in skill level is small. In addition to this, factors such as the scope of the RTA, the degree of liberalisation, complementarity of members relative to non-member countries, exclusive investment chapters and whether trade and FDI are substitutes or complements influence the quantum of FDI flow from home country to host country.

The positive effect on FDI inflows from outsiders is likely to arise from the size of the market being created as a result of the formation of the PTA. This, in turn, generates increasing returns to scale and makes larger markets a more profitable investment opportunity than smaller markets. The market size effect applies mostly to market-seeking FDI, although vertical FDI (driven by a cost reduction motive) may also be stimulated if the output is destined for other members of the PTA.

Interregional FDI may also increase if the average level of external protection increases or is expected to increase as a result of the RTA. Regarding intra-regional FDI, the lowering of internal tariffs tends to reduce the incentives for tariff-jumping FDI, but on the other hand, facilitates vertical FDI that delocalises the production process to countries with the best location advantages. Intra-regional FDI motivated by the exploitation of intangible assets should not be negatively affected by the lowering of internal tariffs. Finally, the significant efficiency benefits brought about by an RTA may feed into higher growth rates and possibly more R&D, which would further stimulate both interregional and intraregional FDI IMF (2017).

Therefore, the link between FDI and PTAs is mainly derived from the effect of the aggregation of member state markets into a single market. This aggregation tends to reduce trade cost, broaden market access and improve policy credibility for individual economies. This is one additional reason why further integration through the creation of a PTA is also expected to promote FDI. Athukorala (2013) in this regard proposes two kinds of FDI that would suit this description, horizontal investment or market-seeking FDI (HFDI) and vertical or efficiency-seeking FDI (VFDI). Horizontal FDI reduces trade cost for multinational enterprises (MNEs) by eliminating transport cost of exporting goods from one country to another because MNEs produce the same goods or services in different countries or locations. VFDI, by contrast, fits

to MNEs that like to fragment production of goods into a number of stages to improve efficiency. According to Athukorala (2013), HFDI can promote intraregional trade through enlargement of markets. Trade between countries in the same region may further increase if member economies have similarities in income and demand, but diversity in preferences. The author indicates that formation of a RTA or regional trading agreement can attract HFDI inflows by creating incentives for new investments. Head and Mayer (2013) have also added that liberalisation of the economies in the same region may expand markets and therefore facilitate better utilisation of resources, which benefits the HFDI regimes of all member states. On the other hand, RTAs among developing countries have limited impact on intraregional VFDI flows because members have similar factor endowments. However, VFDI may take place in the case of economic integration among developing countries that have differences in stages of development.

The other potential regional integration linkages on FDI are linked to the dynamic effects of degree of competition, high efficiency of resources allocation and accelerated economic growth, which is exalted by the creation of PTAs (Petroulos, 2007). The creation of monetary integration is the third stage of the PTA process linked to the reduction of exchange rate volatility. By reducing related transaction costs, the monetary integration tends to boost FDI inflows. Di Mauro (2000) argues that the net effect of a monetary union on FDI is unclear before the creation of said monetary union. From the theoretical framework above, the relation between PTAs and FDI is neither self-evident nor straightforward. This is because the decision for foreign investment depends upon many factors including economic, social and political ones. The extent that Tanzania will be the best location of FDI choice relative to other EAC countries will depend on the extent to which Tanzania has integrated EAC investment policy change in relation to other EAC countries. The choice will also depend on the opportunity through which Tanzania will realise from the PTAs due to the aggregating individual country market into a PTA market and additional economic growth associated with PTA formation. The aggregated market will enhance investment climate, stimulate investment inflows, enlarge export market, increase competition and allow countries to exploit economies of scale as permitting them to specialise in production of goods and services best suited to their resources and factor endowment (Domazet & Marjanović, 2017).

4.0 Methodology

This study examines the relationship between the EAC Integration process and FDI inflows in Tanzania. Both short and long-run relationship have been estimated. This study has employed several econometrics methods being pooled mean group, and mean group. The impact of a change in FDI inflows is also analyzed using panel ARDL method. The data was collected from multiple sources such as the World Development Indicators, UNCTAD, Transparency International and the Heritage Foundation. Table 4 presents all the variables used in the study, sources of data and their expectations. Our dependent variable is foreign direct investment inflows of Tanzania. Control variable for fundamental regional integration process, includes, Openness index which provide the extent to which policy have been liberalized and harmonized in the EAC, Aggregate GDP for the EAC Countries which signal about the market size created

by the EAC integration process., similarity index which give a picture as to whether FDI tend to receive similar or differentiated FDI. Per capital differences measure the extent to which FDI inflows in EAC is based on the factor endowment or is due to efficiency created by the EAC integration process.

Table 4: Definition of Variables and Sources.

Variable	Measurement	Source	Exp Sign
FDI	FDI inflows of Tanzania	UNCTAD	+
Level of liberalization done by EAC Partner states	Openness Index	WDI	+
Market Size	Aggregate GDP for the EAC Countries	WDI	+
Stability	GDP per capital for the EAC Partner States	WDI	+
	Interest rate		
Inflation	Consumer price index	WDI	-
Infrastructure	Gross fixed capital formation	WDI	+
Capital Formation	Capital formation to GDP	WDI	+
Human Capital			
Quality of Labour Force	Secondary School leavers	WDI	+
Investment Climate	Return on Investment	WDI	+

4.1 Panel Autoregressive Distributed Lag (ARDL) Estimation Method

Pesaran et al. (2000) and Ditzgen (2018) discuss various models for testing long run relationship in panel data models. Their work compares and acknowledges the relevance of various panel models such Autoregressive Distributed Lag Model (ARDL) and Cross Sectionally Distributed lag (CS-DL) panel models; the Dynamic panel OLS; the Full Modified Dynamic OLS (FM-OLS) and a pooled mean group (PMG) in capturing cross-sectionally dependent errors in heterogeneous panels. In this paper, we adopt a Pooled Mean Group panel ARDL model from the grounds that; it takes care of unobserved cross-sectional factors (H. Pesaran *et al.*, 2015); the model, while confining sameness of long run coefficients, it allows for heterogeneity of short run coefficients across countries and the model is not only appropriate with relatively large sample size but also it gives consistent estimates when the panel data has variables integrated at different levels, preferably variables at I(0) and I(1), (Asghar & Nadeem, 2015; Onuoha, Okonkwo, & Okoro, 2018).

When conducting panel ARDL model estimation, firstly we need to carry out three steps, namely model definition, descriptive statistics and correlation test. As mentioned earlier in this study, we should go straight to unit root test and selection of optimal lag length. And then, the cointegration test is considered, which helps us to observe the long-term relationship between the main variables. The second is the Hausman test, which can help us to choose the best analysis method among mean group (MG), pooled mean group (PMG) and dynamic fixed effects (DFE). Finally, we need to estimate the model and organize the causality test.

More specifically, the autoregressive distributed lag (ADRL) form proposed by Pesaran and Smith (1995) is as follows. :

$$\Delta y_t = \alpha_0 + \gamma Y_{t-1} + \gamma_2 X_{t-1} + \gamma_3 Z_{t-1} + \sum_{i=1}^n a_{2,i} \Delta X_{t-i} + \sum_{i=1}^n a_{3,i} \Delta Z_{t-i} + \mu_t$$

$$i = 1, 2, \dots, N; t = 1, 2, \dots, T \dots \dots \dots (1)$$

The term α_0 represents the constant term, also the terms γ_i and α_i represent the long-term and short-term coefficients, respectively. In addition, in the specific example, it is possible to include other determinant variables such as the time variable, various pseudo-variables and additional extraneous terms, with a certain number of time lags. Subsequently, the next statistical check follows:

$$H_0; \gamma_1 = \gamma_2 = \gamma_3 = 0 \dots \dots \dots (2)$$

$$H_1; \gamma_1 \neq 0 \text{ or } \gamma_2 \neq 0 \text{ or } \gamma_3 \neq 0 \dots \dots \dots (3)$$

In the case where in the above statistical control the null hypothesis is rejected, this lead us to the conclusion mean that there is a cointegration relation to the variables of the model, whereas, if we accept the null hypothesis, we accept that there is no cointegration. Also, F-statistic is used to perform the test, which is modified by Pesaran Shin and Smith in 2001. Furthermore, they calculated necessary critical values against the number of variables and also calculated the case where a constant term or time trend is included in the model. The critical values calculated are displayed in the form of a detailed interval. The lower end of the space is based on the fact that the variables are I(0), ie they have a zero order of completion while the upper end is based on the fact that the variables are I(1) ie are completed first degree.

Therefore, three different cases can arise from F-statistics. The first case much arises is F-statistic to be smaller than the lower end then we accept the null hypothesis from which it implies that there is no coincidence. The second case that may occur is that F-statistic arises larger than the upper end and therefore, the null hypothesis is rejected, so the result is that there is a coincidence. In the third and final case where the F statistic is between the two extremes, the fact that is reached requires a further investigation of the issue. The next step is to select the best ARDL model that is best suited to data based on specific criteria, such as the Akaike criterion, the Schwarz criterion, and the Hannan and Quinn criteria. In the next relationship we have the general form of an ARDL model (ρ, q_1, q_2) to declare time lags, so we have:

$$Y_t = \beta_0 + \sum_{i=1}^{\rho} \beta_{1,i} Y_{t-i} + \sum_{i=0}^{q_1} \beta_{2,i} X_{t-i} + \sum_{i=0}^{q_2} \beta_{3,i} Z_{t-i} + \varepsilon_t$$

.....(4)

Further, the long term coefficient are the following

$$a_0 = \frac{\beta_0}{1 - \sum_{i=1}^{\rho} \beta_{1,i}}, a_1 = \frac{\sum_{i=0}^{q_1} \beta_{2,i}}{1 - \sum_{i=1}^{\rho} \beta_{1,i}}, a_2 = \frac{\sum_{i=0}^{q_2} \beta_{3,i}}{1 - \sum_{i=1}^{\rho} \beta_{1,i}}$$

.....(5)

With a_0, q_1, q_2 to represent long term coefficients, finally, we calculate the estimates of short-term coefficients by creating the appropriate error correction model as a function of the excellent ARDL found previously so the model will take the following form:

$$\Delta Y_t = \sigma_0 + \sum_{i=1}^{\rho} \delta_{1,i} \Delta Y_{t-i} + \sum_{i=1}^{q_1} \delta_{2,i} \Delta X_{t-i} + \sum_{i=1}^{q_2} \delta_{3,i} \Delta Z_{t-i} + \xi ECT_{t-1} + \varepsilon_t$$

.....(6)

The error correction term is represented by the ECT_{t-1} and the coefficient ξ represents the adjustment factors in equilibrium after an exogenous shock.

Since the ARDL model has an autoregressive structure, the model needs to be dynamic and relatively stable. This means that the inverse roots of the feature equation associated with the model are strictly within the unit circle. When this prerequisite is met, bounds testing can be performed. According to Pesaran et al. (2001), only when bound testing provides a cointegration conclusion can the long-term equilibrium relationship between variables be predicted.

One of the most benefits of panel ARDL method is that it can contain both integrated I(0) and I(1) variables, but it must not have I(2) in the regression. In order to overcome the potential multicollinearity and the high degree of autocorrelation between variables, all the variables related to currency or money in this paper are natural logarithms. In addition, this paper uses the Im, Pesaran and Shin (IPS) method for unit root testing, which assumes that the variable has heterogeneous slopes, which is more in line with the actual situation of the data. Meanwhile, the time trend of variables will not be included in the unit root inspection process. The unit root test results are shown in Table 3 (where is Table 3? below. All variables are stationary under the condition of I(0) or I(1). For logarithm of GDP (LnGDP), it is not significant at the significance level of 0.05 but significant at the significance level of 0.10, and

its $I(1)$ is very "nonstationary". Therefore, $\ln GDP$ is included in the $I(0)$ stable group in this paper. The panel unit root test results for all the groups is presented in the Table 21 below (where is Table 21?). After examining the stationarity of the variables involved in the study, an attempt was made to figure out the level of co integration between the examined variables, i.e., those tied in a long-run relationship. Co integration Test is conducted to determine the long-run economic relationship between the variables (Thomas, 1993).

4.2 Unit Root Test

Smeeke and Wijler (2020) argued that time series behaviors of an individual variable should be well approximated. This is important since if the series has a unit root, it will not be stationary and its mean and variance might be changing over time eventually the OLS will not apply. Additionally, running a model with non-stationary variables yields bogus results that are difficult to interpret and fail to conform to the basic assumptions of a linear regression model. To minimize the non-stationary in panel variables, transforming of the variables is very crucial. Therefore, the need for testing whether panel variables are stationary or non-stationary is essential and determination of the order of integration for each time panel variable is required.

Breitung & Pesaran, (2005) indicated that to test for panel unit root test the first test is the Levin, Lin and Chu (LLC test) which has appeared to be most popular in the panel unit root test. Levin and Li in 1992 developed one of the first unit root test of panel data which Levin and Li first presented this test in a paper which created in 1992 and finally published in 2002 with Chu as a co-writer (Levin, Li & Chu, 2002). This abbreviation of this test is LL, is referred from the initials of their names of the first two authors. It is also worth noting that the event Levin and Li adopted a test that can be regarded as an extension of DF unit root test. The reason for the choice of this test is the fact that it is based on the ADF principle. Furthermore, LLC test assumes homogeneity in the dynamics of the autoregressive (AR) coefficients for all panel members. Concretely, LLC test assumes that each individual unit in the panel shares the same AR (1) coefficient, but allows for individual effects, time effects and eventually a time trend. Lags of the dependent variable may be introduced to allow for serial correlation in the errors. The test may be viewed as a pooled Dickey-Fuller test, or an Augmented Dickey- Fuller (ADF) test when lags are included, with the null hypothesis that of non-stationary ($I(1)$) behaviour.

The second applied unit root test will be Im, Pesaran and Shin (IPS) test, which is heterogeneous panel unit root test based on individual ADF test. Im et al. (2003) proposed this test as a solution to the homogeneity issue. The test allows for heterogeneity in both the constant and slope terms of the ADF regression. In the study of Asterios (2006), it is referred that the LL test has a major disadvantage that limits the p to be homogeneous for all i . The test is expounded by Im, Pesaran and Shin (1997), allowing for heterogeneity in the coefficient of $Y_{i,t-1}$ variable and as a main test is suggested the average of the individual unit-root test statistics. Simultaneously, the IPS test has different estimates for each i section, where different specifications are allowed of the parametric values, the residual variance and finally the lag lengths. Because of the disadvantage of the LLC test and the nature of this study that my panel data have some gaps then LLC is not recommended rather, hence because of the gaps

in my panel IPS test is the most recommended test. Table 5. Presents the results of the Unit Root Test.

Table 5 : Result of the Unit Root Test

Since the main focus of this research project was to establish the relationship of the regional integration on FDI inflows in EAC, with FDI inflows in Tanzania as the dependent variable. Hence to Tanzania automatically enters the autoregressive distributed lag model as an explained variable. As explained earlier in this section, tests of stationary indicated presence of a mix of orders of integration among variables where some were found to be integrated of order zero and others of order one after first differencing. According to theory as discussed above, if such a mix of order of integration is detected then an autoregressive distributed lag modelling becomes an appropriate data generating process (DGP) which can best work in $I(1)$ variables. The model estimation was then run using STATA statistical software and the results which separately displays short and long run relationships between FDIs and the other variables are presented in the above table.

As is customary, the error correction equation which captures short run dynamics among variables is extracted and presented below.

Error Correction Model

$$D \log FDI_i = -0.57 D \log FDI_i - 0.86 \log open_i - 0.72 \log int er_i + 15.49 \log se \min dex_{ij} + int er_j + 6.96 d \log regy_{ij} + 2.01 d \log openes_j - 3.58 d \log rri_{ij} - 1.97 d \log pcidiff + \varepsilon$$

.....(7)

As evident in the ECM above, the results indicate that approximately 57% of disequilibrium deviations of FDI inflows from their optimal level are being corrected. The error correction term also suggests that with an adjustment rate of approximately 57 percent the speed of adjustment of FDI towards long run equilibrium is satisfying as it stands above 50 percent. In the short run, Tanzania interest rate is found to negatively cause FDI inflows to Tanzania. One unit decrease in interest rate in Tanzania is expected to attract more FDI by nearly 72%. This result was expected since theoretically the two are expected to move in opposite directions.

An increase in interest rates on capital loans are more likely to discourage current and prospective investors from desiring to borrow for investing. Not surprising, interest rates in the Other EAC Partner States positively causes more inflows. Similarly Increase in interest rates in EAC Partner states will cause potential investors in the Region. Aggregate Gross domestic product in all the countries of the block, Tanzania inclusive, show positive causality with FDI inflows to Tanzania in the short run, which is not something of a surprise, since for example, within a country, an increase in aggregate GDP is theoretically more likely to cause increases in government public expenditures, increase in employment opportunities, resulting in increased aggregate demand providing an expanded market place for new or potential investments.

As might have been expected, lending rates (*rri*) in Tanzania are found to negatively cause FDI in the same country. A one unit increase in lending rates in Tanzania leads to FDI inflows to fall by approximately 36% on average. Like interest rates, lending rates in the rest of the countries of the block moves in opposite directions with the Tanzania FDI inflows. An increase in the lending rates in partner countries are found to be likely to attract more FDI to Tanzania. Per capita difference is in the short run negatively related to the FDI inflows to Tanzania with findings showing that a unit increase in it reduces Tanzania's FDIs by 20%.

Cointegration Equation: Long Run Relationships

$$D \log FDI_i = \alpha_{ij} + 1.47 \log Openness_i - 1.02 \log \text{int } er_i + 40 \log \text{se min } dex_{ij} - 0.63 \log \text{int } er_j - 2.68 \log regy_{ij} - 6.41d \log openness_j + 13.6d \log rri_j + 7.73d \log peidiff_{ij} + \varepsilon$$

.....(8)

The integrating equation above captures the long run equilibrium relationship between FDI and the explanatory variables of the model. In the long run, Tanzania trade openness behaves the same way as the short run in terms of its equilibrium relationship with the same country's FDI. In fact, in the short run, openness is negatively related to FDI where as in the long run the same is true. Improvements in openness within Tanzania tends to reduce foreign direct investment inflows both in the short and long runs with the long run impact reaching 51% more than the short run causality. Openness in partner countries is positively related to FDI flows to Tanzania. Evidence from findings presented in the ECM above indicated that a one unit increase in openness in partner country in the short run increases FDI inflows to Tanzania by 20% approximately. Interest rates on the other hand, and as economic thought would suggest, records negative relationship with FDI inflows. Like in the short run, in the long run equilibrium, FDI in Tanzania tends to decrease with increases in within country interest rates.

Moreover, the model results reveal that the magnitude of impact on FDI due to changes within Tanzania's interest rates tend to increase with time horizons where roughly in the long run the impact on Tanzania's FDI increases by 30% of the short run impact. Also, in the long run, Interest rates of Tanzania's partner countries i.e country *J* behave negatively against Tanzania's FDI. One unit increase in partner country's interest rate decreases Tanzania's FDI inflows by almost 63%.

5.0 Conclusions and Policy Recommendations

Result from ARDL has demonstrated that the long run relationship exists among aggregate GDP for the EAC Partner States, openness index, business regulator environment and Tanzania

FDI inflows this suggest that deeper integration process will generate more FDI inflows to Tanzania than the short run effect, Tanzania is expected to enjoy more benefits from the EAC integration process in the long run than the short run, with a speed of adjustment of 57% which has also positive impact on FDI inflows in Tanzania. This speed is above 50% which is sufficient to ensure sustaining long run benefits at the equilibrium level.

Furthermore the autoregressive distributed lag model test revealed that there exist a long run relationship between Tanzania Return on Investment and FDI inflows which also provides the expected sign and significant. Similarly, Tanzania interest rate with interest rates of other EAC Partner states relate positively with FDI inflows of Tanzania. Furthermore, Tanzania Openness index and the openness index of other EAC Partner state at equilibrium level have positive relationship with FDI inflows in Tanzania, since openness provide the measure of the level of liberalization done in the EAC integration process from Customs Union, Common Market and Monetary union, which is a typical milestone of the deeper integration process. This evidence demonstrates that in the long run the pattern of FDI inflows of Tanzania from EAC will be more based on the deeper integration aspect provide for by the creation of Common market and Monetary union, This evidence further suggests that the pattern of FDI inflows will shift from resources seeking FDI to efficiency and market seeking. Hence, it is evident that deeper integration process will generated more FDI inflows to Tanzania than the short run effect. Tanzania is expected to enjoy more benefits from the EAC integration process in the long run than in the short run.

On the other hand, the study findings showed a fairly strong speed of convergence towards the long run equilibrium. i.e approximately 57% of disequilibrium deviations of FDI inflows from their optimal level are being corrected. The error correction term also suggests that with an adjustment rate of approximately 57 percent the speed of adjustment of FDI towards long run equilibrium is satisfying as it stands above 50 percent. Four variables out of the six multi-variables in the sample were significant and positively related to Tanzania FDI in the short run. These variables include per capital differences between Tanzania and her Trading Partners in EAC, interest rate, Return on investment, and openness index.

The establishment of the EAC Common market has been implemented through the elimination of barriers on free movement of people, goods, capital and services, However, no substantial effects have been realised in the short run because most of the variables had no effect on FDI in the short run. The EAC need to complement the implementation of the Common Market protocol through the implementation of the regional law or act that add more weight to the process similar to what was done in the establishment of Single European Union Act. Consolidation of the market will create a unified market across EAC, so market-seeking FDI from outside the EAC would be strongly attracted to the EAC because of the size of the domestic market and the possibilities of exploiting economies of scale and reducing transaction costs. The expectation is that positive relationship in a long run is likely to change the pattern of FDI inflows from resources seeking to efficiencies seeking and market seeking FDI. The Common market is also likely to increase FDI between member states, because of the significant differences in costs among them, especially labor costs, combined with relatively short supply chains and low transaction and coordination costs. Hence, EAC countries need to

speed up the harmonization of domestic policies to enhance proper functioning of the common market. On top of that the integration process need to be complimented by compensatory and complimentary policies to ensure equilibrium relationship indicated by the integration variables is well sustained.

Examining the Factors Affecting Coffee Supply Chain Management in Ethiopia: A Case of Commodity Exchange at Jimma Branch

Abebe Ayalew Balcha¹ & Jane Wilson Massi²

¹Department of Management, College of Business and Economics, Ambo University, Ambo, Ethiopia

²Department of Education, College of Business Education (CBE), Dar es salaam, Tanzania

Abstract

Coffee is the most traded commodity on the global market. Hence, the purpose of this paper is to examine the factors affecting Coffee Supply Chain Management (CSCM) in Ethiopia. Data for this study were gathered from 178 respondents as sample size and the main sources of data for this survey were primary data which were collected by using survey questionnaires. This data was analyzed using descriptive and inferential statistical techniques. The results of this study show that all independent variables have a significant effect on the dependent variables. According to the regression model results, R values (94.1%) clearly show a significant relationship between the dependent variable and the predictor variables, and an adjusted R-squared reveals that all predictor variables (such as economic factors, institutional factors, infrastructure factors and marketing factors) can predict the dependent variable (coffee supply chain management) by 88.3 %. However, economic-related factors have great effects (56.48%) on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch followed by institutional related factors which have (30.67%) effects on CSCM while infrastructural related factors and marketing related factors are the least important (10.47% and 2.38%) respectively. The study concludes that coffee supply chain management is unproductive because of corruption, lack of technology, lack of financing, insufficient training, and lack of managerial competency. Hence the study suggests that all stakeholders focus more on developing a policy for blending coffee supply chain which includes production, storage, and marketing, and preventing constraints such as corruption, poor management systems, and insufficient training to improve coffee supply chain management and marketing systems, particularly in Ethiopian Commodity Exchange at Jimma Branch.

Keywords: *coffee, coffee supply chain management, coffee production, marketing*

1.0 Introduction

Coffee is an agricultural raw material widely traded on a global and regional scale (Bali et al., 2020, Wakjira, 2021). In today's global market, various commodities are available in the international market, with coffee being one of the most important commodities (Bali et al., 2020). Coffee is a vital production for development activities that provides a living for millions

of people worldwide by generating financial returns in subsistence economies (Gebermedin & Tolera, 2015). Coffee production and harvesting in developing countries are labor-intensive, and it is a valuable source of rural employment for both men and women (Mutandwa et al., 2009). It is unique in that, coffee is grown in practically every non-arid tropical country. Over 50 countries produce considerable amounts of coffee, and the sources of their income are largely based on coffee exports which are critical to the country's balance of payments (Chauhan et al., 2015; Gebermedin & Tolera, 2015). In the Ethiopian economy, agricultural products particularly coffee accounts for about half of Gross Domestic Product (GDP) (Lemecha, 2019). It nearly accounts for about 47% of GDP, 80% of export revenues, and employment for 85% of the communities, and all of these made it the country's economic backbone (Nguni, 2016).

Multiple studies in Ethiopia show that coffee is one of the most essential commodities in international and local consumption and trade, which provides a significant source of income for several nations (Temesgen & Tufa, 2017; Aliyi, 2019, Asefa et al., 2016; Wakjira, 2021). This suggests that the expansion and development of the coffee business can have a major impact on national, regional, and household economic growth (Gebre, 2020; Kebede et al., 2021). However, the coffee value chain has not yet fully capitalized on its role as a supplier of most of the world's greatest coffees (Degaga, 2020).

Ethiopian coffee supply chain faces numerous problems due to a lack of market outlets, insufficient market information among participants, and limited investments in market linking activities (Amamo, 2014; Minten et al., 2019). As a result of these and other factors, the farmers' share of the present price has decreased and Ethiopia's government also recognized the issue and allowed coffee unions to sell their members' products directly to international markets, without any middlemen. However, while these cooperatives or unions may be able to shorten the coffee supply chain, they are having trouble in adding value to their members' products in terms of logistics, marketing, and institutional factors (Aliyi, 2019).

Currently, various literature and study have been conducted on CSCM in Ethiopia. For instance the study by Angula, 2010; Kabeta, 2021; Kassaye et al., 2018; Shumeta & D'Haeseb, 2016; Temesgen, 2020. In this regard, coffee supply chain analysis is an intriguing procedure that needs extra attention in this field of research. However, most of these studies did pay attention to determinants/factors affecting the coffee supply chain rather than the extent to which those factors impact CSCM. Therefore, the main objective of this research was to bridge this practical gap by examining the extent to which those factors impacts CSCM of Ethiopian Commodity Exchange (ECX) at the Jimma Branch. Specifically, the study were to examine the extent of institutional, infrastructural, market, and economic factors impacts on the Ethiopia's CSCM. This study is significant to inform the Coffee Regulatory Authority in Ethiopia and other stakeholders in coffee industry about the level of impact of each factor and suggesting the appropriate measures.

2.0 Related Literatures

Coffee is one of the five main important commodities in the world markets (Ibrahim & Zailani, 2010). In today's dynamic economic environment, individual companies may begin to compete as distinct entities instead of as active participants in a bigger supply chain that encompasses a

network of different businesses and partnerships. As a result, suppliers operate in an ever-changing environment and are vulnerable to a wide range of risks at all levels due to a constantly changing landscape caused by variety of factors (Ibrahim & Zailani, 2010). Many supply chains span large areas and are susceptible to a variety of global risks (Butner, 2010; Christopher & Holweg, 2011). Customers are becoming increasingly demanding of product customization, pricing, and service level (Christopher & Holweg, 2011; Sayed et al., 2017).

Product variation is also continuing to increase because of high clock frequency in so many companies which leads to rapid technological changes and the ongoing launch of new technology to the market. Besides, the external environment is extremely vibrant leading to economic (energy costs, raw material prices, and availability, currency values), socioeconomic (civil disorder, changing customer needs), and natural events (Sayed et al., 2017). In such, businesses must be incredibly agile to stay alive in this complicated world, as well as build a large level of adaptability and mitigating risk skills, as well as a porous structure that allows for rapid response to these problems. According to Christopher & Holweg (2011), structural flexibility is the supply chain's ability to adjust to essential changes in the market. However, adaptability and perseverance come with a cost in the form of an extra resource base such as safety stock and extra space, as well as higher transaction costs (Christopher & Holweg, 2011).

Firms must have the greater profile of the entire supply chain, the essential speed to respond rapidly to changes, and effective coordination with vendors and distributors in terms of balancing the usually needed level of resilience and flexibility and the cost of achieving it (Christopher & Holweg, 2011). It is also critical in assisting supply chains in coping with the issues of an ever-changing environment and a plethora of risks at all stages. Supply chain interactions are being elevated to a new level, with the potential of human-to-thing interaction and independent cooperation between many 'things' while still being retained in an institution or transported between various supply chain organizations (Mulyati & Indrawan, 2021; Phyllis, 2014; Sarker, 2018). These new tools provide a huge opportunity for dealing with confronted more successfully. It enables new levels of logistics, flexibility, and versatility to deal with a variety of supply chain management challenges (Ellis et al., 2015). This will permit for a decrease in time among data collection and judgment, letting supply chains respond to events in real-time, enabling for levels of nimbleness and ability to respond never before seen (Ellis et al., 2015).

Ethiopia's economy is mostly reliant on agriculture, which accounts for roughly 40% of GDP and 80% of exports (Sarker, 2018). Coffee in Ethiopia is most important agricultural export product, accounting for 65% of the country's foreign exchange revenues. In a country where a huge portion of the population lives in poverty, coffee farming is critical to the country's cultural and socioeconomic well-being.

According to a World Bank assessment, over 25% of Ethiopia's population is dependent on coffee cultivation, processing, and marketing, either directly or indirectly (Umaran et al., 2022). Ethiopia is noted for having a suitable environment for growing coffee, with a mix of optimum height, temperature, rainfall, and soil type, and Ethiopia is the source of Arabica coffee. For this Arabica coffee, the country has a diverse genetic background with significant

variation. Ethiopia produces a variety of coffees and they have significant potential for specialty coffee sales (Sayed et al., 2017).

2.1. Factors Affecting Coffee Supply Chain Management in Ethiopia

While new markets emerge, many coffee-dependent poor countries, such as Ethiopia, are struggling to produce and export their coffee. Ethiopia is the world's fifth-largest coffee producer and the continent's leading producer. Most of the coffee is consumed in the country, and it has the highest domestic consumption rate on the African continent (Anwar & Nguyen, 2010).

Ethiopia is famous not only for being the birthplace of Arabica coffee but also for its high-quality coffee, which is prized for its aroma and flavor. Another appealing aspect of Ethiopian coffee is its variety of flavor and quality. There is widespread agreement that the five most significant marketing-related constraints confronting Africa's farmers revolve around five points: (1) high production and marketing costs, resulting in low profitability and a disincentive to produce for the market; (2) limited access to credit, particularly for small-scale farmers; (3) a scarcity of profitable new farm technologies to adopt and use sustainably; (4) price volatility; and (5) poor market access and competitiveness conditions (Jayne et al., 2014).

The primary goal of a coffee exchange value is to establish a fair, orderly, and efficient system for aligning supply and demand to enable "market pricing," or the true current value based on supply and demand conformity (Alam, 2020; Angula, 2010; Jima Degaga et al 2017). To attain this alignment, an exchange value can and must restrict market behavior through risk assessment equipment designed to ensure that market behavior adheres to the principles of a fair, orderly, and efficient marketing system. These tools include, among other things, limiting trading positions, trying to adjust the rate of return and other deposit prerequisites, and establishing price loop filtration to limit price swings, marketing factors, finances, government policies, and physical and human resources greatly affected coffee production (Catturani et al., 2008; Gathura, 2013; Issa & Chrysostome, 2015).

Ethiopia's export competitiveness is improved by first getting the domestic market in order, whereby three groups of problems in the commodity market are identified: 1) the lack of an integrated commodity marketing policy that addresses all processes involving transport, grading, storage, and information facilities for both producers and consumers; 2) the lack of a well-equipped institutional establishment capable of providing all marketing services to all market actors; and 3) the lack of private and public partnership in the commodity market (Alam, 2020; Angula, 2010; Gebermedin & Tolera, 2015). Thus, commodity exchanges are established for a variety of reasons, the most important of which is to address the aforementioned and related challenges. Conversely, dissatisfaction with transportation and communications services; a lack of complete, accurate, and accessible global marketing information; a lack of adequate warehouses, grading, and sampling systems; and a higher premium cost for failing to pull back commodities from storage facilities on time were identified as some of the ECX difficulties for agriculture products export members (Abebaw, 2014; Shumeta et al., 2012; Shumeta & Haese, 2018).

Exchange rates can be useful throughout physical trade in emerging markets, including the financing of commodity inventories. They can lower the cost of physical exchange exploration and counterparties in deals with a number by providing a transparent, disciplined marketplace (Ngmenipuo & Issah, 2015). Commodities that work properly can encourage more efficient and productive, storage, marketing, and agriculture sectors processing activities, as well as significantly improved agriculture sector effectiveness. (Apriyanti, 2020).

Small-scale farmers, privately held farmers, and state businesses are among the producers at this stage in Ethiopia's coffee supply chain (USDA, 2019). Producers, particularly large-scale private coffee plantations and state farms of coffee plantations, control the majority of the volume of goods mobilized, value-adding services, market share, and capital in the country's coffee value chain. Subsequently, the coffee is made and matured, those producers execute the following value-added operations in the value chain, gathering coffee chary and delivering it to processing regions (USDA, 2019). A supply chain's primary complaint is to start producing value-added goods or services for a market location by improving an organization and utilizing infrastructure and services inside the possibility and restrictions of its institutional context. As a result, we believe that the restrictions to value progress are associated to access to the common market (municipal, geographic, and worldwide) and market alignment (Hernandez, 2015; Perdana et al., 2018; Sayed et al., 2017).

Despite its high quality, Ethiopian coffee is the least advertised and promoted on the global market. Evidence suggests that roasters are aware that Ethiopian coffee is superior, but they are unable to sell it because we have not approached them. That is, one of the problems with coffee marketing in Ethiopia is that there is insufficient effort to promote coffee and ensure trademark rights for the best and most well-known Ethiopian coffee varieties, the majority of which are motive and number one in the world. Furthermore, exporters lack experience and knowledge of the coffee market (Angula, 2010; Kabeta, 2021). However, to the best of the researcher's knowledge, none among the empirical study has been conducted in the Ethiopian Commodity Exchange (ECX) at Jimma Branch and most of these studies did pay attention to determinant/factors affecting the coffee supply chain rather than its contributions to economic growth or the extent to which those factors impact the CSCM. Therefore, this study will be worthy of persuit to bridge this gap and add knowledge to the existing literature.

2.2 Conceptual Framework of the Study

Based on the aforementioned information and reviewed literature, the researchers presented the conceptual framework depicted in figure 1.

Infrastructural related factors

- Proximity
- Storage facility
- Transportation facilities
- Technology

Marketing related factors

- Timely deliver
- Marketing informations
- Processing supply
- Price volatility

Coffee Supply Chain
Management in Ethiopia

Economic related factors

- Access to credit
- Income

Figure 2: A Conceptual framework for factors affecting coffee supply chain management in Ethiopia

Source: Developed from reviewed literature

3.0 Methodology

3.1 Research Design

The study employed a cross-sectional survey design which incorporates both descriptive and explanatory research design to examine data and get enough information about the study's realities. The descriptive research design was used to describe the contributions and constraints of each determinant factor on coffee supply chain management and marketing system in Ethiopia at EXC of Jimma Branch. The study also used an explanatory research design to investigate the relationship between independent variables (institutional, infrastructural, marketing, and economic factors), and dependent variables (coffee supply chain management) because those variables have a cause-and-effect relationship.

3.2 Target Population and Sample Size

Agreeing to (Kothari, 2004), the "target population" refers to the intended population of a study in terms of age group and gender in a certain geographical area such as a country, region, or town. Accordingly, the study used 321 employees of the Ethiopian Commodity Exchange (ECX) of the Jimma branch as the target group of the study. Hence, the researchers selected a sample of responders among these employees. The study employed the (Yamane, 1969) sampling technique for determining sample size as shown in equation (1). Thus, the researcher chooses 178 employees as a sample size out of 321 employees.

The formula for sample determination is $n = \frac{N}{1+N(e^2)}$, whereby: n =sample size, N =Targeted population, e =Level of precision or sampling error which is 0.05.

$$\text{Thus, the sample employees of ECX, } n = \frac{321}{1+321(0.05^2)} = 178$$

3.3 Sources of Data

The main sources of information for this survey were primary data. Questionnaires and interviews were used to collect primary data. The questionnaires were created for the entire

group of respondents, and it is the best and most important primary sources. The cross-section survey research method was used to collect data for this study because it is an appropriate method for measuring respondents' opinions and attitudes. The researchers had carefully crafted insightful interview questions in addition to the questionnaires. The interview was conducted under the assumption that the participants' perspectives are valuable, that they are knowledgeable in the field, that they can make accurate comments, and that their perspective influences the study's success.

3.4 Method of Data Analysis

Various statistical methods, including descriptive statistics such as mean and standard deviations, as well as inferential statistics (multiple regressions and the Automatic linear regressions model) were used to analyze the data. The study employed multiple linear regression analysis to analyze the strength of the relationship between the independent variable and various predictor variables, as well as the importance of each predictor to the relationship with the influence of other predictors. The data was then analyzed and interpreted considering the information gathered from respondents. Accordingly, the general model for this specific study is as follows: $y = b + m_1x_1 + m_2x_2 + m_3x_3 + m_4x_4 + \varepsilon$

Where;

y = The dependent variable of the regression which is coffee supply chain management (CSCM)

b = Constant or the y-intercept

m_1 = Regression coefficient of the first independent variable

x_1 = First independent variable of the regression which is Marketing related factors

m_2 = Regression coefficient of the second independent variable

x_2 = Second independent variable of the regression which is Infrastructural related factors

m_3 =Regression coefficient of the third independent variable

x_3 = Third independent variable of the regression which is Institutional related factors

m_4 = Regression coefficient of the fourth independent variable

x_4 = Fourth independent variable of the regression which is Economic related factors

ε = Model error

3.5 Validity and Reliability of the Study

Validity is a measurement trait that describes a research instrument's or tool's ability to measure what it was designed to measure. The validity of instruments is ensured in this study by using simple language when creating instruments so that respondents can understand them easily. The questionnaires was examined and checked by consultants and potential experts in quantitative research. Then were pre-tested to employees of ECX at Jimma branch who were not part of the study sample. Reliability is the degree to which a research mechanism produces reliable outcomes or data the same way each time it is used under the same condition with the same subjects. The reliability of the study would be checked by using Cronbach alpha which was calculated by using SPSS software.

4.0 Results, and Discussion

This chapter discusses the presentation, interpretation, and analysis of the study's data. The variables in the study were the factors and their effects on CSCM. Descriptive statistical analysis, such as percentages and frequencies, was designed to present how these factors affect CSCMM. To assess the influencing factors on CSCM in Ethiopia, Multiple linear regression and automatic linear regressions were used to show the effects and importance of the predictors. To conclude, 178 questionnaires were distributed to respondents, and the collected data were presented and analyzed by using SPSS (version 26) statistical software to test the study's variables and the effects of the independent variables on the dependent variable.

4.1 Validity and Reliability of the Data

The study used Cronbach's alpha which is dealing with the amount to which item responses obtained at the same time are highly correlated with one another, and the widely accepted social science cut-off is that alpha should be greater than 0.70 for an agreed of items to be considered a scale (Field, 2009). Accordingly, the Cronbach's alpha test was performed by using SPSS 26 versions, and the results are summarized as shown in Table 1. The calculated coefficient of alpha for this study was 0.970 for all variables, which is greater than the required threshold of 0.70, indicating that the variables are internally reliable.

Table 9: Summarized Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
0.970	0.980	15

The inter-item correlation was also used to determine the correlation coefficients for items in the study's scale, to check and see if the items interrelated well. To be the inter-item correlation interrelated well, the threshold of the reliability test has to be greater than 0.3 (Field, 2009). This technique also shows that the survey data was statistically reliable. For all items that are inserted in the systems of Cronbach alpha, the value is greater than 0.3 which fits above the required standards. This shows the data used by the study is reliable and valid for analysis. (See below Table 2)

Table 10: The correlation coefficients for inter-item

Item-Total Statistics				
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
o Timely delivery	59.847	56.246	0.779	0.971
o Marketing information	59.3820	56.961	0.926	0.966

o Processing and supply	61.0112	60.870	0.918	0.968
o Price volatility	59.2022	55.835	0.839	0.969
o Operational quality	59.0112	60.870	0.918	0.968
o Proximity to cooperative society	59.2921	58.920	0.874	0.967
o Storage facilities	60.5730	50.777	0.951	0.970
o Transportation facilities	59.1966	61.560	0.797	0.969
o Technology	59.0112	60.870	0.918	0.968
o Management capacity	59.1067	60.955	0.875	0.968
o Government policies	59.0052	60.755	0.865	0.968
o Training	59.0112	60.870	0.918	0.968
o Corruptions	58.9663	61.276	0.889	0.968
o Access to credit	59.2865	62.691	0.674	0.971
o Income	59.1067	60.955	0.875	0.968

As shown in Table 2 above, the overall and inter-item Cronbach's alpha values of all dependent and independent variables in the study meet the minimum requirement of reliability analysis (i.e. $\alpha > .70$). As a result of this finding, the researcher concludes that the instrument's pilot test is reliable enough to use in the current study. Additionally, all the items contribute positively to yielding the highest Cronbach's alpha for the instrument.

4.2 Descriptive Analysis

The Descriptive analysis and interpretation are based on the respondent's responses and clear sentences to express obtained data by using the table of frequencies, percentage, mean and standard deviations; whereas the data collected through interviews were analyzed qualitatively to strengthen the analysis of the results from the study. The descriptive analysis mainly focuses on explaining the contributions of the independent variables such as Marketing related factors (Timely delivery, Marketing information, Processing and supply, Price volatility, and Operational quality), Institutional related factors (lack of management capacity, Inadequate training, and Corruptions), Infrastructural related factors (Proximity to cooperative society, Storage facilities, Transportation facilities, and Technology) and Economic related factors (Access to credit and Income) for dependent variables such as coffee supply chain management and marketing.

Descriptive analysis was used to summarize the results of each variable based on the response for each item and analyzed by comparing the "mean" and "standard deviation" scores of each variable. According to Zaidaton & Bagheri (2009), the mean score below 3.39 was considered as low, the mean score from 3.40 up to 3.79 was considered moderate, and the mean above 3.8 was considered as high as illustrated below. (See below Table 3)

Table 11: Comparison bases of the mean score of the five-point Likert scale instrument

Mean Score	Description
------------	-------------

<3.39	Low
3.40 -3.79	Moderate
>3.80	High

Hence, based on the above table 3 descriptive statistics were employed to analyze the data that was calculated by using SPSS, and the interpretations of each descriptive statistic were presented in table 4. (*See below Table 4*)

Table 12: The descriptive results for each independent variable

	Descriptive Statistics		
	N	Mean	Std. Deviation
Marketing related factors	178	3.9506	0.64714
Infrastructural related factors	178	4.1222	0.64672
Institutional related factors	178	4.6278	0.45352
Economic related factors	178	4.4438	0.45060
Valid N (listwise)	178		

The results of above table 4 show the average mean and standard deviations of the predictor variables that have a significant effect on dependent variables. Hence the above table shows that Marketing related factors have a mean of 3.95 with standard deviations of 0.647, Infrastructural related factors have a mean of 4.122 with standard deviations of 0.646, Institutional related factors have a mean of 4.627 with standard deviations of 0.453, and Economic related factors has a mean of 4.443 with standard deviations of 0.450. According to Zaidaton & Bagheri (2009), the mean score below 3.39 was considered as low, the mean score from 3.40 up to 3.79 was considered moderate, and the mean score above 3.8 was considered as high. Based on this information all the above results are greater than the cutoff point or above the average which means that all independent variables (Marketing related factors, Infrastructural related factors, Institutional related factors, and Economic related factors) have greater effects on dependent variables (coffee supply chain management and marketing).

4.3 Inferential Statistics

The analysis and interpretation based on the respondent's responses were also interpreted by inferential statistics such as multiple regressions and automatic linear models to clearly state the relationships between each variable and their effects on (ECX) at Jimma Branch deeply disclosed according to the following (See below Table 5)

Table 13: Model Summary of relationships between variables of the study

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate

1	0.941 ^a	0.886	0.883	0.16688
---	--------------------	-------	-------	---------

a. Predictors: (Constant), Economic related factors, Marketing related factors, Institutional related factors, Infrastructural related factors

The model summary is depicted in the above Table 5 shows, R which indicates a highly significant relationship between the dependent variable and the linear combination of the predictor variables is (0.941) which is the set of all independent variables explained 94.1%. R-squared, on the other hand, measures the proportion of the difference in the dependent variable that can be described by independent variables, irrespective of how well they are correlated with the dependent variable. Thus, the R Square value is (0.886) which indicates all independent variables explained 88.6% of the disparity in the dependent variables. However, this is not a desirable characteristic of goodness-fit of the results of the statistics. Hence, Adjusted R – squared, also provides an adjustment to the R-squared statistic, such as independent variables that correlate with the dependent variable. Accordingly, adjusted R-squared is preferable to R- squared for determining the model's success in the real world. Therefore, adjusted R-squared is the proportion of deviation described by the regression of the dependent variable on the combined effect of all predictor variables, which is 88.3%. Hence, the independent variables (such as economic, marketing, institutional, and infrastructure factors) can predict the dependent variable (coffee supply chain management) by 88.3 %.

Table 14: ANOVA results showing average amount of deviation described by the model and residual

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	37.300	4	9.325	334.852	0.000 ^b
	Residual	4.818	173	0.028		
	Total	42.118	177			

a. Dependent Variable: Coffee supply Chain Management
b. Predictors: (Constant), Economic related factors, Marketing related factors, Institutional related factors, Infrastructural related factors

The ANOVA (Analysis of variance) Table 6 above shows that, based on the total observation value (42.118), the regression model was explained by the majority of the observations (37.300). The remaining observation values (4.818) were explained by extraneous variables. The mean square of the model (regression) represents the average amount of deviation described by the model is 9.325; whereas the mean square of the residual is 0.028 and represents the average amount of deviation described by extraneous variables (the unsystematic variation). The F – ratio (334.852) is a degree of the percentage of deviation described by the model to variation explained by extraneous variables. Thus, the value of F is large enough to conclude that the model represents an actual practice of the business operators under study.

The significant value in the model, also known as the P-Value ($p \leq 0.001$), indicates that the independent variables in the model explain the dependent variable. (See below Table 7)

Table 15: Regression coefficients result for related factors which predicts CSCM

		Coefficients ^a			
Model		b	Std. Error	t	Sig.
1	(Constant)	1.717	0.220	7.794	0.000
	Marketing related factors	0.308	0.079	3.881	0.000
	Infrastructural related factors	0.432	0.116	3.730	0.000
	Institutional related factors	-0.732	0.079	-9.215	0.000
	Economic related factors	0.670	0.070	9.504	0.000

a. Dependent Variable: Coffee supply Chain Management

The unstandardized coefficient of an independent variable (b) which is a constant or the y-intercept in the equation, measures the strength of its relationship with the performance of the dependent variable. Thus, the coefficient for marketing-related factors is 0.308, the coefficient for infrastructure-related factors is 0.432, the coefficient for institutional-related factors is -0.732, and the coefficient for economic-related factors is 0.670. Thus, marketing, infrastructure, institutional, and economic-related factors predict coffee supply chain management by 30.8%, 43.2%, and 73.2% and 67%, respectively.

Using the regression coefficients for independent variables and the constant term given under the column labeled b, the researchers constructed the regression equation for predicting a firm's performance as follows: $y = b + m_1x_1 + m_2x_2 + m_3x_3 + m_4x_4 + \varepsilon$

$$\text{Therefore, } y = 1.717 + 0.308x_1 + 0.432x_2 + 0.732x_3 + 0.670x_4 + \varepsilon$$

Generally, the above finding implies that improving coffee marketing conditions, and enhancing infrastructural and institutional facilities were among the important factors to improve coffee supply chain and marketing, thereby improving the livelihoods of coffee producers in the study area.

Table 16: Automatic linear model results for predictors' performance/Importance on CSCM

Nodes	Importance	Importance	V4	V5
Marketing related factors transformed	0.0238	0.0238	Marketing related factors	0.0238
Infrastructural related factors transformed	0.1047	0.1047	Infrastructural related factors	0.1047
Institutional related factors transformed	0.3067	0.3067	Institutional related factors	0.3067

Economic related factors transformed	0.5648	0.5648	Economic related factors	0.5648
--------------------------------------	--------	--------	--------------------------	--------

The results in the above table 8 were obtained by using automatic linear modeling which reveals that, the most important predictors for this study are economic-related factors such as farmer's or coffee producer's access to credit. Hence economic-related factors have great (56.48%) effects on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch followed by institutional related factors which have more (30.67%) effects on CSCM while infrastructural related factors and marketing related factors are the least important (10.47% and 2.38%) respectively. Hence, the finding of this study discloses that institutional related factors such as poor institutional managements system, absence of training, and corruption are among various factors which have a serious effect on CSCM in Ethiopian Commodity Exchange (ECX) at Jimma branch next to economic related factors. In general, it was discovered that most of the respondents agreed on the coffee supply chain management and marketing are ineffective.

5.0 Conclusion and Recommendations

The purpose of this study was to examine the factors affecting Coffee Supply Chain Management in Ethiopia: the case of Ethiopian Commodity Exchange at Jimma branch. The descriptive and explanatory research analysis was used for the study. The finding of descriptive statistics show that all the independent variables have an influence on dependent variables. The finding from the inferential statistics also shows that the model represents an actual practice of the business operators under study. The significant value in the model, also known as the P-Value ($p \leq 0.001$), indicates that the independent variables in the model explain the dependent variable. The adjusted R-squared shows the proportion of deviation described by the regression of the dependent variable on the combined effect of all predictor variables, which is 88.3%.

In general, it was discovered that coffee supply chain management is ineffective, whereby corruption, lack of technology, lack of access to credit, inadequate training, and management capacity are major important factors. Therefore, the study recommends that sufficient and interest-free credit facilities should be made available to coffee producers and other actors or members on time. Microfinance institutions play an important role in this regard, and strategies should be developed to link microfinance with all actors further the government should give attention to formulate policies regarding all these factors. Moreover, corruptive practices should be reduced by raising awareness about the effects of corruption, dismissing corrupted committees, firing the corrupted employees in the unions and, care should be taken to consider their background and ethical standards while recruiting committee members and employees.

Shaping Today's HEI Students: Evacuate Theoretical to Digitalized Skills and Competences

Hamisi R. Zahoro¹ & Shima D. Banele²

¹Department of Accountancy and Marketing , College of Business Education, Mbeya, Tanzania.

²Department of Education, College of Business Education, Dar es Salaam, Tanzania

Abstract

This paper explores the influence of technical services provided by incubators on the performance of digital entrepreneurs in Tanzania, with a focus on the University of Dar es Salaam ICT Incubator (UDICTI). Utilizing the Open Innovation theoretical framework, a mixed-methods approach was employed to gather and analyze data from 42 students benefiting from incubation services. Furthermore, data were analyzed using Seemingly Unrelated Regression (SURE) and content analysis method Findings indicate that technology training as well as industrial and experts' practitioners had positive and significant influence on blending digital startups. On further note, access to the UDICT Lab and innovation space with facilities also had positive and significant influence on the performance of digital entrepreneurs. This paper concludes that, higher learning institutions ought to adopt the components of open innovation in developing innovation hubs like UDICT where the students will access training, mentorship, expert guidance, a laboratory with learning materials and free innovation spaces that together contribute while shaping today's HEI to evacuate from the content to digitalized skills, innovation and talents development for sales, employability, and product innovativeness. The findings of this research offer valuable insights for policymakers and stakeholders in establishing supportive ecosystems that empower digital startups, driving innovation and economic growth in Tanzania and other developing regions.

Key terms: *incubates, hubs, students, innovation, digitized skills, competences*

1. Introduction

The landscape of future working environments anticipates complexities and dynamism context (Sulintang et al., 2024; Olawale et al., 2024). Nonetheless, was observed by Sikubwabo et al. (2024) that the youth graduates' unemployment has been an alarming jargon that needs appropriate mechanisms to sort out. According to Kaligotla (2023), technology deployments in teaching and learning had been upheld to root booth and catalyze reshaping and deployment of multiple competencies to graduates for jobs undertaken in the Fourth Industrial Revolution (4IR). Likewise, the alarmed curriculum components are mismatched with new labor market trends need colleges and universities to rethink, redesign, and redevelop appropriately to reflect the society's requirements (Cassaro & Lee, 2024). Social-cultural and economic practices in 4IR entail colleges and universities to focus on pillars that inculcated Autonomous Robots,

Industrial Internet of Things (IoT), Augmented Reality, Additive Manufacturing, Cybersecurity, Cloud Computing Simulation/ Digital Twin, and Big Data and Analytics.

Further, Olaya-Escobar et al. (2024) disclosed the presence of demands on procedures for technology-based approaches acquainted with paradigm shifts for 4IR competencies acquisition. Undoubtedly, Mishrif et al. (2023) insisted that realistic teaching and learning had to become not only the responsibility of academicians, but also experts, and practitioners from fields and industries. Certainly, through collaborative teaching the persistent debates that doubt the HEI graduates' competencies gaps had to be fixed. Likewise, today and future important skills including financial and digital literacy and wide attributes behaviors are advocated to be articulated by the graduates to suit sustainable socio-economic driven agendas (Merino, Maroun & Callaghan, 2024). Subsequently, revolutionization challenges brought by (4IR) pertained to the need to change the curriculum implementation from theoretical to practical skill-based endeavors and large attributes that are ventured into digital-related skills, knowledge, and competencies (Olawale et al., 2024).

Additionally, the uniqueness of globalization trends correspondingly to digitalization fostered graduates to possess other wider competencies and attributes for collaboration, communication, critical thinking and creativity (4Cs), problem-solving, and innovation to live at any space, pace, and place. The required voluntary and involuntarily wider attributes had to be substantiated and induced to students during the classroom teaching and learning process (Halloun, 2023); day-to-day contextual interaction with the society (Kaligotla, 2023); engaging with the experiential experts in the work-based environment (Cassaro & Lee, 2024). Attainability of appropriate endeavors demanded to inculcate the need to change colleges and universities' teaching and learning approaches towards engagement of hands-on activities, field practices, and internships, industry expertise dialogues as blending education sandwiches ingredients for students' exposition beyond the classroom teaching and learning walls (Sulintang et al., 2024).

Seemingly, Valarmathi et al. (2024) ascertained the need for the academic industry to shape today and future human capital to enable the significant paradigm shift towards inculcating multi-disciplinary competencies of entrepreneurship, skills commercialization, knowledge, and innovations being blended with digitalization. Habitually, colleges and universities contextual environment had to establish the digital entrepreneurs' startups and hubs that are focused on designing, developing, and supplying technological-related products or services (Hong & Evertsen, 2023; Kabelele et al., 2023). Furthermore, Ullah et al. (2023) insisted that the Higher Education Institutes (HEI) are struggling to establish small and medium innovation hubs to undertake high-tech innovations and creativity. Also, the innovation hubs in HEI are utilized not only as practical laboratories to restructure teaching and learning-delivering approaches, strategies, and procedures but also as entrepreneurial enterprises (Pokidina et al., 2023). Similarly, in the hubs and start-ups innovative-knowledge-led reflections on economic stimulation, growth, and sustainability are taking place (Hayman, 2023).

However, digital startups face various challenges hindering their operationalization and growth, including limited access to capital, inadequate managerial capabilities, and market

accessibility issues (Satalkina & Steiner, 2020). To address these challenges and foster entrepreneurial activities, the establishment of business incubators has gained prominence. Incubators provide essential support services, such as professional, technological, and critical support, nurturing technology-based ventures and enhancing individual, national, and regional socio-economic development (Leitão et al., 2022)

Countries worldwide are increasingly establishing incubation programs to provide support for new and young digital enterprises, promote technological innovation, and drive industrial regeneration (Li et al., 2020). Well-incubated digital enterprises have been shown to revolutionize socio-economic landscapes by creating jobs, stimulating high-tech businesses, encouraging technological entrepreneurship, and facilitating technology commercialization (Cavallo et al., 2020; Tang et al., 2021). A key factor contributing to this transformation is the range of services provided by incubators. For Instance, Lyken-segosebe et al. (2020) found that incubator services provide entrepreneurs with networks that facilitate the process of learning by doing, leaning by using, and learning by interactions with professionals in their field of expert. Learning by doing offers an opportunity to collaboratively develop and test prototypes, and commercializing the final product. In the incubation network, Muiruri (2020) observed that digital entrepreneurs are provided with product design and development techniques, production and marketing techniques pertinent for successful innovation.

Furthermore, technical support offered by incubators significantly impacts the innovation capacity of startups. The study by Xiao et al. (2021) observed that technical support in form of provision of laboratories spaces, technology training, research facilities, and equipment positively influence business innovation. In this view, it can be urged that, the form of technological support offered by entrepreneurs determines the level of technical innovation. For instance, Indiran et al. (2021) and Aladejebi & Oladimeji (2020) found that shared facilities, such as office space, equipment support, personal computers, and communication facilities, along with technical training, significantly influence technological innovation.

According to Leitão et al. (2022) business incubators helps in development of new ventures by fostering the opening of innovation practices by accessing knowledge, skills and techniques from university academicians in the incubation networks, digital entrepreneurs engage in the open innovation system to improve their business performance. However, Freire et al. (2020) observed that, the type of technical support accorded to entrepreneurs determines the level of innovation therein. Furthermore, Lose et al. (2020) revealed on new challenges faced by technology business incubators within their ecosystem especially in technical provision support such as lack of facilities, limited access to technology-based prototypes, lack of access to industry business skills, lack of product selection and design

Accordingly, in Tanzania, there is no uniformly developed framework for guiding HEI to undertake incubation, innovation, and entrepreneurial activities through start-ups and hubs. Nonetheless, HEI independently decides either to develop or to adopt different models and frameworks for the establishment of innovation hubs and incubation activities as part of the teaching and learning process. Supplementary, the University of Dar es Salaam ICT Incubator (UDICT), decided to adopt the Open innovation theory (OI) shown in Figure 1. The OI is

utilized as a resource to change the student's competencies from theories towards open-innovative practices, developing categorical entrepreneurial start-up firms related to the digital-technologies (Audretsch & Belitski, 2023). Moreover, the University of Dar es Salaam (UDSM) incorporated internal and external support to incorporate different stakeholders in the establishment and operationalization of digital innovation and entrepreneurial hubs for students as future workforce.

Figure 1. Open Innovation Theory Components (Chesbrough, 2012)

The UDICT deployed components of OI in guiding students to generate innovative ideas, solutions, insourcing technologies, and adaptation and commercialization to the existing and new markets (UDICTI, 2023). Also, the innovation activities in the UDICT are implemented via internally established ventures including Startup Academy, Y4C, FinHub, and NextGen, for the provision of practical training, mentorship, networking towards opportunities, sharing the experiences that enabled bridging the gap between academia and the digital industry (UDICTI, 2023). Nonetheless, these new practices eventually changed students' mindsets from job seekers after graduation instead joining entrepreneurial ecosystems as job creators, self-employed, and employers of others (Hayman, 2023). Students are nurtured and incubated in appropriate approaches, techniques, and procedures endowed with managerial skills including start-ups and innovation hubs operationalization for growth, capital accessibilities, and financial handling, business networking and market accessibilities, acquisition of technical supports, technology-based ventures and enhancing individual, national and regional socio-economic development.

However, the usefulness of OI in education perspective particularly in Tanzania HEI was relatively less unexplored about its integration to support digital start-ups and entrepreneurial performance. Based on those grounds, the paper intended to assess the deployment of OI at the University of Dar es Salaam ICT Incubator (UDICT) as an example of HEI fostering digital innovation and entrepreneurship as a mechanism to evacuate content based towards innovation, digitalization, and talents development (UDICTI, 2023). Certainly, the two objectives were covered that are to:

- i. Assess the usage of Open Innovation Theory components in blending digital start-ups at UDICT
- ii. Investigate the impact of innovation space provision on digital entrepreneurial performance at UDICT

2. Methodology

The study in hand was conducted at UDICT as an innovation hub under the College of Information and Communication Technologies, at the University of Dar es Salaam. UDICT was purposively selected due to the presence of an ICT incubator that comprises ICT incubation programs specialized in programming, mobile app development, and ICT-related projects. Also, the UDICT is the most influential actor in the technology innovation ecosystem in Tanzania (World Bank, 2017). The descriptive design was deployed through mixed research approaches. Simple random sampling was employed to select the sample of 42 active students incubates currently engaged in different ICT-related projects (UDICTI, 2023). The rationale for selecting 42 incubates was attributed to their activeness and endurance in ICT-related services as being in work up to date. Furthermore, the included incubates were still engaged with UDICT in which a close monitoring of their business undertaking was in contact and thus regarded as active incubates hence being essential for this study. Further, the quantitative data were collected via questionnaire, and qualitative through semi-structured interview guides. Data were analyzed using Seemingly Unrelated Regression (SURE) whereby each independent variable was tested with each dependent variable to establish the existing influence. Finally, the findings were presented through Tables and narrative themes.

3. Findings

3.1 Usage of Open Innovation Theory components in blending digital start-ups

Internalities and externalities factors assessed relied on the technology training and influential aspects of engaging the industrial and experts' practitioners in the provision of guidance.

3.1.1 Influence of Technology Training on the Performance of Digital Entrepreneurs

Technology-related development needs training support from different experts. Students at UDICT leveraged time and efforts for developing different technologies projects including systems for Virtual Reality (VR), Artificial Intelligence and Machine Learning, 3D printing, Cloud Computing, and Biometrics, cloud computing. Nevertheless, appropriate training, mentorship during development, and commercialization approaches to becoming digital entrepreneurs lead to succession. The study findings in Table 1 were at a 95% Confidence interval revealing that technology training influenced digital product innovativeness whereas the P value was found as $0.002 < 0.05$. Also, was found that the training enabled university students as young digital developers to sales growth holding the P value of $0.003 < 0.05$. Moreover, the employment growth on training provided through innovation hubs possessed the P value of $0.011 < 0.05$.

Table 1: Influence of Technology Training on Performance of Digital Entrepreneurs

Technology Training	Coef.	Std. Err.	Z	P	[95%Conf. Interval]	
Sales Growth	.127	.116	1.09	0.003		0.355
_cons	3.269	.552	5.92	0.000	0.101	4.352
					2.187	
Employment Growth	.108	.098	1.11	0.011	.083	.301
_cons	3.442	.463	7.43	0.000		4.350
					2.534	
Product Innovativeness	.121	.046	2.154	0.002	.075	.232
_cons	1.084	.306	5.205	0.000		1.480
					1.824	

Source: Field Data, (2024)

Furthermore, respondents through semi-structures interviews disclosed that access to technical training helped on the journey of becoming digital entrepreneurs as underneath portrayed:

... Technical training programs offered via the incubation hubs were keen to stay updated with the latest technologies and techniques, that directly impacted the designed and developed digital product development process students became more skilled to end up with the improved product quality.
(Respondent 4, Interview Session, 2024).

3.1.2 Influence of Experts and Guidance on Performance of Digital Entrepreneurs

In ascertaining the influence of technical and industry experts and guidance on the performance of new digital entrepreneurs was assessed by measuring the sales, employment growth, as well as digital and technology product innovativeness. Finding in Table 2 disclosed that the technical and industrial experts influenced the developed digital and technology projects' sales growth by a P value of $0.018 < 0.05$; the provision of guidance for employment growth had a P value of $0.014 < 0.05$ and product innovativeness held the P value of $0.002 < 0.05$.

Table 2: Influence of Experts/Guidance on Performance of Digital Entrepreneurs

Technical Experts and Guidance	Coef.	Std. Err.	Z	P	[95%Conf. Interval]	
Sales growth	.355	.224	1.58	0.018	0.085	0.796
_cons	2.285	1.002	2.28	0.023	0.320	4.250
Employment Growth	.409	.167	2.45	0.014	.081	.736
_cons	2.136	.744	2.87	0.004	2.676	3.595
Product Innovativeness	.371	.117	3.17	0.002	.142	.601
_cons	2.623	.522	5.02	0.000	1.599	3.648

Source: Field Data, (2024)

Certainly, the semi-structured interview revealed that the collaboration of the university with technical and industry experts positively contributed to influencing the performance of digital entrepreneurs as was cited:

... Consultation from technical and industry experts was cheaper and easily accessible for digital startups.... provided hands-on support, guidance, and easier navigating experienced complex challenges in developing the digital startups based on real experience (Respondent 1, Interview Session, 2024).

3.2 Impacts of Innovation Space on Digital Entrepreneurial Performance

The mixed analysis was made on accessibility to the UDICT laboratory and innovation space towards sales, employment growth, and product innovativeness through Seemingly Unrelated Regression (SURE) and thematic.

3.2.1 Influence of Access to UDICT Lab on the Performance of Digital Entrepreneurs

Seemingly unrelated regression was used to ascertain the influence of access to UDICT Lab on the performance of digital entrepreneurs. The study findings indicated the status of accessibility of UDICT lab on sales growth had a P value of $0.012 < 0.05$, employment growth had a P value of $0.007 < 0.05$ and product innovativeness had a P value of $0.012 < 0.05$ as shown in Table 3.

Table 1: Influence of UDICT Lab on the Performance of Digital Entrepreneurs

Access to University Lab	Coef.	Std. Err.	Z	P	[95%Conf. Interval]	
Sales Growth	.576	.231	2.50	0.012	0.124	1.029
_cons	1.307	1.028	1.27	0.000	0.707	3.323
Employment Growth	.475	.177	2.68	0.007	.128	.823
_cons	1.841	.790	2.33	0.020	.292	3.390
Product Innovativeness	.269	.136	1.97	0.048	.002	.536
_cons	3.076	.606	5.07	0.000		4.266
					1.887	

Source: Field Data, (2024)

Seemingly, the semi-structured interview was conducted and the respondents showed that accessibility of UDICT laboratory enabled the acquisition of technical support as was revealed:

... To develop digital startups students are enabled to access technological devices and other supportive resources accessibility of the same resources outside the university is expensive ... university laboratories enable students to conduct experiments, design, and develop prototypes play significant roles in succession as digital entrepreneurs. (Respondent 2, Interview session, 2024).

3.2.2 Influence of Innovation Space on the Performance of Digital Entrepreneurs

Similarly, the study examined the influence of innovation space on the performance of digital entrepreneurs. Obtained study findings indicate that the influence of innovation space on sales growth had a P value of $0.003 < 0.05$; the influence of innovation space on employment growth had a P value of $0.001 < 0.05$ and the influence of innovation space on product innovativeness had a P value of $0.042 < 0.05$.

Table 4: Influence of Innovation Space on Performance of Digital Entrepreneurs

Innovation Space	Coef.	Std. Err.	Z	P	[95%Conf. Interval]	
Sales Growth	.182	.198	1.92	0.003		0.571
_cons	2.070	.866	2.28	0.000	0.2017	4.770
					1.371	
Employment Growth	.135	.154	2.88	0.001	.167	.439
_cons	3.358	.674	3.98	0.000	2.035	4.680
Product Innovativeness	.123	.113	1.09	0.042	.098	.354
_cons	3.734	.494	7.56	0.000	2.766	4.703

Source: Field Data, (2024)

Also, the semi-structured interview revealed that innovation space with facilities had a positive impact on the performance of digital entrepreneurs as respondents mentioned:

.... Innovation space provided students with the perfect environment to collaborate and innovate. ... accessibility to facilities including co-working spaces, meeting rooms, and labs for prototyping development... fostered creativity and teamwork. ... University innovation spaces allowed students to freely experiment and rapidly iterate digital entrepreneurial ideas, leading to a succession of innovations to digital startups... (Respondent 8, Interview session, 2024).

4. Discussion

The technology training, experts, and guidance were found to contribute highly significant levels of increasing sales growth, employment growth, and product innovativeness to the students found at UDICT. Moreover, the findings disclosed that technology training provided by the internal and external experts was positively affecting the students to increase the sales of developed digital tools, equipment apps, and software developed from the UDICT space. Also, was found that students were easily accessible through UDICT whereas mentorship was easily made, and gradually students' digitally augmented ideas were changed towards the development of unique digital and technological products. Likewise, was found by Pokidina et al. (2023) that the training enables capacitating and influencing shifting of expertise for better performance.

Certainly, the digital product developed at UDICT was not only easily accessible to the market but also works as an open space where different stakeholders meet with student innovators, networking with different industrial practitioners and companies hence employment accessibility and growth. Audretsch and Belitski (2023) and Ullah et al. (2023) insisted that industry and firms possess valuable contributions to foster innovative education practices such as the provision of capital, networking, tools, equipment, and devices. The implication is made on the findings that HEI needs to open its doors share experience with industrial and field practitioners, and adopt curriculum flexibilities to engage more practical aspects than theories. Also, the suggestion is made that the 4IR teaching and learning process needs leverage of multiple expertise for the betterment of bringing new experiences and shaping the future workforce.

The dependent variables of laboratory and innovation space to the independent variables of sales, employment growth, and product innovativeness showed positive significant levels by P being less than 0.05. It is therefore portrayed that, access to UDICT lab allowed students as incubates to undertake different practical activities related to the digital prototypes and artifacts development that provide the solutions to existing socio-economic problems. Likewise, scholars found that the provision of free innovation working space enabled the students to explore, design, develop, try-outs, and shape the developed incubated digital artifacts in a friendly and conducive manner (Kruger & Steyn, 2024; Wang, 2023).

Nonetheless, the findings implied that student-incubates are mentored, and supported technically, materially, and financially to reach the intended digital project objectives. Moreover, the provision of innovation space implied that students-incubated are in a position to network and share ideas among themselves henceforth developing confidence in innovation procedures and processes. Certainly, the laboratory and innovations spaces are mentioned by Sun & Sun (2023) as pillars for inducing critical thinking, collaboration, communication, and creativity (4Cs) for discovery as pillars highly required in 4IR. The recommendation was made that the hands-on activities, developed digital artifacts, and application from UDICT are important in future sustainability and paradigm shift for action research holding findings to solve real existing problems.

5. Conclusion and Recommendation

The conclusion is made that HEI must adopt the components of OI in developing innovation hubs like UDICT where the students will access training, mentorship, expert guidance, a laboratory with learning materials, and free innovation spaces that together shape today's HEI to evacuate from the content to digitalized skills, innovation and talents development for sales, employability, and product innovativeness.

The findings highlight the need for incubators within higher education institutions (HEIs) to adopt structured approaches that integrate open innovation (OI) principles by providing students with access to advanced infrastructure, expert mentorship, and collaborative spaces, incubators can foster the development of market-ready skills and innovations. Moreover, strengthening partnerships with industries is essential for bridging the gap between academic

learning and practical applications. Furthermore, incubators should implement robust monitoring systems to track and improve the journey of innovations from ideation to commercialization.

For policymakers, the findings underscore the importance of creating a supportive ecosystem for innovation hubs. Policies should incentivize industry-HEI collaborations, fund resource allocation for state-of-the-art facilities, and ensure curricula and incubation programs align with labor market needs. Establishing standardized mentorship guidelines and accreditation systems can enhance the quality of innovation programs, fostering employability and entrepreneurship. These efforts collectively enable HEIs to evolve into centers of innovation, equipping students with the skills, creativity, and expertise required to thrive in the modern workforce.

Moreover, the future study recommendations are in the following aspects: -

- i. Participation of industrial practitioners to enable HEI students to gain practical experiences and competencies.
- ii. Explore the mentorship procedures offered to students incubates at the HEI to support practical learning aspects.
- iii. Assessing the legitimacy of student-incubate graduates in securing labor market jobs.

ABSTRACT

This study investigated the impact of Single Custom Territory (SCT) on Foreign Direct Investment (FDI) in selected countries of Sub-Saharan Africa (SSA). The study employed quantitative methods using the Difference in Difference (DID) econometric technique to establish empirical evidence. The treatment and control groups were; the East African Community (EAC) member states and control group was the randomly selected Sub Sahara African countries respectively. The time series data set from the World Development Indicators (WDI) for the period of 2000 to 2019 was used. The main findings demonstrate that EAC Single Custom Territory has a significant and positive impact on Foreign Direct Inflow (FDI). The study implies that SSA should embrace a joint effort through SCT to increase the market size and boost their level of economic performance through; FDI inflow, cost reduction and cross border procedures during cross boader transport of goods. Also, EAC governments should invest in strengthening their cooperation by working closely to mitigate challenges in the implementation of SCT to reap its maximum goals.

Keywords: *foreign direct investment, single custom territory.*

1.0 Introduction

For the past quarter of a century, globalization has shown an impressive rise in global Foreign Direct Investment (FDI). Despite such growth in global FDI, Sub Saharan Africa has recorded a declining share of global FDI from 5.1 per cent in 2009 to 3 per cent in 2012 as compared to 26.0 per cent for Asia and 11.9 per cent for Central and South America (Darley, 2012). When compared to GDP levels, this figure is far less because the regional share is just 2.44 per cent of global GDP (Juma, 2012).

Some efforts have been put forth by SSA countries to attract FDI including; creating special investment zones and Export Processing Zones (EPZs), by providing investment incentives such as tax holidays that allow for duty-free imports of capital goods, production materials, and equipment. However, despite these efforts, SSA did not benefit from FDI from the 1980s to the 1990s. For example, it received only \$256 million in 1980 and \$9 billion in 1999, whereas the other developing countries attracted FDI inflows of \$7 billion in 1980 and \$216 billion in 1999 (Ideue, 2018).

Figure 1.1: Trends of FDI inflow in SSA by sub region from 2009 to 2015(in '0' US \$ Billion)

Source: UNECA (2016)

In addressing the challenges of inadequate FDI inflows in Sub Saharan Africa some countries have embarked on joint initiatives while others continued to act independently. In 2014 for instance, the East African Community (EAC); Tanzania, Kenya, Rwanda, Uganda, and Burundi signed the treaty to implement a *Single Customs Territory (SCT)* by its member states. In a short period SCT has been impactful by the removal of restrictive regulations and minimization of internal border restrictions on goods moving between the member states with an ultimate realization of free circulation of goods.

Figure 1.2: Trends of FDI inflows in EAC by country from 2007 to 2023(in % of GDP)

Source: WDI (2024)

Despite such initiatives put forth by EAC, some of the remained states in SSA have not embraced such approach and continued to act individually on their own perspectives in improving trade and investment inflows. This study therefore examines the impact of SCT on FDI inflows to countries which have adopted SCT against countries which have not adopted SCT based on EAC as a treatment case.

1.0 Objectives

2.4.1 General Objective

To explore the impact of single custom territory on FDI in selected countries in SSA.

2.4.2 Specific Objectives

- i. To examine the effect of SCT adopted by EAC on FDI inflows compared to similar effect on countries which did not adopt SCT in SSA.
- ii. To examine the differences in FDI inflows to the EAC member states which adopted SCT based on market size compared to countries which did not adopt SCT in SSA; and
- iii. To examine the differences in FDI inflows to the EAC member states which adopted SCT based on access to seaport compared to countries which did not adopt SCT in SSA.

1.1 Rationale of the Study

The contribution of this proposed study stems on a novel idea on a comparative study between countries (in this case East African member states) which adopted an impactful SCT and other economies which did not in Sub Saharan Africa. SCT is believed to have increased business and investment inflows to EAC within a short period after being implemented. The achievements include but not limited to removal of hurdles to investment inflows in EAC through an agreed and recognized snap shot documentation at borders that is accepted by the rest of the members states regardless of which country approved the documents at entry point (Darley, 2012). Knowing the importance of SCT may encourage other countries to benchmark on the best practice of EAC on SCT to revamp the sluggish pace of economic development through FDI attraction especially in SSA region which experiences inadequate FDI inflows.

2.1 Related Literature

2.1.1 OLI Electric Theory of Market Seeking FDI

The theory underpinning this study is OLI Electric Theory of Market Seeking FDI. Dunning (1988) defined OLI as Ownership advantage; Location advantage and Internationalization. The emphasis in the study is given to Internationalization in which; countries of FDI origin would wish to land their investments by taking advantage of the existing market niches of its prospective goods and services to be manufactured in the host countries. He further explained

that internalization is preceded by realizing Ownership advantage through ownership of monopoly power, technology and economies of scale. The second to ownership is Locational advantage postulating economic, social and political advantages within the host countries which are necessary for investment decision.

The SCT implies unified system of member states as one market, the united EAC sub region based on SCT terms provides conducive market through free movement and seamless movement of products just after entry to one of the member states boarder without boarder restrictions to other sovereign states. This removal of restrictions provides attractive environment to Multinational Companies to invest in EAC by taking advantage of existing market boosted by boarder free movement of partner states members.

2.1.2 Summary of Empirical Review

Little is known on the impact of single custom territory on foreign direct investment in Africa. This is because most of the studies conducted by various researchers such as Kamau and Odongo (2020), Mbwapbo (2020), Mpakaniye (2017) mainly focused on SCT effect on trade. This study explores the impact of SCT on FDI in SSA countries which has not been conducted in existing literature and therefore; gives recommendations in accordance to the revelation of the study. The study focuses on SSA states which adopted a SCT, based on comparative Difference in Difference (DID) approach to provide a comparative finding between SSA countries which adopted SCT as treatment group and SSA countries which have not adopted SCT as a control group.

3.0 Methodology

3.1 Research Approach

The study will employ the quantitative research approach and experimental strategy which seeks to determine if a specific treatment influences an outcome /impact by providing a specific treatment to one group and withholding it from another (Control Group), as the enquiry strategy for the study.

3.2 Econometric Model and Specification

The study employs Difference in Difference (DID) econometric technique that provides a comparative analysis between a treatment and control groups based on before and after time demarcations. Consider an experiment set to evaluate the impact of exogenous interventional shock such as policy that requires outcomes comparison between the effected/treatment group to an unaffected /control group, supported by time bound before and after the shock. In the same manner let's assume that there are two regions A and B subject to before and after shock context. Both regions are equally exposed to a shock free environment before a shock. The intervention time provides a cut off line into before and after periods. Assuming that region B is suddenly subject to shock intervention and exposed to after effects that result into a notable difference of group B relative to group A. The difference may be due to the shock intervention,

but also might be due to other key characteristics that varies between the two groups which also determines the outcome differences, e.g. region A might be subject to different weather condition relative to region B which might be a contributing factor to the outcome difference in the level of business performance for instance. If the outcome is sales volume which also depends on whether that varies in the two regions, a favorable weather in region B relative to region A might also contribute to a better performance of group B apart from a shock intervention exposed to group B that needs to be evaluated. A better remedy for this overlapping is to evaluate the impact of the intervention by controlling for other characteristic difference between the two regions. It's difficult to control for unobservable characteristics, even if we have enough data to control observable ones.

However, apart from the difference in characteristics that might contribute positive changes experienced by region B, it might also be contributed by other changes in a course of intervention apart from the shock that cannot be captured. Now consider a double approach that comprises of after and before associated with the treatment and control group comparative approach.

Figure 1.1: Difference in Differences Illustration
Source: Researchers' Own Construction

If the after and before difference in the control group emanates from the same difference in the treatment group, then if other changes that occur over time are also present in the control group, then these factors are controlled for when the control group after and before difference is netted out from the impact estimate.

Also, if there are important characteristics that are determinants of outcomes and that differ between the treatment and control groups, then, as long as these treatment and control group differences are constant over time, their influence is eliminated by studying changes over time so is for any time invariant unobservable characteristics which are also netted out.

Alternatively, the following mathematical equations elucidate the above pictorial presentation. Let us consider a two-group scenario $\{G= 1, 2\}$ in two different periods $\{T=1, 2\}$. Initially at

T₁, both groups are exposed to control status. At T₂ is when only G₂ is exposed to treatment status, let $T_g=1$ represents a dummy variable capturing group 2 observations at T₂ while $P_t=1$ represents a dummy variable capturing treatment period 2 observations. In the two periods two groups DID, the treatment variable is simply the product of these two dummy variables: $D_{gt}=T_g \times P_t$. This is because $D_{gt}=0$ is when both groups are exposed to the first period because $P_t=0$ and $T_g=0$; and $D_{gt}=1$ only happens when the second group is exposed to the treatment because this is when both T_g and P_t dummies are equal to 1. Let's further assume that untreated expected outcome is given by

$$Y(0)_{gt} = \beta_0 + \beta_1 T_g + \beta_2 P_t + \varepsilon_{gt} \dots \dots \dots (1).$$

Before and shock intervention, the expected outcome in the first group is β_0 in the first period while in the second period is $\beta_0 + \beta_1$. The expected untreated outcome in the second group is equal to $\beta_0 + \beta_1$ while in the second period is $\beta_0 + \beta_1 + \beta_2$. We assume a common trend applies where the coefficient on T_g provides a time-invariant difference in expected outcomes between the two groups. The group coefficient includes the combined effects of all the constant differences between the two groups and during the study period. Likewise, the coefficient P_t captures the changing combined effects between the two periods which also affect outcomes similarly in both cases. Practically, β_1 is termed as the group effect and β_2 the time trend. Basically, the model for the expected treatment outcome is the sum of untreated outcome and treatment effect, which is usually constant across observations:

$$Y(1)_{gt} = Y(0)_{gt} + \beta_3 \dots \dots \dots (2)$$

Thus generally the overall outcome is expressed as;

$$Y_{gt} = Y(0)_{gt} + D\{Y(1)_{gt} - Y(0)_{gt}\} \dots \dots \dots (3)$$

Replacing the outcomes notations with the model specification it gives;

$$Y_{gt} = \beta_0 + \beta_1 T_g + \beta_2 P_t + \varepsilon_{gt} + D_{gt}\{\beta_0 + \beta_1 T_g + \beta_2 P_t + \varepsilon_{gt} - Y(0)_{gt}\} \dots \dots \dots (4)$$

In the two-group two-period model, $D_{gt} = T_g \times P_t$, which implies that after cancelling the $Y(0)_{gt}$ terms we to obtain the standard DID estimation equation:

$$Y_{gt} = \beta_0 + \beta_1 T_g + \beta_2 P_t + \beta_3 (T_g \times P_t) + \varepsilon_{gt} \dots \dots \dots (5)$$

3.3 Identification Strategy and Estimation Technique

The DID econometric estimation technique was directly adopted from the aforesaid theoretical model as follows;

$$Y_{gt} = \beta_0 + \beta_1 T_g + \beta_2 P_t + \beta_3 (T_g \times P_t) + \varepsilon_{gt} \dots \dots \dots (6)$$

where; Y_{gt} treatment outcome in this case FDI inflows while, $\beta_0, \beta_1, \beta_2$ are constant terms for group and period coefficients respectively where β_3 is DID coefficient. T_g is a group dummy 1 if is in treatment (firms which opted for SCT) and 0 otherwise, P_t is period dummy 1 if is after treatment period and 0 otherwise, $(T_g \times P_t)$ is a composite interaction term of the treatment effect while ε_{gt} is a composite error term. The model was executed under other key assumptions of DID model including the common trend parallel assumption, time invariant group characters and period time-variant attributes and strictly exogenous policy intervention.

3.4 Data and Data Source

The study employed data from a reliable source; the World Development Indicators (WDI) which provides FDI data for the countries worldwide. The FDI inflows data from 2003 to 2019 was considered the time period before the implementation of SCT by EAC member states which is from year 2000 to 2013, and the time period after implementation of SCT which is from year 2014 to 2019.

Table 3.1: The list of Member States Included in the Sample

S/N	Country	Group	Location
1	Tanzania	Treatment group	East Africa
2	Kenya	Treatment group	East Africa
3	Burundi	Treatment group	East Africa
4	Rwanda	Treatment group	East Africa
5	Uganda	Treatment group	East Africa
6	South Sudan	Control group	East Africa
7	Malawi	Control group	Central Africa
8	Mozambique	Control group	South East Africa
9	Mali	Control group	West Africa
10	Cameroon	Control group	West Africa
11	Ethiopia	Control group	East Africa

13	Zambia	Control group	Central Africa
14	Eritrea	Control group	East Africa
15	Somalia	Control group	East Africa

Source: WDI (2023)

Treatment group is the EAC member states which adopted SCT while the control group was remaining countries in SSA which adopted SCT strategy. The list of countries involved in the study is indicated in Table 3.1

4.0 Empirical Results

This section presents a discussion of the results obtained from the research. After a pre-estimation test for a common trend parallel assumption comes the baseline and primary results of the investigation. In the end, it discusses the robustness analyses that were done in order to evaluate the baseline findings on FDI based on SCT shocks to the EAC in comparison to the benchmark group that are non- EAC.

4.1 Baseline Results

Hypothesis (i): *There is no significant difference between countries that adopted a single custom territory and those that did not in terms of FDI inflow.* This null hypothesis was tested using the Difference-in-Difference econometric technique. The result indicates the proportion of variance in the dependent variable that is explained by the model's coefficient for the treatment variable, which is SCT proxied by DID. The findings presented in Table 4.1 indicate that the DID variable is positive and statistically significant at one percent significance level. Therefore, the null hypothesis (H_0) was rejected and the alternative hypothesis (H_1) accepted. This suggests that there is a substantial difference in FDI inflow between countries in SSA that adopted SCT and those which did not. Based on estimation (1) on average, EAC member states that adopted SCT experienced a 6.5270 increase in FDI inflows compared to selected SSA member states that did not adopt SCT. The reason for relatively higher FDI to the EAC could be attributed by the availability of unified large market and investment catchment area because of SCT initiative of the EAC. Based on FDI theory by Dunning (1993) larger markets are more likely to attract FDI than smaller markets.

Table 4.1: Baseline Model on the Impact of SCT on FDI Inflows to EAC which Adopted SCT

VARIABLES	(1) FDI	(2) FDI	(3) FDI	(4) FDI
DID	6.5270*** (2.347)	7.8917*** (2.219)	6.6283*** (2.213)	6.5270*** (2.347)

4.2 Robustness Checks

4.2.1 Market Size

Hypothesis (ii): *There is no significant difference in the Impact of SCT on FDI Inflow between large and small market economies within EAC compared to economies which did not adopt SCT in SSA.* This null hypothesis was also tested using a difference-in-difference econometric technique and a comparative analysis between countries in the treatment group between EAC member states with large market size and EAC member states with small market size to determine if there were differences in FDI inflows. Korsak (2017) analyzed the economies of the East African Community by defining their population size, therefore in this study Tanzania, Kenya and Uganda termed as large market economies with the population of more than 30 million people while Rwanda and Burundi as small market economies with the population of less than 30 million people. The first row of Table 4.2 Displays the coefficient of EAC member states with large and small market sizes respectively.

The estimates of the key variable DID for small and large market economies are positive and statistically significant by at least five per cent significance level. The null hypothesis (H_0) was therefore rejected, and the alternative hypothesis (H_1) was accepted. Based on estimation (1) and (3), the coefficients for large and small markets are 6.3513 and 6.6021, respectively. This implies that even though EAC enjoys marketing seeking FDI inflows explained by Dunning (1993), the asymmetrical inflow of FDI is evident between large and small economies in EAC. It is very interesting that even small market economies indicate higher affinity to attracting FDI versus large market economies {6.6021:6.3513}. The probable reason could be unutilized opportunities within small economies due to the fact that priority for market seeking FDI investors is normally given to large market economies meaning that small countries come next after depletion of investment opportunities in large economies. Given the FDI inflow pace in African counties which gained momentum in 1980's, it is more likely that if from the beginning investors priority was given to large market economies in EAC, to date most of investors must have shifted their interest to small market economies other things being equal.

Table 4.2 Impact of SCT on FDI Inflow for EAC Based on Market Size

	Large Market		Small Market	
VARIABLES	(1) FDI	(2) FDI	(3) FDI	(4) FDI
DID	6.3513*** (2.374)	6.5046*** (2.222)	7.3864*** (2.666)	8.7833*** (2.374)
Treatment	-8.5604*** (2.348)	-12.5587*** (1.505)	-15.4894*** (4.608)	-10.4470*** (1.602)
Time	-5.1793 (5.535)	-2.5232 (2.434)	-7.3006*** (2.061)	-6.5250*** (1.845)
Constant	9.6131*** (3.319)	12.3896*** (3.858)	22.4121*** (3.892)	12.8146*** (1.214)
Year Dummy	Yes	Yes	No	No
Country Dummy	Yes	No	Yes	No
Observations	159	159	145	145

Robust standard errors in parentheses *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

4.2.2 Location

Hypothesis (iii): *There is no significant difference in the Impact of SCT on FDI Inflow between landlocked and close to seaport economies within EAC compared to economies which did not adopt SCT in SSA.* This null hypothesis was also tested using DID econometric technique and a comparative analysis between countries within EAC member states which are landlocked and EAC member states which have access to seaports in order to determine if there were differences in FDI inflows based on such locational differences. The first row of Table 4.3 (across column 1&2 and 3&4) displays the coefficient magnitudes of EAC member states which are landlocked and EAC member states which have access to seaports respectively.

The estimates of the key variable DID for landlocked and seaports access economies are positive and statistically significant by at least five per cent significance level. The null hypothesis (H_0) was therefore rejected, and the alternative hypothesis (H^1) was accepted. Based on estimation (1) and (3), the coefficients for landlocked and seaport access are 7.1994 and 5.6589, respectively. Landlocked economies indicate higher affinity to attracting FDI versus seaport access economies (7.1994:5.6589). The probable reason for relatively higher inflow level of FDI to landlocked could also be unutilized opportunities within landlocked economies due to the fact that before SCT priority was given to seaport access economies meaning that landlocked countries come next after depletion of investment opportunities in close to seaport access economies. It is more likely that from the beginning investors priority was given to close to seaport access economies in EAC due to geographical bottlenecks such as long distances to markets and higher transaction costs which characterize landlocked countries. Due to establishment of SCT some of the obstacles have been reduced and therefore, most of investors must have shifted their inflows to landlocked economies.

Table 4.3 Impact of SCT on FDI Inflow for EAC Based on location

5.0 Conclusion and Policy Implication

This study was conducted with the intention of investigating the impact that SCT has on FDI inflows based on market seeking theory. The study used the DID econometric model to establish empirical evidence. It adopted the quantitative research approach as its method of investigation. The treatment group consisted of the member states of the EAC, and the control group was randomly chosen countries from the SSA. To reveal empirical evidence, we utilized the time series data set that was compiled by the WDI and covered the period from 2000 to 2019. The findings revealed that EAC SCT have a significant impact on FDI inflows to EAC economies.

The findings indicate that due to the implementation of SCT, even small market economies have relatively attracted more FDI compared to large market economies. This may be because before SCT, small market economies were unable to attract significant FDI due to their market size as FDI is concerned with the size of the market in developing countries (Dnning 1988). Countries with large markets have a higher potential for FDI inflows than those with small markets not on a per capita basis, but rather in aggregate size (Akin, 2009). Due to SCT, the size of the market of small market economies has increased in aggregate.

Furthermore, the findings have established that due to SCT land-locked nations have experienced more FDI inflow compared to countries in close access to seaports. This may be because initially the bottlenecks experienced by such countries and issues with high transport costs, complicated cross-border procedures, long distances, and isolation from the global market mainly caused by limited access to the seaport which impeded such countries from attracting significant FDI inflows. However, with SCT, the cost of transportation and cross-border procedures have been reduced, hence more investments.

The study recommends that SSA countries should embrace a joint effort through SCT to increase the market size which will boost the level of economic performance and reduce cost and cross border procedures during transportation of goods for economic growth.

Towards Improved Quality of Information Services: Is Perception and Satisfaction Significant?

Joseph Andrew Mhando

College of Business Education

josephmhando@gmail.com

Abstract

This study sets out an overview of how information units would in turn make an effective assessment of quality of information services on offer. The study used postgraduate business students as Mzumbe University to ascertain the impact of perception and satisfaction on improved quality of information services. SERVIQUAL (LibQUAL+™) model was used to govern this study. Data were collected through questionnaire and analysed using correlation and descriptive statistics methods. The study findings revealed that perception and satisfaction had positive and significant impact on the improved quality of information services. The study further concluded that perception and satisfaction that arose from users positively and significantly at less than 0.05 significance level and thus being effective in impacting improved quality of information services. The study recommends for information units to gauge users' expectations as well to set an equilibrium while ascertaining the quality of underlying services since improved quality requires both high positive perception with high level of satisfaction.

Keywords: *user perception, quality of information services, service quality*

Introduction

User satisfaction with services provided in information unit is essential for quality teaching and learning, research, and community service provision. Generally, most information units perceive service quality as a driving force for outstanding service delivery (Naidu, 2019). Previously, assessment of quality of information service on offer based on collection size and usage patterns as earmarked by underlying statistics. These strategies were deficient in meeting information needs of the users (Cullen, 2001). With the emergence of innovative mechanisms such as the use of LibQUAL+™ instrument, the quality of library services in libraries is now also assessed by understanding users' perception of the quality of library services on offer (Majumdar, 2023). Use of instruments such as LibQUAL+™ is likely to enhance the validity of assessment of quality of service delivery from the users' perspectives.

Users' perception of the quality of information services constitutes a management tool for examining how the library effectively meets the users' expectations and needs as well as determining the strengths, weaknesses and opportunities stemming from the services delivered for the purpose of identifying better ways of refining the quality of services on offer (Adam, 2017). For instance, information units have been wrongly based on what passes to be users' perception of service quality and, thus, the quality of library services provided has remained unsatisfactory (Masoy, 2019).

Furthermore, the assessment of the users' perception of the quality of services gets higher attention in business firms but less attention in service provision organisations including academic libraries (Thusithakumar, 2020). Information users to some extent lack opportunities to show how they perceive the quality of services on offer. As a result, it is difficult to understand how they perceive the quality of respective services and at what level they may be satisfied with such services provided for retention purposes (Rita, Oliveira & Farisa, 2019).

Despite the invention of modern tools such as LibQUAL+™, which are used to assess the quality of information services provided by libraries, many libraries still use traditional methods to establish the collection size, circulation statistics and number of users visiting the library in their assessment of the quality of library services (Mayende, Awuor & Namande, 2021). Yet, these traditional methods have failed to indicate user expectations, perceptions and satisfaction with the services on offer, thus failing in many cases to provide the kind of quality services that meet the information user needs (Moses *et al.*, 2016; Cristobal, 2018).

Similarly, despite the fact that more than a decade has passed since LibQUAL+™ was tested in assessing quality of information services at Mzumbe University library, the University library still uses traditional methods for assessing the quality of information services and experiences low utilisation limited remote access to remote information services, an indication of poor provision of information services (Isibika and Kavishe, 2018; Mosha, 2021). Consequently, the traditional methods used to assess the quality of information services at Mzumbe University do not capture the users' perception of and satisfaction with the quality of information services on offer, thus failing to establish whether users were satisfied with the services.

In interrogating the matter, this study will be guided by the following

- i. Users' perception has positive impact on improved quality of provided information services
- ii. Users' satisfaction has positive impact on improved quality of provided information services

Literature Review

Conceptualizing Quality of Information Services

User satisfaction is one of the key areas of concern in the library and information profession (Muthuvennila & Kannan, 2021). This is particularly so in teaching and learning institutions where libraries support learning processes. Service quality is perceived by academic libraries as a driving force for excelling in service delivery (Naidu, 2019). User satisfaction with services provided in academic libraries is essential in engendering quality research as well as the teaching and learning process. Collection size, user statistics and suggestion boxes are commonly used as strategies for gauging user satisfaction. But these strategies are not very effective in identifying the information needs of the users (Kalankesh, 2020) from the users' perspective. As alluded to by Donati, Festo and Consolata (2024), the incorporation of users' expectations and user needs into the provision of library services is one of the effective ways

of boosting the quality of library services. This marked the shift from traditional methods of assessing service quality in libraries to modern methods motivated by developments and change in technology. With the emergence of innovative mechanisms in technology the quality of services of different institutions, including academic libraries incorporated tools that involve users' perception to improve service quality (Msamula, 2015).

Users' Perceived Quality of Information Services in Libraries

Adam (2017) assessed the library service quality and user satisfaction among undergraduate students in Nigeria and found that, students are highly satisfied with the quality of library services. This satisfaction was basically with the library collection, reference services and library seating arrangement. Cristobal (2018) examined the library users' minimum acceptable, desired, and observed service performance level of the University of Saint Louis (USL) College Library using the LibQUAL+™ instrument. The study found that the users were satisfied with circulation, library instruction, current awareness, reference, multimedia service, and depository area services provided by the library. The areas of users' satisfaction and results on the role of libraries in disseminating information in both print and electronic environment indicate low performance in delivery of electronic services at USL mainly attributable to limited internet access time (10 hours) per student throughout the semester.

Khaola and Mabilikoane (2015), who investigated the perception of library service quality, satisfaction, and frequency of use of library resources using LibQUAL+™ instrument, found a strong and positive correlation between service quality and user satisfaction. Findings established that there was no relationship between usage statistics and satisfaction, hence indicating that assessing service quality based on usage statistics is no longer effective in establishing users' satisfaction as it does not influence satisfaction. Moreover, such measures are not necessarily related anyhow to the impact quality of service delivery. Newane's (2016) assessment of the users' perceptions of service quality and level of user satisfaction in South Africa found that the frequency of postgraduate students' use of the library was low because they both worked and studied, and treated studying as their part-time task. Besides, results show that the overall quality of the services provided by the library was perceived to be good.

Nyantakyi-Baah's (2016) study on the users' perception of the service quality and value of libraries in Ghana found that university students use libraries for various purposes including borrowing and reading library materials, working on assignments/projects, reading personal notes, preparation for examinations, consulting reference materials, accessing the Internet and reading newspapers. Furthermore, users had very high expectations of the library but they were largely not met as the quality of library services available was wanting.

Msamula (2015) carried out a study on service quality in academic library in Tanzania with specific reference to Mzumbe University's main campus library. Though this study did not use the LibQUAL+™ instrument, the study findings show that students, as part of academic library users, were satisfied with library procedure for processing library cards, readiness of staff to respond to queries, and procedures for paying overdue charges. Simba (2006), on the other hand, examined the users' perceptions of the quality of service at the Iringa University College

Library of Tumaini University, Tanzania. This study used LibQUAL+™ and involved more male than female respondents. The findings show that the majority of the respondents used the library and its resources daily but used its information gateways weekly.

Studies on user perception of libraries' service quality reviewed indicate slight differences on the users' perception of the quality of library services. However, the use of the LibQUAL+™ instrument for the assessing quality of library services facilitates capture of statistical and non-statistical elements during the evaluation of the quality of library services. Therefore, this study used the literature reviewed to indicate the strengths, weaknesses and knowledge gaps which can theoretically be used to add to the existing body of knowledge and support study findings.

Users' Satisfaction with Information Services in Libraries

The practice that users have about service quality in academic libraries varies depending on the continued experience that users gain from the service offered in the course of time (Kiran, 2010). The perceptions and expectations that library users have of the quality of library services provided are marked as fundamental in determining customer satisfaction with the services provided (Cristobal, 2018). A critical concern that most of academic libraries have is on achieving the highest level of service satisfaction among users (Kaur and Singh, 2010). Academic libraries need to anticipate dynamic changes of the users' needs continuously since fulfilment of each user need serves is essential in enhancing user satisfaction (Ahmad and Abawajy, 2014). User satisfaction in libraries is based on factors such as the availability of up-to-date information, visibility of library facilities to the users, ease of the resources' accessibility, good communication and friendliness of library staff to users during service provision (Thakuria, 2007). Through the assessment of user perceptions and expectations, an academic library can evaluate the state of satisfaction of its users once users are highly satisfied with the services provided. The services provided can of good quality; however, when users' satisfaction is low the implication is that the services provided are poor or irrelevant (Sajna and Mohamed, 2016). Nevertheless, user satisfaction cannot stand alone as an indicator of the quality of library services despite being an essential indicator of the provision of valuable services to the users and when users are highly satisfied, they value them as good quality services.

Users' Assessment on Quality of Information Services

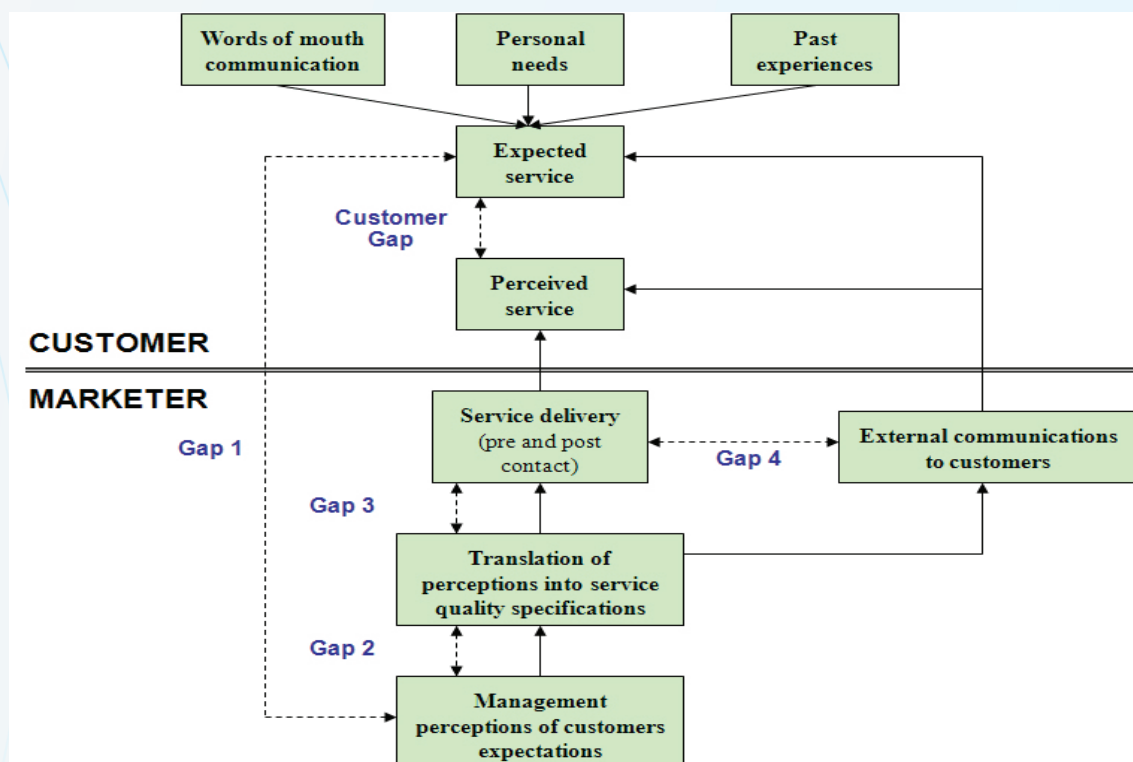

Assessment of quality of information service has been performed when the service has been experienced by the users. Knowledge of the service delivered can either make the expectations lower than the perception of quality-of-service delivery or otherwise which influence users' satisfaction (Alan *et al.*, 2016). Identification of the drawbacks in information service provision help information units including libraries to make changes aimed to meet and sustain appropriate standards which are essential for ensuring satisfactory service delivery (O'Neill and Palmer, 2017). However, knowledge on the situations both before and after the service provisions is important in enhancing the identification of deficiencies in the quality of information services (Mbise, 2015).

Tools for Assessing Quality of Information Services

Assessing the quality of information services is important in the management of academic libraries and application of management tools for the delivery of services (Melo and Sampaio, 2019). Traditionally, common tools for assessing the quality of information services comprised the use of circulation statistics, size of available collections, and the number of users entering a library of any other information unit which are no longer significant (Sahu, 2020). The change in information and communication technology has transformed how libraries gather, process, organise, store, retrieve and disseminate information, hence necessitating a change in the tools used in assessing service quality of information services as well in preference for modern tools such as the Total Quality Management (TQM), SERVIQUAL and LIBQUAL, which are highly recommended due to their significance in assessing the quality of library services in both the print and electronic environments (Thakuria, 2017; Ahmad and Abawajy, 2018).

Theoretical Model: SERVIQUAL

This study was guided by the service quality model, namely the SERVIQUAL developed by Parasuraman, Zeithaml and Berry in 1985 which is the bases for LibQUAL+TM that assesses the perceptions of customers of the quality of library information services provided. The model helps to determine gaps and linkages that exist between the service provider (marketer) and the user of particular service (customer) whereby on the customer's part elements including personal needs, expected service and perceived service are aligned whereas on the marketer's part elements such as service delivery (pre and post contact), translation of perceptions into service quality specifications and management perceptions of customer expectations are provided to represent service quality (Parasuraman, Zeithaml and Berry, 1985).

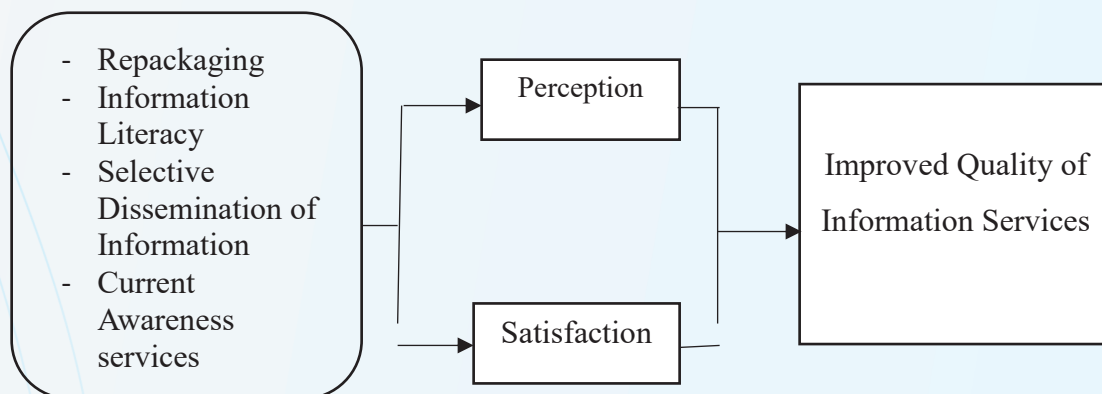

From the given model, the study used customer variables only, which are, personal needs, perceived services and expected services. These are integrated with five (5) elements/dimensions of service quality. The five elements/dimensions are: 1) tangibles (appearance of physical facilities, communication materials, personnel, and equipment), 2) reliability (ability to accurately accomplish the described service), 3) responsiveness (staff willingness to assist users), 4) assurance (staff ability and knowledge to convey confidence and trust to users), and 5) empathy (individual attention and care that service organization offers to users).

The use of SERVQUAL was of paramount importance as it is a tested instrument that is used relatively for benchmarking motives which can be administered repeatedly on a regular basis, thus producing valid outcomes (Shahin, 2006). The adopted SERVQUAL model served as a guide in this study as it is the most experimented upon model that has successfully been tested as an instrument by a number of scholars (Bhim, 2010). This instrument has been used to assess quality of services in various context including academic libraries and its drawbacks pale before the comparative strengths it engenders in assessing service quality (Zeshan, Afridi, and Khan, 2014).

Conceptual Model

The conceptual framework provided shows the relationship between independent variables (information repackaging, information literacy, current Awareness Services (CAS), Selective Dissemination of Information (SDI) and reference services), intervening variables (perception and satisfaction) and the dependent variable (improved quality of information services).

The conceptual model presents repackaging as one of the information services under this study. The variable indicates that information is collected with vagueness and thus it needs to be grouped into specific forms or categories to be easily understood by the target groups. With information repackaging, users once they perceive the repackaged information as useful and satisfied with it then contributes towards improved quality.

Information literacy forms another information service designed to suit information users. Information literacy refers to the ability that user expects to find, evaluate, organize, use, and disseminate information for meeting prescribed need. Therefore, if an information unit

provides effective information literacy to users and such service is perceived positively and users are satisfied with it, then it contributes towards improving quality of information services.

Selective Dissemination of Information (SDI) is another information service that this study investigates its relationship with improved quality of information services. Selective dissemination of information refers to the service offered to user of information based on their needs, areas of specialization and special request made by them to the information units. If an information unit appropriately select information for a certain user and such information is perceived useful and users have satisfied with it then it contributes towards improved quality of information services.

Current Awareness Services (CAS) also form another information service that is assumed to contribute towards improved quality of information services. With current awareness services refers to the service that intends to alert users on newly received/acquired information resource in the collection of an information unit. When an information unit effectively conduct this service and the users perceive it effective and being satisfied with it then it contributes in improving quality of respective service and if not vice versa prevails.

Methodology

Research Design

This study used a descriptive research design. Descriptive research design was used in this study because allowed the researcher to collect large amounts of data at a time and respondents were able to described how they perceived the quality of information services.

Study Area

The study was carried out at Mzumbe University (MU) main campus which is located in Mvomero district in Morogoro region. The MU main campus was selected primarily because a decade ago, LibQUAL+™ pioneers did a pilot test of the tool in assessing quality of information services offered but the University still utilizes traditional tools. The use of MU therefore was appropriate to ascertain the study gaps.

Population

The population of this study comprised postgraduate (master's and PhD) students in the business administration programme at Mzumbe University in Morogoro region, Tanzania. Postgraduate students in the business administration programme were chosen because they were being prepared to be business managers and entrepreneurs whereby service quality is the utmost success factor for customer loyalty and retention.

Sampling Method

This study used total enumeration sampling method to incorporate all 41 postgraduate (master's and PhD) students in the business administration programme s study respondents. The method was used since the population was little to the extent that sampling could be nearly impossible and thus the whole population was included.

Sample Size

Sample size for this study was 41 postgraduate (master's and PhD) students in the business administration programme at Mzumbe University. The sample was attributed to the total enumeration sampling method employed in which the whole study population turned into study sample size.

Data Collection Tools

This study used semi structured questionnaire adopted and modified from LibQUAL+™ instrument to collect data from postgraduate business students. The questionnaire comprised closed and open-ended questions that were derived from 22 core LibQUAL+™ elements plus 5 additional elements. A total of 41 questionnaires were distributed to the respondents and successfully returned. Twenty-one (21) questionnaires were self-administered whereas 20 were mailed to the respondents.

Furthermore, the questionnaires were pre-tested to five (5) postgraduate students of the University Dar es Salaam Business School (UDBS) since they had similar professional traits with the respondents of the study at the MU. Although LibQUAL+™ is a standardized tool, the researcher pre-tested the questionnaire developed based on LibQUAL+™ because the core 22 LibQUAL+™ elements were customised to suit the study's context.

Data Analysis

The study data were analysed using descriptive and inferential (Pearson correlations) statistics to establish the significance of perception and satisfaction on improved quality of information services.

Validity and Reliability

This study used criterion validity to ensure that the study produced valid findings. A standard benchmark for assessing service quality in libraries named LibQUAL+™ instrument based on SERVIQUAL model was used to enhance the validity of the study findings. LibQUAL+™ was used to enhance the validity of the study as it is a recognised instrument that a number of scholars in Information Science (Ncwane, 2016; Nyantakyi-Baah, 2016; Adam, 2017; Cristobal, 2018) have applied to assess service quality in the information settings.

To ensure reliability of the measuring instrument, the researcher correlated the findings to check the level of Cronbach alpha internal consistency of variables tested.

High internal consistency was found on the measuring instrument as internal consistency represented by Cronbach alpha values greater or equal (\geq) to 0.7 were found to signify high internal consistency between correlated variables and low variance. Thus, the measuring instruments were reliable and can produce almost the same results once the test is repeated.

Table 1 presents the results of the reliability tests.

Table .1: Reliability Test of Variables

Variable	Cronbach's Alpha
Perception	.952
Satisfaction	.892

High internal consistency was found on the measuring instrument as internal consistency represented by Cronbach alpha values greater or equal (\geq) to 0.7 were found to signify high internal consistency between correlated variables and low variance. Thus, the measuring instruments were reliable and can produce almost the same results once the test is repeated. Table 1 presents the results of the reliability tests.

Findings and Discussion

Demographic Profile of Respondents

Gender, education, and age categories of respondents were assessed in this study to ascertain their relevance of engagement in this study.

Table 1: Demographic Profile of Respondents

Category	Descriptions	Frequency	Percent
Gender	Male	18	44
	Female	25	61
	Total	41	100
Education Level	PhD	8	19.5
	Masters	33	80.5
	Total	41	100
Age Categories	18-30	22	53.7
	31-50	17	41.5
	51 and above	2	4.9
	Total	41	100

Female respondents, masters level of education and 18-30 age category emerged with highest responses. Regarding gender, the findings confirm an observation made by Wallentine (2017) that business schools are progressively experiencing an increase in the number of female students, hence creating a possibility of bridging the gender gap in the number of male and female students enrolled. On education levels, findings corresponded to the requirement raised by Unwana and Men (2017) commented that the availability of users of information units including academic libraries with distinctive higher academic qualifications such as master's and PhD requires quality services to make sure that they become efficient users of offered information services.

Descriptive Statistics Results

The results of the descriptive statistic revealed that perception had mean score of 2.853 with a minimum of 1.25 and maximum of 3.25 and a standard deviation of 1.133; satisfaction had mean score of 2.018 with a minimum of 1.01 and maximum of 2.60 and a standard deviation

of 0.512; improved quality of information services had mean score of 1.923 with a minimum of 1 and maximum of 1.75 and a standard deviation of 0.377; Furthermore, the study distributions test being Skewness and Kurtosis were also undertaken. For Skewness, the study findings showed that perception, satisfaction and improved quality of information services, the skewness values were less than 1. On the side of Kurtosis, the study findings showed that perception had -1.720 and satisfaction had 0.145 while improved quality of information services had 0.884.

Table 2. Descriptive Statistics of Results

Variables	N	Min	Max	Mean	Std. Deviation	Skewness		Kurtosis	
						Statistics		Statistics	
						Std.		Std.	
						Error		Error	
Perception	41	1.25	3.25	2.853	1.133	-.055	.288	-1.720	.428
Satisfaction	41	1.01	2.60	2.018	0.512	.611	.288	.145	.428
Improved quality of information services	41	1.00	1.75	1.923	0.377	.758	.3288	.884	.428

Study findings in Table 2 showed that data of the study variables being perception, satisfaction and perceived quality of information services were close to each other based on minimum and maximum entities with an average variance of 2. Mean and standard deviations had very slight difference implying that the study data had high level of significance.

For the Skewness, it was observed that perception and quality of information services were positively skewed. For Kurtosis, perception, satisfaction and perceived quality of information services had negative Kurtosis since values across variables were less than 3. Findings thus signifies that data employed in this study follows a normal distribution with medium tails and not very high degree of peakedness.

Information Services

Various information services offered were identified for the purpose of informing the industry as shown in Figure 1.

Figure 1: Information Services Offered

Study findings revealed five (5) important information services that ought to be delivered in information units including libraries. The obtained services without considering their ranking included information repackaging, information literacy, Selective Dissemination of Information (SDI), Current Awareness Services (CAS) as well as reference services. These services have emerged as pillar for information advocacy and thus being offered assures the establishment and existence of information society.

Impact of Perception and User Satisfaction on Improved Quality of Information Services

Pearson correlation test was carried out to establish the thought relationship and impact that perception and satisfaction would bring to perceived quality of information services considering the information services offered.

Table 3. Impact of Perception and Satisfaction on Improved Quality

	Perception (P)	Satisfaction (S)	Perceived Quality of Information Services (PQIS)
Perception	1		
Satisfaction	0.003	1	
PQIS	0.001	0.026	1

**** Correlation is significant at the 0.01 level (2-tailed)**

The study findings revealed that perception and satisfaction had significant relationship with improved quality of information services. The study findings connect with Okolo (2022) who reported the essential role played by information units including libraries in providing perceived useful information services that satisfy the information needs of the users. In line

with that, Research Information Network (RIN) contends, information units place much emphasis on developing and sustaining their physical and electronic collections to meet information needs of users as per specific information service inquiry (RIN, 2020). With such obtained study findings, a close correlation was established between perception, satisfaction, and improved quality of information services. In line with what this study established, Thuannadee (2022) also revealed that perception and satisfaction were relatively related to improved quality of information services and thus correlates to each other. Obtained findings verifies the foundation of this study that improved quality of information services would relatively consider how such services are perceived by users and the level of satisfaction excelled. Furthermore, the study findings revealed that the significance of perception and satisfaction variables in this study implies the overall average satisfaction of information services at MU as supported by Msamula (2021) who found that MU users though at medium level, they were also satisfied with the overall quality of information services provided at the library.

Conclusion and Recommendations

Towards improved quality of information services, it was established that perception and satisfaction that arose from users positively and significantly impact improved quality of information services. The study findings imply that perception that users had with the actual satisfaction are diverse and thus affecting the overall satisfaction with information services at MU. The study recommends for information units to gauge users' expectations as well to set an equilibrium while ascertaining the quality of underlying services.

Assessing Customer Satisfaction in Tanzania's Non-Life Public Insurance Sector: A SERVQUAL Model Approach at the National Insurance Corporation

Winie Ernest¹ & Margareth Mapunda²

¹College of Business Education

²College of Business Education

Abstract

This research explores the assessment of service quality's impact on customer satisfaction within Tanzania's non-life public insurance sector, focusing on the National Insurance Corporation (NIC). The study addresses assessment of the service quality on customer's satisfaction in non-life public insurance sector. The research design adopts a cross-section approach to provide a comprehensive understanding of the research problem. The study's population comprises 120 employees, selected using a random sampling technique. This research aims to contribute valuable insights to enhance service quality and customer satisfaction within Tanzania's non-life public insurance sector. The study found that customers who were accessing non-life public insurance services at NIC were satisfied with the timeliness of responding to their problems or enquires, this is due to the fact that the management of NIC have a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their enquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer. Also, the study found that few of the respondents were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied. NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. The study concluded that increase in responsiveness, reliability, tangibles, empathy and assurance in delivering non-life insurance services to customers increases the level of satisfaction among the customers. The study recommended that, NIC should conduct specialized training programs focused on developing empathy and emotional intelligence. This includes active listening, recognizing emotional cues, and responding appropriately to customer emotions.

Keywords: *Customer's Satisfaction, Non-Life Public Insurance Sector, Service Quality.*

7. Introduction

Non-life public insurance refers to insurance policies that cover all types of risks other than life insurance. This includes property, liability, health, and accident insurance provided by government or public entities (Rhena, 2021). Non-life public insurance covers damage or loss of property due to events like fire, theft, natural disasters, protects individuals and businesses from legal liabilities due to accidents, injuries, or negligence, costs associated with accidents, including medical expenses and loss of income (Fheme, 2020). At the global level; non-life public insurance plays a crucial role in the global economy and society in various ways; helps individuals and businesses manage risks associated with property damage, liability, health issues, and accidents. By providing a safety net, it ensures that unforeseen events do not lead to financial ruin (Bennkn, 2019). Non-life public insurance programs stabilize economies among the developing and developed countries by spreading risk across a large pool of participants in economic booming among the nation members of the United Nations. This can help prevent economic shocks from natural disasters, major accidents, or health crises (UN, 2022).

Also, some of the African countries like South Africa, Malawi, Zimbabwe, DR Congo, Egypt and Somalia are prone to natural disasters such as floods, droughts, and earthquakes whereby public insurance programs help mitigate the financial impact of these events on individuals, businesses, and governments, facilitating quicker recovery and rebuilding efforts (Dannel, 2016). Non-life public insurance, such as crop and livestock insurance, provides a safety net for farmers against adverse weather conditions, pests, and diseases, ensuring food security and economic stability (ibid). Non-life public insurance programs help increase financial inclusion by providing access to insurance products for low-income and marginalized African communities that empowers individuals to manage risks and build financial resilience (Haknni et al, 2019).

In Tanzania, non-life public insurance plays a crucial role by protecting businesses from risks related to property damage, theft, and liability, public insurance encourages entrepreneurship and investment (Shenn, 2016). This drives economic growth, job creation, and poverty reduction. Tanzania is susceptible to various natural disasters, including floods, droughts, and earthquakes. Public insurance helps mitigate the financial impact of these events, aiding in faster recovery and reducing the economic burden on affected communities and the government (Ghene, 2020). Public insurance programs in Tanzania, such as crop and livestock insurance, provide farmers with a safety net against adverse weather conditions, pests, and diseases, ensuring food security and economic stability.

Despite of this importance of non-life public insurance to the community, customer satisfaction in non-life public insurance faces several global challenges. These challenges often stem from the complexity of the insurance process, lack of transparency, slow claims handling, inadequate digital infrastructure, and regional disparities. Addressing these problems requires a concerted effort to enhance the customer experience across all touchpoints (Wissa, 2029). Different countries in the word have been faced with various problems associated with customers' satisfaction on non-life insurance and they have tried to come up with various mitigation

measures to curb the problems. For instance, insurance policies are often difficult to understand due to complex terms and conditions, poor digital infrastructures and insufficient, leading to poor online services have contributed to increase poor non-life insurance services provision in some of the developed and developing countries (Gwemen, 2021).

Various steps have been taken to solve the problem of customer dissatisfaction on non-life insurance services including simplifying policy documents and provide clear, concise explanations. Using plain language and visual aids to help customers understand coverage, exclusions, and the claims process (Wideer, 2020) invest in robust digital platforms, including websites and mobile applications, that allow customers to review their policies, report and file claims, and inquiring for customer services easily. Ensure these platforms are user-friendly and accessible across different devices.

Insurance in Tanzania for non-life is controlled by the Tanzania Insurance Regulatory Authority (TIRA) under the Insurance Act No. 10 of 2009 (the Insurance Act, 2009). TIRA oversees, supervises, regulates, and controls the insurance and reinsurance industry in Tanzania. The authority establishes and enforces national rules for the conduct of insurance and reinsurance industry (TIRA Report, 2022). People get general insurance to protect their economic resources. Other than life insurance, general insurance encompasses all types of insurance (Agnes et al., 2023). Consequently, according to the TIRA analysis, as a result of using such a strategy, the country enjoyed economic growth, albeit at a slower rate of 4.9% in 2021 compared to an average growth rate of 6.7% during the preceding five years (TIRA Report, 2022). General insurance covers property from fire, burglary, and other immovable property, among other things. Non-life or general insurance covers non-life things such as animals, agricultural produce, goods, factories, cars, and so on (Jones et al., 2017). Individual behavior losses are also covered by non-life insurance (Naik & Panicker, 2018). Therefore, through the Tanzania Insurance Management Authority, the National Insurance Corporation (NIC) has an impact on regulation of non-life insurance sector and , solvency monitoring-based regulations with few entry limitations have shown to be the most effective (TIRA Report, 2022). When it included restrictions on prices, availability, and profitability, it was more detrimental (Naik & Panicker, 2018).

Hence, in Tanzania, the assessment of service quality in the non-life public insurance sector is especially pertinent due to its potential impact on consumer trust and the overall growth of the industry. The study aims to identify specific challenges and opportunities within the Tanzanian context, offering actionable recommendations for policymakers, insurers, and other stakeholders to enhance service quality and, consequently, customer satisfaction.

8. Literature Review

2.1 Theoretical Literature Review

This part concerns with various theories involved in the study;

2.1.1 Service Quality Theory

The SERVQUAL Model, developed by Parasuraman, Zeithaml, and Berry in the 1980s, is a widely used framework to measure service quality by assessing the gap occurring between customer expectations and their perceptions of the actual service received (Zeithaml et al., 1993). According to (Gangil & Vishnoi, 2020) the model identifies five key dimensions of service quality including Reliability; explains the ability to perform the promised service dependably and accurately, Assurance; explaining the knowledge and courtesy of employees and their ability to convey trust and confidence, Tangibles; the appearance of physical facilities, equipment, personnel, and communication materials. Empathy; the provision of caring, individualized attention to customers and Responsiveness; the willingness to help customers and provide prompt service.

The service quality model involves in determining on how customers perceive or react on the new products or service offered by the company or seller. It reflects the organization's willingness to go the extra mile for customers. Also, it focuses on the care and attention that service providers extend to customers. It involves understanding customers' individual needs, showing empathy, and providing personalized services. According to (Kavitha et al., 2012) this model is typically assessed through a combination of customer expectations and perceptions. Customers are being asked to rate their expectations of service quality and their actual experiences (perceptions) across each of the five factors. The difference between expectations and perceptions provides insights into the quality-of-service delivery. Therefore, this model could be applied to evaluate the quality of services dimensions (reliability, responsiveness, assurance, empathy, and tangibles) provided by non-life public insurance. And the model has contribution on the influence of perceived service quality on customer loyalty in non-life public insurance in this study.

2.1.2 Expectancy – Disconfirmation Theory

The Expectancy-Disconfirmation Theory was first introduced by Richard L. Oliver in his 1980 article titled "A Cognitive Model of the Antecedents and Consequences of Satisfaction Decisions" describes that, this is psychological framework that describe individual perceptions and their actual experiences with a product, service, or situation (Oliver, 1980). According to study by (Tien et al., 2021) The expectations are influenced by factors such as prior experiences, marketing messages, word-of-mouth, and personal needs. Also, study by (Thangadurai & Rahim, 2015) described that the perceived Performance are After the actual experience with the product or service, individuals assess how well it performed compared to their initial expectations. This perceived performance is a subjective evaluation of the quality, efficiency, and overall outcome of the experience. The Expectancy-Disconfirmation Theory highlights the significance of managing customer expectations and delivering experiences that align with or exceed those expectations. It acknowledges that customer satisfaction isn't solely determined by the objective quality of a product or service but also by how well that product or service meets or surpasses initial expectations (Hennayake & Hennayake, 2017). Hence, this theory shows the relationship between customer expectations, perceived service performance, and satisfaction.

Therefore, these theories provide comprehensive understanding of service quality and customer satisfaction in the non-life public insurance.

9. Methodology

In this section, research design, population, sampling and sample size, data collection and analysis were presented thereof.

9.1 Research Design

The study used a cross-section research design method to guide the study. The study adopted the cross-section study design simply because it provides a snapshot of a particular moment, allowing researchers to identify patterns, relationships, and prevalence of certain characteristics or outcomes within the studied group (Kothari, 2016).

This study was guided by the following research questions;

- vi. How does responsiveness of non-life public insurance facilitate customer needs?
- vii. How is the reliability of services to customers in non-life public insurance?
- viii. What are the tangibles of services to customers in non-life public insurance?
- ix. How does the empathy of service providers facilitate customer satisfaction?
- x. How is the assurance of services to customers in non-life public insurance?

9.2 Population and Sampling

9.2.1 Population

In this study, the targeted population was non-life insurance customers and staff at National Insurance Corporations (NIC) in Dar es Salaam, Tanzania. It is important to define the population from NIC clearly and accurately in research because the validity of the findings depends on how the sample represents the population. According to (NIC Tanzania, 2023) number of employees at headquarters in Dar es Salaam are 114 employees are among population of the study. Approximately number of customers at NIC more than 114 companies served.

9.2.2 Sampling and Sample Size

The study employed a simple random sampling technique to get a sample size from the study population by using a standardized sampling formula known as Yamane's sampling formula. 92 respondents were chosen to constitute a sample size.

9.3 Data Collection and Analysis

The main purpose of the study was to assess the service quality on customer's satisfaction in non-life public insurance sector in Tanzania. Hence, in order to ensure collection of data which is free from biasness, author used structured questionnaire and documentary review as the data collection methods. Further, the data was analyzed using Probit linear regression model and descriptive statistics to address the research questions.

10. Results and Analysis

This part presented the findings and analysis of the study

10.1 Profiles of Respondents

The study intended to analyze sex of the respondents involved in the study with purpose of keeping gender equality and to discover the responses on the research questions between male and female. The findings showed that (59.6%) of the respondents were male and (40.4%) were female. Moreover, the study sought the description of the respondents by their age groups and findings revealed that majority (49.3%) of the respondents had age range of 21 – 30 years and few of them (5.3%) had age range of 41 – 50 years. Furthermore, the study sought the description of the respondents by their levels of education. findings divulge that majority of the respondents (64%) had bachelor degree education level. (13.3%) had master's degree, (12%) had tertiary education, (6.7%) had secondary education and (4%) had primary education.

Table 33. Profiles of Respondents

Parameters		Frequency	Percent (%)
Gender	Male	68	59.6
	Female	46	40.4
	Total	114	100.0
Age	21 - 30	58	50.9
	31 - 40	50	43.9
	41 - 50	6	5.3
	Total	114	100.0
Education Level	Primary education	3	4.0
	Secondary education	5	6.7
	Tertiary education	9	12.0
	Bachelor degree	48	64.0
	Master's degree	10	13.3

10.2 Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

This section sought to describe the responsiveness of the National Insurance Cooperation on providing nonlife insurance services to the customers in facilitating customer's expected needs from NIC. Analysis of the responsiveness of non-life public insurance services involved the analysis of timeliness of the response from the National Insurance Corporation (NIC) when addressing customer queries or concerns, effectiveness in handling customer inquiries and complaints, and customers' satisfaction on the overall responsiveness of the NIC in meeting customers' insurance-related needs.

4.2.1 Timeliness of the Response from the NIC when Addressing Customers' Queries or Concerns

Findings described in Figure 1 reveal that the majority (38.7%) of the respondents involved in the study commented that the timeliness of the response from the NIC when addressing customers' queries or concerns is good. This implies that customers who are accessing non-life public insurance services at NIC are satisfied with the timeliness of responding to their problems or inquiries, this is because the management of NIC has a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their inquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer.

Furthermore; the findings described in Figure 1 showed that the least (8%) of the respondents involved in the study commented that the timeliness of the response from the NIC when addressing customers' queries or concerns is very poor. Meaning that few of the customers who are accessing non-life public insurance services are not satisfied with the timeliness of receiving responses about their problems or concerns related to the services provided. Also, the findings showed that 36% of the respondents commented that timeliness of the response from the NIC when addressing customers' queries or concerns is fair, 10.7% commented that timeliness of the response from the NIC when addressing customers' queries or concerns is poor and 6.7% of the respondents commented that timeliness of the response from the NIC when addressing customers' queries or concerns is very good. Therefore, according to the customers' responses on the timeliness of the response from the NIC when addressing customers' queries or concerns it can be revealed that most of the customers accessing non-life public insurance are satisfied with the responsiveness of NIC staffs on facilitating customer needs specifically on timeliness of responses when addressing customers' problems or other concerns.

Figure 31. Respondents' Responses on Timeliness of Response from the NIC when Addressing Customers' Queries or Concerns

4.2.2 Assessment of the Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Findings in Table 2 describes that responsiveness of National Insurance Corporation (NIC) on provision of non-life public insurance services is high due to the fact that the provided insurance services facilitate meeting customers' needs. The study found that the National Insurance Cooperation (NIC) can tell customers exactly when services will be performed (Mean = 4.45; Standard deviation = 1.596). the magnitude of the mean and the standard deviation tells that majority of the respondents slightly agreed with the statement that the National Insurance Cooperation (NIC) can tell customers exactly when services will be performed that increase satisfaction among customers on the services provided by NIC.

Also, the findings of the study described in Table 2 revealed that NIC can give prompt customer service and attend to customers' needs/problems (Mean = 4.75; Standard deviation = 1.586), NIC employees are always willing to help customers in emergencies (Mean = 4.89; Standard deviation = 1.689), NIC employees are approachable and easy to contact (Mean = 4.89; Standard deviation = 1.689), NIC Employees' can communicate clearly with the customer (Mean = 4.89; Standard deviation = 1.689) and I am getting as quick a turnaround as I need on requests for new reports or data (Mean = 4.89; Standard deviation = 1.689). The magnitude of the mean and standard deviation of the statements tells that respondent slightly agreed that NIC can give prompt customer service and attend to customers' needs or problems, NIC employees are always willing to help customers in emergencies, NIC employees are approachable and easy to contact, NIC Employees' can communicate clearly with the customer, and customers gets quick a turnaround as they need on requests for new reports or data.

Table 34. Responses on the Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Statement	No. Respondents	Mean		Std. Deviation
		Statistic	Std. Error	Statistic
The National Insurance Cooperation (NIC) can tell customers exactly when services will be performed	75	4.45	.184	1.596
NIC can give prompt customer service and attend to customers' needs/problems	75	4.75	.183	1.586
NIC employees are always willing to help customers in emergencies	75	4.89	.195	1.689
NIC employees are approachable and easy to contact	75	4.85	.150	1.302
NIC Employees' can communicate clearly with the customer.	75	4.97	.160	1.385
I am getting as quick a turnaround as I need on requests for new reports or data.	75	4.52	.173	1.501

4.2.3 Customers' Satisfaction with the Reliability of Services Offered by the NIC

Findings described in Figure 2 revealed that majority (44%) of the respondents involved in the study were satisfied with the reliability of services offered by the National Insurance Corporation (NIC). This imply that customers accessing non-life public insurance services at NIC are satisfied with the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage. Also, the NIC management keeps trust among the customers by responding quickly to the insurance requests submitted within Seven (7) working days that increase the level of trust among the customers knowing that their grievances be taken into consideration within short time. Furthermore, the findings of the study described in Figure 2 revealed that 30.7% of the respondents involved in the study were neutral meaning that they had no choice weather were satisfied or dissatisfied. About 12% of the respondents were very satisfied with the reliability of services offered by the National Insurance Corporation (NIC), 9.3% of the respondents were dissatisfied and 4% were very dissatisfied.

The findings of the study tell that few of the respondents involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the respondents who were satisfied. It means that the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage is high that increase the level of satisfaction among customers accessing services at NIC.

Figure 32. Customers' Satisfaction with the Reliability of Services Offered by NIC

10.3 Reliability of Services to Customers in Non-Life Public Insurance

Findings in Table 3 describes that the reliability of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers (Mean = 4.73; Standard deviation = 1.605). the magnitude of the mean and the standard deviation tells that majority of the respondents slightly agreed with the statement that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers. Also, the findings of the study described in Table 3 revealed that NIC has been truthful (keeping to promises) to customers regarding insurance services (Mean = 4.68; Standard deviation = 1.749), NIC is dependable and consistent in solving customers' complaints (Mean = 4.64; Standard deviation = 1.666), NIC can perform services right the first time (Mean = 4.86; Standard deviation = 1.511), NIC can insist on error-free records (Mean = 4.51; Standard deviation = 1.545). The magnitude of the mean and standard deviation of the statements tells those respondents slightly agreed that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers, NIC has been truthful (keeping to promises) to customers regarding insurance services, NIC is dependable and

consistent in solving customers' complaints, NIC can perform services right the first time, and NIC can insist on error-free records.

Table 35. Responses on the Reliability of Services to Customers in Non-Life Public Insurance

Statements	No. of Respondent	Mean		Std. Deviation
		Statistic	Statistic Error	Statistic
The National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers	75	4.73	.185	1.605
NIC has been truthful (keeping to promises) to customers regarding insurance services	75	4.68	.202	1.749
NIC is dependable and consistent in solving customers' complaints	75	4.64	.192	1.666
NIC can perform services right the first time	74	4.86	.176	1.511
NIC can insist on error-free records	75	4.51	.178	1.545

10.4 Tangibles of Services to Customers in Non-Life Public Insurance

Findings from Table 4 describes that the tangibility of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that NIC can give customers access to information, product/service catalogs (Mean = 5.03; Standard deviation = 1.786), NIC provides visually attractive, offices, equipment, and materials to customers (Mean = 4.67; Standard deviation = 1.359), and NIC provides a variety of entertainment facilities to customers (Mean = 5.83; Standard deviation = 8.323). The magnitude of the mean and standard deviation of the responses imply that customers agreed that NIC can give customers access to information, product/service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, and NIC provides a variety of entertainment facilities to customers.

Table 36. Responses on the Tangibility of Services to Customers in Non-Life Public Insurance

Statements	No. Respondents	Mean		Std. Deviation
		Statistic	Std. Error	Statistic
NIC can give customers access to information, product/service catalogs,	75	5.03	.206	1.786
NIC provides visually attractive, offices, equipment, and materials to customers	75	4.67	.157	1.359
NIC provides a variety of entertainment facilities to customers, etc.	75	5.83	.961	8.323

10.5 Empathy of Service Providers in Non-Life Public Insurance

Findings in Table 5 describes that the empathy of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that NIC has favorable terms and conditions to customers (Mean = 4.73; Standard deviation = 1.465), NIC has operating hours convenient to all customers (Mean = 4.81; Standard deviation = 1.477), NIC has a sound loyalty program to recognize you as a frequent customer (Mean = 4.67; Standard deviation = 1.436), NIC makes efforts to understand specific customer needs (Mean = 5.00; Standard deviation = 1.366) and NIC apologizes for the inconvenience caused to customers (Mean = 4.97; Standard deviation = 1.294). The magnitude of the mean and standard deviation of the responses imply that customers strongly agreed that NIC has favorable terms and conditions to customers, NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize you as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers.

Table 37. Responses on Empathy of Service Providers to Customers in Non-Life Public Insurance

Statements	No. of respondents	Mean		Standard deviation
		Statistic	Std. Error	Statistic

NIC has favorable terms and conditions to customers.	74	4.73	.170	1.465
NIC has operating hours convenient to all customers	75	4.81	.171	1.477
NIC has a sound loyalty program to recognize you as a frequent customer	75	4.67	.166	1.436
NIC makes efforts to understand specific customer needs.	75	5.00	.158	1.366
NIC apologizes for the inconvenience caused to customers	75	4.97	.149	1.294

10.6 Assurance of Services to Customers in Non-Life Public Insurance

Findings in Table 6 describes that the assurance of services to customers in non-life public insurance services provided by the National Insurance Cooperation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that the behavior of employees of NIC instills confidence in customers (Mean = 4.76; Standard deviation = 1.550), Employees' use of required skills and knowledge to answer customers' questions (Mean = 5.00; Standard deviation = 1.602), Employees of NIC are consistently courteous with customers (Mean = 4.63; Standard deviation = 1.402), Ability to provide variety of value-added services to customers (Mean = 4.71; Standard deviation = 1.667). The magnitude of the mean and standard deviation of the responses imply that customers strongly agreed that the behavior of employees of NIC instills confidence in customers, Employees' use of required skills and knowledge to answer customers' questions, Employees of NIC are consistently courteous with customers and NIC staffs have ability to provide variety of value-added services to customers.

Table 38. Response on the Assurance of Services to Customers in Non-Life Public Insurance

Statements	No. Respondents	Mean		Std. Deviation
		Statistic	Std. Error	Statistic
The behavior of employees of NIC instills confidence in customers	75	4.76	.179	1.550

Employees' use of required skills and knowledge to answer customers' questions	75	5.00	.185	1.602
Employees of NIC are consistently courteous with customers	75	4.63	.162	1.402
Ability to provide variety of value-added services to customers	75	4.71	.192	1.667

Specific Observations:

In the methodology section the author said Probit linear regression model will be applied as the data analysis technique. However, Throughout the document no data analysis using Probit linear regression model. The Probit regression model is a type of regression used when the dependent variable is binary (i.e., it takes on two values, often coded as 0 and 1). It is commonly used in situations where researchers want to understand the probability that an event occurs based on one or more predictor variables. For example, in your study, the dependent variable might be whether a customer is satisfied (1) or not satisfied (0) with the service quality. The independent variables could include factors like service responsiveness, reliability, empathy, assurance, and tangibles. See an example below:

Assuming you ran a Probit regression analysis with the following results:

Table: Probit Regression Results on Customer Satisfaction in Non-Life Insurance

Variable	Coefficient (β)	Standard Error	z-Statistic	p-value
Service Responsiveness	0.35	0.10	3.50	0.0005
Service Reliability	0.50	0.12	4.17	0.0001
Service Empathy	0.25	0.09	2.78	0.0054
Service Assurance	0.40	0.11	3.64	0.0003
Service Tangibles	0.10	0.08	1.25	0.2110
Constant	-1.20	0.30	-4.00	0.0001

Interpretation of Findings

6. Service Responsiveness ($\beta = 0.35$, $p = 0.0005$): This positive coefficient suggests that as the responsiveness of the service increases, the likelihood of customer satisfaction also increases. The p-value indicates strong statistical significance ($p < 0.001$).
7. Service Reliability ($\beta = 0.50$, $p = 0.0001$): This variable has the highest coefficient, meaning it has a substantial positive impact on customer satisfaction. It is also highly

significant, indicating that reliability is a critical factor influencing customer satisfaction.

8. Service Empathy ($\beta = 0.25$, $p = 0.0054$): This positive coefficient indicates that greater empathy from service providers is associated with higher customer satisfaction, and the result is statistically significant.
9. Service Assurance ($\beta = 0.40$, $p = 0.0003$): Like reliability, assurance is also significantly related to customer satisfaction, suggesting that customers who feel assured by the service are more likely to report satisfaction.
10. Service Tangibles ($\beta = 0.10$, $p = 0.2110$): This variable does not significantly influence customer satisfaction ($p > 0.05$), indicating that while tangibles might have some effect, it is not strong enough to be statistically significant in this model.

11. Discussion and Implication

11.1 Discussion of Key Results

11.1.1 Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Wilson (2021) conducted a study on the factors influencing customers' satisfaction on the non-life public insurance services in Kenya, the study found that, majority (82%) of the customers accessing non-life insurance services become satisfied with the non-life insurance services due to the insurance companies being responding to the customers concerns on time and through digitalized reporting systems without visiting the insurance company branches physically to submit their problems or concerns.

Rhenne (2022) conducted a study on the performance of insurance companies in providing non-life public insurances in Tanzania, found that good communication between customers and services providers, and developing systematic reporting channels between customers and the service providers contributes to the performance of the insurance companies by 79.9%. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help customers promptly and address their needs, concerns, or inquiries. It reflects the organization's willingness to go the extra mile for customers.

Yunnis (2020) found that customer satisfaction with the reliability of non-life public insurance services can be influenced by several key factors including claim processing time revealed by speed of processing repayments, clear communication about the status of claims and what is needed from the customer enhance satisfaction among the customers accessing non-life public insurance services. Also, regular collection of customer feedback to identify and address issues and demonstrated efforts to improve services based on customer feedback, analyzing the nature and frequency of customer complaints to identify areas for improvement improves customers' satisfaction.

11.1.2 Reliability of Services to Customers in Non-Life Public Insurance

In this section it was observed that few of the customers involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied, these findings concur with Mimie (2022) who conducted a study on the performance of insurance companies in providing non-life public insurances in Kenya, although, it was founded that solving customers' claims and responding to their enquires on time, good communication between customers and services providers, and developing systematic reporting channels between customers and the service providers contributes to the increase of trust among the customers and customers becomes satisfied with the provided services regardless of the company performance in the insurance market. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help customers promptly and address their needs, concerns, or inquiries. It reflects the organization's willingness to go the extra mile for customers.

11.1.3 Tangibles of Services to Customers in Non-Life Public Insurance

It was observed that NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. Likewise, Fenkin (2019) conducted a study on the impacts of Information Communication Technology on non-life insurance services performance among the public insurance companies in Tanzania, whereas, it was revealed that the performance of non-life insurance services can be influenced by providing visually attractive, offices, equipment, and materials to customers, clear and professional signage that reflects the organization's credibility and reliability, well designed, easy-to-read, and comprehensive documents that explain the terms, conditions, and coverage of insurance policies.

11.1.4 Empathy of Service Providers in Non-Life Public Insurance

Findings in this part revealed that NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers. The findings of the study were supported by Bagun et al (2021) found that, empathy plays a significant role in customer satisfaction, particularly in the context of non-life insurance companies by improving communication whereby empathetic customer service agents listen actively to customers' concerns, which helps in understanding and addressing their needs more effectively. Added that, empathetic employees better understand and anticipate the specific needs of individual customers, offering tailored solutions that enhance customer experience and satisfied customers are more likely to remain loyal and recommend the company to others, contributing to higher customer retention rates.

11.1.5 Assurance of Services to Customers in Non-Life Public Insurance

It was observed that NIC has created assurance of its services to customers due to improvements in the following areas; behavior of employees of NIC instills confidence in

customers, Employees' use of required skills and knowledge to answer customers' questions. Bannie (2022) conducted a study on the performance of insurance companies in providing non-life public insurances in Tanzania, whereas it was founded that employees' usage of required skills and knowledge to answer customers' questions, employees of being consistently courteous with customers and the ability to provide variety of value-added services to customers improves the performance of insurance companies and increase the level of customers' satisfaction. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help customers promptly and address their needs, concerns, or inquiries. It reflects with the findings of the study that the behavior of employees of NIC instilling confidence in customers, employees' usage of required skills and knowledge to answer customers' questions, employees of NIC being consistently courteous with customers and the ability to provide variety of value-added services to customers' increases assurance of services to customers in non-life public insurance.

11.2 Implications

Implications for Research

The study on assessing customer satisfaction in Tanzania's non-life public insurance sector using the SERVQUAL model offers several implications for future research. Firstly, it contributes to the academic understanding of service quality and customer satisfaction within the insurance industry in developing countries, particularly in the context of Tanzania. The findings can serve as a basis for comparative studies across different regions or countries, enhancing the generalizability of the SERVQUAL model in various cultural and economic settings. Additionally, the research highlights potential gaps in the current literature, such as the need for more nuanced models that incorporate cultural factors and local market dynamics, paving the way for more context-specific studies. Future research could also explore the relationship between customer satisfaction and business performance metrics, such as customer retention, profitability, and market share in the Tanzanian insurance sector.

Implications for Practice

For practice, the findings of this study provide actionable insights for improving service quality in Tanzania's non-life public insurance sector. By identifying the key dimensions of the SERVQUAL model—tangibles, reliability, responsiveness, assurance, and empathy—that most significantly impact customer satisfaction, the study enables the National Insurance Corporation (NIC) and other similar institutions to prioritize areas for improvement. For instance, if the study reveals that customers are particularly dissatisfied with the reliability or responsiveness of services, the NIC can focus on streamlining processes, enhancing communication channels, and ensuring timely service delivery. This practical application of the research can lead to enhanced customer satisfaction, potentially increasing customer loyalty and market competitiveness.

Implications for Practitioners

For practitioners within the insurance sector, including managers, service designers, and customer service professionals, the study offers critical insights into customer expectations and perceptions of service quality. By leveraging the SERVQUAL model, practitioners can better understand the specific aspects of their service delivery that need improvement. This could lead to targeted training programs for staff, emphasizing areas such as empathy and assurance, where customer interaction is most impactful. Moreover, the study encourages practitioners to adopt a customer-centric approach, using feedback and satisfaction surveys as continuous tools for service enhancement. Ultimately, by aligning their practices with the dimensions highlighted by the SERVQUAL model, practitioners can improve overall service quality, thereby boosting customer satisfaction and retention in the highly competitive insurance market.

12. Conclusion, Limitations and Future Studies

12.1 Conclusion

6.1.1 The Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Analysis of the responsiveness of non-life public insurance services involved the analysis of the timeliness of the response from the National Insurance Corporation (NIC) when addressing customer queries or concerns, effectiveness in handling customer inquiries and complaints, and customers' satisfaction on the overall responsiveness of the NIC in meeting customers' insurance-related needs. It was concluded that, customers who were accessing non-life public insurance services at NIC were satisfied with the timeliness of responding to their problems or enquires, this is due to the fact that the management of NIC have a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their enquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer. Also, concluded that, NIC management and its supporting staffs shown to be responsive because customers agreed and commented that NIC can give prompt customer service and attend to customers' needs or problems, NIC employees are always willing to help customers in emergencies, NIC employees are approachable and easy to contact, NIC Employees' can communicate clearly with the customer, and customers gets quick a turnaround as they need on requests for new reports or data

6.1.2 The Reliability of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, few of the customers involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied. It meant that the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage is high that increase the level of satisfaction among customers accessing services at NIC. Also, customers accessing non-life public insurance services were satisfied with the services provided by NIC this was because the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers, NIC has been truthful (keeping to promises) to customers regarding

insurance services, NIC is dependable and consistent in solving customers' complaints, NIC can perform services right the first time, and NIC can insist on error-free records.

6.1.3 The Tangibles of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. This shows empathy and tangible deliverables among the NIC staffs and increase the level of satisfaction among the customers accessing non-life insurance services at NIC.

6.1.4 The Empathy of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers. This shows empathy deliverables among the NIC staffs and increase the level of satisfaction among the customers accessing non-life insurance services at NIC.

6.1.5 The Assurance of Services to Customers in Non-Life Public Insurance

The study under this section included that NIC has created assurance of its services to customers due to improvements in the following areas; behavior of employees of NIC instills confidence in customers, Employees' use of required skills and knowledge to answer customers' questions, Employees of NIC are consistently courteous with customers and NIC staffs have ability to provide variety of value-added services to customers.

6.1.6 Customers' Satisfaction on Non-life Public Insurance Services

Under this section the study used components of the service quality model to assess whether customers were satisfied with non-life insurance services or not. From the findings of the study, it was concluded that, factors like responsiveness, reliability, tangibles, empathy and assurance have direct effect on customer satisfaction on non-life insurance services. Also, it was concluded that increase in responsiveness, reliability, tangibles, empathy and assurance in delivering non-life insurance services to customers increases the level of satisfaction among the customers.

12.2 Limitations and Future Studies

Other respondents neglect to participate in this study due to the fact that, they were busy doing different works. Again, there was limited secondary data concerning this study. Therefore, the discussion of the study was based on assessing customer satisfaction on non-life insurance services at the National Insurance Corporation (NIC) by using the components of the Service Quality Model. It highly recommended that further studies to be undertaken upon assessing how the application of the SERVQUAL Model affects the non-life insurance industry performance in terms of financial performances and customers retention.

E-mail: jonathankomanya4@gmail.com

Abstract

Public institutions in developing countries often face challenges in effectively managing their procurement processes, which can significantly impact their overall performance. This study aimed to assess the impact of strategic procurement practices on the performance of public institutions, using the case of Dodoma City Council in Tanzania. The specific objectives were to determine the effects of supplier relationships, procurement cost management techniques, and information technology applications on the performance of the institution. A quantitative research approach was adopted, and data was collected from 109 respondents using a questionnaire. The findings revealed that supplier relationships, procurement cost management, and information technology applications had significant positive correlations with institutional performance. The study recommends that public organizations should focus on developing strong supplier relationships, implementing effective cost-management techniques, and leveraging information technology to improve their overall performance.

Keywords: *Strategic procurement, supplier relationship, procurement cost management, information technology, public institutions, organizational performance*

1. Introduction

Procurement is a critical function in both public and private organizations, as it plays a crucial role in acquiring goods, services, and works necessary for the smooth operation and achievement of organizational goals (Basheka, 2008). In the public sector, effective procurement management is essential for ensuring the efficient utilization of limited resources, promoting transparency and accountability, and delivering quality services to citizens (Muma et al., 2014).

However, public institutions in developing countries, including Tanzania, often face various challenges in managing their procurement processes effectively. These challenges include lack of skilled procurement personnel, bureaucratic and outdated procurement systems, political interference, and inadequate financial resources (Ndiwalana & Mugurusi, 2019). As a result, public institutions may experience suboptimal performance, such as delayed project completions, cost overruns, and poor service delivery to the public (Basheka & Mugabira, 2008).

In recent years, the concept of strategic procurement has gained increasing attention as a means of enhancing the performance of public institutions (Muma et al., 2014). Strategic procurement involves the alignment of procurement practices with the overall organizational strategy, with the aim of creating competitive advantages and improving organizational performance (Carr & Smeltzer, 1997). This approach emphasizes the integration of procurement activities with other business functions, the development of long-term supplier relationships, and the application of innovative procurement techniques to drive cost savings and efficiency (Monczka et al., 2015).

The Dodoma City Council, as a representative public institution in Tanzania, serves as the focal point of this study. Dodoma is the capital city of Tanzania and has experienced significant growth and development in recent years, which has placed increasing demands on the city's procurement function. Understanding the impact of strategic procurement practices on the performance of the Dodoma City Council can provide valuable insights for other public institutions in Tanzania and similar developing country contexts.

The specific objectives of this study were to:

1. Determine the effect of supplier relationship on the performance of the Dodoma City Council.
2. Examine the influence of procurement cost management techniques on the performance of the Dodoma City Council.
3. Assess the impact of information technology application on the performance of the Dodoma City Council.

The study was guided by the following research questions:

1. What is the effect of supplier relationship on the performance of the Dodoma City Council?
2. How do procurement cost management techniques influence the performance of the Dodoma City Council?
3. What is the impact of information technology application on the performance of the Dodoma City Council?

1.2 Significance of the Study

The findings of this study contribute to the existing body of knowledge on strategic procurement practices and their impact on the performance of public institutions, particularly in the context of developing countries. The insights generated can inform policymakers, public sector managers, and procurement professionals on the critical areas to focus on in order to enhance the performance and service delivery of public institutions.

1.3 Literature Review

This study is grounded in the institutional theory, which provides a framework for understanding the influence of institutional pressures and norms on organizational practices

and performance (DiMaggio & Powell, 1983). The institutional theory posits that organizations must align their structures, processes, and practices with the prevailing institutional environment to gain legitimacy and ensure their survival and success (Scott, 2008).

In the context of public institutions, the institutional theory suggests that the adoption of strategic procurement practices may be influenced by the need to conform to external regulations, industry standards, and stakeholder expectations (Lian & Laing, 2007). Public organizations are often subject to stringent procurement regulations and guidelines, as well as pressure from political and social actors to ensure transparency, fairness, and accountability in their procurement processes (Muma et al., 2014).

By aligning their procurement practices with institutional norms and expectations, public institutions can enhance their legitimacy, access to resources, and overall performance (Zheng et al., 2014). The institutional theory, therefore, provides a suitable theoretical foundation for this study, as it helps to explain the adoption and impact of strategic procurement practices within the context of public institutions.

Giath et al. (2021) assessed the influence of strategic management of procurement process on the organizational performance of public institutions in Kenya with a focus on National transport and safety authority. The study used descriptive research design, which employed stratified sampling technique to select 92 respondents from 923 employees. Data collected through close ended questionnaires and analyzed by descriptive statistics and linear regression and correlation to show the relationship between variables. The study revealed that there was significant relationship between supplier management, technology utilization and organizational capacity to the organizational performance. The study suggests that there is need for management to invest in research and development for the purpose of adopting new technologies to keep pace with the global changes.

Chenini et al. (2020) examined how strategic procurement and supplier integration influence firms manufacturing performance and speed to market. The study adopted explanatory and cross-sectional research design in which the primary data were collected by using structured questionnaire from 279 procurement officials. Nonprobability and purposive sampling techniques were used to target respondents selected using social network web LinkedIn. The data reliability, validity, analysis and correlations were examined using AMOS version 24. The study findings revealed the significance of strategic procurement and supplier integration in superior manufacturing and speed to market performance. It was further revealed that procurement strategy and supplier integration were the key determinants of lead time and significantly affect the manufacturing performance. The study recommended well planned procurement and excellent supplier integration to increase the firm efficiency.

Oliech and Mwangangi (2019) researched the effect of strategic procurement management on firm performance, with a focus on level five hospitals in Kenya. The study collected both primary and secondary data. The data collection instruments were questionnaires. Secondary data was collected from published materials and information from other sources such as world

health organization reports, periodicals and health procurement publications. They established that e-procurement, strategic sourcing, procurement planning and supplier relationships have a significant relationship with the performance of level five hospitals. They further recommended that organizations should strengthen their outsourcing procurement activities and design workable frameworks on how best to do so. In addition, they suggested that an organization should put in place mechanisms or frameworks that enhance supplier relationships if it is to sustain its performance against its competitors.

Muswere (2020) sought to examine the impact of strategic procurement practices on firm performance at CBZ Bank. The study adopted a mixed research approach. The study collected both, primary and secondary data. The research instruments used to gather primary data were the questionnaires and interview guides. Secondary data were collected from procurement publications, journals, books, other internet sources, and reports from the Supply Chain Council. The population of the study included 82 employees selected by convenience sampling, a non-probability sampling technique. The data was analyzed by descriptive statistics and Pearson product-moment correlation co-efficient through Microsoft Excel worksheets and Statistical Package for Social Science (SPSS). The findings of the study showed that strategic cost management, supplier integration, early supplier involvement and supplier relationship management had a positive relationship with firm performance.

Abdul and Mashenene (2022) examined the effect of procurement planning on the efficiency of public procurement at the Ministry of Education, Science and Technology, Tanzania. A cross-sectional design was adopted with a sample size of 108 selected by using proportional stratified sampling. Data were collected by using questionnaire and interview as data collection tools. Data collected was analyzed by content analysis and binary logistic regression model. The main findings revealed that procurement planning was positive and significant with public procurement efficiency in terms of delivery time and reduction of procurement costs. The study recommends organizations embrace these practices and policymakers to develop required policies and procedures for smooth applications.

Orio (2020) analyzed the impact of strategic procurement on the effectiveness of procurement functions in the public sector. Specifically, the study focused on determining the extent to which procurement practitioners influence green procurement in public procuring entities. The study adopted institutional theory to explain the relationship with the study conducted. A descriptive research design was used where administrative questionnaires were used to collect data from the total sample of 60 respondents. Collected data were analyzed with the help of SPSS and tables were used to present findings. The findings showed that no provision of training to staff, a lack of enough knowledge on green procurement policy, a lack of environmental specification on products offered by suppliers as well and a high price of green procurement products in at market. The study concluded that public organizations have not focused on practicing strategic procurement since many factors are hindering its implementation.

Tesha (2019) assessed the role of strategic procurement in promoting value for money in the

construction industry the study used a descriptive research design to describe the situation of the problem. The researcher used purposive sampling in which the researcher selected seventy-nine (79) employees as a sample size of the Tanzania Building Agency. Questionnaire and interview methods were adopted in collecting the data from the respondents and were analyzed quantitatively. The findings of the study show that procurement cost management techniques in general promote value for money through cost planning and controlling, forecasting, and value management. On the side of utilization of resources, a challenge of inadequacy of resources especially machinery and equipment resource was noted, and lastly, procurement quality management approaches pointed out the benchmarking as the rare method in supporting quality.

While the existing literature has examined the relationship between strategic procurement practices and the performance of public institutions, the majority of these studies have been conducted in other developing country contexts, such as Kenya and Uganda. There is a relative paucity of research specifically focusing on the Tanzanian public sector and the Dodoma City Council in particular.

Moreover, the existing studies have often focused on individual aspects of strategic procurement, such as supplier relationship or procurement cost management, without considering the comprehensive impact of multiple strategic procurement practices on institutional performance. This study aims to bridge this gap by providing a more holistic assessment of the effects of supplier relationship, procurement cost management techniques, and information technology application on the performance of the Dodoma City Council, a representative public institution in Tanzania.

2. Method

Research Design and Study Area

This study adopted a quantitative research approach, utilizing a cross-sectional research design. The study area was the Dodoma City Council, which is the local government authority responsible for the administration and development of Dodoma, the capital city of Tanzania.

Sampling and Data Collection

Purposive sampling was employed to select the respondents for this study. The target population included procurement officers, finance officers, and other relevant personnel involved in the procurement function of the Dodoma City Council. A total of 109 respondents participated in the study. Data was collected using a structured questionnaire, which was developed based on the key variables identified in the conceptual framework. The questionnaire comprised both closed-ended and open-ended questions to gather information on the strategic procurement practices and the performance of the Dodoma City Council.

Data Analysis

The collected data was analyzed using both descriptive and inferential statistics. Descriptive statistics, such as frequencies, percentages, and mean scores, were used to summarize the respondents' characteristics and their perceptions of the strategic procurement practices. Inferential statistics, including Pearson's correlation and multiple regression analysis, were employed to examine the relationships between the strategic procurement practices and the performance of the Dodoma City Council. Pearson's correlation was used to assess the strength and direction of the relationships, while multiple regression analysis was conducted to determine the predictive power of the independent variables on the dependent variable. The statistical analysis was performed using the Statistical Package for Social Sciences (SPSS) software, version 26.

Reliability and Validity

The reliability of the research instrument was assessed using Cronbach's alpha coefficient. The values of Cronbach's alpha for the key variables ranged from 0.789 to 0.928, indicating a high level of internal consistency and reliability. The validity of the research instrument was established through content validity and construct validity. Content validity was ensured by aligning the questionnaire items with the conceptual framework and the existing literature. Construct validity was assessed through factor analysis, which confirmed the hypothesized factor structure of the key variables.

3. Results

Respondents' Characteristics

The respondents were selected from different departments in the Dodoma City Council, with 41.3% working in the Procurement and Supplies Department. Most of them (54.1%) had bachelor's degrees, and 41.3% had between 6 and 10 years of work experience. This focus on the Finance, Procurement, and Tender Board departments shows a clear effort to gather important insights about how the council operates. These departments are key to managing public resources and ensuring financial transparency, which previous studies have shown is vital for good governance. The combination of their education and experience suggests they are well-equipped to think critically and solve problems in procurement. Overall, their backgrounds not only help them provide valuable data but also enhance the understanding of procurement practices in the Dodoma City Council.

Supplier Relationship and Institutional Performance

The results showed a strong positive correlation ($r=0.969$, $p<0.01$) between supplier relationships and the performance of the Dodoma City Council. Specifically, the aspects of early supplier involvement ($r=0.958$, $p<0.01$), supplier development ($r=0.945$, $p<0.01$), and collaboration ($r=0.907$, $p<0.01$) were all significantly correlated with institutional performance.

The results indicating a strong positive correlation ($r=0.969$, $p<0.01$) between supplier relationships and the performance of the Dodoma City Council suggest that effective engagement and collaboration with suppliers significantly enhance the council's overall performance. This means that as the quality of supplier relationships improves, so does the council's operational efficiency and service delivery. Specifically, the correlations with aspects such as early supplier involvement ($r=0.958$, $p<0.01$), supplier development ($r=0.945$, $p<0.01$), and collaboration ($r=0.907$, $p<0.01$) highlight the importance of these practices. Early supplier involvement allows for better planning and decision-making, while supplier development enhances the capabilities of suppliers, leading to more reliable goods and services. Collaboration fosters a partnership approach, enabling both the council and suppliers to share knowledge and resources effectively.

Previous studies have similarly found that strong supplier relationships contribute to enhanced organizational performance. For instance, a study by Alshurideh (2022) emphasized that effective supplier management leads to improved product quality and faster delivery times, ultimately benefiting organizational efficiency. Additionally, Kamau (2013) demonstrated that collaboration with suppliers can result in greater innovation and responsiveness in supply chains. These findings reinforce the idea that strong supplier relationships are essential for successful institutional performance. Overall, the results suggest that the Dodoma City Council can achieve better outcomes by investing in and nurturing these relationships with suppliers.

Procurement Cost Management Techniques and Institutional Performance

The findings revealed a moderate positive correlation ($r=0.194$, $p<0.05$) between procurement cost management techniques and the performance of the Dodoma City Council. The specific cost management techniques, such as waste elimination ($r=0.215$, $p<0.05$), competition ($r=0.134$, $p<0.05$), and budget allocation ($r=0.189$, $p<0.05$), were all positively correlated with institutional performance, although the correlations were relatively weaker compared to supplier relationship.

The findings indicated a moderate positive correlation ($r=0.194$, $p<0.05$) between procurement cost management techniques and the performance of the Dodoma City Council. This suggests that effective cost management practices can enhance the council's overall performance, although to a lesser extent than supplier relationships. Specific techniques such as waste elimination ($r=0.215$, $p<0.05$), competition ($r=0.134$, $p<0.05$), and budget allocation ($r=0.189$, $p<0.05$) all showed positive correlations with institutional performance. While these correlations indicate a beneficial impact, they are relatively weaker compared to the strong correlations observed with supplier relationships.

This finding aligns with previous studies that have explored the relationship between cost management techniques and organizational performance. For example, research by Odhiambo and Kamau (2003) who found that effective cost-management practices contribute to improved

operational efficiency and customer satisfaction. Additionally, a study by Basheka and Mugabira (2008) highlighted the importance of waste reduction and budget management in enhancing organizational performance. Although the correlations in this study are not as strong as those related to supplier relationships, they still underscore the significance of implementing effective cost-management techniques to support the overall performance of the Dodoma City Council.

Information Technology Application and Institutional Performance

The results indicated a moderate positive correlation ($r=0.209$, $p<0.05$) between information technology applications and the performance of the Dodoma City Council. The specific IT applications, including supplier identification ($r=0.182$, $p<0.05$), e-payment ($r=0.176$, $p<0.05$), and information sharing ($r=0.197$, $p<0.05$), were all positively correlated with institutional performance.

The results indicated a moderate positive correlation ($r=0.209$, $p<0.05$) between information technology applications and the performance of the Dodoma City Council. This suggests that the use of IT in various processes can enhance the council's overall effectiveness. Specific IT applications, such as supplier identification ($r=0.182$, $p<0.05$), e-payment ($r=0.176$, $p<0.05$), and information sharing ($r=0.197$, $p<0.05$), were all positively correlated with institutional performance. These correlations highlight the importance of integrating technology into procurement and administrative processes to improve operational efficiency.

Previous studies have similarly emphasized the role of information technology in enhancing organizational performance. For instance, a study by Mashari et al. (2003) found that effective IT applications lead to improved decision-making and streamlined processes in public sector organizations. Additionally, research by DeLone and McLean (2003) demonstrated that information sharing and e-payment systems can significantly boost efficiency and accountability in public administration. Although the correlations observed in this study are moderate, they underscore the potential benefits of leveraging information technology to support and improve the performance of the Dodoma City Council.

Multiple Regression Analysis

The multiple regression analysis revealed that the three strategic procurement practices (supplier relationship, procurement cost management techniques, and information technology application) collectively explained 91.4% of the variance in the performance of the Dodoma City Council ($R^2=0.914$, $p<0.001$). Supplier relationship emerged as the strongest predictor of institutional performance ($\beta=0.778$, $p<0.001$), followed by information technology application ($\beta=0.154$, $p<0.01$) and procurement cost management techniques ($\beta=0.097$, $p<0.05$).

The multiple regression analysis revealed that the three strategic procurement practices—supplier relationship, procurement cost management techniques, and information technology application—collectively explained 91.4% of the variance in the performance of the Dodoma

City Council ($R^2=0.914$, $p<0.001$). This high level of explained variance indicates that these practices significantly impact the council's performance. Among them, supplier relationship emerged as the strongest predictor of institutional performance, with a coefficient of $\beta=0.778$ ($p<0.001$). This finding underscores the critical role that effective supplier relationships play in enhancing operational outcomes. In addition, information technology application ($\beta=0.154$, $p<0.01$) and procurement cost management techniques ($\beta=0.097$, $p<0.05$) were also identified as important predictors, although their influence was comparatively weaker. The findings align with previous research that emphasizes the importance of strategic procurement practices in improving organizational performance. Overall, the results suggest that the Dodoma City Council should prioritize strengthening supplier relationships while also enhancing its use of information technology and cost management techniques to optimize its performance.

4. Discussion

The findings of this study provide valuable insights into the influence of strategic procurement practices on the performance of public institutions, particularly in the context of the Dodoma City Council in Tanzania.

Supplier Relationship and Institutional Performance
The strong positive correlation between supplier relationship and the performance of the Dodoma City Council aligns with the existing literature, which emphasizes the importance of developing collaborative and mutually beneficial relationships with suppliers (Muma et al., 2014; Ndiwalana & Mugurusi, 2019). By fostering early involvement, supplier development, and collaboration, the Dodoma City Council can leverage the expertise and resources of its suppliers to enhance the quality and timeliness of service delivery, leading to improved overall performance.

Procurement Cost Management Techniques and Institutional Performance
The moderate positive correlation between procurement cost management techniques and the performance of the Dodoma City Council suggests that the adoption of cost-saving measures, such as waste elimination, competitive sourcing, and strategic budget allocation, can contribute to improved financial and operational performance. This finding corroborates the existing literature, which highlights the importance of effective procurement cost management in the public sector (Odhiambo & Kamau, 2003; Basheka & Mugabira, 2008).

Information Technology Application and Institutional Performance
The moderate positive correlation between information technology application and the performance of the Dodoma City Council indicates that the adoption of IT-based procurement practices, including supplier identification, e-procurement, and information sharing, can enhance the efficiency, transparency, and effectiveness of procurement processes, leading to improved overall performance. This aligns with the existing literature, which emphasizes the critical role of IT in enhancing the performance of public institutions (Muma et al., 2014; Ndiwalana & Mugurusi, 2019).

5. Conclusion, Implications, and the Area for Further Research

In conclusion, the study found that supplier relationship, procurement cost management, and information technology application all have significant positive impacts on the performance of public institutions, using the case of Dodoma City Council. The researcher provides recommendations for public institutions to develop supplier relationships, adopt cost-reducing procurement strategies, and continue leveraging IT systems, while addressing any weaknesses. The findings have theoretical, practical, and policy implications related to the importance of strategic procurement practices in the public sector.

The researcher suggests that future studies explore strategic procurement in private institutions, the regulatory framework supporting it in the public sector, and the key drivers and determinants of strategic procurement adoption by public organizations.

Abstract

The study was focused on the effect of Working environment on careers satisfaction in public sector: Case of Chemba District Council. The study used a cross-sectional research design while Simple random sampling and purposive sampling techniques were used to get members of the sample size of 107 respondents. Data were collected through questionnaires and interviews while data were analysed using Logistic Regression. The chi-square results indicate a significant association between the Working environment and career satisfaction. The Logistic regression analysis revealed that approximately 60.45% of Career' satisfaction can be explained by the Working environment alone (Pseudo R-squared = 0.6045), with a highly significant LR Chi (3) (LR = 66.74, $p < 0.001$). Based on this logistic regression analysis, working hours and Workload, and Job autonomy and teamwork are significant predictors of career' satisfaction in Chemba district council. These aspects of Working environment play crucial roles in determining employees' career satisfaction levels, while Physical workspace statistically insignificant at 0.05 level of significance.

Key words: *Working Environment, Career' Satisfaction, Physical workspace, Work hours, Workload, Job autonomy and Teamwork.*

1.0 Introduction

Career satisfaction is the level of peacefulness that someone feels about their job; one of the most critical determinants that determines work quality, productivity, turnover, and organizational performance (Msanya *et al.*, 2020). Low career satisfaction has long been a source of concern in many organizations. Including the Chemba District Council. According to a study by Ali and Shukralla (2021), many employees in this Chemba District Council are

dissatisfied with their jobs due to several factors such as poor working conditions, inadequate compensation lack of opportunities for growth and development, and ineffective management practices. Furthermore, Kinyua (2020) found that career development opportunities, job security, and work-life balance were the most critical factors influencing career satisfaction among employees in the public sector in Kenya.

Rodríguez (2021) defines the physical environment as the physical atmosphere in which an organization's employees work and may perceive it as emotionally favorable or unfavorable. A favorable physical environment includes giving employees space and privacy to do their work, making the office more comfortable, and improving communication. Moreover, upholding a positive workplace environment helps boost employee morale, retention, and productivity. Freedman (2022) argues that the physical environment for employees impacts their mood, drive, mental health and performance. If employees work in a tedious office setting with unfriendly workers, they likely won't have enough confidence or job satisfaction. Likewise, a safe workplace environment has been addressed by the International Labor Organization (ILO). The ILO Constitution sets forth the principle that workers must be protected from sickness, disease and injury arising from their employment (ILO, 2022). Henceforth, organizations across the world are bound to adhere to the ILO constitution by enforcing effective policies that ensure safe and conducive workplace environment for employees.

Globally, it has been reported that a conducive physical environment for employees plays a crucial role towards employees' satisfaction. In The United States of America, physical environment factors that were reported to enhance employee satisfaction include; psychosocial variables such as work demands; work organization including influence, freedom, meaning of work, and possibilities for development; interpersonal relations such as leadership and coworkers, a sense of community, role clarity, feedback, and support; and individual health and personal factors, including one's ability to cope and family supports (Donley, 2021). In Asia, evidence from Pakistan reveals that the physical environment has a positive impact on the employees' satisfaction, whereby bad working conditions limit employees to showcase their competences and attain full potential, so it is important that organizations should realize the potential of good physical environment towards employee satisfaction and performance (Raziq & Maulabakhsh, 2015). Likewise, In China, Zhenjing et al. (2022) reports that a positive physical work environment has improved employee satisfaction, commitment level and achievement-striving ability which in turn has led to improved organizational performance.

Empirical data from the Chemba District Council Human Resource Department reveals a high turnover rate of employees due to job dissatisfaction. From 2018 to 2021, the Chemba District Council recorded an average annual employee turnover rate of 25 %, which is significantly higher than the industry average of 15 %. This high turnover rate indicates that the current initiatives to enhance career satisfaction have not been successful (HR, 2023).

However, recent Tanzanian research found that 54 % of respondents were unsatisfied with their current work and 35 % planned to leave (Naburi *et al.*, 2017). One empirical study by Al-Sada and Al-Jazzify (2020) found a significant relationship between job satisfaction and employee

performance in the public sector in Kuwait. Still, there is a theoretical gap in understanding the specific factors that influence career satisfaction among employees in the Chemba District Council.

Previous studies conducted in similar areas include a study by Aziri, Wu, and Huang, (2015, 2018) on the factors influencing job satisfaction among employees in the public sector, also Khedhaouria and Gurau, (2017) did a study on the impact of management practices on employee job satisfaction in the Tunisian public sector. The key difference between these studies is the focus on the specific factors that influence career satisfaction among employees at the Chemba District Council. This study aims to provide a comprehensive understanding of the factors that influence career satisfaction in this Chemba District Council, which can inform the development of effective initiatives to enhance employee satisfaction and retention.

The issue of employee Career satisfaction has been a long-standing problem in many organizations across various sectors. The extent of this problem is evidenced by the high turnover rates, absenteeism, and decreased productivity among employees (Hammer et al., 2015). In the case of the public sector, this problem is even more prevalent due to the bureaucratic nature of the organization, which often leads to a lack of autonomy and job dissatisfaction among employees (Khan *et al.*, 2017).

The selection of the study area on the effect of organizational culture on career satisfaction in the public sector was motivated by the need to address this problem. According to recent data, the public sector has the lowest job satisfaction levels compared to other sectors, the study found that only 32% of public sector employees in the Chemba District Council reported being satisfied with their jobs, with organizational culture being a significant predictor of job satisfaction levels (Al-Hawari *et al.*, 2018). This highlights the need for interventions that focus on improving the organizational culture in the public sector to improve job satisfaction levels among employees. This highlights the urgent need for interventions to improve job satisfaction levels among public sector employees.

Various initiatives have been implemented to address this problem, including job redesign, salary increases, and training programs. However, the success of these initiatives has been limited. For instance, despite the implementation of job redesign turnover initiatives, the turnover rates among public sector employees remain high (Hammer *et al.*, 2015). If this problem is not resolved, it could have serious implications for the public sector, including decreased productivity, increased costs, and a loss of talented employees to other sectors. This could ultimately lead to a decline in the quality of public services and a loss of public trust in the government.

2.0 Empirical Literature Review

According to Mgaiwa (2021) for improved work performance, decreased Intention to leave the company, increased organizational commitment, and decreased job burnout, employees job happiness is essential. The topic of academics ' job happiness in non-European nations has

received little research, and studies on Tanzania are particularly rare “. The findings showed that academics' job satisfaction was statistically significantly predicted by academic freedom, participative decisions, teamwork, supervision, and resources, over and above their marital status, gender, age, academic rank, and institutional type. This research has both practical and policy consequences, and its findings add to the larger body of knowledge on management.

Salifu *et al.* (2018) evaluated the FIT - Choice (Factors Influencing Teaching Choice) scale's structural validity in the Ghanaian context using pre - tertiary school teachers. 354 teachers were divided into cohorts for a quantitative survey, and descriptive and inferential statistics were used to examine the results. The study discovered that rather than extrinsic utility value, the participants were persuaded by social utility value and personal utility value to pursue a teaching job. The study also revealed that while teaching, the teachers mostly relied on their subject-matter knowledge and were content with their decision to pursue a career in education without any outside pressure. The study suggested providing teachers with a better chance to benefit from employment security, family time, transfers, and social equality.

Another Recent studies have also explored the relationship between the working environment and career satisfaction. A study by Wang *et al.* (2018) found that a supportive and positive work environment was positively associated with job satisfaction among employees. Another study by Yen and Chen (2015) found that a positive work environment, including factors such as work-life balance, job security, and employee benefits, was positively correlated with job satisfaction. Similarly, a study by Afsar *et al.* (2018) found that a positive work environment, including factors such as leadership support, employee empowerment, and job autonomy, was positively associated with job satisfaction.

Several recent studies have explored the link between personality traits and career satisfaction. According to a study by Judge *et al.* (2017), conscientiousness and emotional stability were positively associated with job satisfaction, while neuroticism was negatively associated with job satisfaction. Another study by Li *et al.* (2017) found that extraversion and openness to experience were positively correlated with career satisfaction, while agreeableness was not. A study by Ng *et al.* (2019) also found that extraversion and conscientiousness were positively associated with job satisfaction, while neuroticism was negatively associated with job satisfaction.

Likewise, a study by Nouri *et al.*, (2020) investigated the impact of workspace characteristics on employees' job satisfaction in the healthcare industry in Iran. The study found that workspace characteristics, such as lighting, temperature, and cleanliness, had a significant positive effect on job satisfaction. The authors suggest that providing a clean and comfortable work environment can improve employees' job satisfaction. However, the study did not explore the potential influence of individual differences, such as personality traits or job roles, on the perceived importance of specific workspace characteristics

Another study has also explored the link between organizational culture and career satisfaction. A study by Jaiswal and Dhar (2019) found that a positive organizational culture, including factors such as trust, communication, and fairness, was positively associated with job

satisfaction among employees. Another study by Thapa *et al.* (2018) found that a positive organizational culture, including factors such as employee development, teamwork, and employee recognition, was positively correlated with job satisfaction. Similarly, a study by Kim *et al.* (2020) found that a positive organizational culture, including factors such as ethical leadership, organizational justice, and organizational support, was positively associated with job satisfaction among employees.

Finally, a study by Zeljković and Veselinović (2021) investigated the impact of the physical work environment on employees' job satisfaction in the tourism industry in Serbia. The study found that physical work environment factors, such as noise, temperature, and air quality, had a significant negative effect on job satisfaction. The authors suggest that addressing these physical work environment factors can improve employees' job satisfaction. However, the study did not assess the specific interventions or strategies that organizations in the tourism industry can implement to address these identified issues, providing actionable insights for improving job satisfaction in this sector.

The review of studies on the impact of the work environment on employees' career satisfaction provides valuable insights that are relevant to my study. It underscores the positive impact of various work environmental factors, such as physical workspace, Work hours, Workload, Job autonomy and Teamwork., on career satisfaction across diverse industries. The strength of this review lies in its comprehensive exploration of different aspects of the physical environment and their effects on employee career satisfaction. However, a limitation is the identified gaps in each study, such as the lack of exploration into variations across roles or levels and the influence of individual differences. To address these gaps, my study aims to build upon these insights by examining the effects of Work environment on career satisfaction, considering potential variations across organizational and individual characteristics, thereby contributing to a more rounded understanding of this relationship.

3.0 Methodology

This chapter presents the methodological techniques that were employed in conducting this study. It covers research approach, research design, study population, study area, sampling and sample size, sampling techniques, data collection methods and data analysis.

3.1 Research Approach

To assess the impact of the Working environment on employees' career satisfaction mixed research approach has been used. Mixed methods research is a research design that includes both qualitative and quantitative research elements, to integrate or combine the strengths of both approaches to gain a more comprehensive understanding of the research problem (Creswell & Plano, 2018). Mixed methods research allows combining the strengths of both quantitative and qualitative approaches. By integrating these approaches, we can achieve a deeper and more comprehensive understanding of research questions than would be possible with either me

3.2 Research Design

A cross-sectional research design is a type of observational study where data is collected at a single point in time from a sample of the population. This design was selected because it allowed for the collection of data at a single point in time, making it efficient and cost-effective. The study used a survey questionnaire to collect data from employees in the Chemba District Council. (Boru 2018). Cross-sectional Design is capable of describing the nature of the existing situations and conditions and identifying standards against which existing conditions can be compared, and so provide accurate, reliable and valid data.

3.3 Area of Study

The study area of this research is assessing the effect of organizational culture on career satisfaction in the public sector, specifically focusing on the Chemba District Council.

The rationale for selecting this area is to gain an understanding of how organizational culture affects career satisfaction in the public sector, which is a significant topic for policymakers and managers. Research findings from a Chemba are more likely to have direct applicability and relevance to local policymakers, administrators, and managers.

3.4 Study Population

Population refers to the complete set of individuals, items, or units of interest to a study, typically residing within a specific geographical area or sharing a common characteristic. It is a fundamental concept in statistics and research, encompassing the entirety of a defined group from which data is collected and analyzed. The population of study serves as the target group from which a sample is drawn to gather data and make inferences about the broader population. (Creswell, 2014) The population of the study was 167 employees of the Chemba District Council.

3.5 Sampling Techniques

Sampling techniques refer to the methods used to select a subset of individuals or items from a larger population for the purpose of making inferences or generalizations about the population. These techniques are crucial in research and statistical analysis to ensure that the sample accurately represents the population of interest, thereby allowing researchers to draw meaningful conclusions from their data. (Babbie, 2016). This study simple random sampling and purposeful sampling were used.

3.5.1 Simple Random Sampling

This study used two sampling techniques was used to select participants. Simple random sampling was used to select respondents for the survey, while purposive sampling was used to select key informants for the interviews and focus groups. Simple random sampling is a type of probability sampling where each member of the population has an equal chance of being selected for the sample. In this study, a random sample of employees from different departments and levels within the Chemba District Council was selected to participate in the survey. The sample size was determined using a sample size calculator to ensure that the sample is representative of the population. Simple random sampling is suitable for this study because

it ensures that each employee has an equal chance of being selected for the sample, making it a fair and unbiased sampling method.

3.5.2 Purposive Sampling

Purposive sampling, also known as judgmental sampling, is a non-probability sampling technique where participants are selected based on their expertise or knowledge of the research topic. In this study, key informants who have a deep understanding of the organizational culture and career satisfaction in the Chemba District Council were selected for the interviews and focus groups. The key informants were selected based on their job titles, roles, and responsibilities within the Chemba District Council. Purposive sampling is suitable for this study because it allows for the selection of participants who have the expertise and knowledge needed to provide rich and detailed data on the research topic. purposive sampling was employed to select key informants, who were managers or senior officials of the Chemba District Council.

3.6 Data Collection Methods

Methods of data collection encompass the systematic approaches used to gather information or data for research purposes. These methods are essential for ensuring data accuracy, reliability, and relevance to the research questions or objectives. (Neuman, 2014). This study includes techniques such as interviews and Questionnaires. A questionnaire was used to gather information from the employees of the Chemba District Council. The questionnaire was distributed to a representative sample of employees across different levels of the organization, which included questions about their perceptions of the organizational culture, level of career satisfaction, and demographic information. The questions included in the questionnaire were designed to assess the employees' perceptions of the Work environment, their level of career satisfaction, and the relationship between the two. Additionally, the interviewees were asked to provide information on how the Working environment and career development opportunities have affected their own career satisfaction and growth at the Chemba District Council. The interviews were conducted in a semi-structured format, allowing for follow-up questions and probing to gather more detailed information. The information gathered from the interviews was used to complement and validate the data collected from the questionnaire.

3.7 Variable Measurements and Data Analysis

3.7.1 Variable Measurements

Variable	Measurement
----------	-------------

Working Environment (Independent Variable 1)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Physical workspace	
Work hours and Workload	
Job autonomy and teamwork	
Career Satisfaction	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Source: Researcher (2024)

3.7.1.1 Transformation of Employee satisfaction

The 5-point Likert scale data on Career satisfaction were transformed into an index scale using the overall mean scores. Thus, the mean score greater or equal to the overall mean was termed as Satisfied while the score below the overall mean was termed Not satisfied.

3.7.1.2 Distribution of Career Satisfaction

The distribution of career satisfaction in a binary format, indicates the data on career satisfaction, indicating the frequency and percentage of employees categorized as either "Not Satisfied" or "Satisfied." Of the total sample, 23.36% of employees expressed that they were not satisfied with their careers, while the majority, comprising 76.64%, reported being satisfied. This data suggests that a significant proportion of employees are content with their careers, but there is also a notable portion that does not feel satisfied. Understanding the reasons behind both satisfaction and dissatisfaction can be crucial for organizational management to address concerns and improve overall employee well-being and performance.

One of the primary reasons why employees are satisfied with their careers at Chamba District Council is the presence of a supportive work environment. This includes having approachable supervisors, open communication channels, and a culture that values employee well-being. When employees feel supported and valued, they are more likely to be satisfied with their jobs. Another important factor that contributes to employee satisfaction is the availability of opportunities for growth and development within the organization. Chamba District Council may offer training programs, career advancement opportunities, and mentorship initiatives that help employees enhance their skills and progress in their careers. Employees are likely to be satisfied with their careers at Chamba District Council if they receive competitive compensation packages and attractive benefits. Fair pay, bonuses, healthcare coverage, retirement plans, and other perks can significantly impact employee satisfaction levels.

satisfied.

Table 3.7.1 Distribution of Career Satisfaction

Employee satisfaction	Frequency	Percent
Not Satisfied	25	23.36
Satisfied	82	76.64

Source: Researcher (2024)

3.7.2 Data Analysis

Logistic regression analysis was employed to examine the significance of the relationship between the independent variable, which is the physical environment, and the dependent variable, employee satisfaction, within the National Food Reserve Agency (NFRA). The Logistic regression equation used for this analysis encapsulates this relationship below;

$$\text{logit}\left(\frac{p}{1-p}\right) = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}$$

Where:

Logit = logistic link function

p = probability that there is an influence of Working *environment and career satisfaction* in Chemba district.

$1-p$ = probability that there is influence of Working *environment and career satisfaction* in Chemba district.

β_0 = intercept

β_1 - β_3 = parameter estimates or logit coefficients

y =Career satisfaction

- X_1 - X_4 = Physical workspace(X_1), Work hours and Workload (X_2), Job autonomy and Teamwork(X_3).

3.8 Validity and Reliability of Data

To enhance validity, a preliminary study was carried out to improve the research's credibility by testing the research tools on a small group of participants beforehand. This initial assessment was designed to verify that the tools accurately capture the desired variables.

The reliability of the data was evaluated using Cronbach's Alpha test. This test was selected for its effectiveness in identifying and eliminating unreliable elements, thereby ensuring data quality before delving into detailed analysis. A higher Cronbach's Alpha (closer to 1) indicates better reliability. The physical workspace has a Cronbach's Alpha of 0.868, indicating strong reliability. Work hours and Workload show a Cronbach's Alpha of 0.862, reflecting very good

internal consistency. Job autonomy and Teamwork with a Cornbrash's Alpha of 0.838, indicates good reliability. Values have a slightly lower Cornbrash's Alpha of 0.793, but it is still within acceptable limits for reliability also Career Satisfaction shows the lowest Cronbach's Alpha of 0.769, yet it remains within the acceptable range.

Table 3.7.1 Overall Reliability Statistics

Working environment		
Physical workspace	0.868	5
Work hours and Workload	0.862	5
Job autonomy and Teamwork	0.838	5
Dependent variable		
Career Satisfaction	0.769	5

3.9 Ethical Consideration

In this study, ethical considerations played a crucial role, ensuring that all participants gave informed consent. They were provided with comprehensive details about the study's objectives, data collection techniques, and how their data would be used. This study adhered to four research ethics, which include obtaining informed consent from all participants, maintaining confidentiality and anonymity of the participants, avoiding harm to the participants, and ensuring the research findings are accurate and honest. Participants were reassured that their involvement was voluntary, and they had the right to withdraw from the study at any point without any consequences. Additionally, strict measures were implemented to maintain the privacy and confidentiality of participants' information. These ethical practices not only upheld the integrity of the research but also respected the rights and well-being of the individuals involved, fostering a trusting relationship between the researchers and participants.

4.0 Results

The research focused on evaluating the significant regression between the predictor variable, Working Environment, and the outcome variable, Career Satisfaction in Chemba District, Tanzania. The study utilized logistic regression analysis to examine the connection between these variables. By employing this statistical method, the research aimed to ascertain the extent to which the working environment, encompassing, influences career satisfaction levels within Chemba district.

4.1 Association Between Working Environment on Career Satisfaction Among Employees

The association between the working environment and career satisfaction among employees, was analyzed at a significance level of 0.05. Each variable (Physical workspace, Work hours and Workload, Job autonomy and teamwork) is assessed in terms of its impact on employee satisfaction, categorized as "Not satisfied" and "Satisfied."

For the variable of Physical workspace, the chi-square value is 4.9899 with a corresponding p-value of 0.025, indicating a statistically significant association between the physical workspace and employee satisfaction. The data shows that among employees who responded negatively to their physical workspace (No), 22 (18.42%) were not satisfied, while 3 (23.68%) were satisfied. What entails that a well-designed physical workspace can significantly impact employee productivity. Providing ergonomic furniture and adequate lighting can reduce physical strain and discomfort, leading to improved focus and efficiency. At Chemba District Council, a comfortable and functional workspace can enhance employees' ability to perform their tasks effectively, ultimately contributing to higher job satisfaction. The layout of the physical workspace can also influence collaboration and communication among employees. An open-plan office design can facilitate spontaneous interactions and idea-sharing, fostering a sense of teamwork and camaraderie. Through promoting communication channels through the physical workspace, Chemba District Council employees are more likely to feel connected with their colleagues and engaged in their work. A conducive physical workspace contributes to the overall well-being of employees. Factors such as access to natural light, green spaces, and comfortable break areas can positively impact mental health and reduce stress levels. At Chemba District Council, prioritizing employee well-being through the physical workspace demonstrates a commitment to creating a supportive work environment that values the health and happiness of its staff members. The physical workspace plays a crucial role in fostering a sense of belonging among employees. By incorporating elements that reflect the organization's culture and values, such as branded decor or communal areas for socializing, employees at Chemba District Council can develop a stronger connection to their workplace. Feeling a sense of belonging can boost morale and job satisfaction, leading to higher levels of employee retention and engagement. The study findings are supported by Afsar *et al.* (2018) that a workspace that is ergonomically designed with comfortable seating, proper lighting, and suitable desk and computer setups can reduce physical strain and discomfort, leading to better health and well-being for employees. This, in turn, contributes to higher job satisfaction. A well-organized and distraction-free workspace can help employees concentrate better and be more productive. Factors like adequate privacy, noise control, and proper ventilation can create an environment conducive to focused work, enhancing job satisfaction. Conversely, among those who responded positively (Yes) to their physical workspace, 53 (81.58%) were satisfied, and 29 (76.32%) were not satisfied. This suggests that a positive perception of the physical workspace is associated with higher levels of job satisfaction.

Similarly, for the variable of Work hours and Workload, the chi-square value is 5.8889 with a p-value of 0.015, indicating a significant association. Among employees who reported dissatisfaction with work hours and workload (No), 21 (30.88%) were not satisfied, and 4 (10.26%) were satisfied. This entails that work hours play a vital role in determining employee

satisfaction at Chemba District Council. When employees are required to work excessive hours without adequate rest or breaks, it can lead to burnout, decreased job satisfaction, and increased turnover rates. On the other hand, providing employees with reasonable work hours that allow for a healthy work-life balance can enhance job satisfaction and overall well-being. For example, if employees at Chemba District Council are consistently required to work overtime without proper compensation or recognition, it can result in feelings of resentment and dissatisfaction. Conversely, implementing flexible work schedules or offering telecommuting options can empower employees to manage their time effectively, leading to higher levels of job satisfaction. Meanwhile, the workload assigned to employees also plays a significant role in determining their level of satisfaction at Chemba District Council. A manageable workload that aligns with employees' skills and capabilities can boost morale and job satisfaction. Conversely, overwhelming workloads that exceed employees' capacity can lead to stress, fatigue, and decreased job satisfaction. If employees at Chemba District Council are consistently overloaded with tasks that surpass their abilities or resources, it can negatively impact their performance and job satisfaction. Providing adequate resources, training opportunities, and support systems to help employees manage their workload effectively is essential for enhancing job satisfaction and overall productivity. When work hours and workload are optimized to meet the needs of employees at Chemba District Council, it results in higher levels of job satisfaction. Employees feel valued, respected, and motivated to perform at their best when they have a healthy balance between work responsibilities and personal life. This leads to increased engagement, loyalty, and commitment to the organization's goals. The study findings are supported by Judges (2017) who claimed that reasonable work hours and a manageable workload allow employees to maintain a healthy balance between their professional and personal lives. When work demands encroach too much on personal time and responsibilities, it can lead to burnout, stress, and dissatisfaction with the job. Excessive workloads and long work hours can create a high-stress environment, where employees feel overwhelmed and unable to cope with the demands of their job. This can lead to physical and mental exhaustion, decreased productivity, and a general sense of dissatisfaction with the job. On the other hand, among those satisfied with work hours and workload (Yes), 47 (69.12%) were satisfied, and 35 (89.74%) were not satisfied. This indicates that favourable perceptions of work hours and workload are linked to higher levels of job satisfaction.

Lastly, on Job autonomy and teamwork, test the chi-square value is 32.1033 with a p-value of 0.000, showing a highly significant association. Among employees without job autonomy and teamwork (No), 13 (20.63%) were not satisfied, and 12 (27.27%) were satisfied. What gives an implication of the fact that At Chemba District Council, providing job autonomy to employees can contribute significantly to their satisfaction. For example, allowing employees to have flexibility in how they manage their daily tasks can lead to a greater sense of ownership and accomplishment. When individuals feel that they have the authority to make decisions related to their work without constant supervision, it can enhance their motivation and engagement.

On the other hand, teamwork involves collaboration among individuals working towards a common

goal. When employees at Chemba District Council are encouraged to work together effectively as a team, it fosters a sense of belonging, support, and camaraderie. This collaborative environment can positively impact employee satisfaction in several ways. Teamwork promotes communication and idea-sharing among employees, leading to enhanced problem-solving abilities and innovation. When individuals feel supported by their colleagues and are able to rely on each other for assistance, it creates a positive work culture that boosts morale and job satisfaction. Additionally, successful teamwork often results in shared successes and achievements, which can further motivate employees and increase their overall job satisfaction. Employees at Chemba District Council who are given autonomy in managing their projects may experience higher job satisfaction levels compared to those with limited independence. For instance, a project manager who has the freedom to choose the strategies for implementing a community development initiative may feel more invested in the project's success. In departments where teamwork is emphasized at Chemba District Council, such as during collaborative efforts on public service campaigns or infrastructure projects, employees may report greater job satisfaction due to the sense of unity and shared accomplishments within the team. Conversely, among those with job autonomy and teamwork (Yes), 50 (79.37%) were satisfied, and 32 (72.73%) were not satisfied. This suggests that having job autonomy and positive teamwork environments is strongly associated with higher career satisfaction levels.

Table 4.1.1 The Association between Working Environments on Career Satisfaction Among Employees

Variable	Not satisfied	Satisfied	Chi-square	P-Value
Physical workspace			4.9899	0.025
No	22(18.42)	53(81.58)		
Yes	3(23.68)	29(76.32)		
Work hours and Workload			5.8889	0.015
No	21(30.88)	47(69.12)		
Yes	4(10.26)	35(89.74)		
Job autonomy and teamwork			32.1033	0.000
No	13(20.63)	50(79.37)		
Yes	12(27.27)	32(72.73)		

Overall, the data indicates that the physical workspace, work hours and workload, and job autonomy with teamwork significantly influence employee satisfaction levels, highlighting the importance of these factors in creating a positive work environment. The study findings are linked to the study by Ng *et al.* (2019) that when employees have autonomy, they feel a sense of ownership and responsibility for their work, which can increase intrinsic motivation and job satisfaction. Autonomy allows employees to exercise their skills, creativity, and problem-solving abilities, leading to a greater sense of accomplishment and fulfillment. Employees with autonomy can tailor their work methods to their preferences, strengths, and work styles, resulting in better work-life balance and job satisfaction.

4.2 Diagnosis Test

4.2.1 Omnibus Tests of Model Coefficients

Working environment, the omnibus test also indicates a significant association ($\chi^2 = 28.095$, $df = 4$, $p = 0.004$). This suggests that the Working environment factors considered in the model have a significant impact on Career satisfaction, at 0.05 level of significance.

Table 4.2. 1 Omnibus Tests of Model Coefficients

Logistic regression model	Chi square	Degree of freedom	significance
working environment on career satisfaction	7.1419	3	0.002

4.2.3 Hosmer and Lemashow Model Test

the logistic regression model examining the Working environment, the Hosmer and Lemeshow test shows a chi-square value of 1.748 with 4 degrees of freedom and a p-value of 0.276. Again, with a p-value greater than 0.05, this suggests that the model also fits the data adequately. Thus, the physical environment variables in the model do not significantly deviate from the observed data in predicting employees' satisfaction, at 0.05 level of significance.

Table 4.2..2 Hosmer and Lemashow Model Test

Logistic regression model	Chi square	Degree of freedom	significance
working environment on career satisfaction	1.748	4	0.276

4.3 To Examine the Effect of the Working Environment on Career Satisfaction Among Employees.

The results of a logistic regression analysis examining the effect of the working environment on career satisfaction among employees. The analysis includes three aspects of the working environment: physical workspace, work hours and workload, and job autonomy and teamwork. The base outcome for career satisfaction is "Not satisfied." Physical Workspace. The coefficient (Coef.) for the physical workspace is 0.511. The odds ratio (OR) is 1.0417. The z-value is 6.222. The p-value ($P>|z|$) is 0.065. The positive coefficient (0.511) and odds ratio (1.0417) suggest a slight positive association between having a suitable physical workspace and career satisfaction. However, the p-value of 0.065 is above the 0.05 significance threshold, indicating that this relationship is not statistically significant. Thus, there is insufficient evidence to conclude that the physical workspace significantly affects career satisfaction.

The coefficient (Coef.) for work hours and workload is 1.2619. The odds ratio (OR) is 2.4312 and the z-value is 14.114. The p-value ($P>|z|$) is 0.001. The positive coefficient (1.2619) and odds ratio (2.4312) suggest that employees with manageable work hours and workloads are more than twice as likely to report career satisfaction compared to those without such conditions. The p-value of 0.001 is well below the 0.05 threshold, indicating that this result is statistically significant.

Therefore, work hours and workload have a significant impact on career satisfaction. Job Autonomy and Teamwork.

The coefficient (Coef.) for job autonomy and teamwork is 1.4011. The odds ratio (OR) is 3.0312. The z-value is 10.164. The p-value ($P>|z|$) is 0.000. Interpretation: The positive coefficient (1.4011) and odds ratio (3.0312) indicate that employees who experience job autonomy and effective teamwork are three times more likely to report career satisfaction. The p-value of 0.000 shows this result is statistically significant at the 0.05 level, demonstrating that job autonomy and teamwork significantly enhance career satisfaction. Constant: The constant coefficient is 0.1616 with an odds ratio of 0.1783 and a z-value of 0.3436. The p-value ($P>|z|$) is 0.000. Interpretation: The constant term in the model is statistically significant, which sets the baseline level of career satisfaction when all predictors are held at zero.

Table 4.3.3. Logistic Regression Analysis to examine the physical environment on employees' satisfaction in NFRA

Career satisfaction	Coef.	Odds Ratio	z	$P> z $
Not satisfied (base outcome)				
Openness and conscientiousness				
Yes	1.884	2.246	18.93	0.001
No (Reference)				
Extraversion				

Yes	1.2122	1.9783	12.87	0.006
No (Reference)				
Agreeableness and Neuroticism Yes	0.3516	1.002	3.422	0.071
No (Reference)				
Constant	0.553	.1154	0.423	0.000

Number of observation = 107 LR Chi2(3) = 109.2

Prob > Chi2 = 0.000

Pseudo R2 = 0.65

Source: Authors compilation from STATA 17

Overall, the logistic regression model includes 107 observations and has a Likelihood Ratio (LR) Chi2 value of 66.074 with a p-value of 0.000, indicating that the model as a whole is statistically significant. The Pseudo R2 value of 0.6045 suggests that the model explains approximately 60.45% of the variance in career satisfaction. Notably, work hours and workload, as well as job autonomy and teamwork, show significant positive effects on career satisfaction, while the physical workspace does not have a statistically significant effect at the 0.05 level.

5.0 Discussion

The findings of the present study regarding the role of the Working environment on Career satisfaction within Chemba district a general perception among participants that the Working environment has potential impacts on their overall satisfaction.

In The logistic regression analysis indicates a coefficient of 0.511 and an odds ratio of 1.0417 for the physical workspace, suggesting a slight positive association with career satisfaction. However, the p-value of 0.065 indicates that this relationship is not statistically significant. This finding suggests that while an appropriate physical workspace can positively impact employee satisfaction, the effect may not be strong enough to be deemed statistically reliable. Existing literature supports the notion that environmental factors, such as ergonomically designed spaces, contribute to employee well-being and productivity Afsar et al., (2018). Ergonomics can reduce physical strain, potentially leading to improved job performance. However, as the results show, the impact may vary among individuals, and further research could explore specific aspects of the workspace that might enhance satisfaction more significantly.

In contrast to the physical workspace, work hours and workload demonstrate a strong relationship with career satisfaction, evidenced by a coefficient of 1.2619 and an odds ratio of

2.4312. The p-value of 0.001 indicates a statistically significant impact, suggesting that employees with manageable workloads and reasonable work hours are more than twice as likely to report satisfaction. This aligns with previous studies that emphasize the importance of work-life balance and manageable workloads in enhancing employee satisfaction and reducing burnout (Judges, 2017). Organizations that prioritize reasonable work hours and workload distribution are likely to see improved employee morale and retention.

The variable of job autonomy and teamwork has the most substantial impact on career satisfaction, with a coefficient of 1.4011 and an odds ratio of 3.0312. The p-value of 0.000 confirms this relationship is statistically significant. Employees who experience autonomy in their roles and engage in effective teamwork are three times more likely to report satisfaction. This finding resonates with the body of literature that links autonomy and collaboration to higher job satisfaction and employee engagement (Ng et al., 2019). When employees feel empowered to make decisions and collaborate with colleagues, it fosters a positive work environment that enhances their sense of belonging and motivation. Organizations should thus focus on cultivating a culture that encourages autonomy and teamwork to improve overall job satisfaction.

6.0 Conclusion

This study underscores the significant influence of the working environment on career satisfaction among employees at Chemba District Council. The analysis reveals that while the physical workspace has a positive, albeit non-significant, association with satisfaction, work hours and workload, along with job autonomy and teamwork, demonstrate strong and statistically significant impacts. These findings highlight the critical importance of manageable workloads and fostering a collaborative culture that promotes employee autonomy. By prioritizing these factors, organizations can enhance employee satisfaction, reduce turnover, and ultimately improve overall organizational performance. This research contributes valuable insights for policymakers and organizational leaders, emphasizing the need for comprehensive strategies that create supportive and engaging work environments. Future studies could further explore specific elements within these variables to deepen the understanding of their effects on employee satisfaction and performance..

7.0 Recommendations

The government should implement policies that promote work-life balance and mental well-being in the workplace. This could include regulations on maximum work hours and guidelines for promoting healthy work environments. Additionally, initiatives that support ergonomic standards in public sector offices can help create healthier workplaces, which may lead to improved productivity and employee satisfaction.

Chemba District Council should prioritize investments in physical workspace improvements, ensuring that work environments are ergonomically designed and conducive to collaboration. Furthermore, the Council should consider regular assessments of workload distribution among

employees to prevent burnout. Offering flexible work arrangements can also enhance employee satisfaction and overall performance.

Employers within the Chemba District Council should foster a culture of autonomy and teamwork by empowering employees to make decisions related to their roles. Providing training and resources for effective teamwork can enhance collaboration. Regular feedback mechanisms should be established to ensure that employees feel valued and heard, which is crucial for maintaining high levels of job satisfaction.

Employees should take an active role in voicing their needs regarding workload management and workplace conditions. Engaging in open communication with supervisors about work hours and responsibilities can lead to a more balanced work environment. Additionally, employees should prioritize their well-being by seeking support when feeling overwhelmed, thereby contributing to a healthier workplace culture.

The impact of the Managerial Support on Implementation of Internal Audit Recommendations in Local Government Authorities: A Case of Dodoma City Council

Leah Lupala¹, & Richard Msaki²

¹College of Business Education

²College of Business Education

Email: leahlupala4@gmail.com / rimsaki@yahoo.com

Abstract

This paper investigates the impact of managerial support on the implementations of internal audit recommendation in local government authorities. The study draws experience from Dodoma City Council. Using explanatory research design, a sample of 222 employees was randomly selected from Dodoma City Council. Data were collected through survey questionnaire while the descriptive statistics were presented through mean and standard deviation. Also, inferential statistics were presented using linear regression analysis. The findings show that management is committed in allocating resources, incorporating strategic plan and supporting training and capacity building. The study further unveils that allocation of resources, incorporation into the strategic plan, training and capacity building are significantly associated with the implementation of internal audit recommendations in local government authorities. The study recommends that the management of Dodoma City Council should continue supporting the audit committee in order to be active, independent, and well-resourced. In addition, it is recommended that the committee should regularly review progress on implementing audit recommendations, provide guidance to management on addressing any challenges, and report directly to senior leadership.

Keywords: *Internal Audit Recommendations, Local Government Authorities, Dodoma City Council*

1.0 Introduction

The field of internal audit has garnered increasing attention in recent years, particularly within the context of global corporate governance (Mahyoro & Kasoga, 2019). The implementation of internal audit recommendations is crucial for organizations to enhance their operations and achieve their objectives. Successful implementation requires senior management oversight, audit committee involvement, and robust follow-up mechanisms (Alias, 2019). Internal auditors play a vital role in assisting local government authorities (LGAs) in maintaining comprehensive frameworks for governance and accountability. The successful implementation of audit recommendations requires senior management oversight, audit committee, follow-up mechanisms implementation approaches that set clear actions, and aggressive monitoring and follow-up (Alias, 2019). The internal audit function plays an important role in helping local government authorities maintain a comprehensive framework of internal controls. Internal auditors assist management in monitoring the design and proper functioning of internal control policies and procedures, and also conduct performance audits, special investigations, and studies (Mahyoro & Kasoga, 2021). In developed countries such as

the UK and US, the implementation of internal audit recommendations is a legal requirement. The Federal Managers' Financial Integrity Act of 1982 in the US and the Standards for Internal Controls in the Federal Government require prompt resolution of audit recommendations (Tahajuddin *et al.*, 2019). In the UK, the Chartered Institute of Internal Auditors (IIA) has developed a code of practice that outlines the principles and practices for internal audit, including the implementation of recommendations (Katuli, 2019).

However, the situation in developing countries presents a different picture. In many African nations, while the importance of implementing internal audit recommendations is recognized, challenges persist. Limited resources, lack of political will, and inadequate follow-up mechanisms often hinder the effective implementation of audit recommendations. This gap between developed and developing nations highlights the need for context-specific research and solutions. In Tanzania, the decentralization of decision-making has transferred power and authority from the central government to LGAs. This process aims to empower local communities, enhance service delivery, and foster development at the grassroots level (Massawe, 2020).

LGAs in Tanzania are established under Articles 145 and 146 of the 1977 Constitution of the United Republic of Tanzania. Their primary functions include social development, public service delivery, and promotion of local development through participatory processes (Rugeiyamu *et al.*, 2018). Ideally, internal audit has a crucial role in boosting organizations accomplish their desired objectives. It has constantly been viewed as fundamental part in corporate governance, and improving the performance of the public and private institutions (Manyama, 2020). It is from this context the government established Internal Auditor General Division (IAGD) based on the Public Finance Act, 2004 as amended in 2010. This Act compels accounting officers to establish an efficient internal audit service unit within the council as stated in Regulation 28 of the Public Finance Regulations 2001 revised in 2004. Pursuant to this Act LGAs were required to fully comply not with audit but also implement all internal audit recommendations.

Weak audit committees, inadequate resources, insufficient management commitment, and deficient auditor skills have been identified as key obstacles to the implementation of internal audit recommendations (Wadesango, 2017). Similarly, Dwamena (2021) revealed that internal auditors face many setbacks. Internal auditors are taken for granted and lack independence and cooperation from other staff and management support. Again, they have defined scope of work with limited power and have inadequate career development to make them effective in performing their roles. Likewise the study by Onumah, and Krah (2012), the effectiveness of internal audit in the Ghanaian public sector is hampered by several factors: low professional proficiency of internal auditors; lack of management ownership and support for internal audit activities, lack of budget authority of the internal audit units and weak functioning of audit committees, among others.

Thus, most reviewed studies focused on the challenges facing internal auditors were conducted outside Tanzania (Onumah & Krah, 2012; Wadesango, 2017; Dwamena, 2021). Also, studies in the Tanzanian context had their focus on the challenges facing internal auditors

(Mtelevu & Sila 2021; Mbogella *et al.* 2024). Thus, there is a dearth of literature focusing on the impact of managerial support on the implementation of internal audit recommendations in local government authorities.

While Tanzania government emphasizes on community development and service delivery (Mwita, 2023), specific research focusing on the implementation of internal audit recommendations in Tanzania's LGAs are lacking. But the current study will increase the degree of implementation of internal audit recommendations in LGAs the effectiveness and efficiency to the staff and decision makers. The study is crucial for effective implementation of audit recommendations due to the essential for achieving value for money in public finance management within LGAs, also it is vital for enhancing accountability and transparency in local governance, and understanding the factors influencing implementation can inform policy decisions related to management support.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 Management Support

Management support refers to the active involvement, commitment, and assistance provided by an organization's leadership to ensure the successful implementation and operation of various initiatives, projects, and day-to-day activities. Effective management support is crucial for the success of any organization, as it ensures that teams have the backing they need to achieve their objectives and contribute to the organization's overall mission (Jafar *et al.*, 2022).

2.1.2 Internal Audit

Internal audit refers to the strategies and practices implemented within the decentralized health system to maintain skilled healthcare professionals within their roles over time. It encompasses the policies aimed at creating a supportive and motivating work environment that encourages employee engagement, commitment to organizational goals, and a sense of job satisfaction (Krichene, & Baklouti, 2021). Indicators of retention in this study include factors such as trainings opportunities, career development prospects, work-life balance initiatives, competitive compensation and benefits, recognition and rewards for performance, and supportive leadership. These indicators collectively measure the effectiveness of organizational strategies in reducing turnover and retaining healthcare professionals in Dodoma City's decentralized health system.

2.1.3 Internal Audit Recommendations (IAR)

Internal audit recommendations are suggestions and proposals made by internal auditors to enhance an organization's operations, governance, risk management, and internal control processes. Previous studies have investigated the factors affecting internal audit

effectiveness (Alqudah, *et al.*, 2019). Internal auditing is an independent, objective assurance and consulting activity designed to add value and improve organization's operations. In order to strengthen the implementation of internal audit recommendations in LGAs there is the need for government to support management of local government by overseeing the implementation of internal audit recommendations to achieve the goals of local governments especially in Dodoma City Council.

2 Theoretical Framework

2.2.1 Resource Based Theory

Resource based theory was developed in the mid-1980s by Birger Wernerfelt, Jay Barney, and other organizational theorists and it was merged as a counterpoint to Porter's theory that a firm's external environment determines strategy and performance (Barney, 2001). According to this theory, resources can be tangible (financial capital, physical assets) or intangible (specialized skills, organizational culture, and intellectual property) (Barney, 2001). Managerial support plays a crucial role in allocating resources to implement internal audit recommendations. When managers are supportive, they are more likely to allocate necessary resources such as budget, time, and personnel to ensure that audit recommendations are effectively implemented. From a resource-based theory perspective, managerial support can be viewed as a critical resource that contributes to the successful implementation of internal audit recommendations. The resource-based theory (RBT) provides some insights into the implementation of internal audit recommendations in Local Government Authorities (LGAs) in Dodoma Municipal Council, Tanzania, but it also has some limitations.

In the field of internal audit and the implementation of audit recommendations, several studies have utilized the resource-based theory as a theoretical framework: Mahyoro and Kasoga (2021) assessed the role of management support in enabling effective internal auditing in the Tanzanian public sector context, leveraging the resource-based theory to understand how internal audit capabilities can be a source of competitive advantage. These studies demonstrate the applicability of the resource-based theory in understanding the implementation of internal audit recommendations and the role of internal audit capabilities in contributing to organizational performance and competitive advantage. However, RBT primarily focuses on internal resources and capabilities, but it may not adequately address the influence of external factors, such as regulatory requirements, stakeholder expectations, or political considerations, which can also play a significant role in the implementation of internal audit recommendations in LGAs.

2.3 Empirical Literatures

Girma (2023), conducted a study to determine the variables influencing Commercial Nominees Plc's internal audit effectiveness in Ethiopia. To assess the impact of internal organization, internal audit quality, management support, and internal audit competencies on internal audit efficiency, the study used both quantitative and qualitative data to get data-

gatherings. Using a stratified random sampling technique, 270 employees made up the study's sample. The results showed that the greatest influence on internal audit efficiency came from managerial assistance. Significant determinants also included internal organization, audit quality, and the competencies of internal auditors. According to the study, management support plays a crucial role in improving the efficacy of internal audits. It is suggested that the effective execution of internal audit recommendations is largely dependent on managerial support and sufficient resources. The study is relevant in the sense that it focused on internal audit. However, the study was conducted in private entities while the current study was conducted in public entities. Similarly, the reviewed study was conducted in Ethiopia while the current study was conducted in Tanzania.

Similar to the study by Girma (2023), the research by Jaffar *et al.* (2022) was also conducted outside Tanzania. However, the study assessed the relationship between internal audit Function in Malaysia, Management Support, and Corporate Governance in the Public Sector. The study employed both Agency and Institutional theories. The Google Scholar online means was used to collect the articles systematically sampled. It was revealed that management support fostered the IA performance through staffing, training, and compensation for effectiveness. Also management's active involvement and buy-in demonstrate their commitment to addressing the issues identified by the internal audit. Effective implementation of internal audit recommendations often requires the allocation of resources, such as personnel, budget, and time. Management's support is crucial in ensuring that the required resources are made available to implement the recommendations. Thus, the reviewed study by Moreover, Jaffar *et al.* (2022) focused on assessing the relationship between internal audit function, the current study focused on the impact of the managerial support on implementation of internal audit recommendations in local government authorities. Likewise, the study was conducted in Malaysia while the current study was conducted in Tanzania.

Additionally, Alzeban and Gwilliam (2012) conducted a study that aimed to furnish empirical information regarding the main factors that impact the efficiency of internal audits in public sector organizations located in Saudi Arabia. They examined the relationship between internal audit effectiveness and five principal factors internal audit competence, internal audit department size, internal and external auditor relationship, management support for internal audit, and internal audit department independence using data from 79 public sector organizations and 442 usable questionnaires responses. They also used conventional multiple regression and path analysis. Their findings indicated that management support was the primary driver of internal audit effectiveness, significantly influencing other aspects such as hiring qualified staff, providing sufficient resources, enhancing relationships with external auditors and maintaining an independent internal audit department.

Meanwhile, Poltak *et al.* (2019) looked at what factors affected internal audit effectiveness; they discovered that management support was a significant moderating factor in Indonesia. According to the study, management support has a beneficial impact on internal audit effectiveness, especially in companies where the internal audit function is well-established and when management values internal auditors' opinion. Like the study by Girma

(2023), Jaffar *et al.* (2022), and the study by Alzeban and Gwilliam (2012), the study by Poltak *et al.* (2019) was also conducted outside Tanzania.

On the other hand the study conducted in Tanzania by Dogani (2020) focused on the effectiveness of internal audits in enhancing financial management of the Fire and Rescue Force departments using the case of the Fire and Rescue Force department and find out challenges facing effectiveness in internal audit. The study noted that internal audit units in the Fire and Rescue Force department are effective; their effectiveness was due to several factors; including the independence of internal auditors, roles of the audit committee, and resources to internal auditors, due care, training and promotion. The study however was conducted in central government entities while the current study was conducted in local government authorities.

Moreover, Mtelevu and Sila (2021) determined internal auditors' challenges in implementing IRMF in mitigating organisational Risks in Higher Learning institutions in Tanzania, a Case Study of One Higher learning institution in Arusha. The results indicated that there are several challenges are affecting audit at One Higher learning institution in Arusha such as lack autonomy independent, inadequate funding, involvement of internal auditors in non- audit work, Inadequacy number of staff and inadequate staff training on risk mitigation and management, inadequate management support, staff awareness of risk and management response to recommendations of the Internal Auditors report is very minimal. It is clearly indicated that the focus of the study was to determine the challenges faced by auditors while the focus of this current study was to investigate the impact of managerial support on the implementations of internal audit recommendation in Local Government Authorities in Dodoma City Tanzania. Like the study by Dogani (2020), the study by Mtelevu and Sila (2021) was conducted in central government entities while the current study was conducted in local government authorities.

Also Mbogella *et al.* (2024) examined challenges facing internal auditors in Tanzania: a case of local government authorities in Tanzania. The study included that Ilala CC, Dodoma CC, Iringa MC, Singida DC, and Chamwino DC. The study found that Local Government Authorities still face serious challenges in terms of preparation of audit documents and filing systems before auditing, non-compliance to audit standards, Audit teams staying longer without updating their skills and unclear flow of command which still erodes the internal audit section. Given the fact that Internal Audit is a key parameter of good governance, addressing all audit issues, thus should not be underestimated by the Local authorities. Both these studies were conducted in local government authorities. Nevertheless, while the reviewed study by Mbogella *et al.* (2024) examined challenges facing internal auditors in Tanzania: a case of local government authorities in Tanzania, the current study focused on the impact of the managerial support on implementation of internal audit recommendations in local government authorities: a case of Dodoma City Council.

In the Tanzanian context, empirical studies have primarily focused on assessing challenges facing internal auditors as highlighted by Mtelevu and Sila (2021) and Mbogella *et al.* (2024). Yet, there have been insufficient studies in research regarding the impact of

management support on implementation of internal audit recommendations in local government authorities with reference to Dodoma City Council.

To conclude from the provided literature, a clear research gap emerges. While previous studies have investigated various aspects of internal audit effectiveness and challenges, there are some notable distinctions and gaps in relation to your research on managerial support in the implementation of internal audit recommendations within local government authorities (LGAs) in Dodoma City Council. Girma (2023) and Jaffar *et al.* (2022) focused on internal audit in private sector organizations and public entities outside Tanzania (Ethiopia and Malaysia, respectively). However, this study specifically investigated local government authorities in Tanzania, creating a gap in understanding how managerial support influences internal audit recommendations within Tanzanian LGAs.

While much of the reviewed literature, such as studies by Girma (2023) Jaffar *et al.* (2022), Alzeban and Gwilliam (2012) and Poltak *et al.* (2019), focused on different countries, there is a lack of localized research on this topic in Tanzania. This study provides a unique exploration of the Tanzanian public sector specifically Dodoma City Council filling this gap. Moreover, the studies by Dogani (2020) and Mtelevu and Sila (2021) were focused on central government entities and higher learning institutions, whereas this study focused on local government authorities, an under-researched area. This highlights the gap in understanding the dynamics and effectiveness of managerial support in local government authorities. Likewise, studies such as Mtelevu and Sila (2021) and Mbogella *et al.* (2024) focused on challenges facing internal auditors rather than the impact of managerial support on implementing audit recommendations. This research offers a new perspective by directly addressing how management's role facilitates or hinders implementation within local government authorities. Thus the study addresses a significant gap by exploring how managerial support affects the implementation of internal audit recommendations in local government authorities in Tanzania, a subject that has received limited attention in previous research. This localized focus on Dodoma City Council and the specific aspect of recommendation implementation offers a fresh contribution to the existing body of knowledge.

3.0 Material and Methods

This section describes the research methodology which includes: research design, area of study, research approach, population, sample, sampling techniques, sample size, data collection methods and tools data analysis technique, reliability and validity of the instruments and ethical considerations.

3.1 Research Design

In this study, explanatory research design was employed. Explanatory research was used to understand the cause-and-effect relationships between variables. In the context of internal audit recommendations, it helped in understanding how management support has an impact on the implementation of these recommendations.

3.2 Research Approach

Research approach entails that procession of indenting the kind of data prior data collection (Kumar, 2019). The current study used a quantitative approach because it makes it possible to gather and examine numerical data, which can then be statistically examined to find patterns, relationships, and causes (Creswell & Creswell, 2017). The research employed a quantitative approach to measure respondents' opinions using a five-dimensional Likert scale which was analyzed using linear regression to establish a statistical relationship between the independent variable (managerial support) and the dependent variable (implementation of internal audit recommendations), making this approach appropriate (Turok, 2017).

3.3 Study Area

The study was conducted at the Dodoma City Council in Tanzania. Dodoma City Council was purposively selected from among the councils in Dodoma region because it is one of the LGAs that were noticed to have low implementation rate of audit recommendations, with only 30% fully implemented within the recommended timeframe over the past year according to the Internal Audit Report (2023).

3.4 Study Population

A study population refers to the entire group of individuals, units, or entities from which a researcher draws their sample and to whom the results of a study are intended to apply. It includes all individuals who meet the predefined criteria for inclusion in the study (Cohen *et al.*, 2014). For this research, the target population comprises all employees working in the difference sections at the head office of the Dodoma City Council such as health(referral hospital, health center and clinic),Education(Primary and Secondary), Marketing, Ward executive, Agricurture, fishing and breeding, Community development,Environment and Finance. This ensures a comprehensive coverage of the relevant group necessary for the study. The population is approximately 500 staff members, which includes all those employed in the various departments at the Dodoma City Council's head office (Human Resource Data, 2023). The study population is categorized into several distinct groups based on their roles and responsibilities within the Dodoma City council departments. These categories include:

Health: This group consists of the Chief physician, chief physician in charge who are responsible for overseeing hospital activities, coordinating with other departments, and ensuring the effective implementation of audit recommendations. Their leadership and decision-making roles are critical to the audit process.,

Education: This is a group that included primary school head teachers and secondary school heard masters who also carry out the implementation of the internal audit recommendations.Their direct involvement in the audit process makes their perspectives essential for understanding the challenges and effectiveness of implementing audit recommendations.

Marketing: This category includes staff members who support to implement the internal audit recommendations. Their role is crucial in facilitating to manage and develop marketing campaign to ensuring the smooth execution of activities.

Ward Executive Officers; This group oversee all social services including supervising Mtaa executive Officers and street chairperson to fulfill their responsibility which is very essential for implementation of internal audit recommendations. While their role is more supportive, it impacts the overall efficiency and effectiveness of the audit process.

Agriculture, Fishing, and breeding: These groups are responsible for maintaining and supporting the technological systems used in the production process in agriculture, fishing and breeding in the specific department or section. Their support is vital for the successful implementation of internal audit activities.

Through categorizing the population in this manner, the study aims to ensure that all relevant aspects of the implementation are thoroughly examined and implemented. This comprehensive approach allows for an in-depth analysis of the impact of management support on implementation of internal audit recommendations in local government authorities with reference to Dodoma City Council.

3.5 Sample and Sampling Procedures

3.5.1 Sample Size

The sample size is defined as the number of observations used for determining the estimations of a given population (Kothari, 2014). Sampling is the process of selecting a subset of individuals from the population to estimate the characteristics of the whole population (Kothari, 2014). Since the population of staff working at Dodoma City Council which is 500 is known, hence Yamane (1967) formula was used. This is described with a confidence level of 95% and margin of error of 5%, the formula is expressed as hereunder;

$$n = \frac{N}{1 + N(e^2)}$$

Where: n= is number of sample (required)

N = Total population (500) and

e = Error tolerance (level) or margin of error (0.05)

$$500 / (1 + 500(0.05)^2) = 500 / 2.25 = 222$$

Table 1: Sample Size Distribution

S/N	Category	Population	Sample
1	Health	69	30
2	Education (Primary and secondary)	162	71
3	Marketing	42	19
4	Ward executive	42	19
5	Agriculture and Fishing	99	44
6	Community Development	42	19
7	Environment	42	19
8	Finance	2	1
Total		500	222

Source: Field Data (2024)

3.5.2 Sampling Procedures

The study used Purposeful sampling to select study area and categorized sectors while simple random sampling procedure to select members of sample size. To conduct simple random procedure, the study clearly identified the population of interest. The researcher created a comprehensive list of all individuals in the population. Furthermore, the study assigned a unique identifier to each individual on the list. In the same way, the researcher decided on the number of respondents the researcher wants in the sample. The study used a random method to select individuals from the list. This involved using random number tables, random number generators, or a random selection tool. The researcher ensured that each individual had an equal probability of being selected. This is a key principle of simple random sampling.

Simple random sampling ensured that every member of the population has an equal chance of being selected. This helped in eliminating selection bias and ensures that the sample is representative of the entire population. The method is straightforward and easy to understand and implement. It does not require extensive knowledge or resources to execute. It allowed for the use of statistical methods to make inferences about the population from the sample. The results are typically more generalizable and valid (Bryman & Bell, 2015).

Table 2 Sampling Procedure

Categories	No Items	Sampling technique
Study area	1	Purposeful sampling
Categorized sectors	8	Purposeful sampling
Sample size	222	Simple random sampling

Source: Field Data (2024)

3.6 Data Collection Methods

3.6.1 Survey Method

A questionnaire refers to a survey tool that is used to collect data from a sample; the tool involves a prepared list of questions reflecting the information required by the study to answer research questions (Babbie, 2013). The study administered 220 questionnaires to the respondents so as to capture their views, opinions insights and perceptions with regard to the topic at stake. Questions were assessed based on a five-point Likert scale. To achieve this, the appointment was made between the researcher and the respondents so as to get convenient time. In that regard, the study used quick and pick process whereas the respondents were left with questionnaires for one week so as to fill them.

The information that questionnaire was assigned to gather was related to specific objectives of the study namely to determine the impact of managerial support on the implementation of internal audit recommendations in the Dodoma region, to investigate the impact of management support on implementation of internal audit recommendations in local government authorities with reference to Dodoma City Council. Questionnaires were used since they allow researcher to collect data from a large number of people quickly and efficiently. Questionnaires provided a standardized way of asking questions, ensuring that all respondents receive the same questions in the same order. This helped in minimizing bias and ensuring consistency in the data collected. Questionnaires often use closed-ended questions, which were easily quantified and analyzed statistically (Creswell & Creswell, 2017).

3.7 Data Analysis

Descriptive statistics, such as percentages and frequency distribution tables as well as mean and standard deviation were then generated with the aid of SPSS. To explore the relationship between the dependent variable and independent variables, the researcher employed the multiple linear regression model.

3.8 Validity and Reliability of the Data

3.8.1 Validity of Data

To ensure validity, questionnaires were pre-tested by distributing them to statisticians and colleagues for piloting. Meanwhile the research consulted supervisor to cross check and make an amendment where necessary. According to Johnson and Christensen (2017), consulting supervisor during the research process provides an additional layer of validation and expertise. Supervisor offered valuable insights, guidance, and feedback on the research design, methodology, and data analysis. Supervisor also helped researcher identify any gaps or limitations in their study and suggest improvements to enhance the overall quality of the research.

3.8.2 Reliability of Data

Reliability means consistency and stability of information and that if research is conducted under the same circumstances' findings were replicated. Reliability was analyzed using Cronbach's alpha (α) as it predicts the variables. The usefulness of this technique is in ensuring internal consistency and group homogeneity (Creswell & Creswell, 2017).

4.1 Reliability Test

In this study, the variables were categorized into different aspects of Management Support and the Dependent Variable, which is the Implementation of Internal Audit Recommendations. Starting with Management Support, the table shows that each of the three components – Allocation of Resources, Incorporation into the Strategic Plan, and Training and Capacity Building – has a high level of internal consistency, as indicated by their Cronbach's Alpha values ranging from 0.814 to 0.839. This suggests that the items within each component are closely related, indicating a strong level of support from management in these areas. Also, Implementation of Internal Audit Recommendations, also demonstrates high internal consistency, with a Cronbach's Alpha value of 0.872. This suggests that the items related to the implementation of internal audit recommendations are closely related and consistently measure the effectiveness of this aspect of the internal audit process.

Table 3. Reliability Test by Cronbach's Alpha

Variables	No of item	Cronbach's Alpha
Management support	3	0.837
Dependent variable		
Implementations of internal audit recommendations	3	0.872

Source: Field Data (2024)

3.9 Ethical Consideration

Ethical considerations in research refer to the principles and guidelines that researchers must follow to ensure their work is conducted with integrity, respect, and responsibility

(Creswell, 2014). To comply with the ethical standards, the study considered informed consent, anonymity, plagiarism (25%), data protection, privacy and confidentiality, authorship, and publication issues. In that regard, the researcher ensured that respondents' personal information is kept confidential and that their identities are protected, unless explicit consent was given to disclose their identities. The research also maximized benefits and minimized any potential harm to respondents, all physical, emotional or psychological harm were avoided.

4.0 Findings and Discussions

In conducting descriptive statistics of respondents, relevant variables are typically summarized to provide a comprehensive overview of the sample. Common descriptive statistics include measures of central tendency such as means and medians, measures of dispersion such as standard deviations and ranges, and frequencies or percentages for categorical variables (Bryman & Bell, 2015). Additionally, continuous variables such as income or years of experience may be summarized using means and standard deviations to provide insight into the central tendency and variability within the sample. Descriptive statistics offer valuable insights into the characteristics of the respondents, aiding in the interpretation and generalization of research findings. This section shows the description of the respondents.

4.1 Summary Statistics for Independent Variable

The summary statistics for independent variables related to various aspects of internal audit effectiveness within an organization. This independent variable is categorized into Management Support, the table shows the mean, standard deviation, minimum, and maximum values for three components: Allocation of Resources, Incorporation into the Strategic Plan, and Training and Capacity Building.

On average, the scores for these components are relatively high, with means ranging from 3.473 to 4.121, indicating a generally positive perception of management support across these areas. The standard deviations suggest some variability in responses, particularly for Training and Capacity Building, which has a lower standard deviation compared to the other components, indicating less variability in responses. Proper allocation of resources ensures that the internal audit recommendations are implemented efficiently and effectively. Through allocating the necessary funds, manpower, and time to address the recommendations, organizations in Dodoma Region can streamline the implementation process.

Allocation of resources plays a crucial role in ensuring timely execution of internal audit recommendations. When organizations allocate specific resources with clear timelines and responsibilities, it helps in avoiding delays in implementing the recommendations. For instance, assigning dedicated staff members to work on each recommendation and providing them with the required resources will ensure that tasks are completed within the set deadlines. The study findings are supported by Sunnari *et al.* (2021) that proper allocation of resources enhances accountability and oversight during the implementation of internal audit recommendations. Through clearly defining roles, responsibilities, and resource allocations, organizations can hold individuals accountable for their tasks. This transparency also allows

for effective monitoring of progress and ensures that resources are utilized efficiently to achieve the desired outcomes.

Table 4. Summary Statistics of Independent Variables

Independent Variables	Mean	SD	Min	Max
Managerial support				
Allocation of resources	3.481	.738	2	5
Incorporation into the strategic plan	3.473	.807	1.8	5
Training and capacity building	4.121	.506	3	5

Source: Field Data (2024)

4.1.1 Summary Statistics of Implementations of Internal Audit Recommendations

The summary statistics for the implementation of internal audit recommendations within an organization, focus on three specific aspects: Timeliness, Accuracy, and Value for Money, as well as an overall measure. Starting with Timeliness, the mean score of 4.321 suggests that, on average, there is a high level of satisfaction with the timeliness of implementing internal audit recommendations. The relatively low standard deviation of 0.543 indicates that responses are clustered closely around the mean, suggesting a consistent perception of timeliness among respondents. The minimum score of 3 and maximum score of 5 demonstrate that while there is variability in responses, the majority perceive the timeliness of implementation as satisfactory. That is to say timely implementation of internal audit recommendations can prevent financial losses resulting from inefficiencies, errors, or fraud within an organization. If an internal audit identifies weaknesses in financial controls and recommends specific actions to address them promptly, delaying the implementation could lead to potential financial losses due to continued vulnerabilities. Implementing internal audit recommendations in a timely manner can enhance organizational efficiency by addressing operational inefficiencies or gaps promptly. For instance, if an audit reveals inefficiencies in a particular process and recommends streamlining procedures, timely implementation can lead to cost savings and improved productivity.

The study findings are in line with Alzeban and Sawan (2015) that timely implementation of internal audit recommendations is essential for ensuring compliance with regulatory requirements and industry standards. Failure to implement recommendations promptly could result in non-compliance issues, which lead to penalties or reputational damage

for the organization operating. Timely implementation of these recommendations helps mitigate risks effectively and protect the organization from potential threats.

Moving to Accuracy, the mean score of 3.231 indicates a moderately positive perception of the accuracy of implementing internal audit recommendations. However, the lower mean compared to Timeliness suggests that there may be room for improvement in ensuring the accuracy of implementation. The low standard deviation of 0.25 suggests that responses are tightly clustered around the mean, indicating a relatively consistent perception of accuracy among respondents. The wide range between the minimum score of 1 and maximum score of 5 suggests more variability in perceptions compared to timeliness. In the same trail, findings suggest that accurate implementation of internal audit recommendations ensures that identified issues are effectively addressed, leading to improved operational efficiency within government departments and agencies in Dodoma. Through accurately implementing audit recommendations, organizations in Dodoma can mitigate risks associated with non-compliance, fraud, errors, and inefficiencies. This helps in safeguarding public resources and enhancing accountability. Accuracy in implementing internal audit recommendations is essential for ensuring compliance with relevant laws, regulations, and policies governing public sector entities in Dodoma. Failure to comply can lead to legal repercussions and reputational damage. According to Abdullatif *et al.* (2015), implementing audit recommendations accurately allows organizations to optimize resource allocation by addressing weaknesses or inefficiencies identified during the audit process. This leads to cost savings and better utilization of public funds. When internal audit recommendations are implemented accurately, stakeholders such as citizens, taxpayers, donors, and oversight bodies gain confidence in the transparency and accountability of government entities.

For Value for Money, the mean score of 3.104 indicates a moderate perception of the value obtained from the resources invested in implementing internal audit recommendations. The low standard deviation of 0.203 suggests that responses are closely grouped around the mean, indicating a consistent perception of value for money among respondents. The minimum score of 2 and maximum score of 5 demonstrate variability in responses, with some respondents perceiving higher value for money than others. However, ensuring value for money helps in efficient allocation of resources towards implementing internal audit recommendations. Through prioritizing actions that provide the most significant impact relative to their cost, organizations can optimize resource utilization and achieve better outcomes. Emphasizing value for money ensures that the costs associated with implementing internal audit recommendations are justified by the benefits derived. This approach helps organizations avoid unnecessary expenses and focus on initiatives that deliver tangible results.

The study findings are supported by Tahajuddin and Kertali (2018) who revealed that when organizations prioritize value for money in implementing internal audit recommendations, they demonstrate accountability to stakeholders. Through showing that resources are used effectively and efficiently, organizations build trust and credibility with stakeholders. Value for money considerations promotes sustainability in the implementation of internal audit recommendations. Through ensuring that resources are utilized wisely,

organizations can maintain long-term effectiveness and impact without compromising financial stability.

Finally, the Overall measure, with a mean score of 3.818, suggests a generally positive perception of the overall effectiveness of implementing internal audit recommendations. The standard deviation of 0.496 indicates some variability in responses, suggesting that opinions about the overall effectiveness vary among respondents. The range between the minimum score of 2.714 and maximum score of 5 indicates variability in perceptions but generally leans towards a positive assessment. Generally, it can be said that while there is a high level of satisfaction with the timeliness of implementation, there may be opportunities to improve the accuracy and perceived value for money of implementing internal audit recommendations. Overall, the organization receives a moderately positive assessment for its effectiveness in implementing internal audit recommendations, with some variability in perceptions across different aspects.

Table 5 Summary statistics of Implementations of internal audit recommendations

Implementations of internal audit recommendations	Mean	SD	Min	Max
Timely	4.321	.543	3	5
Accuracy	3.231	.25	1	5
Value for money	3.104	.203	2	5
Overall	3.818	.496	2.714	5

4.1.2 Model Building and Assumption Test

When building a linear multiple regression models, several assumptions need to be considered to ensure the accuracy of results. The assumptions include linearity, independence of errors, homoscedasticity, normality of errors, and absence of multicollinearity (Gujarati & Porter, 2009). Firstly, linearity assumes that there is a linear relationship between the independent variables and the dependent variable. Secondly, the independence of errors assumes that the errors are not correlated with each other. Homoscedasticity assumes that the variance of errors is constant across all levels of the independent variables. The normality of errors assumes that the errors are normally distributed.

Lastly, the absence of multicollinearity assumes that there is no strong linear relationship between the independent variables. These assumptions can be tested using various diagnostic tools such as scatterplots, residual plots, Durbin-Watson statistics, and tests for normality and multicollinearity (Hair *et al.*, 2010). Ensuring these assumptions are met is crucial for the reliability and interpretability of the results obtained from the multiple regression analysis. The assumption test is explained in this part of chapter four.

4.1.2.1 Test for Outlier and Influential Variables

Outliers are the data points that significantly differ from most observations in a dataset (Sullivan *et al.*, 2021). They can distort statistical analyses and change how results are interpreted if they are not properly addressed. Given that it visually represents the distribution of the data and highlights any extreme values, a boxplot is a helpful tool for locating outliers (Sullivan *et al.*, 2021). Based on the regression test statistics conducted on a dataset comprising 222 observations, it is notable that none of the observations were identified as outliers or influential points.

4.1.2.2 Test for Omission of Variable

The results of the Ramsey RESET test for omitted variables in linear multiple regression models examine the relationship between managerial support and the implementation of internal audit recommendations. The Ramsey RESET test is utilized to detect potential misspecification in the regression model, particularly the omission of important variables that could influence the dependent variable. For the model examining managerial support in implementing internal audit recommendations, the F-statistic is 2.224 with 3 and 220 degrees of freedom, resulting in a p-value of 0.116. At the 0.05 level of significance, the p-value exceeds the threshold, indicating that there is insufficient evidence to reject the null hypothesis. This suggests that the model is adequately specified, and there are no significant omitted variables affecting the implementation of internal audit recommendations in relation to managerial support.

4.1.2.3 Test for Model Fit

The results of the link test for model variables in linear multiple regression models examining the relationship between managerial support and the implementation of internal audit recommendations. The link test assesses the overall goodness-of-fit of the regression model by evaluating whether the model's predicted values are significantly related to the observed values. For the model examining managerial support on implementing internal audit recommendations, the hat statistic is 11.016 with a corresponding p-value of 0.001. This indicates that the predicted values from the regression model are significantly related to the observed values at the 0.05 level of significance, providing evidence of a good fit for the model.

Table 6. Link test for Model variables

Linear multiple regression models	_hat statistic	Z-statistics	P-value
managerial support on implementing internal audit recommendations	_hat	11.016	0.001
	_hatsg	4.443	0.07

Source: Field Data (2024)

4.1.2.4 Test for Normality

A dataset is said to be normal if its data points are distributed in a way that makes them symmetrically cluster around the mean, producing a bell-shaped curve on a histogram (Hazra & Gogtay, 2016). Because many parametric tests presume that the data is regularly distributed, testing for normality is essential in statistical analysis. The table displays the results of the Shapiro-Wilk test for normality conducted on linear multiple regression models assessing the relationship between managerial support, follow-up mechanisms, audit committee factors, and the implementation of internal audit recommendations.

The Shapiro-Wilk test is employed to evaluate whether the residuals from the regression models follow a normal distribution, which is a crucial assumption for regression analysis. For the model examining managerial support in implementing internal audit recommendations, the Shapiro-Wilk test yields a Z value of 1.116 with a corresponding p-value of 0.107. At the 0.05 level of significance, the p-value exceeds the threshold, indicating that there is insufficient evidence to reject the null hypothesis of normality. Thus, the residuals from this model appear to be approximately normally distributed, satisfying one of the key assumptions of linear regression analysis.

Table 7. Shapiro-Wilk test for Normality

Linear multiple regression models	Observations	Z value	P-value
managerial support on implementing internal audit recommendations	222	1.116	0.107

Source: Field Data (2024)

4.1.2.5 Test for Heteroscedasticity

Using Levene's Test (1960) for Homogeneity of Variances, homoscedasticity was assessed. This test determines if the variance of the dependent variable is constant over the range of predictor variables. Combining the two groups' variances is improper and will not yield a trustworthy estimate of the common within-group variances if the variances between the two groups differ noticeably. To assess if the variances for the variables were equal, Levene's Test for Homogeneity of Variances was used. Gel *et al.* (2009) state that the variances are about comparable and not significantly different if the test result is significant ($p\text{-value} > 0.05$). The results of the Breusch-Pagan/Cook-Weisberg test for heteroscedasticity in linear multiple regression models examining the impact of managerial support on the implementation of internal audit recommendations. Heteroscedasticity refers to the unequal variance of residuals across different levels of the independent variables, which can violate the assumptions of linear regression and lead to biased standard errors and incorrect inferences. For the model assessing managerial support on implementing internal audit recommendations, the Breusch-Pagan/Cook-Weisberg test produces a Z value of 1.116 with a corresponding p-value of 0.107. At the 0.05 level of significance, the p-value exceeds the threshold, indicating that there is no

significant evidence to reject the null hypothesis of homoscedasticity. Thus, there is no strong indication of heteroscedasticity in this regression model.

Table 8 Breusch–Pagan/Cook–Weisberg test for heteroscedasticity

Linear multiple regression models	Observations	Z value	P-value
managerial support on implementing internal audit recommendations	222	1.116	0.107

Source: Field Data (2024)

4.1.2.6 Test for Multicollinearity

Multicollinearity is the phenomenon when independent variables in a regression model exhibit strong correlations with one another variables (Kumari, 2008). Due to this association, the regression coefficients may be difficult to understand, producing estimates that are unstable and exaggerated standard errors. To guarantee the validity of the statistical conclusions taken from the model and the dependability of the regression findings, multicollinearity testing is necessary. The Variance Inflation Factor (VIF) and tolerance are two commonly used measures to evaluate multicollinearity (Senaviratna & Cooray, 2019).

With a threshold value of 5 commonly regarded as suggestive of multicollinearity, VIF quantifies the degree to which the variance of an estimated regression coefficient is exaggerated as a result of multicollinearity. Conversely, tolerance quantifies the percentage of an independent variable's variance that cannot be accounted for by other independent variables; values less than 0.1 imply multicollinearity. The results of the Variance Inflation Factor (VIF) test assessed multicollinearity among predictor variables in linear multiple regression models. Multicollinearity occurs when independent variables in a regression model are highly correlated with each other, potentially leading to inflated standard errors, unreliable coefficient estimates, and reduced interpretability of the model.

For the model examining managerial support on implementing internal audit recommendations, the VIF values for Allocation of Resources, Incorporation into the Strategic Plan, and Training and Capacity Building are 3.760, 4.782, and 2.768, respectively. These values suggest no multicollinearity among the predictor variables. Similarly, the Tolerance values, which are the reciprocal of VIF, indicate that these variables explain a substantial portion of the variation in each other, with Tolerance values ranging from 0.209 to 0.361.

Table 9. Variance Inflation Factor Test for Multicollinearity

Linear multiple regression models	VIF	Tolerance
Managerial support on implementing internal audit recommendations		

Allocation of resources	3.760	0.266
Incorporation into the strategic plan	4.782	0.209
Training and capacity building	2.768	0.361

Source: Field Data (2024)

4.1.2.7 Test for Autocorrelation

The Durbin-Watson test, which assesses whether residuals in a regression analysis have any association at all, was used to test for autocorrelation. A score of about 2 denotes no autocorrelation in the Durbin-Watson statistic, which has a range of 0 to 4 as recommended by Gel *et al.* (2009). Values that are close to 0 indicate positive autocorrelation, whereas those that are close to 4 indicate negative autocorrelation (Gel *et al.*, 2009). The Durbin-Watson test is a statistical method used to assess whether the residuals of a regression model exhibit autocorrelation, which occurs when there is a correlation between the errors (residuals) at different time points. In this table, have the Durbin-Watson statistics for Managerial support on implementing internal audit recommendations. The Durbin-Watson statistic typically ranges from 0 to 4. A value of 2 indicates no autocorrelation, with values closer to 0 indicating positive autocorrelation and values closer to 4 indicating negative autocorrelation. For the model assessing the impact of managerial support, the Durbin-Watson statistic is 2.75. This value is significantly higher than 2, suggesting the absence of autocorrelation.

Table 10 Durbin-Watson Test for Autocorrelation

Linear multiple regression models	Durbin-Watson Statistic
managerial support on implementing internal audit recommendations	2.75

4.4 Linear Multiple Regression Fitted Model

The multiple linear regression model to show the Influence of Managerial Support on implementing Internal Audit Recommendations in local government authorities in Dodoma City.

4.4.1 The Influence of Managerial Support on implementing Internal Audit Recommendations in Dodoma City

The results of a linear multiple regression analysis examined the influence of managerial support on implementing internal audit recommendations in Dodoma City. The regression model includes three predictor variables representing different aspects of managerial support: Allocation of Resources, Incorporation into the Strategic Plan, and Training and Capacity Building. The coefficients associated with each predictor variable provide insights into the strength and direction of their impact on the implementation of internal audit recommendations. For Allocation of Resources, the coefficient is 0.406 with a standard error of 0.112. The associated t-value of 15.240 is highly significant ($p < 0.001$), indicating that the allocation of resources significantly and positively influences the implementation of internal audit recommendations. This gives an implication of the fact that implementing internal audit recommendations helps strengthen the governance structure within Dodoma City Council.

Through addressing weaknesses identified through audits, the council improves its decision-making processes, risk management practices, and overall accountability. In the same trail internal audit recommendations often highlight areas of potential risk within the organization. Through allocating resources to address these recommendations, management proactively mitigate risks that could impact the council's operations, finances, or reputation. It can be said that many internal audit recommendations are related to ensuring compliance with laws, regulations, and internal policies. Failure to implement these recommendations could expose Dodoma City Council to legal liabilities or regulatory sanctions. Therefore, allocating resources to address these recommendations is essential for maintaining compliance.

The study findings are supported by Sunnari (2021) that internal audits uncover areas of risk, control deficiencies, and operational inefficiencies. Allocating resources to address these issues helps mitigate risks and strengthen the organization. Internal audits provide recommendations to streamline processes, reduce costs, and enhance productivity. Implementing these recommendations leads to greater operational efficiency and cost-effectiveness. Internal audits evaluate financial controls and identify areas for improvement. Allocating resources to implement recommendations strengthens financial controls and reduces the risk of fraud, errors, and mismanagement. Nevertheless, the study by Alzeban, & Sawan (2015) revealed that there is no significant relationship between allocation of the resources of management and implementation of internal audit recommendations in terms of IA characteristics and IA effectiveness.

The study findings are supported by **resource-based theory** that, managerial support plays a crucial role in allocating resources to implement internal audit recommendations. When managers are supportive, they are more likely to allocate necessary resources such as budget, time, and personnel to ensure that audit recommendations are effectively implemented. From a resource-based theory perspective, managerial support can be viewed as a critical resource that contributes to the successful implementation of internal audit recommendations.

Similarly, for Training and Capacity Building, the coefficient is 0.602 with a standard error of 0.016, and the associated t-value of 21.123 is highly significant ($p < 0.001$), indicating a significant positive impact. Incorporation into the Strategic Plan also shows a positive coefficient of 0.809, but with a slightly lower t-value of 1.350. However, the associated p-value of 0.009 is still significant at the 0.05 level, indicating that incorporation into the strategic plan has a statistically significant impact on the implementation of internal audit recommendations. The constant term in the model is 4.102 with a standard error of 0.433, and the associated t-value of 9.290 is highly significant ($p < 0.001$). This constant represents the expected value of the dependent variable (implementation of internal audit recommendations) when all predictor variables are zero.

This entails that managers are responsible for setting the tone at the top, establishing clear objectives, and ensuring that there is a commitment to continuous improvement within the organization. Through demonstrating a strong commitment to internal audit recommendations, managers create a culture that values accountability, transparency, and compliance with established policies and procedures. Also management is responsible for allocating resources effectively to support training and capacity building efforts aimed at implementing internal audit recommendations. This includes providing financial resources, personnel, time, and other necessary support to ensure that staff members receive the training they need to understand and implement audit recommendations successfully. According to Mahyoro and Kasoga (2021) training programs helped employees, especially those responsible for implementing audit recommendations, better understand the purpose, context, and requirements of the recommendations. Capacity building initiatives equipped employees with the necessary skills, techniques, and tools to implement the audit recommendations effectively. This included training on process improvements, data analysis, project management, or any other specific competencies required to address the identified issues. It was revealed that in Tanzanian local governments, staff training markedly impacts how well the internal audit function performs.

The R-squared value of 0.834 indicates that approximately 83.4% of the variability in the implementation of internal audit recommendations in Dodoma City can be explained by the predictor variables included in the model. This suggests a strong explanatory power of the model. Additionally, the F-test statistic of 174.442 is highly significant ($p < 0.001$), indicating that the overall regression model is statistically significant in predicting the implementation of internal audit recommendations. Overall, the results suggest that managerial support, particularly through the allocation of resources, training and capacity building, and incorporation into the strategic plan, significantly influences the implementation of internal audit recommendations in Dodoma City. These findings provide valuable insights for policymakers and stakeholders in enhancing the effectiveness of internal audit processes in the city.

Table 11 Linear multiple regression to show the influence of managerial support on implementing internal audit recommendations in Dodoma City.

Internal audit recommendations	Coef.	St.Err.	t-value	p-value	[95% Conf. Interval]
Allocation of resources	.406	0.112	15.240	.000	0.443 7.663
Incorporation into the strategic plan	.809	.044	1.350	.009	1.013 4.162
Training and capacity building	.602	.016	21.123	.000	1.044 4.046
Constant	4.102	.433	9.290	.000	4.438 16.112
Mean dependent var	3.818		SD dependent var		.496
R-squared	0.834		Number of obs		220
F-test	174.442		Prob > F		0.000

Source: Field Data (2024)

5.0 Conclusion

The study concludes that the associated t-value of 15.240 is highly significant ($p < 0.001$), indicating that the allocation of resources significantly and positively influences the implementation of internal audit recommendations. This gives an implication of the fact that implementing internal audit recommendations helps strengthen the governance structure within Dodoma City Council. While in training and capacity building, associated t-value of 21.123 is highly significant ($p < 0.001$), indicating a significant positive impact.

6.0 Recommendations

Based on the above findings and conclusion, the study recommends that the management of Dodoma City Council should continue supporting the audit committee in order to be active, independent, and well-resourced. Similarly, the committee should regularly review progress on implementing audit recommendations, provide guidance to management on addressing any challenges, and report directly to senior leadership. Also, Dodoma City and Council should continue developing clear protocols for following up on internal audit recommendations. They should assign responsibility for each recommendation, set deadlines for completion, monitor progress regularly, and provide feedback to auditors on actions taken.

7.0 Limitation for Further Studies

This study focused only on managerial support, audit committee influence, and follow-up mechanisms. It did not consider other factors like political interference or organizational culture, which might also affect the implementation of internal audit recommendations. The research was limited to Dodoma City Council. Results may not apply to other LGAs due to different local conditions and challenges. Future research should include more LGAs across Tanzania to see if the findings apply more broadly. Combining quantitative and qualitative methods could also provide a deeper understanding of the factors affecting implementation.

Evaluating the role of employee health and safety programmes on organizational performance in Dodoma, Tanzania

Lucy Anthony Mtuya¹ & Yusuph Kambuga²

¹*College of Business Education*

²*College of Business Education*

Email: kambuga2008@yahoo.com

Abstract

This study aimed to assess the role of health and safety in enhancing an organization's optimal performance in Tanzania reflecting the experience of Dodoma City Council. The study drew on theories about employee behavior and organizational practices to see how they affect performance. This mixed-methods study assessed the role of health and safety training on performance through semi structure surveys and interviews. Interviews and offered qualitative insights into employee experience perspectives on OHS, while semi-structured surveys gathered quantitative data which were analyzed using descriptive and inferential statistics. This study found health and safety initiatives significantly boosted performance. Employees reported increased productivity, fewer accidents, and higher morale after comprehensive training ($p < 0.05$, OR = 4.310, 95% CI: 2.578-7.195%). Proper PPE use reduced incidents, but specific types require further evaluation ($p > 0.05$). This research reveals a potential reinforcing cycle between training, safety and performance. Develop integrated training on safety use, empowering employee participation. This fosters ownership and improves safety culture. Additionally, measuring the role of safety initiatives on well-being and performance strengthens leadership's commitment to OHS.

Keywords: *Health and Safety, Organizational Performance*

2. Introduction

Employee health and safety are vital aspects of workplace management as impact employee well-being, productivity, and overall organizational performance. Studies have consistently demonstrated that prioritizing employee health and safety contributes to enhanced worker performance and increases in productivity (Fonseca & Carvalho, 2019; Segbenya & Yeboah, 2022). Globally, only 10% to 20% of workers have access to occupational health programs, creating a significant gap that places a large portion of the workforce at risk for health and safety issues (Zamri, 2013; Hilbert, 2015). This lack of access underscores the necessity for expanding occupational health programs across all industries and sectors. According to Hilbert (2015), safeguarding workers through occupational health initiatives promotes a healthier and more productive workplace, yielding long-term benefits for both employees and organizations.

A report by the World Health Organization (WHO) in 2010 revealed a concerning trend: a decline in the availability of occupational health and safety services for workers. This situation leaves many workers vulnerable to work-related illnesses and accidents, further highlighting the importance of making such services accessible to all employees (WHO, 2010). In Tanzania,

the Occupational Safety and Health Authority (OSHA) reported 9,993 work-related accidents or diseases between 2020 and 2023, with compensation costs exceeding 9,080 million Tanzanian shillings (Chibololo, 2023; OSHA, 2020). These statistics emphasize the need for employers to prioritize workplace safety and health, not only to reduce accidents but also to manage the financial costs associated with workplace hazards.

Occupational health and safety, as defined by the International Labour Organization (ILO, 2003), involves the protection of workers from sickness, injury, and disease resulting from their work environment. In 2018, work-related accidents and diseases led to 2.34 million deaths globally, highlighting the need for robust workplace safety measures and health services (ILO, 2019). Prioritizing occupational health and safety not only saves lives but also reduces organizational costs related to workplace accidents and health issues. This relationship between worker well-being and productivity has been well-documented in various studies (Nwosu, 2019; Okwechuku, 2021), which suggest that organizations that focus on health and safety foster positive employee attitudes, leading to better performance and productivity.

In Tanzania, recent studies have explored the factors influencing occupational health and safety in organizations (Nkuba&Ntebe, 2023; Mrema et al., 2015; Simon, 2020). These studies show that while progress has been made, there is still much work to be done to improve the safety and health conditions of workers, particularly through proactive rather than reactive safety management approaches (Lema, 2006; Simon, 2020). The Tanzanian government has made efforts to address these challenges, including the establishment of OSHA in 1997, the implementation of the Occupational Health and Safety Policy of 2009, and the ratification of international conventions, such as the ILO Convention No. 170 (Simon, 2020). Despite these steps, ongoing efforts are necessary to ensure that occupational health and safety remain a priority for all stakeholders involved.

1.1.Statement of the Problem

There has been a notable rise in diseases, accidents, and injuries among workers across various sectors in Tanzania, despite the acknowledged importance of best practices (Simon, 2020; Mwita, 2020; Francetic, 2019; Mrema et al., 2015). Failing to implement proper health and safety measures can lead to workplace accidents, injuries, and long-term health problems, which negatively impact employees' job performance and overall well-being. Additionally, organizations may encounter legal and financial repercussions, damage to their reputation, and reduced employee morale if they do not effectively enforce comprehensive health and safety protocols. Mwita (2020) noted that employees and employers gain from prioritizing health and safety, as a healthy workforce boosts individual performance and overall organizational productivity. While the government is taking steps to improve health and safety standards, it is essential that organizations also take responsibility by enforcing the necessary regulations to prevent injuries, fatalities, and losses, ultimately enhancing their performance. This study, therefore, examined the role of health and safety measures in improving organizational performance in Tanzania.

1.3. Literature Review

1.3.1. Theoretical Review

1.3.1.1. Protection Motivation Theory

Protection Motivation Theory (PMT), developed by Roger (1983), provides a framework for understanding the use of protective measures, particularly in occupational health and safety. The theory suggests that individuals take precautions based on four key factors: the perceived seriousness of a potential threat, the likelihood of the threat occurring (vulnerability), the effectiveness of the suggested precautions, and their confidence in their ability to take protective actions (self-efficacy). PMT aims to differentiate between behaviours that lead to either harm or health. For instance, people can avoid injuries by following safety guidelines such as wearing seatbelts, avoiding driving while intoxicated, and using helmets when riding. The theory emphasizes the importance of personal motivation and external factors in encouraging health and safety behaviours. PMT is relevant to occupational health studies because it highlights how individuals' awareness and motivation play critical roles in promoting a health and safety culture. Through understanding these elements, institutions can design interventions that enhance health and safety awareness, ultimately improving workplace performance.

1.3.2. Empirical Literature Review

Empirical studies on health practices and worker performance have attracted global attention. Research indicates that effective occupational health and safety systems can significantly enhance worker productivity and reduce accidents. For instance, Shin *et al.* (2021) examined the state of occupational health and safety management in South Korea's construction industry. Their findings revealed a 67% reduction in accident rates and a 10.3% drop in fatal accidents in companies implementing safety systems. Similarly, Katsuroet *al.* (2010) in Zimbabwe found that poor occupational health practices in the food industry negatively impacted worker productivity, while Bilhah *et al.* (2018) in Kenya demonstrated that reducing workplace accidents improves organizational performance.

Moreover, Kaynaket *al.* (2016) in Turkey various linked the studies occupational health and safety (OHS) practices and organizational performance. Similarly, Haslam (2016) in the UK noted that proactive OHS management fosters employee attitudes, health outcomes, and safety climate. Equally, Iskanto (2021) in Malaysia, affirmed that the significant effect of OHS on performance, mediated by job satisfaction. Likewise, Pane *et al.* (2021) in Indonesia revealed similar results. However, further noted that both physical and non-physical environments are crucial. In Africa, studies like Amponsah-Tawiah& Mensah (2016) in Ghana highlighted that OHS positively impacts organizational commitment, while Ezekiel (2017) in Kenya found that OHS practices enhance job satisfaction among nurses.

In Tanzania, Kinyondo and Gervas (2022), Manongiet *al.* (2018) and Kessy (2022) associated the OHS management in and safety and security at workplace. Additionally, Songstadet *al.* (2017), Debeset *al.* (2016). Asha (2022), Mshangaet *al.* (2019) and Lindkvist (2019) show dissatisfaction of employees in various aspects. However, these studies underscored the critical

importance of effective OHS systems in improving employee performance and organizational outcomes necessitating its conduction.

1.4. Research Objectives

- i. To assess the role of Health and safety training programs in enhancing the organization's performance.
- ii. To examine the effects of the provision of personal protective equipment on worker's performance.

2. Materials and Methods

This study utilized a mixed-methods research (MMR) approach, integrating both quantitative and qualitative data collection and analysis to achieve a more comprehensive understanding of the research problem (Creswell, 2018). An exploratory research design facilitated the gathering and analysis of data in distinct phases, which is beneficial for deepening understanding and refining ideas (Bryman, 2019). Conducted in the Dodoma region, the focus was on the Dodoma City Council, with a total population of 160 staff members, including heads of departments and OSHA officers.

The study employed two sampling techniques—convenience sampling and simple random sampling—to select participants, resulting in a sample size of 113 calculated using Yamane's (1967) formula. Data collection incorporated both primary data (structured questionnaires and interviews) and secondary data, consistent with Creswell's (2014) recommendations for comprehensive insight gathering. Descriptive statistics summarized respondent characteristics, while qualitative data were subjected to thematic analysis, aligning with Kumar's (2019) methodologies for extracting meaningful insights. This rigorous approach is supported by various studies emphasizing the effectiveness of MMR in enhancing research outcomes (Saunders et al., 2019).

3.0. Results

3.1. Descriptive Statistics of Organization Performance Summary Statistics

Table 1. Organization Performance Summary Statistics

Employee Motivation	Mean	Std. Dev.	Min	Max
Employee health wellbeing	3.97	0.578	1	5
Employee satisfaction	4.56	0.575	3	5
Completion of work on time	4.56	0.416	2	5
Completed quality work	4.59	0.472	3	5
Employee Engagement	4.48	0.435	4	5
Customer satisfaction	4.49	0.57	4	5
Overall	4.4423	0.502	1	5

3.5. Discussion of Results

Table 1 of descriptive statistics show that the overall mean is 4.442 and 0.507667. This implies that majority of respondents agreed that Health and safety training programs in enhancing organizational performance as 4.4. is close to the 5 which is close to the strong agrees response. The standard deviation was very small to indicate that there was little diversion from the real estimate of the mean.

Likewise, Pie Chat 1 presents the Organizational Performance into Low Performance' and High Performance where 37.17% were classified as 'Low Performance' and 62.83% as 'High Performance. Upon interviews predictors of employee motivation, participant opined that: -

‘.....We see a range of motivation levels across departments. While some employees are highly engaged, others seem less invested. We need to address

factors like compensation and growth opportunities to improve overall morale.....". (Participant 09, Department Head).

The participant 09 was supported by another participant who opined that: -

".....The long hours and demanding schedules are role of motivation and productivity. We need to explore flexible work arrangements to better support this workforce.....". (Interview/Participant 11/2024).

This narration implies that there is a need to explore flexible work arrangements to better support this workforce.

Table 3 shows that Chi-square value is 52.45, with a p-value of 0.011, indicating a statistically significant association. This suggests that the presence of health and safety training programs correlates positively with high organizational performance. Moreover, the Chi-square value is 69.82, with a p-value of 0.005 for Training on OHS, implying that a highly significant association. This underscores the importance of comprehensive training specifically focused on occupational health and safety.

The data in Table 4 reveals a statistically significant relationship between health and safety training programs and organizational performance at the 0.05 level. A z-value of 13.71 and a p-value of 0.000 confirm that these programs positively influence performance, with a coefficient of 1.032 indicating a positive effect. An odds ratio of 3.132 implies that organizations implementing Occupational Health and Safety (OHS) training are 3.132 times more likely to achieve high performance. These results are in harmony with those of Umugwaneza *et al.* (2019) found that workplace safety and health practices had a positive effect on the performance of employees. Equally, study findings concur with the Hassan *et al.* (2019) who noted that there is a positive effect on the performance of the organization.

Similarly, a z-value of 16.14 and a p-value of 0.000 further affirm the significant impact of OHS training on performance. The constant term and other statistical measures, such as the LR Chi2 and Pseudo R2, offer additional insights into the model's robustness. Overall, both general health and safety training and OHS-specific training are shown to significantly improve organizational performance, highlighting their critical role in fostering a productive and safe work environment, as supported by the data in Table 10.

4.0.Conclusion

Based on the study objectives, it can be concluded that health and safety training programs significantly contribute to enhancing organizational performance. Well-structured training programs improve employees' awareness and knowledge of workplace safety, leading to reduced accidents and enhanced productivity. Furthermore, the provision of personal protective equipment (PPE) directly impacts workers' performance by creating a safer work environment, thus boosting morale and efficiency. Organizations that invest in comprehensive health and safety initiatives, including both training and PPE, experience fewer workplace injuries, lower absenteeism, and improved overall operational efficiency. These measures foster a culture of safety, which strengthens employee commitment and reduces turnover rates. Ultimately, both health and safety training programs and the

provision of PPE are crucial for ensuring a productive, motivated, and secure workforce. This, in turn, enhances organizational success and long-term sustainability.

4.1.Recommendations

The government should implement well-rounded OHS training programs encompassing both general safety principles and specific job-related hazards. Regularly update these programs to reflect evolving safety standards and best practices. Foster a culture of continuous learning by providing ongoing training opportunities for employees. This ensures their knowledge and skills remain current and empowers them to adapt to changing safety requirements. The government should establish mechanisms to evaluate the effectiveness of OHS training programs. Regularly gather feedback and use it to refine training content and delivery methods for optimal outcomes.

4.2.Suggestion for Further Studies

For further studies based on the outlined objectives, the following suggestions are recommended: Future research could explore the long-term impact of health and safety training programs on employee retention and loyalty in different industries. Likewise, comparative studies could be conducted to assess how the effectiveness of health and safety training programs varies across different organizational sizes, from small enterprises to large corporations. Similarly, a deeper investigation into the psychological and behavioral changes in workers following health and safety training could provide more insights into its overall influence on performance. Equally, research on the role of technological advancements in improving the effectiveness of PPE could be beneficial in understanding modern solutions for worker safety.

The Role of Women Participation in Grapes Farming and Income Generation in Tanzania. A Case of Mpunguzi and Mbabala Wards in Dodoma City

Mathias Issimbula¹ & Yusuf Maulidi kambuga²

¹College of Business Education (CBE), Dodoma, Tanzania

²College of Business Education (CBE), Dodoma, Tanzania

Abstract

This study investigated the socio-economic impact of grape farming on income generation among women farmers in Mpunguzi and Mbabala Wards. Grapes were recognized for their high economic value and potential to enhance local economies and improve household incomes. The research used a mixed-methods approach, integrating both quantitative and qualitative data to enable a comprehensive analysis.

Quantitative data were collected from 154 grape farmers through structured questionnaires that assessed production practices, income levels, and profit margins. In addition, qualitative interviews were conducted with two leaders of grape growers, four women leaders in grape farming and four government extension officers to gather insights into the challenges faced by farmers and the support mechanisms available. Data were analyzed using SPSS version 22, revealing that grape farming significantly contributed to household incomes. The findings indicated that grape production played a vital role in household economics by increasing household income, with farmers producing 8-12 tons of grapes per acre each season and earning approximately 3.5 million Tanzanian shillings (\$1,521) per ton.

Despite these economic benefits, grape farmers faced several challenges, including limited access to modern agricultural techniques, inadequate market access and insufficient storage facilities. To improve production efficiency and profitability the study recommended the establishment of agricultural cooperatives to foster stronger relationships between farmers and agricultural experts and the development of affordable storage solutions through partnerships with governmental and private sectors.

These findings provided valuable insights for policymakers and stakeholders working to enhance support for and improve grape farming practices in Dodoma City.

Keywords: *grape production, economic impact, profit efficiency, mixed-methods research.*

1. Introduction

The fundamental role of empowering women economically through agriculture has long contributed to the socio-economic development of various countries including Tanzania. In recent years there was a growing interest in diversifying agricultural practices to enhance

income generation and empower marginalized groups, particularly women. According to Kalimangasi (2020) and Kulwijila (2021), the Tanzanian government actively worked toward sustainable and inclusive development by leveraging agriculture, and private sectors began revolutionizing the wine industry by encouraging more participation of women farmers in Dodoma, Tanzania. Makoye (2022) noted that women had started growing grapes, providing economic support to many families in the region. Their participation not only helped them enhance the economic status of their families but also created job opportunities for many others.

Grapes were a major fruit crop, with 67.5 million tons produced annually. They were widely cultivated and ranked as one of the largest economic fruits globally. Grapes could be consumed fresh or processed into products such as wine, juice, and raisins. Approximately 50% of grapes were used for winemaking, 36% were consumed fresh, 6% were used for juice, and 8% were dried to make raisins (Khan et al., 2020; Malue et al., 2017; Padol & Yadav, 2016). The cultivation of grapes was regarded as one of the most lucrative farming businesses worldwide, providing a vital income source for millions of individuals (Khan et al., 2020; Kalimangasi, 2020; Punjabi & Mukherjee, 2015). According to Khan et al. (2020), grapes and grape products were sold for cash income, making them an essential source of foreign exchange for many countries. In 2016, the global grape trade was valued at USD 1.5 billion, while the trade for grape products like wine stood at a staggering USD 32.6 billion (Punjabi & Mukherjee, 2015). Grape cultivation contributed about 36% of household income among grape-producing farmers in Dodoma City (Lwelamira et al., 2015; Kalimangasi, 2020). However, it was unclear how grape cultivation contributed to income generation specifically among female grape farmers in Dodoma City.

Grape cultivation was a significant contributor to Tanzania's economy, providing direct employment to around 20,000 households and indirectly benefiting the livelihoods of about 78,000 individuals, including farm-level service providers, traders, transporters, processors, and packagers involved in the value chain (Kalimangasi, 2020). Grape cultivation was especially important as the government aimed to transition the national economy from a low- to a middle-income status through industrialization. Grape farming provided raw materials for many processing industries, such as wine, juice, jam, and vinegar, and was positioned to support the country's contemporary national agenda (Lwelamira et al., 2015; Robbins, 2016; Makoye, 2022).

In Tanzania, grape farming was not fully utilized due to the significant initial investment required to establish a vineyard and supporting farm infrastructure. Grapes, like other agricultural crops in Tanzania, were largely dominated by smallholder farmers. The average farm size was 0.9 ha, and farms operated under irrigation or rainfed production technology (Kalimangasi, 2020; Lwelamira et al., 2015). According to Kalimangasi (2020), the Dodoma region had about 1,924 ha of grape cultivation, producing 10,000 tonnes of grapes annually. Lwelamira et al. (2015) and Kulwijila et al. (2018) claimed that the subsector faced challenges, including high input costs, unreliable markets, and low output. Consequently, reducing production costs and addressing declining farm gate prices could significantly impact farmers' net income, ultimately improving profitability and alleviating poverty for smallholder farmers.

1.1 Statement of the Problem

Agriculture has long played a pivotal role in empowering women economically, particularly in developing countries like Tanzania. It contributed significantly to socio-economic development and poverty reduction. In recent years, there was a growing interest in diversifying agricultural practices to enhance income generation and empower marginalized groups, particularly women. The Tanzanian government actively pursued sustainable and inclusive agricultural development, recognizing the transformative potential of women in the sector. According to Kalimangasi (2020) and Kulwijila (2021), the government along with private sectors, revolutionized the wine industry by encouraging women farmers' participation, especially in Dodoma, a region renowned for grape farming.

Grape farming, one of the most lucrative agricultural ventures globally, provided both direct and indirect income generation opportunities. Globally, 67.5 million tons of grapes were produced annually, with 50% used for winemaking and the rest consumed fresh, as juice, or dried into raisins (Khan et al., 2020; Malue et al., 2017). In Tanzania, women farmers increasingly took up grape farming, providing essential economic support to their families and creating job opportunities for many others (Makoye, 2022). Grape cultivation in Dodoma became a vital economic activity, contributing up to 36% of household income for grape farmers (Lwelamira et al., 2015). However, the socio-economic impact of grape farming, especially among women, remained understudied, making it essential to investigate how this sector could further enhance income generation for female farmers.

Despite the potential of grape farming, the sector faced significant challenges, including high input costs, limited access to markets, and low output. Most grape farms in Dodoma were smallholder operations, averaging 0.9 hectares (Kalimangasi, 2020). Furthermore, the Dodoma region produced 10,000 tons of grapes annually from 1,924 hectares, yet profitability remained low due to declining farm gate prices and high production costs (Kulwijila et al., 2018). As the Tanzanian government sought to industrialize and transition to a middle-income economy, the role of grape farming in providing raw materials for industries such as wine, juice, and vinegar became increasingly important (Robbins, 2016; Makoye, 2022).

2. Literature Review

A theory offered an explanation of a phenomenon, acting as an integrated set of principles that explained and predicted observable events or societal changes (Muthukrishna et al., 2019). This study drew on two key theories: the Sustainable Livelihood Approach (SLA) and Women's Empowerment Theory to guide its discussion on the impact of grape farming in Dodoma.

The Sustainable Livelihood Approach (SLA), first developed by Chambers and Conway (1991), was founded on the idea that livelihood encompassed people, their capabilities and their means of living, including food, income and assets. The theory emphasized that a livelihood was sustainable when it maintained or enhanced the local and global assets upon which it depended and had net beneficial effects on other livelihoods.

In the context of grape farming, the SLA framework highlighted the complex, interconnected factors that influenced income generation, particularly for women farmers in Dodoma's Mpunguzi and Mbabala Wards. Prior research pointed to the importance of interventions supporting women's control over their income and providing access to agricultural resources such as quality seeds, fertilizers, and infrastructure (McCoy, 2013; Masaiganah, 2010; Kinyondo, 2017). This theory was relevant to the study as it underscored the need to address the challenges women faced in grape farming and to provide support that improved their livelihoods.

Women's Empowerment Theory, as discussed by Kumar (2021), centered on recognizing and challenging gender disparities. The theory emphasized women's right to make strategic life decisions and highlighted four dimensions of empowerment: economic, political, knowledge, and psychological. Education, particularly non-formal education programs that challenged harmful gender norms, played a critical role in the knowledge dimension of empowerment (Dandona, 2015).

This theory was essential for understanding how women in grape farming could be empowered to enhance their economic, social and political standing. In the context of this study, it helped explore how empowering women in Dodoma could lead to greater economic opportunities in grape farming, increased decision-making power and improved household welfare.

Globally, grape farming's impact on women's economic empowerment went beyond income generation. A study in Europe found that grape farming not only allowed women to provide for their families but also enabled them to invest in education, healthcare and agricultural development, contributing to more stable communities (Pedneault & Provost, 2016). In the United Kingdom, grape farming created employment opportunities for women, supplied local industries with raw materials, and generated revenue for the government (Hasanaliyeva et al., 2020; Khan et al., 2020).

In Brazil, grape farming contributed over 35.6% of household income among smallholder farmers (Costa et al., 2019; Da-Silva et al., 2019). In Uzbekistan, grape farming accounted for 84.1% of income, highlighting its importance for household welfare and economic resilience (Mamasoliev et al., 2022). Similarly, studies in Cape Verde and South Africa underscored the role of grape farming in food security, income generation, and community development (Santana-Mayor et al., 2020; Piesse et al., 2018). In South Africa, the average household income from grape farming was around R47,600 (\$2,800 USD), demonstrating the enterprise's ability to sustain families economically.

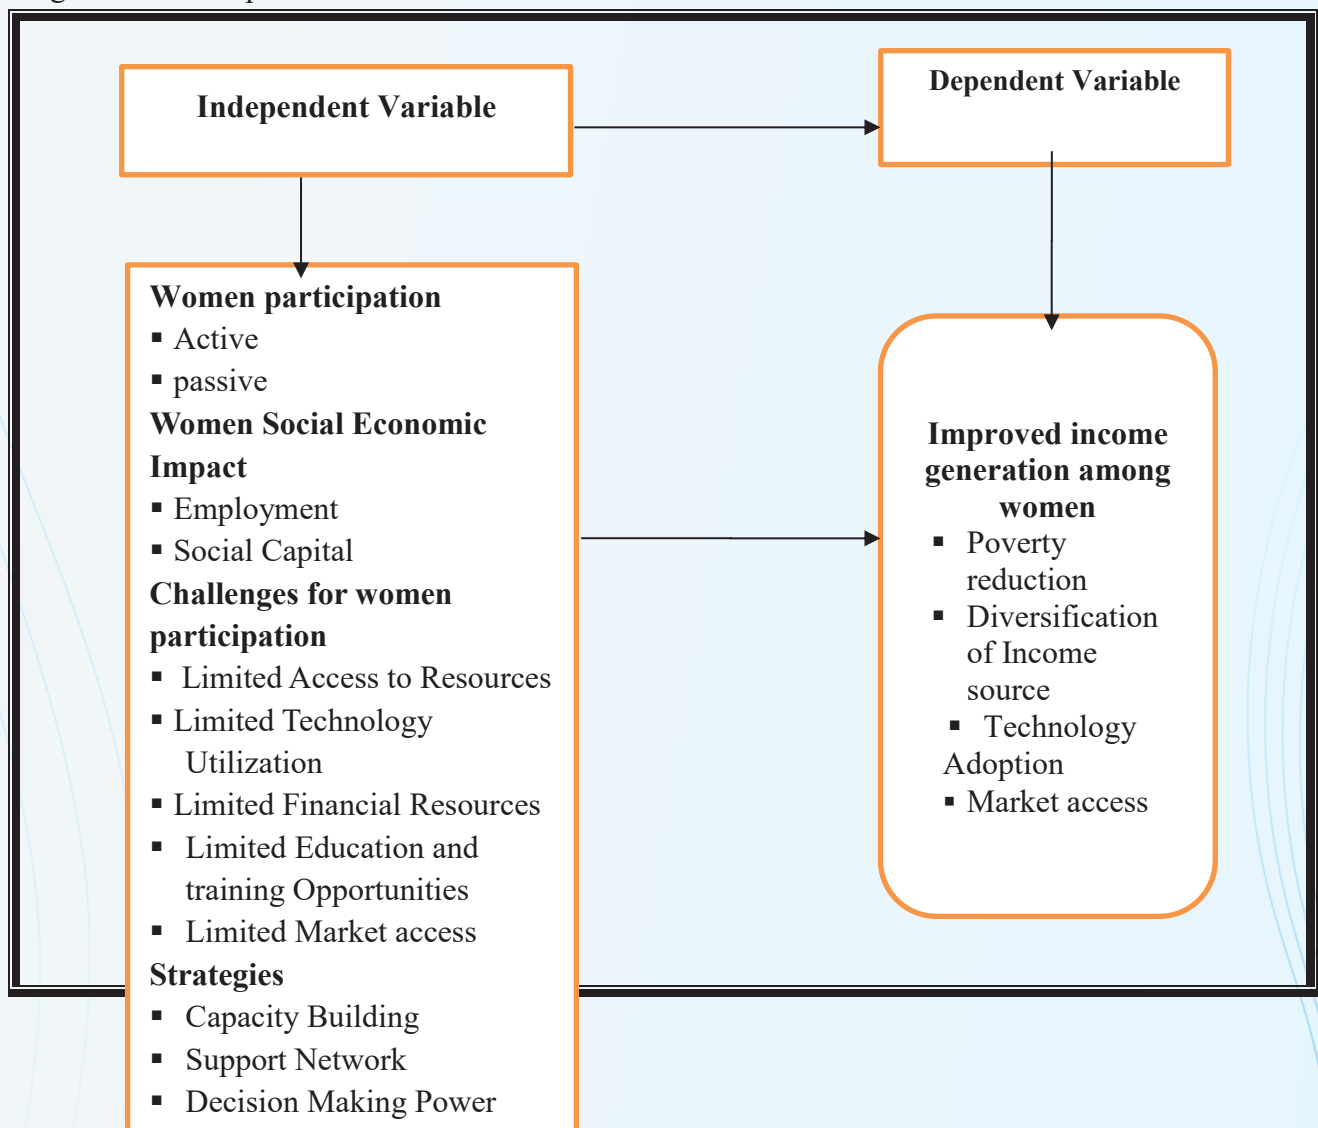

In Tanzania, grape farming, particularly in Mpunguzi and Mbabala Wards, presented a distinct opportunity to uplift the economic status of women by providing employment and income opportunities in rural areas where such opportunities were often scarce. The income from grape farming had a positive impact on local non-farm economies, as farmers tended to spend their income on local goods and services (Martinez, 2022). The economic benefits of grape farming

were also essential for food security and poverty reduction, further contributing to community resilience and sustainability.

2.1 Conceptual Framework

According to Kelley and Knowles (2016), a conceptual framework guided the research design and aided in data analysis. In this study, the independent variable was grape farming, which influenced the dependent variable, household income, measured through indicators like money and food security (O'Sullivan et al., 2016). The framework also included intermediate variables that encompassed constraints and strategies for improving grape farming. A direct relationship was illustrated between the independent and dependent variables, represented by a solid line, indicating that changes in grape farming directly impacted household income. This conceptual framework provided a structured approach to understanding the dynamics of grape farming and its effects on economic outcomes for households.

Figure 33: Conceptual framework

3. Methodology

3.1 Description of the Study Area

The study was conducted in Dodoma City, focusing on Mpunguzi and Mbabala Wards, which were known for their prominence in grape cultivation due to favorable climatic conditions. These wards contributed approximately 3% of the grape farmers in Dodoma, positioning them alongside other notable grape-producing areas such as Hombolo, Chamwino, and Bahi. The selection of Mpunguzi and Mbabala facilitated easy access to transportation and essential farming resources, allowing for comprehensive data collection on grape farming and its effects on women's income generation. Women's participation in grape farming became increasingly significant, contributing to household livelihoods and gender equity in income generation. This research aimed to illustrate the socio-economic impact of grape farming on women's lives within these wards.

3.2 Research Approach

A mixed-methods research approach was adopted, integrating both quantitative and qualitative techniques for a holistic understanding of the impact of grape farming on income generation. The quantitative aspect allowed for data collection from a larger sample, facilitating generalization, while the qualitative approach provided an in-depth exploration of individual experiences. This combination balanced the strengths of each method, enhancing the overall rigor of the research by integrating statistical backing with detailed narratives.

3.3 Research Design

The study utilized a cross-sectional research design, capturing a snapshot of the population at a specific moment. This design was effective for quickly assessing respondents' attitudes, opinions, and socio-economic conditions. By focusing on a single point in time, it identified patterns and correlations without prolonged observation, making it a cost-effective method for gathering descriptive data relevant to grape farming and income generation.

3.4 Population, Sampling, and Sample Size

3.4.1 Population

The study population included women grape farmers, leaders of grape farming groups, agricultural extension officers, and women leaders in grape farming, which allowed for a comprehensive analysis of the impact on various stakeholders.

3.4.2 Sampling Procedures

A combination of purposive, simple random, and cluster sampling techniques was employed:

1. **Purposive Sampling:** Used to select key informants such as leaders of grape farming groups and agricultural extension officers based on their expertise.
2. **Simple Random Sampling:** Applied to select a representative sample of women grape farmers.

3. **Cluster Sampling:** Used for smallholder farmers to ensure representation from different clusters within the study area.

3.4.3 Sample Size

Using the Yamane (1967) formula for an unknown population and a precision level of 0.05, the sample size was calculated as follows:

$$n = \frac{N}{1 + N \cdot e^2} \quad n = \frac{278}{1 + 278 \cdot 0.0025} \approx 164$$

For a population size of 278:

$$n \approx \frac{278}{1 + 278 \cdot 0.0025} \approx 164$$

Thus, the sample comprised 164 respondents, including:

- Leaders of grape growers: 2
- Women leaders in grape farming: 4
- Agricultural extension officers: 4
- Women grape farmers: 154
- Total: 164**

3.5 Data Collection Methods and Tools

3.5.1 Questionnaires

Structured questionnaires were administered to 154 women grape farmers, featuring both closed and open-ended questions to collect data on background information, farming practices, market access, and challenges faced (Moser & Kalton, 2017).

3.5.2 Interviews

Face-to-face interviews were conducted with leaders of grape farming groups, women leaders, and agricultural extension officers, allowing for flexible exploration of decision-making, market access, and training needs (Rutakumwa et al., 2020).

3.6 Data Analysis Plan

Quantitative data were analyzed using SPSS version 22, employing descriptive statistics for demographic information and inferential statistics, including Chi-square tests and logistic regression models, to assess relationships between grape farming and income generation. Qualitative data were coded and thematically analyzed to identify key themes and patterns.

3.7 Validity and Reliability

3.7.1 Reliability

To ensure reliability, the study utilized Cronbach's Alpha, with a threshold of 0.7 considered acceptable. The values for various variables ranged from 0.793 to 0.884, indicating strong internal consistency. A pilot study and pre-testing were also conducted (Mohammed, 2019; Mohajan, 2017).

3.7.2 Overall Reliability Statistics

The overall Cronbach's Alpha for the 45 items combined was 0.911, reflecting excellent internal consistency and suggesting that the measurement instruments effectively captured the constructs under study.

Findings & Discussion

4.2 Response Rate

Out of the initial 278 respondents, a final sample of 164 participants was surveyed, comprising 154 through questionnaires and 10 through interviews. This response rate of 59% reflected strong engagement with the survey, indicating effective data collection strategies. The use of both questionnaires and interviews contributed to a comprehensive dataset, enriching the study's findings.

4.3 Characteristics of the Respondents

This section explored the demographic characteristics of women grape farmers in Mpunguzi and Mbabala Wards, focusing on factors such as marital status, educational qualifications, age, and work experience to understand their economic empowerment through grape farming.

4.3.1 Marital Status

Table 3: Marital Status Distribution of Women Grape Farmers in Dodoma

Marital Status	Frequency	Percent
Single	51	31.10%
Married	103	62.80%
Widow/Widower	6	3.66%
Divorced	4	2.44%

The marital status of women grape farmers in Dodoma revealed significant insights into their socio-economic contexts. The majority of respondents (62.80%) were married, suggesting that family support networks likely played a crucial role in their agricultural activities. This high percentage indicated that married women might have benefited from collaborative family support but may also have faced challenges in balancing domestic responsibilities with farming.

Single women constituted 31.10% of the sample. These individuals may have enjoyed greater decision-making autonomy but could have faced challenges related to the lack of a support system typically provided by family. The relatively small percentages of widows/widowers (3.66%) and divorced women (2.44%) indicated that these groups faced unique challenges, such as potential issues with land tenure or limited social support.

Understanding these marital dynamics was crucial for designing targeted interventions. For instance, programs could have involved spouses in agricultural training to support married women or offered support systems and resources tailored to single, widowed or divorced women to address their specific needs.

4.3.2 Education Qualification

Table 4: Educational Qualifications of Women Grape Farmers in Dodoma

Educational Level	Frequency	Percent
Primary	64	39.02%
Secondary School	62	37.80%
Certificate/Diploma	30	18.29%
Bachelor's Degree	8	4.88%

Respondents exhibited varied educational backgrounds, with 39.02% having primary education, 37.80% secondary education, 18.29% holding certificates or diplomas, and 4.88% possessing bachelor's degrees. This educational diversity suggested a strong foundation in practical farming knowledge, with fewer advanced qualifications. Tailored training programs could have improved agricultural practices and business management, leveraging the specialized skills of those with higher education while addressing challenges faced by those with basic education.

Table 5: Age Distribution of Women Grape Farmers:

Age Group (Years)	Frequency	Percent
25-31	39	36.45%
32-38	39	36.45%
39-45	26	24.30%

Age Group (Years) Frequency Percent

46-52	3	2.80%
-------	---	-------

The majority of respondents were between the ages of 25-31 (36.45%) and 32-38 (36.45%), with fewer in the 39-45 (24.30%) and 46-52 (2.80%) age groups. This youthful demographic indicated a potential for innovation and adoption of new practices. However, it also highlighted the need for targeted strategies to support different age groups; younger women may have required capital and land access support, while older women might have benefited from mentorship and flexibility in farming practices.

4.3.4 Work Experience

Table 6: Work Experience of Women Grape Farmers in Dodoma

Work Experience (Years) Frequency Percent

0-7	35	21.34%
8-14	80	48.78%
15-21	40	24.39%
22 Above	9	5.49%

A substantial proportion of respondents had 8-14 years (48.78%) or 15-21 years (24.39%) of experience in grape farming, indicating a strong foundation in the field. Those with over 22 years of experience (5.49%) represented the most seasoned farmers. This range of experience suggested a potential for mentorship and advanced training programs. Leveraging the expertise of more experienced farmers could enhance the skills and productivity of less experienced farmers, fostering overall sector growth and improved economic outcomes.

4.4 Discussion

The analysis of the respondent data from women grape farmers in Mpunguzi and Mbabala Wards, Dodoma City, reveals important insights into their socio-economic characteristics and the implications for their participation in grape farming.

4.4.1 Marital Status:

The majority of respondents were married (62.80%), which suggested that family support played a significant role in their agricultural activities. This demographic likely benefited from interventions designed to support family-based decision-making, including training programs that involved spouses and addressed challenges related to balancing household duties with farming responsibilities. Single respondents (31.10%) had greater autonomy but faced challenges related to support networks, while the

smaller groups of widows/widowers (3.66%) and divorced individuals (2.44%) encountered specific issues related to land tenure and social support. Tailoring support programs to address these unique needs could have enhanced their participation and productivity.

4.4.2 Educational Qualifications:

The educational background of the respondents is diverse, with the majority having attained primary education were (39.02%) and secondary education were (37.80%). This indicates a reliance on practical knowledge gained through experience rather than formal higher education. The presence of 18.29% with Certificates or Diplomas and 4.88% with Bachelor's degrees suggests that specialized training and advanced knowledge are available but less common. This educational diversity highlights the need for targeted training programs that cater to different educational levels. For those with primary and secondary education, basic literacy and numeracy training alongside agricultural skills development could significantly improve their farming practices. On the other hand, individuals with higher educational qualifications can contribute advanced insights and innovations, driving improvements in farming techniques and practices.

4.4.3 Age Distribution:

The age distribution showed a predominance of younger women, with 72.90% of respondents aged between 25 and 38 years. This youthful demographic was advantageous for adopting new technologies and innovative practices, as younger individuals were generally more open to change and development. However, this age distribution also suggested potential barriers for older women, particularly those in the 46-52 age group, who may have faced different challenges such as physical limitations or greater household responsibilities. Designing age-specific strategies, such as microfinance options for younger women and mentorship programs that leveraged the experience of older women, was crucial for fostering an inclusive and supportive farming environment..

4.4.4 Work Experience:

The data on work experience revealed a substantial presence of women with 8-14 years of experience (48.78%), indicating a well-established foundation in grape farming. This group provided valuable mentorship and advanced insights. Those with 15-21 years of experience (24.39%) further contributed to the sector with their extensive knowledge. The smaller group with over 22 years of experience (5.49%) represented seasoned experts who could lead and guide others. Tailored support programs needed to address

the varying needs of these different experience levels. For newcomers (0-7 years), additional training and resources were essential to build their expertise. For more experienced farmers, advanced technology and leadership opportunities could enhance their productivity and influence in the sector.

In conclusion, the demographic and professional characteristics of women grape farmers in Dodoma City highlighted the importance of designing targeted interventions to support their diverse needs. By addressing challenges related to marital status, educational qualifications, age, and work experience, stakeholders could enhance their participation and productivity in grape farming. By leveraging the strengths of each group and addressing their challenges, it became possible to promote sustainable economic development and improve the socio-economic outcomes for women farmers in the region.

4.4.5 The social economic impact of women participation in grapes farming and income generation in Tanzania.

The social economic impact of grape farming women income generation in Mpunguzi and Mbabala were examined. In addressing this objective a descriptive analysis were applied to presents generation statistics for women grape farmers, detailing the mean, standard deviation, minimum and maximum values for various components contributing to income generation, as shown in Table 7. The mean income from grape farming is substantial, indicating a positive financial impact on the women farmers. The standard deviation reflects the variability in income levels, highlighting differences in productivity and market access. The minimum income value shows that some farmers are at the lower end of the income spectrum, while the maximum value indicates the potential for high earnings among successful farmers. These statistics underscore the importance of grape farming as a significant source of income for women in Dodoma.

Table 7: Income generation summary statistics

	Income generation	Mean	Std. Dev.	Min	Max	
	Yield per Acre	4.11	0.32	2	5	
	Quality grading	4.211	.402	2	5	
	Market prices	4.191	.497	2	5	
	Production cost	3.91807	.395	1	4	
4.4.6	Marketing strategies	4.587	.495	2	5	In
	Overall	4.219	.412	2.44	4.75	

additional the chi-square was tested to measure the Association between social economic impacts of grape farming on income generations. The association between the socio-economic impacts of grape farming and income generation among women was categorized into low income and high income. The analysis show that Chi-square values and P-values to determine the significance of these associations was at the 0.05 level of significance as indicated in table 8

Table 8: Association between Social Economic Impacts of Grape Farming on Income Generations

Variabl e	Low income	High income	Chi- square	P- Valu e
<i>Employment</i>			31.221 2	0.00
No	36(61.02)	23(38.98)		
Yes	19(18.1)	86(81.9)		
<i>Social capital</i>			23.232 9	0.00
No	31(59.62)	21(40.38)		
Yes	24(21.43)	88(78.57)		

The analysis of the association between the socio-economic impact of grape farming and income generation revealed significant findings. There was a clear relationship between employment resulting from grape farming and income generation. Women

employed in grape farming were significantly more likely to be in the high-income group (81.9%) compared to those who were not employed (38.98%). Conversely, a majority of the low-income group (61.02%) were not employed in grape farming. The Chi-square value of 31.2212, with a P-value of 0.00, indicated a statistically significant difference at the 0.05 level, demonstrating a strong association between employment in grape farming and income generation.

Additionally, the analysis showed a significant association between social capital and income generation. Women with higher social capital predominantly fell into the high-income group (78.57%), while those with lower social capital were mostly in the low-income group (59.62%). The Chi-square value of 23.2329, with a P-value of 0.00, further confirmed a statistically significant difference at the 0.05 level.

These findings indicated that both employment in grape farming and social capital had significant positive associations with higher income generation among women grape farmers. Women who were employed in grape farming or possessed higher social capital were significantly more likely to generate higher incomes. The Chi-square tests for both variables showed highly significant associations with income levels, as reflected by their P-values of 0.00, which were well below the 0.05 threshold for significance. This suggests that enhancing employment opportunities and building social capital are crucial for improving income generation among these women.

Furthermore, the study utilized the Hosmer and Lemeshow model coefficient test to examine the association of the socio-economic impact of grape farming on income generation, as shown in Table 9.

Table 9: Omnibus tests of model coefficients

Logistic regression model	Chi square	Degree of freedom	significance
social economic impact on grape farming on income generations	9.2416	2	0.002

The table includes Chi-square values, degrees of freedom, and significance levels for each model. Interpretation of Omnibus tests of model coefficients socio-economic impact on grape farming on income generation with a chi-square of 9.2416, Degree of freedom: 2, significance (p-value): 0.002. The analysis of chi-square value of 9.2416 with 2 degrees of freedom of p-value of 0.002 indicates that the logistic regression model

assessing the socio-economic impact of grape farming on income generation is statistically significant at the 0.05 level. This result suggests that the variables included in the model significantly contribute to predicting income generation among women grape farmers. The low P-value (0.002) confirms that the relationship observed is unlikely to be due to chance, implying a strong association between socio-economic factors and income levels.

Strategies Plan in Women Income Generation Chi-square was 7.1419 Degree of freedom was measured 3 Significance (P-Value): 0.004) and the findings indicates that the logistic regression model evaluating the impact of strategies on women's income generation is statistically significant at the 0.05 level.

This result suggests that the strategic plans included in the model significantly contribute to predicting income generation among women. The P-value of 0.004 confirms that the observed associations are statistically significant and unlikely to be due to random variation, highlighting the importance of strategic planning in influencing income levels. The tests of omnibus model of coefficients demonstrate that both logistic regressions models—one assessing the socio-economic impact on grape farming and the other evaluating strategic plans in women's income generation—are statistically significant at the 0.05 level. The Chi-square values and associated P-values indicate that the variables in each model significantly contribute to predicting income generation among women grape farmers. These findings underscore the importance of socio-economic factors and strategic planning in enhancing women's income from grape farming.

However the results of a Hosmer-Lemeshow goodness-of-fit test for logistic regression models related to the social and economic impact of grape farming on income generation. This test assesses how well a logistic regression model fits the observed data. It compares observed and expected outcomes across categories of deciles of predicted probabilities. Lower Chi-square values and higher p-values indicate a better fit. Results at 0.05 Significance Level: The study considered a p-value greater than 0.05 to suggest the model has an acceptable with social economic impact on grape farming income generations Chi-square of 1.217 (relatively low), Degrees of freedom and (df): 4 p-value 0.301 (>0.05)

Table 10: Hosmer and Lemashow Model Test

Logistic regression model	Chi square	Degree of freedom	significance
social economic impact on grape farming income generations	1.217	4	0.301

4.4.7 Income Generation Categories of Women Grape Farming

The study further assessed the income generation in category of women grape farming. The study found that majority of women earn low income as they are involved in grape farming activities as indicated in figure 3.

Figure 34: Income Generation

The analysis indicates that 33.54% (55 individuals) are classified as having high income from their grape farming activities. This suggests that approximately one-third of the women grape farmers generate a high level of income from their farming operations. Conversely, the majority of the respondents, 66.46% (109 individuals), are classified as having low income from their grape farming activities. This indicates that a significant portion, about two-thirds, of the women grape farmers is earning lower incomes. The data indicates a disparity in income generation among the women grape farmers in Dodoma. While a notable 33.54% manage to generate high income, a larger segment of 66.46% falls into the low-income category. This highlights a potential area for intervention and support to improve income levels for the majority of these farmers. The high percentage of low-income farmers suggests the need for strategies to enhance productivity, access to better markets, or more efficient farming practices to elevate their income levels. Empirical studies support the observed income disparity among women farmers. This finding concurs with Oseni et al. (2015) who found that women in agriculture often face significant barriers to achieving high income, including limited access to resources, education, and markets. Similarly, Goldstein, and Rosas (2013) reported that gender-specific constraints significantly impact women farmers'

productivity and income levels. Furthermore the Qualitative data provided additional insights into income generation among women grape farmers that women are earning the little because they have no strong capital to invest in grape farming.

During interview with Extension officers at Mpunguzi ward he said that,

"The income we get from grape farming is crucial, but it's not enough to cover all our household expenses. We need better access to markets and supports to improve our yields."

Also Leader of grape growers on state of women grape farming has different opinions,

"Those of us who earn more have been able to invest in better farming techniques and marketing strategies, which makes a big difference."

However similar statement of a leader of Women grape growers mentioned“
The necessity of better access to markets and support to improve yields, which is a recurring theme in agricultural development”.

5.0 Conclusions

The study aimed to evaluate how grape farming influenced income generation among women in Mpunguzi and Mbabala Wards, Dodoma City. The findings revealed a clear positive impact of grape farming on women's income. The analysis showed that women involved in grape farming generally experienced higher income levels compared to those who did not participate in grape farming. This correlation underscored the significant role that grape farming could play in enhancing the economic status of women in the region.

Quantitative analyses, including Chi-square tests and logistic regression models, confirmed that several factors were associated with higher income generation. Specifically, the data highlighted those women with more extensive experience in grape farming and higher educational qualifications tended to have better income outcomes. This suggested that both experience and education were crucial in maximizing the economic benefits of grape farming. The positive relationship between farming experience and income indicated that as women gained more experience, their income potential increased, likely due to improved farming practices and productivity.

However, the study also identified several challenges that affected the income potential of women grape farmers. These included high input costs, limited market access, and inadequate training and support. The results indicated that despite the overall positive impact on income, these challenges could hinder the full realization of grape farming's economic benefits. Addressing these issues was critical for ensuring that all women farmers could benefit equally from grape farming.

Overall, the study demonstrated that grape farming was a promising avenue for improving women's income in Mpunguzi and Mbabala Wards. By focusing on the factors that enhanced income generation, such as experience and education, and addressing the challenges identified, there was potential for significant economic improvement for women in these communities.

5.1 Recommendations

Based on the findings, several recommendations are proposed to enhance the income-generating potential of grape farming for women in Mpunguzi and Mbabala Wards. Firstly, addressing the high input costs associated with grape farming is crucial. Implementing subsidies or providing access to affordable inputs can help reduce financial barriers and increase profitability for women farmers.

Improving market access is another key recommendation. Establishing better market linkages and providing training on market strategies can help women farmers secure better prices for their produce and expand their market reach. Additionally, creating platforms for women to connect with potential buyers can facilitate better sales opportunities.

Training and support programs should be expanded to cover various aspects of grape farming, including advanced farming techniques, pest management, and business skills. Tailored training programs that cater to different educational backgrounds and experience levels can empower women with the knowledge needed to enhance their farming practices and income potential.

Supporting women with limited resources through microfinance options can provide the necessary capital for purchasing inputs and investing in farming improvements. Additionally, fostering partnerships with local and international organizations can help secure funding and resources for grape farming projects.

Lastly, policymakers should focus on creating an enabling environment for women grape farmers. This includes developing policies that address land tenure issues, promote gender equality, and provide incentives for women's participation in agriculture. By addressing these areas, the economic empowerment of women through grape farming can be significantly enhanced, leading to sustainable growth and development in the region.

5.2 Limitations to the Study and Areas for Further Research

This study relied primarily on primary data collected through questionnaires and interviews with women grape farmers in Mpunguzi and Mbabala Wards, while limited use was made of secondary data. The inclusion of more secondary data, such

as agricultural reports or market studies, could have enhanced the quality and reliability of the findings through data triangulation. Additionally, the study focused on the social and economic impacts of grape farming on income generation and women's empowerment but did not explore specific grape production volumes and market trends due to the lack of consistent records and accessible data.

Future research could address these limitations by incorporating a more balanced approach between primary and secondary data sources, which may provide a more comprehensive understanding of the determinants affecting women's market access in grape farming. Furthermore, similar studies could be conducted in other grape-producing regions beyond Dodoma City, to compare the findings and gain a broader perspective on the impact of grape farming on women's livelihoods across Tanzania. Expanding the geographical scope could also help identify region-specific challenges and opportunities for enhancing women's economic empowerment through grape farming.

godson.mtallo@cbe.ac.tz

Abstract

This study conducted in Dodoma City Council investigates the impact of the working environment—comprising physical environment, social environment, and organizational culture—on public service delivery. Data collection involved a questionnaire survey distributed among 93 participants across various departments. Variables were measured using a Five-Point Likert Scale, and multiple linear regression analysis was used to analyze the data, exploring how variations in the working environment predict changes in public service delivery outcomes. Prior to the main study, a pilot test ensured instrument validity, and reliability was assessed using Cronbach's Alpha. Ethical considerations included informed consent, confidentiality measures, and transparent reporting. The model summary findings indicated a coefficient of determination (R-squared) of 0.279, indicating that approximately 27.9% of the variance in public service delivery can be explained by the combined influence of the predictors. The standardized coefficients revealed that organizational culture (Beta = 0.408) had the strongest positive impact on service delivery, followed by the social environment (Beta = 0.305) and physical environment (Beta = 0.211). These findings underscore the critical roles played by organizational culture, social interactions, and physical workspace conditions in shaping effective public service delivery in Dodoma City Council.

Keywords: *Working Environment, Organizational Culture, Public Service Delivery*

1.0 Introduction

The quality of public service delivery is a critical determinant of a nation's development and the well-being of its citizens (Andrews et al., 2023). While efficient and effective public services are crucial globally, the issue is particularly salient in developing countries like Tanzania, where they can significantly impact poverty reduction and overall quality of life (World Bank, 2021).

Recent studies have increasingly recognized the influence of the working environment on employee performance and, consequently, on public service delivery (Kim, 2022; OECD, 2020). A conducive working environment encompasses various factors, including physical amenities, social interactions, and organizational culture. These factors collectively shape

employee satisfaction, motivation, and productivity, ultimately influencing their ability to deliver quality public services (Grissom et al., 2021).

For instance, a 2021 World Bank report highlighted the positive correlation between well-equipped offices, comfortable temperatures, and improved service delivery in several African countries. The report further underscored the importance of a positive social environment characterized by teamwork, collaboration, and supportive leadership. Similarly, a 2022 study published in the *Public Administration Review* found that a strong organizational culture fostering innovation and accountability significantly enhanced the responsiveness and efficiency of public services in European nations.

In the African context, the impact of the working environment on public service delivery is particularly relevant due to the challenges faced by many public sector organizations (Adu-Gyamfi et al., 2023). These challenges include limited resources, inadequate infrastructure, and socio-cultural factors that can influence employee behavior and attitudes.

A 2023 study conducted by the African Development Bank revealed that many public sector employees in Africa work in suboptimal physical environments, lacking basic amenities such as clean water, proper sanitation, and adequate lighting. These conditions can negatively affect employee morale, health, and overall job satisfaction. The study also highlighted the prevalence of hierarchical organizational structures in many African public sector organizations, which can stifle creativity, innovation, and employee empowerment.

In Tanzania, the issue of poor public service delivery has been a longstanding concern (Mdee et al., 2022). Citizens often complain about delays, inefficiencies, and a lack of responsiveness from public officials (Ngowi, 2021). While various efforts have been made to address these issues, the focus has primarily been on structural reforms, technological upgrades, and capacity-building initiatives (Tanzania Public Service Commission, 2021). The role of the working environment in shaping public service delivery has largely been overlooked.

Dodoma City Council, as the administrative center of Tanzania, plays a crucial role in delivering public services to the city's growing population. However, the council has faced numerous challenges in recent years, including a lack of resources, inadequate infrastructure, and allegations of corruption (Mwakyembe, 2020). These challenges have undoubtedly contributed to the perceived poor quality of public service delivery in the city.

While some efforts have been made to improve the working environment at Dodoma City Council, such as the construction of a new office building and the provision of basic amenities, much remains to be done. A 2022 survey conducted by the council's human resources department revealed that employees were generally dissatisfied with their working conditions. The survey identified issues such as inadequate office space, poor ventilation, and a lack of communication and collaboration among staff members.

Despite the growing body of evidence highlighting the importance of the working environment for public service delivery (e.g., Kim, 2022; OECD, 2020), there is a paucity of research specifically examining this relationship in the Tanzanian context, particularly at the local government level. The available studies have primarily focused on national-level institutions or specific sectors, such as health and education (e.g., Komba et al., 2021).

This study aims to fill this research gap by investigating the relationship between the working environment and public service delivery in Dodoma City Council. By examining the specific factors that contribute to a conducive working environment, such as physical amenities, social interactions, and organizational culture, the study will provide valuable insights into how these factors influence employee performance and, ultimately, the quality of services delivered to citizens.

2.0 Literature Review

2.1 Empirical Literature Review

The relationship between the working environment and public service delivery has gained significant attention in recent years, with a growing body of research highlighting its importance. This literature review explores the studies to understand how different dimensions of the working environment, including physical, social, and organizational culture, influence employee performance and service quality in the public sector.

The physical environment of the workplace, encompassing factors like office layout, lighting, temperature, and noise levels, has been shown to significantly impact employee well-being, satisfaction, and productivity (Kim, 2022). A study by Adu-Gyamfi et al. (2023) found that public sector employees in Africa who worked in well-designed and comfortable offices reported higher levels of job satisfaction and were more likely to perceive their work as meaningful. Similarly, Grissom et al. (2021) demonstrated that access to natural light and greenery in the workplace can improve cognitive function and reduce stress, leading to enhanced performance among public servants.

However, the impact of the physical environment on service delivery can vary across different contexts. For instance, a study by Mwakyembe (2020) found that while comfortable temperatures were associated with improved service quality in some Tanzanian government offices, this relationship was not observed in all cases. This suggests that the influence of the physical environment may be moderated by other factors, such as job characteristics and individual differences.

Moreover, the social environment, including relationships with colleagues and supervisors, communication patterns, and teamwork, plays a crucial role in shaping employee experiences and behaviors in the public sector. A supportive and collaborative social environment can foster trust, cooperation, and knowledge sharing, ultimately contributing to improved service delivery (OECD, 2020). A study by Mdee et al. (2022) found that public

servants in Tanzania who reported positive relationships with their colleagues and supervisors were more likely to be engaged in their work and provide high-quality services.

Furthermore, the social environment can also influence employee perceptions of organizational justice and fairness, which can further impact their motivation and performance. A study by Ngowi (2021) revealed that when public servants in Tanzania felt that they were treated fairly and equitably by their colleagues and supervisors, they were more likely to be committed to their organization and provide better services to citizens.

Likewise, Organizational culture, encompassing the shared values, beliefs, and norms that guide employee behavior, is a critical factor in shaping public service delivery. A strong organizational culture that emphasizes customer orientation, accountability, and continuous improvement can create a positive work environment and drive employee performance (Andrews et al., 2023). A study by Komba et al. (2021) found that public sector organizations in Tanzania with a strong culture of service excellence and innovation were more likely to achieve their performance goals and deliver high-quality services.

However, creating and sustaining a positive organizational culture can be challenging, particularly in the public sector, where bureaucratic structures and political pressures can sometimes undermine efforts to promote change. A study by Tanzania Public Service Commission (2021) highlighted the need for strong leadership and effective communication to ensure that cultural change initiatives are successful in the Tanzanian public sector.

While the existing literature provides valuable insights into the relationship between the working environment and public service delivery, there are still several research gaps that need to be addressed. First, most studies have focused on individual dimensions of the working environment (e.g., physical, social, or organizational culture) in isolation, without considering their combined effects. Future research should adopt a more holistic approach to examine how these different dimensions interact and influence employee performance and service quality.

Second, there is a need for more longitudinal studies that track changes in the working environment over time and assess their long-term impact on public service delivery. Such studies can provide valuable insights into the sustainability of interventions aimed at improving the work environment and their potential to drive lasting improvements in service quality.

Finally, most studies have been conducted in developed countries, with limited research on the working environment in developing country contexts, such as Tanzania. Future research should focus on understanding the unique challenges and opportunities related to improving the work environment in developing countries, taking into account the specific socio-cultural and economic factors that shape public sector organizations in these contexts.

2.2 Theoretical Literature Review

For this study on the impact of the working environment on public service delivery in Dodoma City Council, the **Organizational Climate Theory** is a suitable theoretical framework. This theory, which falls under the broader category of organizational behavior theories, examines

how various environmental factors within an organization, such as the physical environment, social environment, and organizational culture, influence employees' behavior and performance, ultimately affecting service delivery.

The concept of organizational climate was first introduced by Kurt Lewin in the 1930s and later expanded by other researchers like Litwin and Stringer in the 1960s. The theory has evolved over the decades, with more recent contributions focusing on the specific impacts of climate on employee attitudes and performance. In 1968, Litwin and Stringer formalized the theory by linking organizational climate to employee motivation and performance (Litwin & Stringer, 1968). The theory suggests that the overall atmosphere in an organization significantly affects how employees feel and perform. In recent years, scholars have further developed the theory to incorporate various elements of the working environment, including physical and social factors, thereby making it relevant for contemporary organizational studies (Shanker et al., 2021).

Organizational Climate Theory rests on several key assumptions. First, it assumes that the organizational environment is a significant determinant of employee behavior and attitudes. Factors like the physical setup of the workspace, the nature of interpersonal relationships, and the prevailing organizational culture directly influence how employees feel about their work and their performance (Ostroff et al., 2020). Second, the theory posits that a positive working environment leads to higher job satisfaction, motivation, and productivity. Conversely, a negative environment can lead to dissatisfaction, low morale, and reduced efficiency, which affects overall service delivery (Parker et al., 2020). The theory also assumes that the perceptions of employees about their work environment are shaped by the tangible and intangible aspects of the organizational climate, such as leadership style, communication patterns, and employee recognition programs (Schneider et al., 2020).

One of the major strengths of Organizational Climate Theory is its holistic approach, which considers multiple dimensions of the working environment. This comprehensive perspective enables organizations to understand and address a range of factors that influence employee performance and service delivery (Kuenzi & Schminke, 2020). Additionally, the theory's emphasis on employee perceptions makes it a valuable tool for assessing organizational effectiveness. By focusing on how employees perceive their environment, organizations can identify areas for improvement and implement changes that enhance employee well-being and productivity (Newman et al., 2022). The theory is also adaptable, allowing it to be applied across different types of organizations and sectors, including public service, which makes it particularly relevant for the study of service delivery in Dodoma City Council.

Despite its strengths, Organizational Climate Theory has certain limitations. One of the main weaknesses is its reliance on employee perceptions, which can be subjective and influenced by personal biases (Schneider et al., 2020). This subjectivity can lead to inconsistencies in measuring organizational climate, making it difficult to establish a direct causal relationship between climate factors and employee performance. Additionally, the theory may not adequately account for external factors, such as economic conditions or technological changes, that can also impact organizational climate and performance (Parker et al., 2020). These

limitations suggest that while Organizational Climate Theory is useful for understanding internal dynamics, it should be used in conjunction with other frameworks to capture a more comprehensive picture of organizational performance.

Organizational Climate Theory is highly relevant to this study on the impact of the working environment on public service delivery in Dodoma City Council. By examining factors such as the physical environment, social environment, and organizational culture, the theory provides a structured way to analyze how these elements influence employee behavior and service outcomes. Understanding the organizational climate can help identify specific areas where improvements can be made to enhance service delivery, such as better communication channels, improved physical workspaces, and a supportive organizational culture. Moreover, using this theory allows the study to draw connections between the working environment and public service efficiency, offering valuable insights for policy makers and administrators in Dodoma City Council (Ostroff et al., 2020). The findings from this study can contribute to developing strategies that foster a positive organizational climate, leading to better public service delivery and overall organizational performance.

3.0 Methodology

3.1 Research Design and Setting

This study utilized a cross-sectional research design, which allowed for the collection of data at a single point in time, providing a snapshot of the current state of the working environment and its impact on public service delivery within Dodoma City Council. By focusing on a specific moment, this approach efficiently gathered relevant information regarding how various factors, such as the physical environment, social environment, and organizational culture, influence the quality of public services provided. The cross-sectional design enabled the study to capture a wide range of data from multiple respondents simultaneously, offering a comprehensive understanding of the existing conditions without the need for a lengthy observation period. This method was particularly suitable for identifying patterns and relationships between environmental factors and service delivery outcomes, making it a valuable tool for informing strategic improvements and policy decisions aimed at enhancing public service efficiency and effectiveness within the council.

3.2 Targeted Population and Sample Size

The study population encompassed a total of 120 individuals within Dodoma City Council (Dodoma City Council, 2023). To ensure the research findings were both representative and manageable, a sample size of 93 participants was determined. This sample was carefully selected to capture the diverse perspectives and experiences within the council, enabling the study to draw meaningful insights about the impact of the working environment—comprising the physical environment, social environment, and organizational culture—on public service delivery. By including a wide range of participants from different departments and roles, the study aimed to provide a comprehensive understanding of the various factors influencing

service outcomes, thus ensuring the findings were reflective of the broader organizational context.

3.3 Data Collection Methods

The data collection method employed for this study was a questionnaire survey, which involved the distribution of carefully crafted questionnaires to targeted key respondents to ensure the capture of relevant and specific information. This approach was chosen to facilitate efficient and structured data gathering, allowing participants to provide their responses in a standardized format. The survey specifically targeted individuals across various departments within Dodoma City Council, including administration, human resources, finance, and service delivery units, ensuring that the insights gathered were comprehensive and represented a broad spectrum of experiences and perspectives. By focusing on these key departments, the study aimed to understand how different aspects of the working environment—such as the physical workspace, social interactions, and organizational culture—affect public service delivery within the council.

3.4 Variable Measurements and Data Analysis

3.4.1 Variable Measurements

In this study, the variables were measured using a standardized Five-Point Likert Scale to ensure consistency and reliability in data collection. The independent variables—Physical Environment, Social Environment, and Organizational Culture—as well as the dependent variable, Public Service Delivery, were all assessed with this scale, where participants indicated their level of agreement ranging from 1 (Strongly agree) to 5 (Strongly disagree). This approach allowed for a nuanced understanding of how the physical workspace, quality of interpersonal relationships, and organizational culture within Dodoma City Council impacted the quality and effectiveness of public service delivery. By capturing perceptions and experiences across these variables, the study could effectively analyze their interrelationships and the overall influence on service outcomes.

Table 3.1 Variable Measurements

Variable			Measurement
Physical Environment	(Independent Variable 1)		Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Social Environment (Independent Variable 2)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Organizational Culture (Independent Variable 3)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Public Service Delivery (Dependent Variable)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Source: Researcher (2023)

3.4.2 Data Analysis

The multiple linear regression analysis was used to test the significant relationship between independent (working environment) and dependent variable (Public Service Delivery). The following presents is the multiple regression equation that was utilized

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e$$

Where;

Y = Dependent Variable

β = Beta coefficient

X_1 = Physical Environment

X_2 = Social Environment

X_3 = Organizational Culture

β_1 = Regression coefficient for X_1

β_2 = Regression coefficient for X_2

β_3 = Regression coefficient for X_3

e = error term

3.5 Validity and Reliability of Data

Before proceeding with the main study, a pilot study was conducted to ensure the validity of the research instruments. This preliminary step involved testing the research instruments on a small sample of respondents to confirm their effectiveness in measuring the intended variables accurately. Following this, the reliability of the data collected was assessed

using Cronbach's Alpha test. This test was selected for its ability to identify any unreliable constructs and exclude them from further analysis. Constructs with a Cronbach's Alpha reliability score above 0.7 were considered acceptable and included in the subsequent analysis, while those with scores below 0.7 were excluded due to their unreliability. This approach was particularly valuable for evaluating constructs in the study that exhibited low correlations among their items.

3.6 Ethical Consideration

To ensure ethical integrity in this study, rigorous measures were implemented. Participants were fully informed and provided with clear explanations about the study's purpose, procedures, potential risks, benefits, and their right to withdraw at any time without repercussions. Respect for participants' autonomy was paramount, emphasizing voluntary participation throughout the research process. Confidentiality measures were strictly adhered to, with stringent protocols in place to protect participants' identities and personal information. Data collection, storage, and analysis were conducted with utmost care to maintain confidentiality and anonymity. In reporting the findings, transparency and accuracy were maintained while ensuring that participant confidentiality was upheld. These ethical considerations were central to the study's methodology, ensuring that it adhered to ethical guidelines and safeguarded the rights and welfare of all participants involved.

4.0 Results

Multiple linear regression analysis was employed to investigate the significant relationship between the independent variable, which encompasses elements of the working environment such as physical environment, social environment, and organizational culture, and the dependent variable, Public Service Delivery. This analytical approach allowed for a thorough examination of how these aspects of the working environment collectively influence public service delivery outcomes.

Table 4.1 presents the model summary results for the multiple linear regression analysis conducted in Dodoma City Council. The coefficient of determination (R-squared) for the model is 0.279, indicating that approximately 27.9% of the variance in Public Service Delivery can be explained by the combined influence of the predictors: physical environment, social environment, and organizational culture.

Table 4.1 Model Summary Results

	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	fl	df2	Sig
	.528	.279	.255	.64284	.279	11.497		89	.000

a. Predictors: (Constant), physical environment, social environment, organizational culture

The standardized coefficients in Table 4.2 indicate that Organizational Culture (Beta = 0.408) has the strongest positive impact on Public Service Delivery, followed by Social Environment (Beta = 0.305) and Physical Environment (Beta = 0.211). These findings underscore that improvements in Organizational Culture, Social Environment, and Physical Environment contribute significantly to enhancing public service outcomes. The statistical significance of all predictor variables ($p < 0.05$) and the confidence intervals for the coefficients further validate the robustness of these results, providing insights into how optimizing these aspects of the working environment can lead to improved service delivery effectiveness in the council.

Table 4.2 Coefficient Regression Results

Model		Unstandardized Coefficients		Standardized Coefficients		ig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
	(Constant)	2.760	.660		.181	.000	1.448	4.071
	Physical Environment	.314	.135	.211	2.316	.023	.583	.045
	Social Environment	.235	.070	.305	3.343	.001	.374	.095
	Organizational Culture	.338	.075	.408	.507	.000	.189	.487

a. Dependent Variable: Public Service Delivery

Table 4.3 presents the ANOVA results for the regression model investigating the relationship between Physical Environment, Social Environment, Organizational Culture, and Public Service Delivery in Dodoma City Council. The model shows a significant overall fit ($F = 11.497, p < 0.001$), indicating that these variables collectively explain a significant portion of the variance in Public Service Delivery scores. The Regression sum of squares is 14.253, with 3 degrees of freedom, suggesting that the model's predictors contribute significantly to predicting Public Service Delivery outcomes. These findings highlight the robustness of the regression model in explaining and predicting variations in Public Service Delivery based on the specified working environment factors.

Table 4.3 ANOVA Results

Model		Sum of Squares	df	Mean Square	F	Sig.
n	Regression	14.253	3	4.751	11.497	.000
	Residual	36.779	89	.413		
	Total	51.032	92			

a. Dependent Variable: Public Service Delivery

b. Predictors: (Constant), physical environment, social environment, organizational culture

5.0 Discussion

In Dodoma City Council, the findings of this study underscore the significant impact of the working environment—comprising physical environment, social environment, and organizational culture—on public service delivery outcomes. Firstly, concerning the physical environment, the study reveals that factors such as office layout, lighting, and temperature play crucial roles in shaping employee well-being and productivity. This aligns with research by Kim (2022) and Adu-Gyamfi et al. (2023), which emphasize that well-designed and comfortable workplaces contribute to higher job satisfaction and perceived meaningfulness of work among public sector employees in Africa. Moreover, access to natural light and greenery, as highlighted by Grissom et al. (2021), not only improves cognitive function but also reduces stress levels, potentially enhancing the performance of public servants.

However, the impact of the physical environment on service delivery can vary, as noted by Mwakyembe (2020), depending on contextual factors such as job characteristics and individual differences. This variability suggests a nuanced relationship where the benefits of a comfortable physical environment may not universally translate into improved service quality across all settings within Dodoma City Council.

Secondly, the study emphasizes the critical role of the social environment in shaping employee experiences and behaviors. Positive relationships with colleagues and supervisors, characterized by trust and cooperation, are found to be essential in fostering engagement and facilitating knowledge sharing among public servants. This finding resonates with insights from OECD (2020) and Mdee et al. (2022), highlighting that supportive social environments contribute significantly to improved service delivery by promoting employee engagement and teamwork.

Moreover, perceptions of organizational justice and fairness within the social environment are shown to influence employee motivation and performance. Ngowi (2021) demonstrates that public servants in Tanzania who perceive fairness in their interactions with colleagues and supervisors are more likely to demonstrate commitment to their organization and deliver high-quality services. This underscores the importance of fostering a fair and equitable social environment to enhance public service delivery outcomes in Dodoma City Council.

Thirdly, organizational culture emerges as a critical determinant of public service delivery effectiveness. A strong organizational culture that prioritizes customer orientation,

accountability, and continuous improvement is found to create a conducive work environment that drives employee performance. This finding is supported by Andrews et al. (2023) and Komba et al. (2021), who highlight the positive impact of a service-oriented and innovative organizational culture on achieving performance goals and delivering high-quality services in public sector organizations.

However, the study also acknowledges the challenges in cultivating and sustaining a positive organizational culture, particularly within bureaucratic and politically influenced structures characteristic of the public sector. The Tanzania Public Service Commission (2021) underscores the importance of effective leadership and communication in overcoming these challenges and ensuring that cultural change initiatives are successful.

6.0 Conclusion

The findings from this study conducted in Dodoma City Council underscore the critical importance of the working environment—specifically the physical environment, social environment, and organizational culture—in shaping public service delivery outcomes. The study reveals that improvements in the physical environment, such as office layout and amenities, contribute to enhanced employee well-being and productivity. Likewise, fostering a supportive social environment with positive relationships and equitable treatment among colleagues and supervisors fosters engagement and teamwork, crucial for effective service delivery. Moreover, a strong organizational culture emphasizing customer orientation and accountability proves pivotal in driving employee performance and achieving service excellence. These insights highlight the complexity and interconnectedness of factors influencing public service delivery in Dodoma, emphasizing the need for comprehensive strategies to optimize the working environment.

Based on the findings, several recommendations can be proposed to enhance public service delivery in Dodoma City Council. Firstly, investing in the improvement of the physical workplace environment by ensuring comfortable, well-equipped offices and incorporating elements that promote employee well-being, such as natural light and green spaces, can significantly boost productivity and satisfaction. Secondly, fostering a supportive social environment through team-building activities, effective communication strategies, and promoting fairness and respect among colleagues and supervisors is crucial. This can enhance collaboration, trust, and ultimately improve service delivery outcomes. Lastly, cultivating a strong organizational culture that prioritizes service excellence, innovation, and continuous improvement should be a priority. Leadership should champion these values, provide clear guidance, and incentivize behaviors that align with the organization's mission and goals. By addressing these dimensions of the working environment, Dodoma City Council can create a conducive atmosphere that empowers its employees to deliver high-quality public services efficiently and effectively.

²College of Business Education, Dodoma

Email: patrickmwamakula@gmail.com / g.mashenene@cbe.ac.tz

Abstract

This study assesses the effect of procurement auditors' competence on implementation of procurement audit recommendations in Babati District Council. The study employed a cross-section research design. The study used simple random sampling to select 85 respondents while purposive sampling was used to select Key informants for interview. Data were collected through questionnaires and interview. Both descriptive and inferential statistics particularly multiple linear regression analysis was used to analyze quantitative data and content analysis were used to analyze qualitative data. The findings revealed that, procurement auditors' competence in terms of training, skills and professionalism were positive and significant related to implementation of procurement audit recommendations (p value < 0.05). The study concluded that, training, skills and professionalism were important factors in auditors' competence that affect implementation of procurement audit recommendations in Babati District Council. Thus, the study recommends to the government, policy makers and Babati District council should made effort to improve the skills of procurement personnel through targeted training and mentorship programs, while also fostering a professional work culture to ensure effective application of audit recommendations.

Keywords: *Procurement auditor, Competence, Implementations, Procurement Audit, Recommendation, Babati District council*

1.0 Introduction

Worldwide, procurement audit recommendations are recognized as important in improving effectiveness the of procurement functions in public and private organization. This is because such recommendations can identify areas of improvement, and help to ensure that proper procedures and processes are in place, thereby helping to reduce risks and improve efficiency. Additionally, these recommendations can help to ensure that organizations are compliant with applicable laws, regulations, and best practices. Finally, procurement audit recommendations can help to ensure that organizations are obtaining the best value for their money (Mahaček *et al.*, 2017).

The procurement audit recommendations can help to improve the procurement process in developed countries like Australia and the United Kingdom. These recommendations can help to ensure that the procurement process is efficient, cost-effective, and compliant with the relevant laws and regulations (Procurement Sustainable, 2014). The audit recommendations can include suggestions for changes in the procurement process, such as the establishment of an internal audit system, the implementation of a Purchasing Policy, the adoption of a Purchasing Code of Practice, and the introduction of an internal procurement monitoring system. In addition, the audit may also identify areas in which procurement processes need improvement. In these cases, the audit recommendations may provide guidance on how to address these issues (Procurement Sustainable, 2014).

In Sub-Saharan Africa countries like Nigeria, Malawi, Ghana and Kenya, procurement audit recommendations are an essential part of the overall procurement process. They can provide assurance that the procurement process is being conducted in an efficient and effective manner, identify and rectify any weaknesses in the system, and provide a basis for corrective action (Anin *et al.*, 2022).

In Tanzania's context, procurement audit recommendations also seemed important in improving procurement function in the public sector. The procurement audit recommendations provide an assessment of the current state of the procurement system and what needs to be done to improve it. These recommendations are also used to ensure that the public sector is meeting the needs of the citizens and providing value for money. The recommendations may include changes to the procurement process, introducing new technology, implementing improved training and policies, and introducing more effective control mechanisms (Kinunda, 2020).

Despite the importance of procurement audit recommendations in public procurement entities in Tanzanian public sectors, the implementation of procurement audit recommendations in public procurement entities in Tanzanian public sectors has been ineffective in Local government authorities (Matto, 2017). This is due to the lack of awareness and understanding of the importance of adhering to procurement audit recommendations, the absence of a clear implementation plan and the lack of capacity to monitor and evaluate implementation. Furthermore, there is a lack of financial resources and capacity to implement the

recommendations, and there are concerns about the lack of accountability, transparency to carry out effective audits (David, 2019). Therefore, this is motivation of this study to assess the perceived factors affecting implementation of procurement audit recommendations in Tanzania Local Government Authorities.

Although the scholars acknowledges that the procurement audit recommendations are credible, accurate, and relevant, but still the recommendation is not being implemented as required. (Bedasso & Asfaw, 2020). The same scenario in Tanzania context procurement audit recommendations seems to face unexpected challenges in their implementations (Kinunda, 2020). For example, in its Follow-up Report on the implementation of the recommendations from the previous Performance Audit Reports of the financial year 2021/2022 the findings noted that, the total of 11 recommendations were issued in this particular audit, and all of them were directed to the President's Office - Regional Administration and Local Government (PO-RALG). The overall follow-up results on the implementation of the issued audit recommendations includes procurement audit recommendations indicated that out of the 11 issued recommendations, 10 recommendations were not implemented while one recommendation was partially implemented (CAG report, 2022).

Several studies have been done on factors influence procurement auditing on organization performance, in terms of insufficient procurement auditor's experience, lack of auditing coordination or communication between parties and scarcity of human resources (Muianga *et al.*, 2015; Eyaa & Oluka, 2018; Baha, 2020). Another recent study in Tanzania by Yussuf *et al.* (2021) indicated that the auditor's independent and top management support were the factors affecting internal audit functions on the procurement performance in the parastatal organizations.

However, from previous studies and in Tanzania context there was scanty information explained the factors such as procurement audit competence affecting implementation of procurement audit recommendations. Therefore, this study intended to address the knowledge gap by assessing perceived factors affecting implementation of procurement audit recommendations in Tanzania Local Government Authorities specifically at Babati District. Specifically, the study focused on effect of procurement auditors' competence on implementation of procurement audit recommendations.

2.0 Literature Review

2.1 Theoretical Framework

The study used a competency model first emerged in the early 1990s. The first known use of the term “competency model” was in a 1992 report by the American National Standards Institute (ANSI). At that time, ANSI was developing a model for translating competencies into certification requirements (Cramer *et al.*, 2022).

A competency model is a framework for defining the skill and knowledge requirements of a job. It is a collection of competencies that jointly define successful job performance. Competency models have emerged as valuable tools employed by human resources and training departments to define skill and knowledge requirements of specific jobs, to assess competencies and performances, and help set business strategy (Isnawan & Sudirman, 2022).

According to Cramer *et al.*, (2022) suggests that there are three types of competencies that are needed for success in any organization: technical, human, and conceptual. Technical competencies are those that pertain to the nuts and bolts of a job, such as how to use a computer or how to do the math. Human competencies are those that pertain to the skills and knowledge necessary to do the job, such as how to communicate effectively or how solve problems. Conceptual competencies are those that go beyond the basics and encompass an individual's understanding of their work and the work of their organization, such as understanding how the company operates or knowing how to market a product. Competency model has been widely used in organizations to help employees learn and grow in their careers. It can also be used to assess an employee's skills and assess how well they fit into the company's culture (Cramer *et al.*, 2022).

In this study competency model was applicable to effect of procurement auditor's competence on implementation of procurement audit recommendations. Since the auditor's competence is important in implementation of procurement audit recommendations. The auditor's knowledge of the procurement process and their ability to understand the client's business needs are critical in ensuring that the procurement process is conducted in a fair and objective manner. The auditor also assists the client in ensuring that the best possible procurement options are considered, which ultimately leads to cost-effective solutions.

2.2 Empirical Literature Review

Chogo (2018) examines the determinants impacting procurement law compliance: A case study of Kwale County in Kenya. This study used a survey design. Both qualitative and quantitative approaches were employed, with stratified and simple random sampling used to determine the research respondents' sample size. Data collection methods included questionnaires and interviews. The data was analyzed using descriptive statistics and a qualitative technique. Correlation and regression analysis were used to determine the link between variables and to forecast future associations. The study discovered that while staff training, organizational culture, and law enforcement by agencies all have a favorable effect on regulatory compliance, procurement methods had a negative effect on compliance.

Ayele (2020) conducted a study titled "Assessing the Impact of Procurement Auditors' Competence on Audit Recommendations in Ethiopian Government Institutions." Utilizing a mixed-methods approach, Ayele combined qualitative interviews with quantitative surveys to gather data. The study revealed that while auditors' competence significantly influenced the implementation of audit recommendations, challenges such as inadequate training and resource constraints persisted. Consequently, the study concluded that improving auditors' skills and providing adequate resources are crucial for effective implementation (Ayele, 2020).

Mekonnen and Getachew (2021) explored "The Role of Procurement Auditors' Competence in Enhancing Audit Recommendation Implementation in Tanzanian Public Sector Institutions." This research employed a cross-sectional survey design, collecting data from procurement auditors across various Tanzanian government agencies. The findings highlighted that higher levels of competence among auditors were associated with more effective implementation of audit recommendations. The study emphasized the need for continuous professional development to maintain auditors' skills and effectiveness.

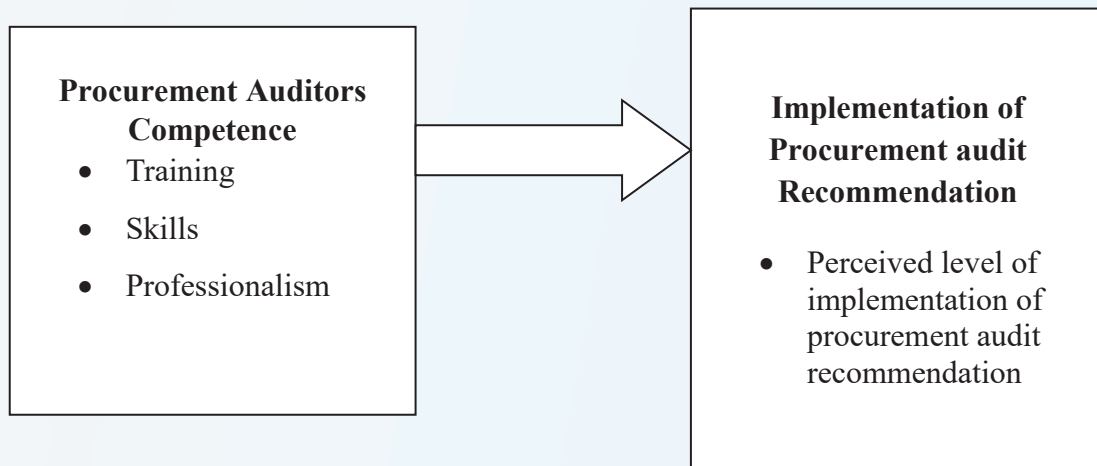

Kebede (2019) examined "Competence of Procurement Auditors and Its Effect on the Implementation of Audit Recommendations: A Case Study of Tanzanian Local Government Authorities." Kebede used a quantitative research approach involving structured questionnaires distributed to procurement auditors and administrative staff. The research found that although competence had a positive impact on the implementation of audit recommendations, there were significant gaps in training and support. The study concluded that targeted training programs and better support systems are essential for enhancing audit recommendation follow-through.

Tesfaye (2022) investigated "Effectiveness of Procurement Auditors' Competence on the Adherence to Audit Recommendations in East African Countries." This study applied a comparative analysis methodology, using data from several East African nations, including Tanzania. The research revealed that auditors' competence played a critical role in the adherence to audit recommendations, but variability existed across countries. The study recommended fostering regional cooperation and sharing best practices to improve auditors' competence and recommendation implementation.

2.3 Conceptual Framework

A conceptual framework is a "written or visual representation of an expected relationship between variables. This study has identified two variables, the independent variable (auditor's competence) and the dependent variable (implementation of procurement audit recommendation) as presented in Figure 1.

In this framework the competence of procurement auditors ensures that audits are conducted with high expertise and accuracy, which contributes to the formulation of practical and actionable recommendations. Thus, auditor competence impact how effectively procurement audit recommendations are implemented, as strong oversight, active involvement, and skilled auditing collectively support the execution of recommended improvements in procurement practices

Independent Variables**Dependent Variable****Figure 35: Conceptual Framework**

Source: Researcher own construct and Literature review, 2024

3.0 Research Methodology**3.1 Research Design**

Kothari (2008) defines research design as the arrangements of the conditions and factors for effective collection and analysis of the data in such a way that it is done and completed at low cost and accuracy in procedures. For the purpose of this study, a cross-sectional research design was employed. This is because data was collected at one point in time to fulfill the study objectives. Also, this design was adopted because it is capable of collecting large data from a relatively large number of participants at a particular time.

3.2 Research Approach

The study will use quantitative research that involved hypothesis testing to determine relationship between independent and dependent variables. The quantitative approach will use for this study since it will base on quantitative facts.

3.3 Study Population

The target group from which the sample is drawn is referred to as the population (Patel, 2019). It reflects a group of people or elements that a researcher has in mind from which data can be obtained. The target population of this study will involve 108 staff from procurement management unit, accountants, tenders board, user departments and the head of department Babati district council (Babati District human resource office, 2023). These was considered for the study for their strategic and operational interaction with the procurement function.

3.4 Sample size and Sampling Procedure**3.4.1 Sample size**

The sample size of this study was 185 respondents which essentially draw from the entire population of 108 respondents. The sample size was determined by the Taro Yamane (1967) formula below so as have a level of significance. The formular hold advantage than other

formulary because it is straightforward and easy to use. It is especially valuable when dealing with finite populations, offering a pragmatic approach that balances accuracy and feasibility. The sample size in this study was determined by the formula shown below:

$$n = \frac{N}{1 + N(e)^2}$$

Where; n= Sample size

N= Number of members

e= Level of precision

e=5% since the level of confidence is 95%

Therefore, sample size calculated as follows;

$$n = 108 / 1 + 108(0.05)^2 = 85$$

Therefore, the sample size is 85 respondents in Babati District Council

3.4.2 Unit of Analysis

In this study, the unit of analysis refers to the individual staff members within specific roles in the Babati District Council, including those from the procurement management unit, accountants, tenders board, user departments, and the head of department. These individuals constitute the primary subjects of investigation, and their perceptions, attitudes, and behaviors were examined to understand the perceived factors influencing the implementation of procurement audit recommendations. In this study unit of analysis consisted audit committee, PMU staff involvement and procurement auditors' competence?

3.4.3 Sampling Procedure

According to Saunders *et al* (2007) sampling is defined as the process of selecting a given number of the subjects or elements from the population as the representation of that population. For this study the sample will use stratified and purposive sampling. The researcher used proportionate stratified sampling that was followed by simple randomly procedure to select 85 respondents from Audit Committee and Procurement Management Unit, since they have equal chance to form the sample size of this study.

Moreover, the researcher used purposive sampling procedure to select respondents who are specifically involved with internal auditing, procurement activities and management decisions. This technique used to collect data from Head and senior procurement officers from procuring entities in Babati District because they are key informants with knowledge on procurement and tendering processes.

3.5 Data Collection Method and Approach

3.5.1 Questionnaire

The researcher will collect data by using questionnaire, the tool was formulated by following a five-point Likert structure that will assess the degree of agreement or disagreement with a certain statement. The Likert scale will range from 1 to 5 with 1 indicating strong disagreement and 5 indicating strong agreement. Each independent variables were measured using the same scale with different questions as concerned.

Questionnaire refers to a series of questions directed to individuals in order to obtain statistically useful information about a given topic (Pandey and Pandey, 2021). The use of questionnaires will arrive at because they provide systematic records to refer to when in need of reviewing responses. By virtual of their position and being able to read and write the self-administering questionnaires to Babati district staffs who deals with procurement related activities was distributed to them. Questionnaires was used since they are able to gather relevant and enough information.

3.5.2 Interview

In this study face to face interview was used to heads of Departments because the accessibility of asking the respondents directly in the organization and the interview guide was prepared by the researcher in order to have consistency in asking questions from the respondent's clarification and follow up of questions. This method was used because it is a simple and easier way or method of acquiring information that provides straight answers to research questions.

3.6 Data Analysis

In this study the data was analyzed quantitatively Quantitative data is any quantifiable information that can be used for mathematical calculation or statistical analysis. This form of data helps in making real-life decisions based on mathematical derivations. In quantitative data analysis the multiple linear regression analysis and descriptive statistics was used. Descriptive statistics methods will involve the estimation of frequencies, percentages and mean while multiple regression analysis will use to show the relationship and the effect of the independent variables to the dependent variable. The reason for using multiple regression analysis because dependent variable (implementation of procurement audit recommendations) was computed as continues variable. Before running multiple linear regression, all variables captured using Likert scale were converted into factor score with aid of principle component analysis tools in SPSS Software.

The following equations introduce the multiple regression model in the study:

$$Y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \varepsilon \dots\dots\dots (i)$$

Whereby:

Y=Implementation of Procurement audit Recommendation

X₁= Training

X₂=Skills

X₃= Professionalism

β₀= Constant

ε₀= Error

Moreover, qualitative data analyzed using content analysis. Content analysis enables researchers to identify patterns, themes, and trends within qualitative data. Through careful examination of the content, researchers can discern recurring ideas, concepts, or sentiments, providing valuable insights into the underlying phenomena being studied.

4.0 Findings and Discussions

This chapter consists of data presentation, interpretation, and discussion of the findings. The first section presented the characteristics of respondents, while other sections are presents findings related to effect of procurement auditors' competence on implementation of procurement audit recommendations in Babati District council

4.2 Respondents General Information

This section gives an analysis of the demographic information about the survey respondents. The analysis was used to make general observations about the data. This part is all about the respondent's demographic profile, which includes their gender, age, level of education, and number of years of work experience. The following are the results of the demographic profile of the respondents.

4.2.1 Sex

Results in Table 4.1 show that out of 85 respondents who participated in the survey the majority of respondents in the field of study were male that having 57.6% of the total respondents while female respondents were only 42.4% of the total respondents. Furthermore, the findings imply that, the gender of respondents may impact the implementation of procurement audit recommendations in several ways. For instance, there may be differences in how males and females perceive and prioritize certain aspects of the recommendations. Gender-related factors such as communication styles, decision-making processes, and power dynamics within the organization could also influence the extent to which the recommendations are implemented (Hasan *et al.*, 2021).

Table 4.1: Distribution of Respondents by Sex (n=85)

Sex Category	Frequency	Percent
Male	49	57.6
Female	36	42.4
Age Bracket (Years)		
18-25	11	12.9
26-30	16	18.8
31-35	37	43.6
36-40	21	24.7
Level of education		
Certificate	13	15.3
Diploma	26	30.5
Bachelor degree	40	47.1
Master degree	6	7.1
Working experience (Years)		
1 – 5	31	36.5
6-10	44	51.8
11-15	10	11.7

Source: Field Data (2024)

4.2.2 Age

The respondents also indicated their age bracket whose analysis is presented in Table 4.1. Results revealed that most respondents were between the age of 26 and 35 years. This was represented by 62%. Those with 36 years and above represented by 24.7% and only 12.9% were between 18-25 years. The findings imply that, majority of the respondents were in young and energetic age which is able to learn various issues including factors affecting implementation of procurement audit report recommendations in Babati District council.

According to Iddi (2020) the age of respondents can play a role in the implementation of procurement audit recommendations. Different age groups may have varying levels of experience, technological proficiency, and openness to change. Younger respondents might be more familiar with new technologies and more receptive to innovative approaches, while older

respondents may have more industry experience and institutional knowledge that could impact their decision-making regarding implementation.

4.2.3 Education Level

The analysis on level of education of respondents reveal that majority of respondents had attained bachelor degree education (47.1%) followed by diploma education (30.5%), certificate education (15.3%) while those with Master degree education represented by 7.1% (Table 4.1). The findings imply that, respondent acquired high education. This signifies that the respondents included in the study had the knowledge required to answer the questions related to factors affecting implementation of procurement audit recommendations in Babati District council.

The findings supported by Hamza *et al.*, (2018) the education level of respondents can influence their understanding and interpretation of the procurement audit recommendations. Higher education levels may provide individuals with more specialized knowledge, critical thinking skills, and analytical abilities, enabling them to better comprehend the recommendations and devise effective implementation strategies. Additionally, higher levels of education could indicate a greater propensity for continuous learning and professional development, potentially facilitating the implementation process.

The findings supported by Ogwel *et al.*, (2019) The working experience of respondents can have a significant impact on the implementation of procurement audit recommendations. Individuals with extensive experience in procurement or related fields may possess a deeper understanding of the challenges and complexities associated with implementation. Their experience could contribute to their ability to identify potential obstacles, develop realistic action plans, and navigate organizational dynamics more effectively. On the other hand, less experienced individuals may rely on the guidance and support of more senior colleagues during the implementation process.

4.2.4 Working Experience

The study further sought to know the duration of time the respondents had been working on their job positions as shown in Table 4.1. The findings revealed that, majority of respondents 51.8% of the respondents had worked in their designated job positions between 6 and 10 years, followed by 36.5% worked less than 6 years while 11.7% had worked more than 10 years. This implies that the respondents have been in their designated jobs long enough to understand various issues outlined and are in a position to give valid information related to factors affecting implementation of procurement audit recommendations in Babati District council.

4.3 Procurement Auditors Competence

This section intended to present the descriptive statistics results the related to the effect of procurement auditor's competence on implementation of procurement audit recommendations. The mean score and standard deviation were used to summarize the responses as shown in Table 4.2.

Table 4.2: Descriptive statistics on procurement auditors' competence

Variables	Mean score	Standard Deviation
Training	4.26	0.825
Skills	4.01	0.186
Professionalism	4.32	0.904

4.3.1 Training

Findings in Table 4.2 show that, the mean score for the statement related to training was 4.26 indicating that, respondent agree that, organization conducting staff training that create capability in implementation of procurement audit recommendations. This implies that, to high extent Babati District council conducting staff training that create capability in implementation of procurement audit recommendations.

The findings were similar to those of Yussuph *et al.*, (2020) revealed that, implementation of procurement audit recommendations often necessitates changes in processes and procedures, and therefore requires adequate training to ensure staff can carry out their roles effectively under the new guidelines. Training programs can help staff understand the rationale behind the recommendations, learn new procedures, and adapt to new systems or technologies. This enables a smooth transition and ensures the correct and consistent application of changes across the organization. In the absence of adequate training, employees may struggle to comply with the new processes, leading to errors, inefficiencies, or even non-compliance.

4.3.2 Skills

Moreover, findings in Table 4.2 show that, the mean score for the statement related to skills was 4.01 indicating that, respondent agree that, the skilled staff was essential in implementation of procurement audit recommendations. Indicating the level of agreement was high. This implies that, having staff with skills related to procurement activities was essential in Babati District council in implementation of procurement audit recommendations.

The findings concur with Baha (2020) revealed that, the skills of the team involved in implementing the procurement audit recommendations are critical to the success of the implementation. Necessary skills might include project management to oversee the changes, technical skills to understand and apply new procedures or technologies, and interpersonal skills to manage change and resistance within the organization. Skill gaps can impede the progress of the implementation, cause errors or inconsistencies, and may even result in failure to achieve the desired outcomes.

4.3.3 Staff Professionalism

Furthermore, findings in Table 4.2 show that, the mean score for the statement related to professionalism was 4.32 indicating that majority of respondent (80.3%) agree that, staff level professionalism enhance the implementation of procurement audit recommendations.

Indicating the level of agreement was high. This implies that, professionalism is important factor in procurement auditor to encourage Babati District council in the implementation of procurement audit recommendations. Therefore, professionalism is crucial for procurement auditors to encourage organizations in implementing procurement audit recommendations. It enhances credibility, builds trust and confidence, and maintains objectivity, showcases expertise, facilitates effective.

The findings supported by Mrope (2018) reveled that, professionalism in the staff contributes to the effective implementation of procurement audit recommendations. This encompasses a range of attitudes and behaviors including commitment to the organization's objectives, adherence to ethical standards, diligence in executing tasks, and a proactive approach towards learning and adaptation. For instance, professionals would understand the importance of the audit recommendations, adhere to the new procedures, and address any issues promptly and appropriately. Lack of professionalism could lead to resistance to change, sloppy execution, and ethical issues, which could undermine the implementation and negatively impact the organization's reputation and performance.

The findings also supported from interview data. The third respondents add the following about PMU staff involvement.

"...Skilled auditors provide accurate, relevant, and actionable insights based on their thorough understanding of procurement processes and regulations. Their expertise ensures that recommendations are practical and tailored to the organization's needs, increasing the likelihood of successful implementation. Additionally, competent auditors can effectively communicate their findings and work collaboratively with stakeholders to address any issues, further facilitating the implementation process..."

4.4 Inferential Statistics Results

This section presents inferential statistics results whereby multiple linear regressions were performed to test significant relationship between independent and dependent variables.

4.4.1 Model Summary

The model summary of independent variables (training, skills and professionalism) and implementation of procurement audit recommendations in Table 4.3, shows the coefficient of determination (R^2) under model one was 0.595, which meant the independent variables (audit committee, PMU staff involvement, procurement audit competence) explained 59.5% of the variations in implementation of procurement audit recommendations.

Table 4.3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.772	0.595	0.511	0.401

a. Predictors: (Constant), Training, skills and professionalism

b. Dependent Variable: Implementation of procurement audit recommendations

4.4.2 Analysis of Variance

The Analysis of Variance (ANOVA) in Table 4.4 was used to assess the overall significance of the regression model. Results in Table 7 indicated that, the F-value was 81.21 and the p-value was 0.000. This meant that the regression model was significant with p-values less than 0.05 at $\alpha = 0.05$ level in explaining the linear relationship between independent variables (training, skills and professionalism) and implementation of procurement audit recommendations.

Table 4.4: Analysis of Variance

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	94.977	4	23.744	81.21	0.000
	Residual	23.891	16	0.251		
	Total	118.868	16			

a. Dependent Variable: Implementation of procurement audit recommendations

b. Predictors: (Constant), Training, skills and professionalism

4.4.3 Regression Coefficients

The Multiple linear regression models with Implementation of procurement audit recommendations as the dependent variable was estimated to determine factors affecting implementation of procurement audit recommendations in Babati District council the results for the estimated regression model are presented by the Table 4.5.

Table 4.5: Regression Results

Model	Unstandardized Coefficients	Standardized Coefficients	T	Sig.
-------	-----------------------------	---------------------------	---	------

	B	Std. Error	Beta		
(Constant)	0.011	0.050		0.217	0.829
Training	0.182	0.041	0.162	2.565	0.011
Skills	0.138	0.018	0.266	4.731	0.001
Professionalism	0.211	0.041	0.237	0.804	0.014
a. Dependent Variable: Implementation of procurement audit recommendations					

According to the regression results in Table 4.5, training has a positive and significant relationship with the implementation of procurement audit recommendations. The coefficient for training is 0.182, with significance level of 0.011. This means that for every unit increase in training, there is a corresponding 0.182 increase in the implementation of audit recommendations, assuming other variables are held constant. This suggested that, the impact of training on the implementation of procurement audit recommendations is statistically significant. This finding is supported by previous studies, such as those conducted by Mwambua and Juma (2019), which show that training improves employees' ability to understand and apply audit recommendations effectively. Adequate training empowers staff with the necessary knowledge and skills to address audit deficiencies, enhancing the overall procurement system's efficiency.

Moreover, the results show that skills have a strong positive and significant impact on the implementation of procurement audit recommendations. The coefficient for skills is 0.138, with significant p-value of 0.001. This implies that a higher level of skills among procurement personnel leads to better compliance with and application of audit recommendations by 13.8%. These findings are consistent with studies such as Chuma (2020), who highlighted that skills are crucial in understanding audit procedures and applying recommended changes. Skilled procurement staff are better equipped to identify gaps in compliance and make the necessary improvements, leading to the successful implementation of audit recommendations.

Furthermore, professionalism also has a significant positive effect on the implementation of procurement audit recommendations, as indicated by an coefficient of 0.211, and a significance level of 0.014. This finding suggests that the more procurement professionals adhere to ethical standards and best practices, the more likely they are to effectively implement audit recommendations. The positive relationship between professionalism and implementation aligns with Nkumbula and Mugoya's (2020) research, which emphasized the importance of professional conduct in ensuring the integrity and effectiveness of procurement systems. Professionalism fosters transparency and accountability, which are essential in addressing audit concerns and ensuring that procurement audit recommendations are adequately implemented.

5.0 Conclusion and Recommendations

5.1 Conclusion of the Study

The study found that, procurement auditor's competence in terms of training, skills and professionalism was positive and significant related to implementation of procurement audit recommendations. This concludes that, PMU staff involvement was important factors that affect on implementation of procurement audit recommendations in Babati District council.

5.2 Recommendations

Based on the key findings of the study, the following recommendations are proposed: To the Ministry of Finance, it is essential to prioritize continuous training programs for procurement staff to enhance their skills and professionalism, as this will significantly improve the implementation of procurement audit recommendations. To the Public Procurement Regulatory Authority (PPRA) as the policy maker, policies should be developed that emphasize the importance of professional certifications and regular capacity-building initiatives for procurement officers to ensure adherence to ethical standards and best practices. To Babati District Council, efforts should be made to improve the skills of procurement personnel through targeted training and mentorship programs, while also fostering a professional work culture to ensure effective application of audit recommendations and compliance with procurement regulations.

5.3 Suggestions for Further Studies

The study was limited in one factor (procurement audit competence) that affect on implementation of procurement audit recommendations in Babati District council. The similar study should be focused on other factors and other Local government Authorities in Tanzania for generalization of findings.

Abstract

The current study was carried out to investigate effect of legal and regulatory framework on public procurement audit performance in local government authorities in Tanzania. The study used cross sectional research design while stratified sampling procedure and purposive sampling procedure were used to select 102 respondents. The data were collected through questionnaire while data were analyzed using descriptive statistics and multiple linear regression analysis. The study found that components of legal and regulatory framework (compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members) were positive and significance related to public procurement audit performance. Therefore, the study concluded that legal and regulatory framework (compliances with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members) has important determinants of public procurement audit performance of local government authorities in Tanzania specifically in Dodoma. The study recommends that Dodoma City Council should continue applying effectively legal and regulatory framework so as to ensure that organizational goals in procurement audit are well achieved.

Keywords: *Legal and Regulatory Framework, Public Procurement, Audit Performance, Local government Authorities, Dodoma city, Tanzania*

1.0 Introduction

Public procurement has grown to be an essential component in the global economic and business landscape. This importance is underscored by the growing attention from donors, governments, civil society, professional organizations, the private sector, and the general public (Njoroge, 2020). Due to the substantial volume of public sector procurement and its operational context, procurement audits are becoming a key responsibility of procurement regulatory bodies (OECD, 2021). These audits review the entire procurement process, from planning to contract execution, and are conducted both internally and externally. The focus on the completeness, efficacy, and accuracy of the procurement process is a major aspect of public sector procurement audits (TPJ, 2022).

In European countries like North Macedonia, public procurement audits cover transactions involving goods procurement, infrastructure and civil works, services, and consultancy and management services. The Law on Public Procurement in North Macedonia mandates that the State Audit Office audit the use and expenditure of public procurement funds by contracting authorities. These audits are regularity audits within the audited entities (Dionisjev, 2021). In the United Kingdom, effective public procurement audits ensure public entities achieve the best value for money and uphold probity, thereby securing public confidence (James, 2021). The audit typically involves both compliance and performance audits.

In African countries, public procurement audits are also practiced. Effective implementation of these audits ensures public procuring entities achieve the best value for money and uphold probity, thus securing public confidence (Asfaw, 2021). However, non-compliance in public procurement practices is increasing annually, attributed to various factors such as non-adherence to auditing standards, lack of capacity-building programs, non-compliance with technical audit factors, legal framework failures, lack of professional skills, and poor records management (Njoroge, 2021).

In Tanzania, public procurement audits have been in practice since the enactment of PPA No. 21 in 2004 and continue to be mandatory for all public organizations (URT, 2021). As per PPA No. 7 of 2011, with amendments in 2016, the Public Procurement Regulatory Authority (PPRA) arranges procurement audits for all public procuring entities using auditors appointed and qualified by the authority. These audits are systematically conducted to assess compliance with the law and ensure value for money (URT, 2022).

Effective implementation of public procurement audits guarantees that public procuring entities achieve the best value for money and maintain integrity, thereby securing public trust (Asfaw, 2018). An efficient audit system is crucial to achieving the objectives of public procurement. It is vital that public procurement bodies strictly follow the applicable rules and regulations governing their activities. This adherence is key to boosting productivity, efficiency, optimal resource usage, and maintaining a balanced government budget. (Ochiri, 2017).

In recent years, the performance of local government authorities in Tanzania, exemplified by Dodoma City Council, has experienced a concerning decline, as evidenced by a 2021/22 report from the Controller and Auditor General (CGA). Notably, the report revealed a stark reality—

46% of the audited local government authorities were found to be non-compliant with audit requirements. This high rate of non-compliance indicates a systemic failure to adhere to proper financial and operational procedures, raising significant concerns about the transparency and efficiency of procurement processes within Dodoma City Council.

Procurement experts' insights are vital for understanding practical challenges and opportunities related to public procurement audit within Tanzanian local government authorities. Experts can provide nuanced perspectives on implementation gaps, regulatory hurdles, and competency issues affecting audit practices (Yussuf, 2021; Sallwa, 2022). Their input will enrich the study's examination of how legal frameworks, auditor competencies, and records management practices contribute to or hinder effective procurement performance auditing.

The 2021/22 CGA report's findings of widespread non-compliance among local government authorities, including Dodoma City Council, highlight significant deficiencies in audit adherence and accountability within public procurement processes (CGA, 2022). These findings underscore the urgent need for strengthened audit practices to enhance transparency, efficiency, and resource management in local government procurement.

While various studies, such as those by Etse & Asenso-Boakye (2020), Jembe and Wandera (2019), and Ochriri *et al.* (2018), highlight the essential role of public procurement audits in ensuring overall procurement performance, there is a notable gap in the literature concerning the determinants of public procurement audit practices specifically within Tanzanian local government authorities. Existing research in the country, including Yussuf's (2021) study on the impact of internal audits on procurement performance and Sallwa's (2022) investigation into the influence of procurement audits on the effectiveness of public organizations, has not addressed the unique challenges faced by local government authorities. This study aims to bridge this gap by examining how factors such as public procurement laws and regulatory frameworks, auditors' competency, and procurement records management influence procurement performance within Dodoma City Council. Through exploring these specific determinants, the research seeks to provide valuable insights that can help address issues of non-compliance and budget deficits, thereby improving the governance and efficiency of procurement processes at the local government level.

In addition, a number of efforts have been taken by the government to ensure proper practice of public procurement audit. These efforts include enactment of legal and regulatory framework guiding public procurement audit practice. But one of the challenges affecting the practice of public procurement audit in most of local government authorities is that, procurement audit is not given priority. Despite the efforts taken, still to date, there is improper practice of public procurement audit. Based on this argument, this study sought to address the identified gap as whether factors such as legal and regulatory framework, are crucial for public procurement audit in procurement performance since there is limited understanding in the academic field in the context of Tanzania.

2.0 Literature Review

2.1 Theoretical Review

The study utilized Institution theory. According to Scott (2004), John Meyer and Brian Rowan, the pioneers of institutional theory, described it as the process through which organizations gradually evolve by adopting new ideas and philosophies in response to changes in the broader business environment. These reforms are significantly influenced by the manager's expertise. The core concepts of institutional theory provide valuable insights for analyzing the relationship between organizations and their environment, emphasizing social rules, expectations, norms, and values as the main sources of pressure on organizations. The theory prioritizes legitimacy over efficiency or effectiveness as the primary goal of organizations.

The environment is seen as the broader context in which organizations operate, encompassing diverse entities such as regulatory bodies, governmental agencies, courts, professionals, professional standards, interest groups, public opinion, laws, regulations, and societal values. Institutional theory suggests that organizations adapt to fit their environment. This theory, commonly used in analyzing public procurement, is rooted in Scott's (2004) identification of three pillars of institutions: regulatory, normative, and cultural-cognitive. The regulatory pillar emphasizes rules, laws, and penalties as mechanisms for enforcement, emphasizing efficiency as a driver of adherence. Scott posits that institutions consist of cultural-cognitive and regulatory components which, in conjunction with associated practices and resources, imbue life with significance. The normative pillar deals with norms (expected behaviors) and values (desired ideals), with social obligation forming the foundation for compliance.

One of the strengths of institutional theory is its emphasis on the importance of rules and regulations within organizations and the broader community. It asserts that progress is dependent on the support of rules, regulations, policies, or laws (Scott, 2014). For instance, the implementation of e-procurement must be underpinned by rules, regulations, and procedures to ensure effective and efficient execution. However, a criticism of institutional theory is that it tends to overlook internal dynamics of organizational change and ignores the roles of power and self-interest.

The legal and regulatory framework plays a crucial role in shaping public procurement audit performance, laws and regulations establish the rules and standards that govern public procurement processes, including auditing practices. These regulations often set out requirements for transparency, accountability, fairness, and efficiency in public procurement activities. Auditors conducting audits of public procurement processes must adhere to these legal requirements to ensure compliance and integrity in their work.

2.2 Empirical Literature Review

Dionisjev (2020) investigated the role of state audits in the public procurement process in the Republic of North Macedonia. This qualitative study revealed that increased financial audits conducted by the State Audit Office significantly enhance control over public funds' expenditure in procurement processes. The research uncovered significant deficiencies in public procurement practices that necessitate improvements through detailed audit

recommendations. It was observed that audits often reveal procedural weaknesses that affect procurement outcomes. Additionally, the study highlighted that audited entities frequently overlook specific sub-findings provided by the State Audit Office, indicating a need for more robust implementation of audit recommendations. The findings underscore the importance of continuous improvement in the regulatory framework to address these challenges.

Kikula et al. (2020) explored the impact of regulatory frameworks on procurement audit performance in East Africa. This study used a mixed-methods approach to analyze how regulatory frameworks affect the effectiveness of procurement audits. The research found that comprehensive legal frameworks are critical for ensuring effective procurement audits. Stronger regulatory enforcement was shown to lead to improved audit outcomes and greater accountability. The study recommended strengthening regulatory frameworks to support better procurement practices and enhance audit performance. It also suggested that regular updates and revisions to legal frameworks are necessary to address emerging issues and challenges in procurement.

Mwaipopo (2020) examined the effectiveness of legal and regulatory frameworks in public procurement in Tanzania. The study employed a case study approach to assess how well-defined regulations influence procurement audit efficiency and effectiveness. The findings indicated that well-structured and clear regulatory frameworks significantly contribute to improving procurement audits. The research emphasized the need for continuous updates and improvements in regulatory frameworks to keep pace with evolving procurement practices and challenges. The study also highlighted the role of regulatory bodies in enforcing compliance and ensuring that procurement processes adhere to established legal standards.

2.3 Conceptual Framework

This study was guided by independent and dependent variables that show the relationship between them. Accordingly, Figure 1 presents the conceptual framework: in this study the legal framework encompasses rules, procedures, and standards typically set by precedent in common law, which guide decisions in legal cases (Willes, 2016). Auditors, acting as independent entities, ensure adherence to these legal requirements and convey their findings to the public's representatives. Core components of audit law encompass compliance, monitoring, documentation, and reporting (Asfaw, 2018). The legal and regulatory framework is defined by entities such as PPA, its regulations, PCCB, PPRA, and GPSA, focusing on compliance and monitoring.

3.0 Research Methodology

3.1 Research Design

The decision to use a cross-sectional descriptive research design for this study is justified by its suitability for capturing a snapshot of a phenomenon at a specific point in time. This design is particularly effective for describing the current state of public procurement audit performance in local government authorities, such as Dodoma City Council. As noted by Creswell (2014), cross-sectional studies are useful for examining the prevalence and characteristics of a particular phenomenon within a defined time frame, providing a clear picture of the situation as it exists at that moment.

3.2 Research Approach

The study used quantitative research approach since quantitative data provided a broad overview and allows for generalizations across larger populations. Quantitative method allowed for the collection of numerical data that can be objectively measured and analyzed (Creswell & Creswell, 2017). This is crucial when assessing factors such as audit performance, which often involved measurable indicators. On the other hand public procurement audits typically involve a large number of transactions and entities across various local government authorities. Quantitative research enabled researcher to gather data from a significant sample size, providing a broader perspective on the factors influencing audit performance.

3.3 Area of the Study

The study was conducted at Dodoma City Council. This is due to the fact that Dodoma City Council is one of the local government authorities in which there is the practice of public procurement audit. Furthermore, it was established that in recent years, the performance of local government authorities in Tanzania, exemplified by Dodoma City Council, has experienced a concerning decline, as evidenced by a 2021/2022 report from the Controller and Auditor General (CGA). Notably, the report revealed a stark reality—46% of the audited local government authorities were found to be non-compliant with audit requirements. This high rate of non-compliance indicates a systemic failure to adhere to proper financial and operational procedures, raising significant concerns about the transparency and efficiency of procurement processes within Dodoma City Council.

3.4 Study Population

Population is the target group to be studied or is the total collection of elements which we wish to make inferences (Creswell, 2014). The study population was all 137 staff (DCC Report, 2023).

3.5 Unit of Analysis

The unit of analysis refers to the specific entity or phenomenon that researchers focus on when conducting an empirical study or analysis. It is the primary unit that is being studied and measured in order to draw conclusions or make inferences about broader populations or phenomena (Cohen *et al.*, 2014). For the purpose of this study, the unit analysis of the study was senior employees' as well as operational employees.

3.6 Sample and Sampling Procedures

3.6.1 Sample Size

Sample size in research denotes the quantity of individuals or entities participating in a study. It holds significant importance in research design as it profoundly impacts the credibility and applicability of the results. The determination of sample size hinges on statistical factors and aligns closely with the study's specific objectives (Cohen *et al.*, 2014). For this study, the sample size is calculated using Slovine's formula, as referenced in Magigi (2015), with a 95% confidence level and a 5% margin of error (1 - 0.05). The formula is presented as follows:

$$n = \frac{N}{1 + N(e^2)}$$

Where: n = is number of sample (required)

N = Total population (137) and

e = Error tolerance (level) or margin of error (0.05)

$$137 / (1 + 137(0.05)^2) = 137 / 1.3425$$

$$= 102$$

The sample size of the study is 102 respondents. The sample size distribution in each respondent is shown in Table 1

Table 39: Sample Size Distribution

Departments	Population	Sample Size	Percent %
Procurement offices	16	12	11.8%
Operational staff	121	90	88.2%
Total	137	102	100%

3.6.2 Sampling Procedures

The researcher employed a proportionate stratified sampling procedure to ensure a representative selection of operational staff from user departments, acknowledging the equal chance for each stratum to contribute to the overall sample size. This approach entails dividing the population of operational staff into strata based on relevant characteristics, such as department or role, and then determining the sample size proportionally from each stratum.

Following the stratified sampling, a simple random sampling technique was implemented within each stratum to randomly select operational staff, ensuring that each individual within the stratum has an equal chance of being included in the study. This method aims to provide a comprehensive understanding of the perspectives and experiences of operational staff in Dodoma City Council regarding public procurement audit performance.

3.7 Data Collection Techniques

3.7.1 Questionnaire

Questionnaire was used to all respondents. In the process of collecting data through questionnaire, the researcher made an appointment with the respondents prior to the date of data collection. Upon such visitation, the researcher made some arrangements. The researcher used drop and pick method in the distribution of questionnaire. Questionnaire was used since it helped the researcher to get first-hand information for analysis. First-hand information for analysis is important since it is the information which was gathered directly from the respondents. Additionally, they are a quick way of getting results the researcher intends to get from the respondents.

3.8 Data Analysis Method

The data collected was checked to avoid any errors or omissions and ensure they are consistent. The data then coded into logical, descriptive, and meaningful categories to provide a framework for analysis. The coded data will then be entered into the computer for analysis by use of SPSS.

Quantitative data were analyzed through descriptive statistics and presented through percentages, means, standard deviations and frequencies. Multiple linear regression models were used to establish the relationship independent variables (Legal and regulatory framework, auditors' competence and procurement records management) and dependent variables (Public procurement audit performance). The following regression model was used

$$PPAP = \beta_0 + \beta_1 LRF + \beta_2 AC + \beta_3 PRM + \epsilon_i \dots \dots \dots (1)$$

Where;

PPAP= Public procurement audit performance

LRF = Legal and Regulatory Framework

AC = Auditor Competence

PRM = Procurement Record Management

β_0 = Constant

ϵ = Error

4.0 Findings and Discussion

This section present and discuss findings related to effect of legal and regulatory framework on public procurement audit performance.

4.1 Respondents' Demographic Characteristics

The findings in Table 4.1 reveal a workforce in procurement audits that is predominantly within the 26-35 (35%) and 36-45 (30%) age brackets, combining fresh perspectives and technological familiarity with experienced insights (Smith, 2013). The gender distribution shows 60% male and 40% female, contributing to diverse viewpoints, which can enhance the comprehensiveness of procurement audit assessments (Sandberg, 2015). Educationally, 50% of respondents hold a Bachelor's degree, and 25% have a Master's degree, highlighting a well-educated workforce essential for navigating complex procurement processes (Dessler, 2013). Additionally, 30% have 11-15 years of working experience, followed by 25% with 5-10 years, indicating a blend of expertise and depth in procurement practices (Jones & George, 2011).

Table 4.1 : Demographic characteristics of respondents (n = 100)

Age	Frequency	Percentage
18-25 years	10	10
26-35 years	35	35
36-45 years	30	30
46-55 years	15	15
56 years and above	10	10
Sex		
Male	60	60
Female	40	40
Level of education		
Diploma	20	20
Bachelor	50	50
Masters	25	25
Doctorate	5	5
Working experience		
Less than 5 years	15	15
5-10 years	25	25
11-15 years	30	30
16-20 years	20	20
More than 20 years	10	10

4.2 Descriptive Statistics Result for Legal and Regulatory Framework

This section presents the descriptive statistics results related to the legal and regulatory frameworks. The responses in each variable were summarized using mean score and standard deviation (Table 4.2).

Table 40.2: Legal and Regulatory Framework (n = 100)

Statement	Mean	Std. Deviation
There is compliance to the legal provision	4.40	.651
Auditing process requires right procedures to be followed as per PPA and its regulations	3.97	1.049
There should be transparency in the auditing procedure	3.94	1.135
Every member of auditing committee should be accountable	3.71	1.122

The

findings in Table 4.2 reveal that, strong agreement on the importance of compliance with legal provisions in procurement audits, with a mean score of 4.40, reflecting its critical role in audit effectiveness. Adherence to auditing procedures as per the Public Procurement Act (PPA) received a mean score of 3.97, though variability in responses suggests challenges in consistent application. Transparency in the auditing process, scoring 3.94, also shows moderate agreement, but with varying emphasis among respondents. Accountability of audit committee members, with a lower mean of 3.71, suggests it is less prioritized, with differing views on its current practice. Supported by Dionisjev (2020), the findings highlight that compliance with legal frameworks ensures fairness, transparency, and quality in public sector audits, reducing risks and enhancing financial integrity.

4.3 Multiple Regression Results

This section presented the multiple linear regression models that were used to establish the relationship independent variables (Compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members) and dependent variables (Public procurement audit performance).

4.3.1 Model Summary

Findings in Table 4.3 indicated that, The R Square value of 0.882 reveals that approximately 88.2% of the variance in the performance of public procurement audits can be explained by the combined effect of compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members. This implies that these factors play a significant role in influencing the effectiveness and efficiency of procurement audits in the studied context.

Table 4.3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.939	0.882	0.879	0.240

a. Predictors: (Constant), Compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members

4.3.2 Analysis of Variance (ANOVA) Results

The ANOVA results provided in Table 4.4 offer an evaluation of the overall significance of the regression model used to predict public procurement audit performance in local government authorities in Tanzania. The F-statistic of 240.164, which is the ratio of the regression mean square to the residual mean square, is significantly large. This high F-value indicates that the model explains a substantial amount of the variance in the dependent variable relative to the error variance. The associated p-value (Sig.) of 0.000 is less than the common alpha level of 0.05, suggesting that the regression model is statistically significant.

Table 4.4: ANOVA Results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	41.394	3	13.798	240.164	0.000 ^b
	Residual	5.516	96	0.057		
	Total	46.910	99			

a. Dependent Variable: Public Procurement audit performance

b. Predictors: (Constant), Compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members

4.3.3 Regression coefficients

Table 4.5 presents the regression coefficients for independent variables.

Table 4.5: Regression Coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		

1	(Constant)	0.122	0.178		0.686	0.494
	Compliance with legal provisions	0.247	0.104	0.230	2.362	0.020
	Auditing process procedures	0.212	0.095	0.194	2.241	0.027
	Transparency in the auditing procedure	0.575	0.063	0.569	9.178	0.000
	Accountability of audit committee members	0.320	0.085	0.301	3.290	0.007

Dependent Variable: Public Procurement Audit Performance

The Findings in Table 4.5 reveals a positive relationship between compliance with legal provisions and public procurement audit performance, as indicated by the Beta coefficient = 0.247 and p-value=0,020, which implies that for every unit increase in compliance with legal provisions, public procurement audit performance increases by 0.247 units. The relationship is statistically significant ($t = 2.362$, $p = 0.020$), meaning that compliance with legal provisions is an important predictor of improved audit performance of local government authorities in Tanzania specifically in Dodoma city. The positive and significant relationship between compliance with legal provisions and public procurement audit performance is consistent with findings from similar studies. For instance, research by Mrope and Nkinga (2018) highlighted that compliance with procurement regulations is crucial for enhancing procurement audit quality, as it ensures that procurement activities adhere to established standards and guidelines.

Moreover, auditing process procedures also show a significant positive influence on public procurement audit performance, with a Beta coefficient = 0.212 and p-value=0.027. This indicates that an improvement in the auditing process procedures by one unit leads to a 0.212 increase in audit performance. The effect is statistically significant, suggesting that adherence to well-established audit procedures can enhance audit outcomes. These findings are echoed in other research. Muthaura (2017) argued that clearly defined and structured audit processes ensure the systematic evaluation of procurement activities, which leads to more accurate and reliable audit outcomes. Additionally, a study by Wang (2020) found that well-established auditing procedures allow auditors to detect discrepancies more efficiently, leading to better public procurement audit performance. These studies suggest that proper auditing procedures not only ensure thorough evaluations but also reduce the likelihood of audit errors, enhancing overall audit effectiveness.

Furthermore, transparency in the auditing procedure has the strongest positive influence on public procurement audit performance, with Beta coefficient = 0.575 and p-value=0.000. This means that an increase in transparency leads to a substantial 0.575 unit improvement in audit performance. The relationship is highly significant, indicating that transparency is a critical

factor in ensuring effective procurement audits of local government authorities in Tanzania specifically in Dodoma city. The findings aligns with findings from a number of other studies. For example, research by Al Mamun (2019) emphasized that transparency in auditing procedures fosters trust and accountability, which are essential for effective audit processes. A study by Ngari and Muturi (2020) similarly found that transparency reduces the chances of manipulation in procurement audits, improving the reliability of audit results. Both studies reinforce the idea that transparent auditing procedures ensure that all stages of procurement are conducted in an open manner, facilitating better oversight and enhancing audit performance. The significant impact of transparency in this study highlights its critical role in promoting accountability and accuracy in public procurement audits.

Additionally, the accountability of audit committee members has a significant positive impact on public procurement audit performance, as shown by the Beta coefficient = 0.320 and p-value=0.007. This suggests that greater accountability leads to a 0.320 unit increase in audit performance. The effect is statistically significant, highlighting the role of accountable committee members in improving audit outcomes of local government authorities in Tanzania specifically in Dodoma city. The findings is consistent with findings from prior studies. For example, research by Kinyua and Odhiambo (2020) found that accountability within audit committees leads to more diligent oversight of procurement activities, which improves the quality and accuracy of audit outcomes. Additionally, Nyamache and Mutua (2021) concluded that accountable audit committee members are more likely to enforce strict adherence to procurement standards, thus reducing instances of mismanagement or fraud in procurement processes. These studies support the conclusion that having accountable audit committee members is vital to ensuring that procurement audits are conducted effectively and that any irregularities are promptly addressed.

5.0 Conclusion and Recommendations

5.1 Conclusion

With regard to the effect of legal and regulatory framework on public procurement audit performance, the study concluded that legal and regulatory framework (Compliance with legal provisions, auditing process procedures, transparency in the auditing procedure and accountability of audit committee members) has important determinants of public procurement audit performance of local government authorities in Tanzania specifically in Dodoma

5.2 Recommendations

The Ministry of Finance and Planning, alongside the Public Procurement Regulatory Authority (PPRA), should continue to strengthen and update the legal and regulatory frameworks governing public procurement audits. Ensuring that these frameworks are aligned with international best practices and robust enough to address contemporary challenges is crucial for maintaining audit effectiveness.

5.3 Area for Further Studies

Future studies could explore various aspects to enhance understanding of public procurement audit performance in local government authorities. One potential area is the impact of

technological integration, such as e-procurement systems and big data analytics, on audit effectiveness.

Abstract

President's Office – Regional Administration and Local Government in Tanzania has prudently invested to issue 10% of their local collection to special groups in cities and municipalities and those members are availed with benefits when they fall due in the future. This paper investigated the factors contributing to non-performing loan of special groups in Dodoma city council. The paper employed a cross sectional research design and stratified sampling procedure was used in the selection of 90 respondents in the study area. Questionnaires were used in gathering data and multiple regression was used in analyzing the factors determining the non-performing loans among special groups in Dodoma city. The paper found out that, people are requesting loans in contrast to their income level hence diverting the amount on normal spending those economic activities analyzed on loan portfolio, individual are not equipped with relevant skills, large family size and youth have to be equipped with relevant attention due to their higher spending are factors leading to increasing trend of nonperforming loans among special groups In Dodoma city council. Therefore, recommended that the organization should limit investment in the loan portfolio by providing loans to the project with attractive returns but with low risks (minimal), to conduct constant monitoring and evaluation (investment auditing) for each investment as well as to equip loan/investment officer with different loan appraisal skills by ways of training.

Keywords: *Non-performing loans, special groups, Local Government Authorities, Dodoma City Council.*

1.0 Introduction

For a time, the cultural norms, beliefs and prejudices were hindering youth, women and people with disabilities are hindering them within the society to achieve access to financing and hence engage fully in economic production, these groups were neglected in loans and those managed to get through financial intermediaries the process were long with conditions. Due to the inabilities of these special groups to have access to funding the government of Tanzania found initiative through local government authorities to set 10% of their collections special for issuing loans to the special groups. Despite of the initiatives made by the government these loans are turning into non-performing loans over the years.

In 1993, the Government initiated a seed fund to economically uplift disadvantaged groups, particularly women and youths who lacked access to loans from financial institutions due to collateral constraints. The Parliament Standing Committee for Local Authorities, in one of a sitting deliberated and later directed the LGAs to contribute 10% of unprotected own sources to the Fund. As the directives lacked a legal base for compliance, not all LGAs could comply fully, and subsequently, in the year 2019, the Government amended the Local Government Finance Act, [CAP 290], and introduced Section 37A which mandates LGAs to allocate 10% of unprotected own source collection to the Fund. (KILANGI, 2019)

Further, PO-RALG requires loans to be issued with a distribution ratio of 40% to women, 40% to youths, and 20% to people with disability. The guidelines were further revised in 2021 (KILANGI, 2019). However, despite the commendable initiative, the Fund encountered numerous challenges, including misallocation of funds by respective Council employees or issuing loans to non-existing groups, nonperforming groups, and unqualified groups thus leading to loan repayment failures.

In response to the above challenges, on 29 March 2023, upon receiving the annual report from the Controller and Auditor General (CAG) for the financial year 2021/22, the President ordered a review of the loan disbursement procedure and to explore the possibility of use of banks to facilitate loan disbursement. Following this directive, the Prime Minister directed all LGAs nationwide to suspend issuing loans to special groups aiming to Controller and Auditor General GR/LGA/2022/23 101 provide time for the Government to establish a new system for issuing loans that will address the identified challenges by the CAG.

As of 30 June 2023, the Fund's net worth for 177 LGAs amounted to TZS 245.31 billion. Before the cessation of loan disbursements in April 2023, a total of 176 LGAs had already allocated TZS 62.69 billion to WYDF Account and issued loans of TZS 73.41 billion for the financial year 2022/23. (Kichere, 2024)

Globally, the rate on non-performing loans (NPL) in USA recorded to 5% of NPL on 2009, and 0.855% on 2019 and it has an on-going fluctuation over years (Bank, Bank Non-Performing Loans to Gross Loans for United States, 2023). (Bank, Bank Non-Performing Loans to Gross Loans for United States, 2023)the average of NPLs for 2022 based on 15 countries was 12.46 percent. The highest value was in Equatorial Guinea: 55.41 percent and the lowest value was in Botswana: 3.75 percent (bank, 2023)

CAG assessment on the performance of revolving fund distributed to women, youth and people with disabilities in 185 LGAs in 2020/21 revealed that, about 155 LGAs had not recovered most of the loans issued to these groups which owe TZS 47.01 billion. The CAG report 2021/22 further revealed that Revolving Fund for Women, Youth and People with Disability found that loan beneficiaries in 180 LGAs defaulted a total of TZS 88.42 billion. (Kichere, 2022)

It was also noted that, loan beneficiaries in 151 LGAs defaulted on loan payments totaling TZS 79.76 billion out of the loans issued, which remained unrecovered as of 30 June 2023 (of which TZS 27.67 billion was for loans issued in 2022/23) (Kichere, 2024)

It was noted that Dodoma city council had outstanding loans totaling TZS 420,993,000 in 2023 from 20 groups that ceased to operate business (Kichere, NATIONAL AUDIT REPORT, March 2024)

2.0 Literature Review

2.1 Theoretical Review

This study is guided by three theories namely asymmetric information, the financial instability theory and Transaction theory as discussed here below.

2.1.1 Asymmetric Information Theory

There is asymmetric information in a financial contract when the borrower has information that the lender ignores or does not have access to. This asymmetry concerns the lender whenever the borrower can use this information profitably and at the lender's expense, and is connected with three circumstances: the borrower violates the contract by hiding information about the characteristics and revenues of the project, the lender does not have sufficient information or control over the borrower to avoid cheating and there is debt repayment risk with the borrower having limited liability. Asymmetric information in can thus results in adoption of adverse selection, moral hazard or monitoring cost

A lender suffers adverse selection when he is not capable of distinguishing between projects with different credit risk when allocating credit. Given the two projects with equal expected value, the lender will prefer the safest one while the borrower the riskier one thus those undertaking risky activities will find it convenient to hide the true nature of the project and exploit the lender's lack of information. Moral hazard occurs when the borrower has the ability to apply the funds to different uses than those agreed upon with the lender, who is hindered by his lack of information and control over the borrower. As in the case of moral hazard, monitoring costs are tied to a hidden action by the borrower who takes advantage of his better information to declare lower-than-actual earnings. Adverse selection appears before the lender disburses the loan whereas moral hazard and monitoring costs appear after the capital has been conceded (Bebczuk, 2003)

Information asymmetry generally gives lenders a harder time in distinguishing between good credit risks and bad credit risks which in turn gives both an equal chance of being lent to. This may make the firms which are good credit risks more averse to borrowing due to the higher interest rates whereas the bad credit risks will be more willing to borrow as they would have expected to have been charged a much higher interest rate. This will in turn have an effect on the lender's portfolio as a larger proportion of the loans will consist of loans with a greater risk of default and in turn result in higher non-performing loans.

2.1.2 Credit Rationing Theory

Credit rationing a situation in which lenders are unwilling to advance additional funds to borrowers at the prevailing market interest rate – is now widely recognized as a problem arising because of information and control limitations in financial markets.

Broadly speaking, ‘credit rationing’ refers to any situation in which lenders are unwilling to advance additional funds to a borrower even at a higher interest rate. In the words of (M. Jaffee and F. Modigliani, 1969), pp. 850–1), ‘credit rationing is a situation in which the demand for commercial loans exceeds the supply of these loans at the commercial loan rate quoted by the banks. Key point to this definition is that changes in the interest rate cannot be used to clear excess demand for loans in the market. In essence, this definition treats credit rationing as a supply-side phenomenon, with the lender’s supply function becoming perfectly price inelastic at some point. If the projects that are being funded by the loan are not scalable, however, then a distinction must be made between a situation in which a lender eventually restricts the size of loan it will provide to any individual borrower and one in which ‘rationed’ borrowers are denied credit altogether.

This phenomenon arises in circumstances in which lending is not scalable. (Stiglitz, 1981) therefore define credit rationing as follows: We reserve the term credit rationing for circumstances in which either (a) among loan applicants who appear to be identical some receive a loan and others do not, and the rejected applicants would not receive a loan even if they offered to pay a higher interest rate; or (b) there are identifiable groups of individuals in the population who, with a given supply of credit, are unable to obtain loans at any interest rate, even though with a larger supply of credit, they would.

According to this definition, lenders fully fund some borrowers but deny loans to others despite the fact that the latter are identical in the lender’s eyes to those who receive loans. Thus, there are two working definitions of credit rationing in the literature. The first focuses on situations in which increases in the interest rate cannot clear excess demand in the loan market, whether this excess demand reflects a single borrower (who would like a larger loan amount) or many. Under this definition, rationing would exist if every potential borrower received a loan but a smaller one than that desired at the equilibrium interest rate.

2.1.3 Transaction Cost Theory

Transaction costs are costs incurred that don’t accrue to any participant of the transaction. They are sunk costs resulting from economic trade in a market. In economics, the theory of transaction costs is based on the assumption that people are influenced by competitive self-interest. In the context of lending, transaction costs include the costs of gathering information about borrowers, monitoring loans, and enforcing contracts. High transaction costs can influence the structure and terms of lending.

(Prakash Singh, 2019) the client transaction costs can become one of the important factors to evaluate transaction costs of the different models of microfinance. policymakers can use the findings to reduce the clients’ transaction costs by benchmarking best practices across all the

microfinance business models. Costs on loan acquisition has significance impacts on loan monitoring, uses and loan repayments.

2.2 Empirical Literature Review

Non-Performing Loans (NPLs) and their Causes

Non-performing loans (NPLs) have been a subject of interest in many economies, particularly in developing countries where financial institutions face challenges in maintaining loan quality. Several empirical studies have been conducted to investigate the factors contributing to NPLs.

A study by (Kithinji, 2010) in Kenya, for example, found that macroeconomic factors such as inflation and interest rates significantly influenced the level of NPLs. The study also highlighted that poor credit appraisal systems and ineffective monitoring of borrowers by financial institutions contributed to the rise of NPLs. Kithinji concluded that both internal bank practices and external economic conditions are key drivers of NPLs.

Similarly, (Fofack H. , 2005) explored the causes of NPLs in Sub-Saharan Africa and found that factors such as low economic growth, poor governance, and external shocks, such as fluctuating commodity prices, were major contributors. Fofack's study emphasized that in developing economies, external macroeconomic instability plays a significant role in determining loan repayment performance.

In the Tanzanian context, (Bofondi, 2011) analysed the banking sector and concluded that weak legal frameworks for debt recovery and inefficient banking practices exacerbated the problem of NPLs. Their study also highlighted the role of institutional factors, such as inadequate risk management frameworks, as key contributors to the accumulation of bad loans.

NPLs Among Special Groups (Women, Youth, and People with Disabilities)

Special groups, such as women, youth, and people with disabilities, face unique challenges in accessing and repaying loans. Studies indicate that these groups often experience higher levels of financial exclusion, which can result in higher default rates. (Morsy, 2020) found that financial literacy and access to credit training significantly affect loan repayment behaviour among women in rural areas of Egypt. The study showed that women with more financial knowledge and access to capacity-building programs were less likely to default on loans. This highlights the importance of financial literacy and education in reducing NPLs among special groups.

In Nigeria, (Aina, 2014) conducted research on the role of microfinance institutions in supporting youth entrepreneurship. The study revealed that youth borrowers faced higher default risks due to a lack of entrepreneurial experience and inadequate support from financial institutions. This led to an increase in NPLs within youth-targeted lending programs. The researchers recommended that financial institutions offer more training and mentorship programs to youth borrowers to help reduce the rate of defaults.

Another study by (Miller, 2021) in Uganda explored loan performance among people with disabilities. The study identified discrimination and lack of tailored financial products as major obstacles to successful loan repayment. People with disabilities were found to have fewer opportunities to generate income, making it harder for them to meet loan obligations. The authors recommended that financial institutions develop specialized loan products and provide support systems tailored to the needs of borrowers with disabilities to reduce the incidence of NPLs.

Financial Inclusion and NPLs

Several studies have explored the relationship between financial inclusion and NPLs, particularly in developing economies. (Kumar, 2016) in their study of Indian microfinance institutions, found that the expansion of financial services to previously unbanked populations led to a significant increase in NPLs. This was attributed to the fact that many of these new borrowers lacked the financial literacy and experience required to manage loans effectively. The study concluded that financial inclusion efforts should be accompanied by financial literacy training to mitigate the risk of loan defaults.

In a Tanzanian study, (Lotto, 2018) analysed the impact of financial inclusion programs on NPLs among rural populations. Lotto found that while financial inclusion initiatives improved access to credit for marginalized groups, they also led to an increase in NPLs due to inadequate financial literacy and poor loan management skills. The study recommended that financial institutions invest in financial education programs to reduce the risks associated with lending to financially excluded groups.

Loan Management Practices and NPLs

The management practices of financial institutions also play a critical role in determining the level of NPLs. (Makri, 2014) in a study of European banks, identified poor loan appraisal and inadequate monitoring systems as major causes of NPLs. The researchers found that banks that implemented rigorous risk assessment frameworks and monitored borrowers closely had lower levels of NPLs compared to those that did not.

A Tanzanian study by (Mwisho, 2001) explored loan management practices in the banking sector and found that inadequate credit appraisal, failure to follow up on loans, and weak enforcement of loan contracts were significant contributors to NPLs. Mwisho's study emphasized the need for banks to adopt more comprehensive risk management strategies and improve the supervision of borrowers to reduce default rates.

In the case of microfinance institutions (MFIs), (Chijoriga, 2011) examined loan default rates in Tanzania and found that poor loan management practices, coupled with a lack of borrower education, contributed to high NPLs. Chijoriga argued that financial institutions must improve their lending practices by conducting better due diligence and offering post-loan support to borrowers, particularly special groups.

Economic Factors and NPLs

Macroeconomic conditions, such as GDP growth, inflation, and unemployment rates, have been widely cited as key determinants of NPLs. (Nkusu, 2011) conducted an empirical analysis of macroeconomic factors affecting NPLs in developing countries and found that economic recessions, high unemployment rates, and inflation had a significant impact on loan default rates. The study concluded that improving the overall economic environment is critical to reducing NPLs.

Similarly, (Louzis, 2012) found that macroeconomic shocks, such as currency devaluation and economic slowdowns, had a strong influence on NPLs in Greek banks. This finding supports the argument that NPLs are not solely determined by borrower behaviour but are also affected by external economic conditions.

In the Tanzanian context, (Magali, 2014) explored the role of economic factors in determining NPL levels in rural SACCOS (Savings and Credit Cooperative Societies). The study found that poor economic performance in rural areas, coupled with unstable incomes, contributed to high default rates. Magali recommended that financial institutions develop more flexible repayment structures that account for fluctuations in borrowers' income, particularly for those in agriculture-dependent regions.

Empirical studies on NPLs provide valuable insights into the various factors that influence loan performance, particularly among special groups. From macroeconomic conditions and institutional practices to borrower characteristics and financial literacy, a range of factors contribute to NPLs. The literature suggests that reducing NPLs requires a multifaceted approach, including better risk management by financial institutions, targeted support for special groups, and improvements in financial literacy. While the empirical evidence from different regions highlights common challenges, there is a clear need for localized research to understand the specific factors affecting NPLs in contexts such as Dodoma City Council.

To conclude there is a research gap in sense that actors such as age, sex and gender was not into consideration and for the purpose of this study these actors will be analysed.

Research Methodology

3.0 Material and Methods

This section describes the research methodology which includes: research design, area of study, research approach, population, sample, sampling techniques, sample size, data collection methods and tools data analysis technique, reliability and validity of the instruments and ethical considerations.

3.1 Research design

Research design is the framework of research methods and techniques chosen by a researcher to conduct a study. The design allows researchers to sharpen the research methods suitable for the subject matter and set up their studies for success. This study has employed the cross-sectional research design to gather both quantitative and qualitative data. The quantitative

phase involves surveys and statistical analysis, while the qualitative phase includes interviews and focus group discussions.

3.2 Area of Study

In this research the area of study is Dodoma city council situated in Dodoma region Tanzania. Dodoma city council has population of 765,179 (statistics, 2022) Is located between Latitudes 6.000 and 6.300 South, and Longitude 35.300 and 36.020 East (municipal) covering approximately 41,311 square kilometres. Dodoma is selected as the area of study because it has substantial amount of NPL, up to February 2022 city executive director declared that only Tshs. 3,981,070,933.62 were paid by borrowers equal to 44.9%, there is 55.1% unpaid. (Vuai, 2022)

3.3 Population of the Study

Population of the study is a complete set of people/individuals with a specialized set of characteristics, the usual criteria of defining population is demographic (J.h.Sheldon, 2010). In this case the population was community development officers of Dodoma city council, DCC employees responsible with 10% loans for special groups and LGA's loan beneficiaries in Dodoma city council.

Also, I have included special groups within Dodoma City Council, including but not limited to women entrepreneurs, youth associations, and minority business owners.

3.4 Sampling Procedures

Sampling techniques are different methods of selecting individual members or subset of a population to make statistical inferences from them and estimate the characteristics of a whole population. (Fleetwood, 2022; Fleetwood, 2022). And in this study the stratified sampling and purpose sampling has employed in the selection of respondents. At the first time, the population was divided into different strata of youth, women and people of disabilities. From each stratum respondents were selected randomly. On the other hand, the purposive sampling was deployed in selecting area of study and Key informants.

3.5 Sample Size Determination

Sample size is number of individuals to be included in the research study and represent the entire population. It references a total number of respondents to be included in the study. In this study the sample size will be calculated by using Slovin's formula which is given as $n = \frac{N}{1 + Ne^2}$ where, N is population, e is margin of error and n is sample size.

$$N=111, e = 0.05$$

$$\text{Hence } n = \frac{111}{(1 + 111 * 0.05^2)}$$

Sample will be 89.4579055 = 90 respondents

Table 3.6: Sample distribution in the study area

special groups	TOTAL POPULATION	SAMPLE SELECTED
Youth	4511	$4511/8601 * 90 = 47$
women	3463	$3463/8601 * 90 = 36$
Group of disabilities	627	$627/8601 * 90 = 7$
TOTAL	8601	90

3.6 Methods of Data collection and Tools

Primary data

The primary data are those which are collected afresh and for the first time, and thus happen to be original in character. (Kothari C. , 2004). Primary data are usually collected from the source—where the data originally originates from and are regarded as the best kind of data in research. Questionnaire Method The structured and unstructured questions were used in the process of collecting primary data from the respondents. The *developed survey questionnaires* were covering factors such as economic status, social conditions, institutional support, regulatory environment, demographic information, financial literacy, and access to resources. The self-administered questionnaires were used in the collection of data from the study area

Documentary Review

The secondary data, on the other hand, are those which have already been collected by someone else and which have already been passed through the statistical process. (Kothari C. , 2004). For the purpose of this study secondary data were collected from previous reports, literatures, journals and other documents related to non-performing loans (NPL) issued by LGA's and other literatures sources including academic journals, books, reports, and articles, to gather insights and findings related to non-performing loans, financial inclusion, and special groups in the context of Dodoma City Council, also, reports and publications from Dodoma City Council, national government agencies, and relevant ministries. Look for data on financial inclusion programs, policies, and statistics related to special groups and non-performing loans

3.7 Variability and Reliability of Data in Research

3.7.1 Validity of Data

The validity of the study refers to the quality and instruments of the study are accurate, correct, and truly meaningful and right (Kothari C. R., 2014). To ensure validity, questionnaires were pre-tested by distributing them to statisticians and colleagues for piloting. Meanwhile the research consulted supervisor to cross check and make an amendment where necessary.

According to (R. Burke Johnson, 2017) consulting supervisors during the research process provides an additional layer of validation and expertise. Supervisors offer valuable insights, guidance, and feedback on the research design, methodology, and data analysis. They also help researchers identify any gaps or limitations in their study and suggest improvements to enhance the overall quality of the research.

3.7.2 Reliability of Data

Reliability refers to the extent to which the same answer can be obtained using the same instruments more than one time. And variability refers to an extent to which requirements of scientific research methods has been followed during the process of generating research findings. Reliability and validity of the research data will be ensured through various measures such as a pilot study, consistency in data collection process, and the use of a standardized questionnaire.

3.7.2.1 Reliability Test

Reliability is the stability and uniformity of measures or results over several administrations or observations. It is a vital component in determining the reliability and correctness of study findings. The internal consistency of instrument is measured by Cronbach's alpha coefficient, a commonly used indicator of reliability. It is generally agreed upon that a Cronbach's alpha level of 0.7 or higher indicates adequate reliability. This limit point indicates that the scale's elements are reliably measuring the same underlying concept. In essence, a Cronbach's alpha greater than 0.7 indicates a high level of internal consistency and a reliable correlation between the scale's items. Cronbach's Alpha is a measure of internal consistency, indicating how closely related a set of items are as a group.

In this study, the variables were categorized into different aspects of factors influencing non-performing loans among special groups in Dodoma city economic factor, social factor and demographic factors. and the Dependent Variable, which is the non-performing loans. Starting with economic factors (income level), it indicates that has high level of contribution to NPL,

Cronbach's Alpha values ranging from 0.824 to 0.854 represent the internal consistency and reliability of a scale measuring the relationship between the level of income and Non-Performing Loans (NPL) among a special group. 0.824 to 0.854, These values fall within the range that indicates good to very good reliability. A Cronbach's Alpha in this range suggests that the relationship between income levels and NPL are likely well-correlated and capture the underlying construct effectively.

Moving to the social factor (level of education) section, it is evident that engagement of education including special skills all have acceptable levels of NPL, with Cronbach's Alpha values ranging from 0.834 to 0.861 represent the internal consistency and reliability of a scale

measuring the relationship between the education level and Non-Performing Loans (NPL) among a special group

In the Follow-up demographic factors (age, gender and family size), Cronbach's Alpha values for age, gender, and family size are notably high, ranging from 0.844 to 0.887 represent the internal consistency and reliability of a scale measuring the relationship between age, sex, family size, and Non-Performing Loans (NPL) among a special group. These values fall within the range that indicates very good to excellent reliability. Values above 0.8 are considered good, and values closer to 0.9 indicate even better internal consistency.

Finally, the Dependent Variable, Non-performing loans, also demonstrates high internal consistency, with a Cronbach's Alpha value of 0.879 on the dependent variable Non-Performing Loans (NPL) among a special group indicates a high level of internal consistency and reliability of the scale used to measure NPL. also, A Cronbach's Alpha of 0.879 suggests that the items on scale are highly consistent with each other. The questions or items used to measure NPL are well-correlated and effectively capture the underlying construct of NPL among the special group.

3.8 Ethical Consideration

Ethical considerations in research refer to the principles and guidelines that researchers must follow to ensure their work is conducted with integrity, respect, and responsibility (Creswell, 2014). To comply with the ethical standards, the study considered informed consent, anonymity, plagiarism (25%), data protection, privacy and confidentiality, authorship, and publication issues. In that regard, the researcher ensured that respondents' personal information is kept confidential and that their identities are protected, unless explicit consent was given to disclose their identities. The research also maximized benefits and minimized any potential harm to respondents, all physical, emotional or psychological harm were avoided.

4.0 Findings and Discussion

The study aimed at investigating factors contributing to non-performing loans of special groups in Dodoma city council. The findings are presented in line with the specific objectives of the study which are articulated in chapter one. The data has been analyzed using Statistical Package for Social Science (SPSS) which made cross tabulation of variables very easy. Also views observed are presented as opinions.

4.1 Demographic Characteristics of Respondent

The characteristics analyzed in this study included age, default history, special groups loans experience, sex distribution and lending knowledge on special groups loans and non-performing loans of the same in Dodoma city council. The reviews of these characteristics provide insight to why the answers of the respondents may vary.

Table 4.2

Gender				
	Frequency	Percent	Valid Percent	Cumulative Percent
Valid male	48	53.3	53.3	53.3
female	42	46.7	46.7	100.0
Total	90	100.0	100.0	

4.2. Age and Gender of Respondents

The results from Table 4.2 indicate that, the males who participated in the study were many than females. About 53.3% of respondents were Male while female was 42 presenting 46.7% of the population. But this does not conclude that gender has impact on loan repayments on loans issued to special groups my municipal and city councils, also Table 4.3 indicates the age and gender distribution from which individual with highest response was age 20years -30 years was 37.8% it's because this group incorporate all youth, women and people with disabilities.

Table 4.2.1 age and gender distribution

characteristics		Frequency	Percent
Age group			
	Under 20	3	3.3
	20-30	34	37.8
	31-40	16	17.8
	41-50	28	31.1
	over 50	9	10.0
	Total	90	100.0
Gender			
	male	48	53.3
	female	42	46.7
	Total	90	100

Family Size

Under my study respondents with different family size was involved from which individual with 1-3 family size was 32.2% the same with 10 or more which was also 32.2%, the logic was to investigate the impact of family size on repayments or to assess the contribution of family size towards non-performing loans in Dodoma city council.

Family Size

	Frequency	Percent	Valid Percent	Cumulative Percent
1-3	29	32.2	32.2	32.2
4-6	10	11.1	11.1	43.3
Valid 7-9	22	24.4	24.4	67.8
10 or more	29	32.2	32.2	100.0
Total	90	100.0	100.0	

Table 4.2.4 Family Size

4.3 The influence of age, gender and family size on non-performing loans among youth, women and people with disabilities.

It was studied the influence of age, gender and family size on non-performing loans on loans issued with local government authorities using Dodoma city council as the case study. Participants with different age categories was involved as depicted on below summary

The age distribution of the sample population shows a strong concentration in the younger age brackets, particularly in the 20-30 age range. This indicates that the majority of the respondents are young adults, which may have implications for the analysis of non-performing loans, as younger individuals face different financial challenges compared to older age groups. Understanding the age distribution helps in tailoring financial education and support programs to meet the needs of the predominant age group.

Participants with age category 20 to 30 years of age was leading with 48.9% of all participants it is because these age categories incorporate all three groups youth, women and people with disabilities, also age category of 41-50 and over 50 years was 3.3% each.

The gender distribution of the sample population shows a slight male majority, with 53.3% of respondents being male and 46.7% being female. This relatively balanced gender distribution ensures that both male and female perspectives are adequately represented in the analysis. Understanding the gender distribution is crucial for tailoring interventions and support programs to address the specific needs and challenges faced by both genders.

Also, from the study participants with different family size were analyzed, the family size distribution shows a diverse range of family sizes among the sample population, with a significant concentration in the 4-6 members category (38.9%) and the 7-9 members category (32.2%). Smaller families (1-3 members) make up 17.8% of the sample, while very large families (10 or more members) represent 7.8%. Understanding the family size distribution was important for tailoring financial education and support programs, as family size can significantly impact financial needs and challenges, including loan repayment capabilities.

A multiple linear regression model was used for data analysis as expressed as: $Y = C_0 + C_1X_1 + C_2X_2 + C_3X_3 + \dots + C_xX_x$ where Y is the dependent variable (non-performing loans) X_1, X_2, X_x are the independent variables (age, gender and family size) and C_0, C_1, C_2, C_x are the unknown regression coefficients. The unknown coefficients are estimated based on n observation for the dependent variable Y , and for each of the independent variables (age, gender and family size).

Findings on the influence of age, gender and family size on non-performing loans is presented in below table,

Model Summary

Model	R	R Square	Adjusted Square	RStd. Error of the Estimate
1	.718 ^a	.647	.514	.272

a. Predictors: (Constant), Family size, Gender, Age

The model, which includes family size, gender, and age as predictors, performs well in explaining the challenges in repaying past loans. The high R Square and Adjusted R Square values indicate that these factors account for a significant portion of the variance in loan repayment challenges among youth, women, and people with disabilities. The low standard error further suggests that the model provides accurate predictions. However, there is still some variance unexplained, indicating that other factors not included in this model may also contribute to loan repayment challenges. Further research and additional variables may help in developing an even more robust model.

Correlation coefficient of 0.718, This represents the simple correlation between the observed and predicted values of the dependent variable. An R value of 0.718 indicates a strong positive correlation between the predictors (family size, gender, and age) and the challenges in repaying past loans and r square of (0.647): This value represents the proportion of variance in the dependent variable that can be explained by the predictors in the model. An R Square of 0.647 means that 64.7% of the variance in challenges in repaying past loans can be explained by family size, gender, and age combined.

4.4 Model Building and Assumption Test

When building a linear multiple regression models, several assumptions need to be considered to ensure the accuracy of results. (Gujarati, 2009) The assumptions include linearity, independence of errors, homoscedasticity, normality of errors, and absence of multicollinearity. Firstly, linearity assumes that there is a linear relationship between the independent variables and the dependent variable. Secondly, the independence of errors assumes that the errors are not correlated with each other. Homoscedasticity assumes that the variance of errors is constant across all levels of the independent variables. The normality of errors assumes that the errors are normally distributed.

Lastly, the absence of multicollinearity assumes that there is no strong linear relationship between the independent variables. These assumptions can be tested using various diagnostic tools such as scatterplots, residual plots, Durbin-Watson statistics, and tests for normality and multicollinearity (Hair *et al.*, 2010). Ensuring these assumptions are met is crucial for the reliability and interpretability of the results obtained from the multiple regression analysis. The assumption test is explained in this part of chapter four.

4.5 Test for Multicollinearity

The collinearity diagnostics table provides insights into multicollinearity issues within your regression model using **eigenvalues**, **condition indices**, and **variance proportions**.

Collinearity Diagnostics							
Model	Dimension	Eigenvalue	Condition Index	Variance Proportions			
				(Constant)	Gender	Age	Family size
1	1	3.345	3.000	.01	.03	.01	.01
	2	.453	3.716	.01	.95	.03	.02
	3	.155	4.642	.00	.00	.46	.46
	4	.046	3.499	.99	.02	.50	.51

a. Dependent Variable: Ability to repay loan

The Gender variable has a high variance proportion of 0.95. This suggests that most of the variance in Gender is explained by this dimension, potentially indicating a relationship with other variables. both Age (0.46) and Family Size (0.46) have moderately high variance proportions, indicating some level of shared variance in this dimension. Age (0.50) and Family Size (0.51) again have high variance proportions, suggesting a moderate level of multicollinearity between these variables.

Gender shows a relatively high variance proportion (0.95) in Dimension 2, which might suggest it is highly related to another predictor in the model. However, the condition index value is low, so this does not pose a critical issue. The moderately high variance proportions for Age and Family Size in Dimensions 3 and 4 suggest that these variables are somewhat collinear with each other, but the condition indices are not high enough to warrant immediate action.

4.6 Test for Autocorrelation

Autocorrelation refers to the correlation of a variable with its own past values or residuals in a regression model. In simple terms, it's when the residuals (errors) from your regression model are not independent but instead follow a pattern, which violates one of the key assumptions of linear regression.

Autocorrelation is particularly common in time-series data, where the value of an observation may be influenced by its previous values. If autocorrelation is present, it can lead to, Inflated R-squared values: Making the model appear to fit better than it actually does. Underestimated standard errors: Leading to incorrect p-values and overconfident conclusions about the significance of the predictors. Biased parameter estimates: Leading to unreliable predictions.

Residuals Statistics					
	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	1.38	2.20	1.90	.179	90
Residual	-1.002	1.207	.000	.511	90
Std. Predicted Value	-2.887	1.676	.000	1.000	90
Std. Residual	-1.927	2.321	.000	.983	90

a. Dependent Variable: Ability to repay loan

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2.843	3	.948	3.504	.019 ^b
	Residual	23.257	86	.270		
	Total	26.100	89			

a. Dependent Variable: Ability to repay loan

b. Predictors: (Constant), Family size, Gender, Age

The F-statistic (3.504) is a measure of the overall significance of the regression model. It tests whether the group of predictors explains a significant proportion of the variance in the dependent variable. The p-value (0.019) indicates the probability that the observed F-statistic could occur by chance if the null hypothesis is true. A low p-value suggests that the model as a whole is statistically significant. **Significance Level (Sig. = 0.019):** The p-value is less than the typical alpha level of 0.05, indicating that the regression model is statistically significant. This means there is evidence to suggest that the independent variables, when considered together, have a significant effect on the ability to repay the loan

Conclusion

The study found out that, special groups are requesting loans in contrast to their income level hence diverting the amount on normal spending those economic activities analysed on loan portfolio and hence failing on meeting loan commitments and turning loans into non-performing loans, individual are not equipped with relevant skills including lending and economic skills, large family size and youth have to be equipped with relevant attention due to their higher spending are factors leading to increasing trend of nonperforming loans among special groups In Dodoma city council.

5.0 Recommendations

This sub-section presents recommendations to various players in the lending decisions of special groups on loans issued by LGAs that include PMO - RALG, committee members, Government officials, business officers, and other participants, based on findings there off I recommends the followings,

Financial Literacy and Education Programs

Equipping individuals with the relevant financial skills to manage loans and spending effectively by Workshops and Seminars Conducting regular financial literacy workshops targeting different demographics, focusing on budgeting, saving, and responsible borrowing. Introduce financial education in schools to equip youth with financial management skills early

on. Also, by Utilizing community centers to hold informational sessions on loan management and financial planning.

Loan Assessment and Approval Processes

Ensuring loans are given based on the applicant's income level and ability to repay. Stringent Loan Evaluation by Implementing stricter assessment criteria that consider the borrower's income, existing financial obligations, and credit history. Income verification by requiring thorough income verification processes to prevent over-borrowing and through tailored loan products, also by Developing loan products tailored to specific income brackets, ensuring repayment terms are realistic and manageable.

Support for Large Families

Providing financial support and management skills to large families to reduce financial strain, Subsidized Financial Counselling through Offering subsidized or free financial counselling services to large families to help them manage their finances effectively, Family Support Programs including Introducing programs that provide additional financial support or benefits to large families, reducing the need for excessive borrowing also by Income-Generating Activities, Encouraging and supporting large families in engaging in income-generating activities to boost their financial stability.

Monitoring and Evaluation

Continuously monitoring the effectiveness of implemented strategies and make necessary adjustments. Regular Reviews, conducting regular reviews of loan portfolios to identify and address emerging trends of non-performing loans. Regularly assess the impact of financial literacy programs and other interventions on reducing non-performing loans, and establishing a feedback mechanism for borrowers to report challenges and receive timely support.

Collaboration with Financial Institutions

Working with financial institutions to develop borrower-friendly policies and practices. Collaborate with banks and microfinance institutions to offer flexible repayment plans that align with borrowers' income flows. Developing and implementing advanced risk assessment tools to better predict and manage potential defaults. Offering loan restructuring options for borrowers facing genuine financial difficulties, reducing the likelihood of default.

Encouraging Participation in Business Training Programs

For LGAs and policymakers, has to highlights the importance of providing or encouraging participation in business training programs as a means to improve loan repayment rates. Supporting such training initiatives could lead to better loan performance and reduced default rates.

Targeted Interventions: Lenders might consider making attendance at business training a part of the loan approval process, especially for new or struggling borrowers, to increase the likelihood of successful repayment.

Focus on Age and Gender

Since age has a stronger positive relationship with loan repayment ability, LGAs might give more weight to age in their credit assessment models.

Although gender has a smaller negative impact, it still provides useful information and should not be ignored entirely. LGAs can develop age-specific financial products or support programs to enhance repayment rates. Also Understanding the reasons behind the negative association with gender could help design interventions to support better repayment outcomes.

Consider Family Size:

LGAs should consider family size when assessing loan applications. Larger families might be at higher risk of loan default due to the increased financial burden.

- **Tailored Financial Products:** Developing loan products that offer more flexible repayment options or support for larger families could help mitigate the risk and support these families better.

Support Programs:

- **Financial Counseling:** Providing financial counseling and budgeting support specifically tailored for larger families could help improve their ability to manage finances and repay loans.

Influence of Human Capital Management Information System on the Performance of Human Resource Functions: A Case of Dodoma City Council

Upendo Ghanday¹, & Richard Msacky²

¹College of Business Education

²College of Business Education

Abstract

This study evaluates the impact of the Human Capital Management Information System (HCMIS) on the performance of the Human Resource (HR) function, focusing on Dodoma City Council. A quantitative approach and cross-sectional design were employed, with the study grounded in the Resource-Based View theory and Task Technology Fit. Both primary and secondary data were gathered from Dodoma city Council staff and documents respectively. The study used the surveys and documentary reviews. Data analysis involved descriptive statistics and multiple regression. The findings indicated that payroll, employee database and reporting management had a positive and significant effect on the performance of the Human Resource. The study recommends that the government should strengthen HCMIS to improve HR performance. Additionally, future research should explore similar topic in different other regions, methods, and populations.

Keywords: *Human Capital Management Information System, Dodoma City Council and Human resources performance*

1.0 Introduction

Globally, Human Capital Management Information Systems (HCMIS) have emerged as part of the broader digital transformation in organizations. Initially, human resource (HR) functions were managed manually, creating inefficiencies in payroll, employee management, and performance evaluation (Kavanagh & Johnson, 2017). As technology advanced in the late 20th century, businesses increasingly adopted automated systems to streamline these processes.

Human Capital Management Information Systems (HCMIS) dimensions, including payroll, employee database, and reporting management, significantly influence HR performance by streamlining processes, improving accuracy, and enhancing decision-making. Efficient payroll systems reduce errors and ensure timely compensation, directly impacting employee satisfaction and organizational trust (Kumar & Singh, 2022). Employee database management facilitates better tracking of workforce skills, attendance, and career progression, enabling HR to allocate resources more effectively and support talent development (Mhando, 2023). Reporting management enhances HR analytics, providing insights into workforce performance and trends, which support data-driven decision-making and strategic planning (Gonzalez, 2021). This comprehensive integration of payroll, employee data, and reporting functions in HCMIS helps HR professionals focus on value-adding tasks, ultimately improving overall organizational performance (Nguyen *et al.*, 2023).

The evolution of human resource (HR) management in Tanzania has transitioned from traditional manual practices to a more advanced Human Capital Management Information System (HCMIS), driven by reforms and regulations. Traditionally, HR relied on paperwork for employee records, payroll, and performance evaluations, creating challenges in data management and decision-making (Mshiu, 2020). Recognizing the need for modernization, the Tanzanian government enacted the Public Service Act, 2002 (revised in 2006), establishing a foundation for professional HR management (United Republic of Tanzania, 2021). This was followed by the National Human Resource Development Strategy (NHRDS) in 2008, aimed at improving the quality of human capital through education and training to address labor market skills gaps (URT, 2021). The 2017 Human Resources Management Policy emphasized creating a skilled workforce fostered by National ICT Policy, 2016 and e-Government Strategy, 2012-2017 (Mshiu, 2020), and the Public Service Management and Employment Policy of 2018 promoted integrating technology in HR practices, advocating for HCMIS adoption to enhance efficiency (URT, 2022).

Human Capital Management Information Systems (HCMIS) significantly enhance HR performance across various regions, including the USA, UK, India, China, Australia, and Africa, by streamlining payroll processing, managing comprehensive employee databases, and facilitating efficient reporting. In the USA and UK, HCMIS implementations have led to improved payroll accuracy and compliance with labor laws, reducing administrative costs and enhancing employee satisfaction (Jain & Singh, 2023; Smith, 2022).

In India, companies are increasingly adopting cloud-based HCMIS to manage vast employee data, which aids in strategic decision-making and performance analytics (Kumar & Raghavan, 2024). China's focus on digitizing HR functions through advanced HCMIS has enabled real-time data access, significantly boosting organizational agility (Li et al., 2023). Meanwhile, in Australia, HCMIS has been instrumental in fostering a data-driven culture that supports workforce planning and performance management (Brown & Green, 2024). In Africa, the implementation of HCMIS in various sectors is gradually enhancing HR processes, though challenges such as infrastructure and skill gaps persist (Musa et al., 2024). Overall, HCMIS serves as a critical enabler of HR efficiency and effectiveness across these diverse regions.

In developing countries, however, Khashman & Al-Ameed (2018) found that adoption of HCMIS has been slower due to challenges like limited infrastructure, budget constraints, and a lack of skilled personnel. However,

HCMIS in Tanzania have become integral to the modernization of human resource (HR) functions across both public and private sectors (Mhando, 2021). These systems are employed to streamline HR processes such as payroll management, employee records, performance evaluations, and compliance with labor regulations, improving efficiency and decision-making. HCMIS implementations, particularly in public institutions, have shown notable success in reducing administrative burdens and enhancing data accuracy for strategic workforce planning (Mushi, 2022; Ngowi, 2023).

Despite these benefits, Mwakyembe, (2023), Chibanga (2021), Kibanda & Mwasaru (2022) stresses that challenges such as system integration issues and user resistance remain unaddressed. While past studies focused on specific functions like payroll or employee databases, few provide a holistic assessment of how HCMIS impacts HR performance in the public sector (Adom et al., 2020; Zhang et al., 2019). This study addresses this gap by investigating the influence of HCMIS on HR performance in Dodoma City Council. Given the increasing importance of digital systems, understanding how HCMIS can improve HR functions is crucial for enhancing public sector service delivery and governance in Tanzania.

2.0 Objectives of the Study

The general objective of this study was to assess the influence of human capital management information system on the performance of human resource function: A Case of Dodoma City Council

3.0 Literature Review

3.1.0 Theoretical Literature Review

3.1.1 Resource Based View Theory (RBV)

The RBV theory was developed by Jay Barney in 1991. It posits that a firm's gains a sustainable competitive advantage through using unique combination of resources. The theory assumes that resources are heterogeneously distributed and are stable over time, allowing for dissimilar performance (Barney, 1991). To gain the competitive edge, the resources must be valuable, rare, inimitable, and non-substitutable (Barney, 1991). The theory is relevant in describing HCMIS is seen as a valuable resource that enhances HR (Marler & Fisher, 2013). By effectively managing these HR functions via enhanced efficiency, reduced errors, and improved decision-making Thus, the RBV theory effectively explains how HCMIS, as a strategic resource, enhances HR

performance and contributes to sustained competitive advantage. However, RBV does not examine the technology fitness to task.

3.1.2 Task Technology Fit (TTF)

The TTF model, developed by Dale Goodhue and Ronald Thompson in 1995. The theory holds that the effectiveness of information technology (IT) is the function of the degree to which the technology fits the tasks (Goodhue & Thompson, 1995). The model assumes that for IT to enhance performance, it must be well-suited to the specific requirements of the tasks being performed. This implies that a good fit between technology and task will lead to improved performance and utilization, while a poor fit will result in reduced effectiveness and underutilization (Goodhue & Thompson, 1995). This makes the model practical for adoption. However, the model fails to consider individual differences among users (Zigurs & Buckland, 1998). The TTF model is highly applicable in explaining the influence of HCMIS on the performance of the human resource (HR) function.

3.2 Empirical Literature Review

Various studies linked the HCMIS and performance of HR functions. Zhang et al. (2019) in China found that efficient payroll management significantly enhances the overall performance of the HR function. Besides, Adom et al. (2020) in Ghana based on a mixed-method approach noted that organizations with modern payroll systems experienced fewer payroll-related disputes and higher employee satisfaction. It was concluded that technology could enhance payroll system. These observations were also noted by Ochieng and Wanjiru (2018) and Mboya et al. (2021) in Kenya who linked payroll improvement and the HR function performance. Likewise, Smith & Johnson (2015) found that employee database management had a positive effect on the HR performance in terms of recruitment and performance appraisal using a mixed-methods approach. Additionally, Brown and Williams (2017) noted that employee database management systems increased HR operational efficiency by 30%. The study was based on a longitudinal study design of 150 companies over five years. Therefore, it is unknown the extent results would change upon changing research approaches and research designs. Lee and Kim (2019) based on interview found that strategic use of employee databases enables better workforce planning and talent management. In the similar vein, Martinez and Garcia (2021) found that effective database management significantly enhances the accuracy and utility of HR metrics. Similarly, Davis and Thompson (2016) using a survey methodology found that organizations

utilizing advanced analytics tools reported a 40% improvement in the accuracy of HR reports. Likewise, Harris and Nguyen (2018) supported findings of Thompson (2016) by noting that HR analytics significantly improves recruitment, performance management, and succession planning. Furthermore, Roberts and Evans (2020) and Mitchell and Lee (2022) through combining quantitative surveys with qualitative interviews. Learned that the use of advanced analytics tools leads to more detailed and actionable HR reports. However, these studies were not based in Tanzania nor focused on the public sector like Dodoma city council.

4.0 Material and Methods

This study adopted a mixed approach. The mixed approach is suitable because it combines the strengths of both qualitative and quantitative methods, providing a comprehensive understanding of complex research problems by capturing both numerical data and in-depth insights (Kumar, 2019). The cross-sectional research design was chosen to capture data at a single point in time, providing a snapshot of the current situation within Dodoma City Council, which is essential for understanding its immediate needs and challenges (Kumar, 2019). Conducting the research in Dodoma City Council is justified due to its growing significance in Tanzania, making it a relevant context for examining the effectiveness of Human Capital Management Information Systems (HCMIS) (Mhando, 2023).

A purposive sampling method was employed to select respondents with specific expertise, including IT staff, Human Resources personnel, and accountants, ensuring that the sample accurately reflects the knowledge required to address the research objectives (Palinkas et al., 2015). Additionally, Purposive sampling is justified because it allows researchers to intentionally select participants who possess specific characteristics or expertise relevant to the research topic, ensuring the collection of rich, targeted, and insightful data from those most qualified to provide it (Etikan, 2023). Data collection utilized both primary and secondary sources through structured questionnaires, and documentary reviews, which provide a comprehensive view of the topic (Fowler, 2014).

Data analysis was performed using descriptive statistics and multiple regression analysis with SPSS version 23, allowing for a robust examination of correlations between variables and ensuring that the findings are statistically sound (Kothari, 2014). To guarantee the reliability of the research instruments, Cronbach's Alpha was used, as it is a well-established measure of internal

consistency, while content validity testing ensured that the questionnaire addressed all relevant topics related to employees' challenges in acquiring employment-related services (Tavakol & Dennick, 2011).

5.0 Findings and Discussion

5.1. HCMIS and Performance of Human Resource Functions

The descriptive statistics was used to determine extent of performance of human resource function is affected by HCMIS. The responses were rated using five-point Likert scale (5 = Strongly disagree, 4= Disagree, 3 = Neutral, 2 = Agree and 1= Strongly agree) See Table 1. The results presented indicate the perceptions of participants regarding the effectiveness of Database Management, Payroll Management, Reporting Management, and their collective impact on HR performance, with each dimension measured on a scale from 1 to 5.

Table 1: Descriptive statistics (n = 63)

	Database management	Payroll Management	Reporting Management		HR performance
N Valid	126	126	126		126
Missing	0	0	0		0
Mean	1.73	1.60	1.73		1.77
Std. Deviation	1.076	1.096	1.076		1.067
Minimum	1	1	1		1
Maximum	5	5	5		5

Interpretation of Results

The mean score for Database Management is 1.73 (SD = 1.076), indicating a low perception of its effectiveness in HR functions, with significant variation in responses. Payroll Management is viewed even less favorably, with a mean of 1.60 (SD = 1.096), suggesting concerns over accuracy and timeliness. Reporting Management has a similar mean score of 1.73 (SD = 1.076), reflecting dissatisfaction among participants.

HR performance shows a marginally better mean of 1.77 (SD = 1.067), yet remains low overall, indicating that improvements are needed across all areas. The low mean scores imply systemic issues that may stem from inadequate technology, insufficient training, or ineffective processes, with high standard

deviations highlighting mixed perceptions among respondents. Organizations should invest in robust HCMIS solutions and provide training for HR personnel, along with regular audits and employee feedback, to enhance HR effectiveness and stakeholder satisfaction.

Table 2: Regression Coefficients for HCMIS Aspects and the Performance of the HR Function

Model	Unstandardized Coefficients		Standardized T Coefficients		Sig.
	B	Std. Error	Beta		
(Constant)	1.722	0.134		12.845	0.000
Salary record	0.663	0.152	0.966	4.366	0.000
Deduction record	0.109	0.147	0.274	2.744	0.039
Bonus record	0.113	0.134	0.817	1.096	0.024

Dependent Variable: Performance of the human resource function
R-square =0.858
F- value = (89.65, P-value < 0.05)

Source: Field Data, (2024)

Findings in Table 3 show that all independent variables has a positive and significant effect as beta coefficient were positive and had p-value less than 0.05.

5.3. Influence of Employee Database Management on the Performance of HR Function

Table 3: Descriptive Result for Employee Database Management (n= 63)

Statements	Mean	Std. deviation
Access to Information	4.1905	1.33026
Data Accuracy	4.3333	1.28264
Storage	4.3175	1.34195
Database Usage.	4.3151	1.14758
Overall mean score	4.2891	1.27561

Source: Field Data, (2024)

The findings from Table 3 indicate a strong positive perception of employee database management's role in enhancing human resource (HR) functions. With an overall mean score of 4.29, respondents largely agree that easy access to comprehensive employee information significantly boosts HR efficiency (Mean = 4.19). The accuracy of work records is also highly valued for improving workforce planning (Mean = 4.33). Furthermore, storing performance reviews in the database is viewed as essential for ensuring fair evaluations (Mean = 4.32) and reducing biases in assessments (Mean = 4.32). These results align with the findings of Mwangi and Sato (2021).

5.5. Multiple Regression Results for Employee Database Management and the Performance of HR Function

Table 4. shows that $R^2 = 0.816$ which means that 81.6% of corresponding variations in performance of the HR function. The result implied that the model explained well the relationship between employee database management and performance of HR function by 81.6%. meanwhile the p-value overall was 0.000 signifying the significant change. All independent variables had a positive and significant effect on the HR functions as beta coefficients were positive and p-values < 0.05 .

Table 4: Regression Coefficients for Employee Data Base Management and Performance of the HR Function

5.6. Influence of Analytical and Reporting on the Performance of Human

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	1.689	0.119		14.224	0.000
Employee information	0.184	0.107	0.156	1.710	0.011
Work record	0.206	0.101	0.110	2.043	0.042
Performance review	0.132	0.078	0.129	5.501	0.000

Dependent Variable: Performance of the human resource function
R-square =0.816
F- value = (95.27, P-value < 0.05)

Resource Function

Table 5: Descriptive Result for Analytical and Reporting (n= 63)

<i>Statements</i>	<i>Mean</i>	<i>Std. deviation</i>
<i>Predictive analytics</i>	4.2429	1.37790
<i>Analytics capacity</i>	4.3889	1.57717
<i>Reporting ability</i>	4.1697	1.63831
<i>Training Need Indetification</i>	3.9857	1.50728
<i>Overall mean score</i>	4.1968	1.52517

Source: Field Data, (2024)

Table 5 shows that analytical and reporting practices received an overall mean score of 4.1968, indicating respondents' value predictive analytics and forecasting for future hiring. Predictive analytics scored a mean of 4.2429, highlighting its importance in planning, while workforce forecasting achieved a mean of 4.3889. Additionally, trend analysis for understanding employee turnover and identifying training needs received

high scores of 4.1697 and 3.9857, respectively. These findings align with Siti and Wong (2023).

5.7. Assumptions for Testing Multiple Regression

5.7.1. Linearity Testing

Regression summarizes the relationship between an independent variable (IV) and a dependent variable (DV) with a straight line, showing how changes in X affect Y. However, this relationship may not always be linear and can include both linear and non-linear elements. The correlation coefficient and slope are reliable only for the linear portion, which may increase the risk of Type II errors for the IV and Type I errors (overestimation) for other IVs in multiple regression. A more effective method for assessing these relationships is to examine residual plots, which show standardized residuals against standardized predicted values and are available in most statistical software.

Source: Researcher Constructs (2024)

ii. Normality Testing

In multiple regression, the normal distribution assumption applies only to the residuals, not to the independent variables, which is a common misconception. Residuals represent the errors between observed and predicted values, and it is their distribution that should be normally distributed across the sample. Additionally, multiple regression assumes that the independent variables are not highly correlated with one another to avoid multicollinearity issues.

Figure 2: Histogram of Normality of Data of Variables

Multicollinearity

This assumption is verified using Variance Inflation Factor (VIF) values. Scholars recommend measuring multicollinearity with tolerance or VIF; a tolerance value below 0.20 or 0.10, or a VIF of 5 or above, indicates a multicollinearity issue. The results showed no multicollinearity among the independent variables, with tolerance indexes ranging from 0.771 to 0.701 and VIF below 1.428. Tolerance reflects the variability of independent variables not explained by others (Hair et al., 2010). VIF is calculated as the inverse of tolerance (Kumar, 2019), and multicollinearity occurs when tolerance is between 0 and 1. Hair et al. (2010) recommend cutoff values of 0.10 for tolerance and 10 for VIF, noting that tolerances above 0.5 may complicate regression coefficient interpretation (Tabachnick & Fidell, 2013). Multicollinearity tests were conducted, as shown in Table 6.

Table 6: Results of Multicollinearity Test

Model Variables	Collinearity statistics	
	Tolerance	VIF
Payroll Management	0.131	7.610
Database Management	0.148	6.753
Reporting Management	0.139	7.206

iv. Autocorrelation Testing

Another multiple regression assumption is autocorrelation, which must be minimal for valid data analysis. Autocorrelation occurs when residuals interact with each other, affecting the results due to their lack of independence (Hair et al., 2010). The Durbin-Watson statistic ranges from 0 to 4, with values near 2 indicating no autocorrelation,

and a value of 2.0 is the standard benchmark. In this study, the Durbin-Watson test yielded 2.114, indicating no autocorrelation problem.

Table 6 reported $R^2=0.734$ which means that 73.4% of corresponding variations in performance of the human resource function. The overall p value of 0.000 implied that change was significant. Individual independent value had a positive and significant effect.

Table 6: Regression coefficients for analytics reporting and the performance of human resource function

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	1.899	0.101		18.840	0.000
Analysis of employee performance	0.124	0.099	0.199	1.254	0.014
Forecast future workforce needs	0.382	0.102	0.594	3.742	0.000
Trend analysis	0.215	0.105	0.349	2.045	0.044
Dependent Variable: Performance of human resource function					
R-square =0.734					
F- value = (72.13 , P-value < 0.05)					

Findings in Table 6 indicated that, the beta coefficient for analysis of employee performance is 0.124 with a p-value of 0.014. This indicates that a unit increase in analysis of employee performance is associated with a 12.4% increase in the performance of the HR function. Moreover, findings in Table 14 indicated that the coefficient for forecast future workforce needs is 0.382 with a p-value of 0.000. This means that a unit increase in forecast future workforce needs is associated with a 38.2% increase in the performance of the HR function. Furthermore, findings in Table 14 indicated that the coefficient for trend analysis is 0.215 with a p-value of 0.044. This indicates that a unit increase in trend analysis is associated with an 21.5 % increase in the performance of the HR function.

6.0 Conclusions of the Study

The study found that, there was positive and significant relationship between payroll management within human capital management information system and the performance of human resource function. Therefore, the study concludes that, payroll management is important aspect of human capital management information system that influence performance of human resource functions in selected public institution in Dodoma City Council.

Moreover, the study found that, there was positive and significant relationship between employee database management within human capital management information system and the performance of human resource function. Therefore, the study concludes that, employee database management is another important aspect of human capital management information system that influence performance of human resource function in selected Public Institution in Dodoma City.

Furthermore, the study found that, there was positive and significant relationship between analytics and reporting within human capital management information system and the performance of human resource function. Therefore, the study concludes that, analytics and reporting management is another crucial aspect of human capital management information system that influence performance of human resource functions in selected Public Institution in Dodoma City.

7.0 Limitations of the Study

The study examining the influence of Human Capital Management Information Systems (HCMIS) on human resource performance in Dodoma City Council faced several limitations. Firstly, focusing on a single local government context restricts the generalizability of the findings to other regions or sectors in Tanzania, indicating a need for broader research. Secondly, reliance on self-reported data raises concerns about biases, as respondents may provide socially desirable answers. The cross-sectional design limits insights into long-term impacts or trends associated with HCMIS implementation. Additionally, challenges with technological infrastructure and access to data likely hindered the depth of analysis, underscoring the need for future research that addresses these limitations and employs longitudinal approaches.

8.0 Recommendations of the Study

Based on the findings, the researcher recommends that the government implement an automated and integrated payroll system to ensure accurate and timely salary disbursements, minimizing errors associated with manual processes. Additionally, effective employee database management should be centralized and well-maintained to streamline HR activities and facilitate quick access to employee records. The government should also leverage advanced data analytics tools to provide HR departments with insights into workforce trends and performance metrics. Implementing a comprehensive reporting system that generates real-time, customizable reports can aid in strategic planning and decision-making. Furthermore, training HR personnel in data analytics is essential to maximize the benefits of these tools.

9.0 Suggestion for Further Research

While this study offers valuable insights into the challenges of implementing HCMIS in Dodoma City Council, its findings may not be fully generalizable to all public institutions in Tanzania. To enhance understanding of HCMIS implementation challenges across the public sector, the researchers recommend expanding the study to include public institutions in other major cities, which would help determine if the challenges identified in Dodoma are consistent elsewhere. Additionally, a comprehensive study involving all public institutions that have adopted HCMIS, not just early adopters, would provide a fuller picture of sector-wide challenges. Integrating qualitative and quantitative approaches in future research could validate current findings, using in-depth interviews with ICT experts and system beneficiaries to gather diverse insights.

Abstract

This study focused on examining the influence of decision-making style on employee performance within the Tanzania Electrical, Mechanical, and Electronics Services Agency (TEMESA). Utilizing a mixed-methods approach, the research combined quantitative surveys and qualitative interviews to gather comprehensive data. A sample of 135 employees was selected through simple random sampling, while key informants, including managerial staff and supervisors, were chosen purposively. Data collection involved structured questionnaires for employees and semi-structured interviews for key informants. The analysis employed descriptive and multiple regression techniques to evaluate the impact of decision-making styles on employee performance. The findings indicated that decision-making style significantly affects employee performance, with timely and participatory decision-making positively influencing performance outcomes. The study also identified issues such as limited employee involvement in decision-making and unclear instructions, which adversely impacted performance. The research underscores the importance of adopting effective decision-making styles to enhance employee performance and provides recommendations for improving decision-making processes within TEMESA. This contribution adds valuable insights to the literature on employee performance in public sector organizations.

Key words: *Decision-making style, Employee performance*

3. Introduction

Decision-Making Style refers to the approach or method used by individuals or groups to make decisions. It encompasses how decisions are made, including the processes and strategies involved. Decision-making styles can vary, such as being participatory (involving input from others), autocratic (centralized decision-making by one person), or consultative (seeking advice but making the final decision independently). The style used can influence how effectively decisions are made and their outcomes.

Employee Performance refers to how well employees carry out their job responsibilities and tasks. It includes various aspects such as productivity, efficiency, quality of work, and the ability to meet goals and objectives. Employee performance can be affected by multiple factors, including the decision-making processes within the organization. High performance is often characterized by employees meeting or exceeding their job expectations and contributing positively to organizational goals. Decision-making styles significantly influence employee performance, particularly within public sector organizations, where the alignment between leadership and decision-making is essential for organizational effectiveness (Ali et al., 2021; Pizzolitto et al., 2023). Employee performance, including efficiency, productivity, and the fulfillment of job responsibilities, is often impacted by how decisions are made at various organizational levels (Dastane, 2020). Decision-making styles, whether participative, autocratic, or consultative, shape employee behavior and can either enhance or inhibit their performance depending on how they are involved in the process (Shafique & Beh, 2017).

In public organizations, such as the Tanzania Electrical, Mechanical, and Electronics Services Agency (TEMESA), decision-making plays a pivotal role in navigating the complex bureaucratic environment and resource constraints (Amegayibor, 2021). Established in 2005, TEMESA is tasked with providing critical services in the fields of electrical, mechanical, and electronics engineering, functioning under the Ministry of Works (URT, 2023). The agency faces various challenges, including limited resources, bureaucratic inefficiencies, and high employee turnover, all of which can negatively impact employee performance (Ali et al., 2021; Amegayibor, 2021). Effective decision-making is essential in overcoming these challenges, as it allows leaders at TEMESA to optimize resource allocation, motivate employees, and enhance organizational performance (Pizzolitto et al., 2023). Participative decision-making, which involves employees in the process, has been shown to foster a sense of ownership and responsibility among employees, ultimately improving performance (Shafique & Beh, 2017). On the other hand, autocratic decision-making may be necessary in situations requiring quick, authoritative actions, but its overuse can lead to reduced employee morale and engagement (Ali et al., 2021).

Understanding the influence of decision-making styles on employee performance at TEMESA is vital to addressing performance gaps and promoting organizational success. As observed in other public organizations globally, the shift towards more inclusive decision-making practices has yielded positive outcomes, such as increased employee satisfaction, higher efficiency, and improved service delivery (Bunjak et al., 2022). In the case of TEMESA, adopting the appropriate decision-making style that

aligns with both organizational goals and employee needs is crucial for enhancing performance and achieving long-term success.

4. Literature Review

This section encompasses the theoretical framework, as well as a review of various relevant literature and the study's conceptual framework.

The theoretical review of the study is based on Contingency Theory, Transformational Leadership Theory, and Transactional Leadership Theory. Contingency Theory highlights the need for leadership styles to adapt to situational factors for effectiveness (Fiedler, 2015), while Transformational Leadership Theory emphasizes inspiring and motivating employees to exceed organizational goals (Burns, 1978). These theories collectively suggest that effective decision-making and leadership styles depend on context, supporting the study's objective of examining their influence on employee performance within TEMESA.

The literature review plays a pivotal role in shaping the study, providing insight into the problem domain, discussing prior research, identifying knowledge gaps, and setting the study's objectives. Effective decision-making processes are crucial for enhancing employee performance and organizational outcomes. Ullah et al. (2022) investigated the influence of authoritative and laissez-faire leadership styles on employee performance within the Board of Intermediate and Secondary Education in Peshawar, Pakistan. The study found that authoritative leadership, which involves decisive and clear decision-making, positively impacted employee performance. This highlights the necessity for leaders to adopt decision-making styles that are clear and decisive to enhance performance.

Haq and Kuchinke (2016) also focused on the relationship between leadership styles and employees' attitudes towards their leaders in the banking sector of Pakistan. The study revealed that transformational leadership, which encourages participative decision-making, substantially improved employee performance. On the other hand, laissez-faire leadership, characterized by a lack of decision-making, did not impact performance, indicating that effective leadership requires active involvement in decision processes.

The conceptual framework for this study examines the influence of decision-making styles on employee performance at TEMESA. Decision-making styles are identified as the independent variable and are measured through employee involvement in decision-making processes, and the timeliness of decision-making. Employee performance, the dependent variable, is measured through key indicators such as

productivity and adherence to deadlines. Research indicates that involving employees in decision-making fosters engagement, job satisfaction, and a sense of ownership, leading to improved performance (Fagaloa, 2022; Bunjak et al., 2022). Timely decision-making reduces uncertainty, allowing employees to execute tasks efficiently and confidently, thus enhancing productivity (Lewis et al., 2004; Nuhu, 2010). Moreover, clear communication and effective information flow within the decision-making process positively impact employees' understanding of expectations and enable them to perform better (Chua et al., 2018; Mwiandi, 2012). Therefore, the framework posits that decision-making styles, particularly those involving employee participation and timeliness, are critical determinants of performance outcomes at TEMESA.

5. Research Methodology

This part encompasses the of research design, area of the study, sampling procedure, targeted population, sample size and sample selection, the research instruments to be used, procedures for data collection, data analysis, reliability and validity of research instruments, and ethical issues to be considered.

The study adopted mixed approach where both qualitative and quantitative techniques were applied. The rationale for using the mixed approach is that, the method appropriates for studying the complex relationships and it allows the examination of both the experiences/perception and numerical data on the matter under study.

The study is centered on the headquarters of the Tanzania Electrical, Mechanical, and Electronics Services Agency (TEMESA) in Dodoma. TEMESA is a crucial public agency responsible for maintaining government infrastructure such as motor vehicles, ferry services, and electrical systems in government buildings. This setting offers a valuable opportunity to explore the influence of decision-making styles on employee performance within a key organization that supports government operations. Dodoma, as Tanzania's administrative hub, is ideal for studying leadership dynamics in public sector institutions like TEMESA (Henn et al., 2015).

This study used a cross-sectional research design. Data was collected from the study area at one point in the given study area. In a cross-sectional study, the researcher measures the outcome and the exposure of the study participants at the same time (Setia, 2016). This type of research design provided meaningful information to a group of people and was done in a smalltime frame.

For this study the target population included all leadership management and employees of TEMESA in Dodoma (Creswell, 2009). Sampling techniques involved simple random sampling for general employee respondents and purposive sampling for key

informants such as department heads and senior managers. The sample size was determined using the Yamane formula (1967), with the total population being 202 employees. A sample size of approximately 134 employees was calculated, reflecting a balance of representativeness and statistical precision for reliable results (Yamane, 1967).

The study employed a combination of qualitative and quantitative methods to collect data. In-depth interviews with key leaders and managers provided valuable insights into decision-making practices and their effects on employee performance. Additionally, focus group discussions with employees were conducted to gather diverse viewpoints on how decision-making styles influence their job satisfaction and performance. Quantitative data was collected using a structured questionnaire survey distributed among TEMESA employees, which included both closed- and open-ended questions to measure the impact of decision-making styles on various performance metrics. Supplementing these methods, a documentary review of TEMESA's organizational reports, performance evaluations, and other relevant documents was performed to further analyze the relationship between decision-making styles and employee performance.

Furthermore, the study employed both qualitative and quantitative data analysis methods. Qualitative data were transcribed, coded, and analyzed thematically from in-depth interviews with managerial staff and supervisors, while document reviews supported content analysis. Quantitative data from questionnaires were cleaned and organized before being analyzed using descriptive statistics, including percentages and means. The study utilized a Multifactor Leadership Questionnaire (MLQ) to assess organizational structure's impact on performance, and logit regression and ordinary least squares (OLS) regression models to examine how decision-making styles affected employee motivation, job satisfaction, and performance metrics. This comprehensive approach provided valuable insights into the relationship between decision-making styles and employee performance at TEMESA.

6. Findings and Discussion

This part presents analysis and discusses the findings of the study. Section one has a description of the demographic characteristics of respondents. Section two represents the findings on the specific objectives which answer the research questions of the study.

The findings show that the respondents' demographic characteristics reveal a diverse workforce profile. The majority of participants were male (62.2%) compared to female respondents (37.8%), suggesting a gender imbalance that may impact leadership

dynamics and gender-sensitive management practices (Ali et al., 2021; Omar et al., 2022). Age distribution showed that 43.0% of respondents were between 38-47 years old, with the majority being middle-aged, which reflects a stable and experienced workforce (Oyewobi, 2022; Llorens et al., 2018). This demographic composition may influence decision-making styles and their impact on performance.

Education levels varied significantly, with 57.8% holding university degrees, indicating a highly educated workforce (Dulewicz & Higgs, 2005; Gemeda & Lee, 2020). The majority had 3-5 years of working experience (50.4%), which highlights a blend of both newer and seasoned employees, essential for organizational knowledge and development (Nuhu, 2010; Oyewobi, 2022). These characteristics are crucial for understanding how decision-making styles affect performance across different employee profiles within TEMESA.

The influence of decision-making style on employee performance

The second specific objective of this study aimed to explore the influence of decision-making style on employee performance within TEMESA. Decision-making style plays a crucial role in shaping organizational culture, employee engagement, and overall performance outcomes (Asrar, 2017). This objective seeks to provide insights into effective decision-making practices that can enhance organizational effectiveness.

The findings of the study regarding the influence of decision-making style on employee performance are presented in Table 3, providing valuable insights into the relationship between decision-making style and employee performance within TEMESA.

Table 41: Influence of decision-making style on employee performance

	Statement/items	Agree		Neutral		Disagree	
		F	%	F	%	F	%
1	Employees are involved in decision-making processes	67	49.6	23	17.0	45	33.3
2	Decision-making processes consider input from employees.	71	52.6	21	15.6	43	31.9
3	Employees have opportunities to contribute ideas and suggestions.	66	48.9	36	26.7	33	24.4
4	Decision-making is timely, with quick resolutions to issues.	31	23.0	17	12.6	87	64.4
5	Decisions are made promptly, without unnecessary delays.	43	31.9	56	41.5	36	26.7

6	Decision-making processes are efficient and streamlined.	81	60.0	13	9.6	41	30.4
7	Employees receive timely feedback on their suggestions.	30	22.2	67	49.6	38	28.1
8	Decisions are communicated promptly to relevant parties.	44	32.6	71	52.6	20	14.8
9	There is transparency in decision-making processes.	70	51.9	21	15.6	44	32.6
10	Employees feel empowered to participate in decision-making.	54	40.0	58	43.0	23	17.0
11	The organization values employee input in decision-making.	74	54.8	19	14.1	42	31.1
12	Decision-making processes are inclusive of diverse perspectives.	56	41.5	68	50.4	11	8.1
13	Employees perceive decision-making processes as fair and inclusive.	61	45.2	51	37.8	23	17.0

The findings presented in Table 4 concerning objective two, which focuses on the influence of decision-making style on employee performance, reveals several key insights into the organizational dynamics within TEMESA. The Likert-scale statements assessed various aspects of decision-making processes and their impact on employee performance.

Employees are involved in decision-making processes:

Findings in Table 3 reveals that 49.6% of respondents agreed that employees are involved in decision-making processes, while 33.3% disagreed. This finding suggests that there is moderate involvement of employees in decision-making within TEMESA. This result aligns with previous research by Ali et al. (2021), which emphasized the importance of employee involvement in decision-making for project success. However, the disagreement from a significant portion of respondents indicates a potential area for improvement in enhancing employee participation in decision-making processes. Organizations that involve employees in decision-making tend to have higher levels of job satisfaction and organizational commitment (Dastane, 2020), implying potential benefits for TEMESA if employee involvement is increased.

Further finding regarding decision-making processes shows that the majority (52.6%) agreed that decision-making processes consider input from employees. This suggests a relatively positive perception of employee input in decision-making within TEMESA. This finding resonates with the literature, as studies by Gemedu and Lee (2020) have shown that considering employee input in decision-making can lead to

higher levels of work engagement and positive outcomes. However, the proportion of respondents who disagreed (31.9%) indicates that there may be room for improvement in ensuring that employee input is consistently valued and incorporated into decision-making processes. Another Key Informant said that;

"Through various joint meetings in the office, we endeavour to receive input from every employee, even if they are security guards" (Key Informant, 2024)

Moreover, findings show employees have opportunities to contribute ideas and suggestions as reflected in Table... that nearly half of the respondents (48.9%) agreed that employees have opportunities to contribute ideas and suggestions. This indicates a moderately positive perception of the availability of opportunities for employee input within TEMESA. This finding is consistent with research by Bunjak et al. (2022), which suggests that organizations that provide opportunities for employee input tend to foster a culture of innovation and creativity. However, the proportion of respondents who disagreed (24.4%) suggests that there may be barriers or limitations preventing some employees from contributing their ideas, highlighting a potential area for improvement.

Only 23.0% of respondents agreed that decision-making is timely, while the majority (64.4%) disagreed. This indicates a significant perception among respondents that decision-making processes lack timeliness within TEMESA. This finding is consistent with the literature, as delays in decision-making can hinder organizational effectiveness and employee productivity (Fagaloa, 2022). The implications of this result suggest the need for TEMESA to streamline its decision-making processes to enhance efficiency and responsiveness to issues.

Similar to the previous statement, a significant proportion (64.4%) disagreed that decisions are made promptly, indicating a perception of delays in decision-making within TEMESA. This finding underscores the importance of timely decision-making, as delays can lead to missed opportunities and decreased employee morale (Oyewobi, 2022). The disagreement from the majority of respondents highlights a critical area for improvement in ensuring that decisions are made promptly to support organizational agility and effectiveness.

A majority (60.0%) agreed that decision-making processes are efficient and streamlined. This suggests a positive perception of the efficiency of decision-making within TEMESA. Efficient decision-making processes are crucial for organizational performance and competitiveness (Shafique & Beh, 2017). This finding aligns with previous research highlighting the importance of streamlining decision-making processes to enhance organizational effectiveness (Liphadzi et al., 2015). However,

the proportion of respondents who disagreed (30.4%) indicates that there may be opportunities for further improvement in enhancing the efficiency of decision-making processes.

Only 22.2% of respondents agreed that employees receive timely feedback on their suggestions. This indicates a perception among respondents that feedback on employee suggestions is lacking within TEMESA. Timely feedback is essential for employee development and motivation (Ullah et al., 2022). The disagreement from the majority of respondents suggests a potential gap in communication and feedback mechanisms within the organization, highlighting an area for improvement to enhance employee engagement and satisfaction.

A significant proportion (52.6%) agreed that decisions are communicated promptly to relevant parties. This suggests a positive perception of communication effectiveness within TEMESA regarding decision outcomes. Prompt communication of decisions is essential for organizational transparency and alignment (Asrar, 2017). This finding is consistent with previous research emphasizing the importance of timely communication in organizational decision-making (Johnson & Christensen, 2019). However, the proportion of respondents who disagreed (14.8%) indicates that there may be instances where decision communication is not effectively executed, highlighting a potential area for improvement.

More than half (51.9%) agreed that there is transparency in decision-making processes. This indicates a moderately positive perception of transparency within TEMESA regarding decision-making. Transparency in decision-making fosters trust and accountability within organizations (Rotberg, 2012). This finding aligns with previous research highlighting transparency as a key factor in effective decision-making processes (Llorens et al., 2018). However, the proportion of respondents who disagreed (32.6%) suggests that there may be perceptions of opacity or ambiguity in certain decision-making processes, emphasizing the importance of enhancing transparency to build trust and confidence among employees.

Forty percent of respondents agreed that employees feel empowered to participate in decision-making. This suggests a moderate perception of employee empowerment within TEMESA. Empowering employees in decision-making can lead to increased job satisfaction and organizational commitment (Bunjak et al., 2022). This finding is consistent with previous research emphasizing the importance of employee empowerment for organizational performance (Amegayibor, 2021). However, the proportion of respondents who disagreed (17.0%) indicates that there may be barriers

or limitations preventing some employees from feeling empowered to participate in decision-making, highlighting a potential area for improvement.

A majority (54.8%) agreed that the organization values employee input in decision-making. This indicates a positive perception of the organization's recognition of employee contributions within TEMESA. Recognizing and valuing employee input can enhance organizational commitment and engagement (Fries et al., 2021). This finding is consistent with previous research highlighting the importance of valuing employee input for organizational success (Cosmas, 2018).

Overall, the findings from Table 3 highlight both strengths and areas for improvement in decision-making processes within TEMESA. While there are positive perceptions regarding employee involvement and the value of employee input, challenges exist concerning the timeliness of decisions, transparency, and inclusivity. Addressing these challenges could enhance organizational effectiveness and employee satisfaction, ultimately contributing to improved performance and outcomes.

7. Conclusion and Recommendation

Conclusion

The study on the influence of decision-making style on employee performance at TEMESA reveals several critical insights. It highlights the significance of clear and consistent decision-making processes, which are essential for optimizing employee performance. The findings indicate that while employee involvement in decision-making is generally positive, inconsistencies and delays in the decision-making process, coupled with communication breakdowns, negatively impact performance. Addressing these issues by refining decision-making styles to ensure clarity and timeliness can significantly enhance employee efficiency and commitment.

Furthermore, the study emphasizes the need for improved communication strategies within TEMESA. Effective communication processes, including clear information flow and feedback mechanisms, are crucial for reducing misunderstandings and fostering a collaborative work environment. By promoting a culture of inclusivity and transparency in decision-making, TEMESA can better engage employees and boost overall performance. These findings suggest that TEMESA's focus on enhancing decision-making practices and communication systems will be pivotal in achieving better performance outcomes and organizational success.

Recommendation

To enhance employee performance at TEMESA, the Government and Ministry of Works, Transport, and Communications should focus on several key areas. First, improving clarity in organizational structures by defining job roles and updating these as needed will help align employees with organizational goals. Promoting inclusive decision-making by involving employees in decision processes can boost ownership and accountability. Investment in communication training and tools, as well as establishing clear feedback mechanisms, is crucial for effective information sharing and performance evaluation. Encouraging transparency in decision-making and fostering interdepartmental collaboration will also enhance employee engagement. Lastly, prioritizing employee well-being and implementing continuous improvement initiatives will contribute to sustained organizational success.

Limitation to the Study and Areas for Further Research

Future research on the influence of decision-making styles on employee performance at TEMESA could benefit from several additional areas of focus. First, examining the impact of different decision-making styles, such as participative versus autocratic, on employee motivation and productivity within TEMESA could provide deeper insights into how these styles influence performance outcomes. Second, investigating how feedback mechanisms, including performance appraisals and employee surveys, affect employee perceptions and performance could reveal strategies for improving these processes. Lastly, exploring the relationship between employee engagement and organizational culture, particularly focusing on factors like leadership behavior and communication practices, could offer valuable information on how to enhance employee motivation and performance.

Abstract

The study aimed to evaluate the determinants of non-performing loans (NPLs) for selected SACCOS in Dodoma District Council, Tanzania. It focused on assessing the effects of leverage, member growth, deposit-to-asset ratio, and management efficiency on NPLs. Using a cross-sectional survey design, quantitative approach, and simple random sampling, the study relied on financial reports from 2018 to 2022. Data was collected through document reviews and surveys, with analysis methods including Descriptive statistics analysis, Correlation analysis, multiple Linear Regression, and the Hausman test. The findings showed that leverage, deposit-to-asset ratio, management efficiency, and member growth significantly impacted NPLs. It was finally, recommended that lax lending should be avoided to lower NPLs among selected SACCOS in Dodoma City.

Keywords: *Non-performing loans, SACCOS, Dodoma District Council*

1.0 Introduction

1.1.Introduction to the Problem

Savings and Credit Cooperative Societies (SACCOS) are essential in the microfinance sector, addressing financial needs in underserved communities (Anania & Gikuri, 2015). Their goals include creating employment, reducing poverty, supporting business growth, empowering marginalized groups, and promoting new ventures (Abebe & Kegne, 2023). SACCOS provide crucial access to financial services for those excluded from traditional banking.

In Tanzania, the cooperative movement began in 1925 with the Kilimanjaro Native Planters Association, and the first SACCOS, the Tanganyika Ismailia Savings and Credit Cooperative Society, was established in 1938 (Eyraud et al., 2021; Anania & Gikuri, 2015). However, the number of registered SACCOS has sharply declined from 6,138 in 2018 to 1,900 in 2022 (WOCCU, 2023). A major challenge for SACCOS, as

well as financial institutions worldwide, is the issue of Non-Performing Loans (NPLs). Factors contributing to rising NPLs has been linked to a multitude of factors, such as poor loan appraisal processes, weak credit risk management, ineffective recovery strategies, and adverse macroeconomic conditions (Samoei, Makokha, & Gregory, 2018; Ozili, 2019). This accumulation of NPLs jeopardizes the financial stability of SACCOS and their capacity to serve their members.

The International Monetary Fund (IMF) and World Bank stress the need for effective loan portfolio management and robust risk management to combat the detrimental effects of NPLs on financial stability and economic growth (IMF, 2017; World Bank, 2018).

In Tanzania, the Bank of Tanzania (BoT) reported an increase in the NPL ratio for Microfinance Institutions, from 6.3% in December 2018 to 8.3% by December 2019, due to weak appraisal and recovery practices (BoT, 2019). While the problem of NPLs is recognized, further investigation into the specific determinants affecting SACCOS is needed. Understanding these factors will help SACCOS devise targeted strategies to manage loan portfolios effectively, enhancing their financial stability and ability to contribute to economic development.

1.2 Statement of the Problem

The primary function of Savings and Credit Cooperatives (SACCOS), which are microfinance institutions, is to promote modest savings and provide loans to individuals who lack access to formal financial services, irrespective of their income levels (Kadaga, 2020). However, a significant issue facing SACCOS worldwide is the prevalence of non-performing loans (NPLs), which jeopardize financial stability and hinder their ability to provide affordable credit (Moti et al., 2012). The World Bank (2021) reported a global NPL average of 6.78%, with Africa at 11.55% and Tanzania experiencing 8.34% from 2011 to 2020 far exceeding the recommended threshold of 5% (BoT, 2020).

In the Dodoma District Council, SACCOS play a crucial role in enhancing financial inclusion, particularly for low-income and marginalized groups. Nevertheless, the rise in NPLs poses serious concerns regarding their sustainability and operational efficiency. Notably, the number of registered SACCOS in Dodoma City has plummeted from 186 in 2017 to just 59 by late 2022 (TCDC, 2022), primarily due to high NPL levels. This decline can be directly attributed to among other factors, is the high levels of non-performing loans (TCDC, 2022)

This study aims to identify the factors contributing to NPLs in SACCOS within Dodoma City, which could impair their ability to manage loan portfolios effectively. Addressing this issue is crucial to reducing loan defaults and financial losses, ultimately safeguarding the economic empowerment of SACCOS members. Although existing research has explored NPL determinants in the banking sector, limited studies have focused specifically on SACCOS. This research seeks to fill that gap by examining the unique factors that influence NPLs in Dodoma City.

1.3 Literature review

1.3.1 Theoretical Literature Review

1.3.1.1. Credit Risk theory

Credit risk theory, established by researchers like Altman (1968) and Merton (1974), offers a framework for assessing the likelihood of default in lending activities. This theory posits that various elements such as borrower traits, economic conditions, and lender-specific factors affect the risk of loan defaults and non-performing loans. Altman (1968) proposed that credit risk can be evaluated through financial ratios and quantitative measures, which can be integrated into a credit risk model to forecast default probabilities. Merton (1974) introduced structural models, which assess credit risk by examining a firm's asset value, debt commitments, and asset return volatility. In the context of SACCOS, credit risk theory can help identify the factors contributing to non-performing loans by analyzing aspects such as borrower creditworthiness, economic conditions, and the cooperative's lending practices and risk management strategies.

1.3.1.2. Agency theory

Agency theory, introduced by scholars like Jensen and Meckling (1976) and Eisenhardt (1989), explores the principal-agent relationship and the conflicts of interest that can arise between them. When the interests of the principal (e.g., shareholders or members) and the agent (e.g., managers) diverge, the agent may act opportunistically, prioritizing personal gain over the principal's interests. To address these agency problems, mechanisms such as incentive alignment, monitoring, and control systems can be implemented (Eisenhardt, 1989). In the context of SACCOS, agency theory helps analyze conflicts between members (principals) and management (agents), and it identifies strategies to align their interests, promoting effective governance that can impact lending practices and the occurrence of non-performing loans (NPLs).

1.3.2. Empirical Literature

The link between leverage and non-performing loans (NPLs) has been widely examined across various financial contexts. Research by Makri et al. (2014) in the Eurozone indicated a significant positive correlation between leverage and NPLs, suggesting that higher leverage ratios lead to increased loan defaults. Ghosh (2015) found similar results in the U.S. banking sector during the 2007-2009 financial crisis. However, the relationship is nuanced, influenced by economic conditions. Louzis et al. (2012) found that in Greece, the impact of leverage on NPLs varied with economic stability; during growth periods, leveraged banks managed debts more effectively, while downturns saw higher NPLs associated with high leverage.

In Africa, Ouedraogo and Sawadogo (2019) noted a similar positive relationship in West African banks, while Kodithuwakku (2015) confirmed this in Sri Lanka. Research on leverage's impact on NPLs in SACCOS is limited but includes Nawai and Shariff (2010), who found a significant positive effect in Malaysian SACCOS. In Tanzania, studies primarily focus on commercial banks, with Kingu et al. (2018) confirming that leverage impacts NPLs, leaving a gap in SACCOS-specific research.

Likewise, membership growth in financial institutions, including SACCOS, has been linked to NPLs. Fofack (2005) found that rapid growth in membership correlated with higher NPLs in sub-Saharan Africa, attributing this to challenges in credit risk management. Similarly, Louzis et al. (2012) reported that increased membership strain operational capacities in Greece, leading to poor loan appraisals and recovery.

Ouedraogo and Sawadogo (2019) confirmed this trend in West African banks, emphasizing the need for institutions to scale operations effectively. Niyonzima and Imanishimwe (2016) also noted a positive correlation between membership growth and NPLs in Rwandan microfinance. However, literature on this topic within SACCOS remains sparse. Nawai and Shariff (2010) highlighted significant challenges in managing loan portfolios amid membership growth in Malaysian SACCOS. In Tanzania, there is a notable lack of studies focusing on membership growth's impact on NPLs in SACCOS, as most research has concentrated on the banking sector.

1.4 Research Objectives

- i. To examine the effects of leverage on non-performing loans (NPL) among selected SACCOS in Dodoma City
- ii. To evaluate the influence of the growth of members on non-performing loans (NPL) among selected SACCOS in Dodoma City.
- iii. To establish the influence of deposit-to-asset ratios on non-performing loans (NPL) among selected SACCOS in Dodoma City
- iv. To investigate the effect of management efficiency on non-performing loans (NPL) among selected SACCOS in Dodoma City

2.0 Material and Methods

2.1. Research Philosophy

Research philosophy refers to a set of assumptions guiding the creation of knowledge (Saunders, 2019). This study adopts positivism, valuing the quantitative method. Positivism is justified by its relevance to studying the effects of leverage and membership growth on non-performing loans (NPLs) among SACCOS in Tanzania.

2.2. Research Approach

The study used a quantitative approach, collecting numerical data to analyze relationships between variables and test hypotheses (Creswell & Plano Clark, 2018). Quantitative methods are ideal for phenomena measured numerically, requiring analysis of variables to produce results (Pandey et al., 2023).

2.3. Research Design

A cross-sectional design was adopted to analyze the determinants of NPLs in SACCOS within Dodoma City. This descriptive design allowed for systematic data collection to describe the factors associated with the research problem (Neuman, 2014).

2.4. Study Population, Study Area, Unit of Analysis, and Unit of Inquiry

2.4.1. Study Population

The population included all registered SACCOS in Dodoma District Council, with 59 SACCOS registered by the third quarter of 2022 (TCDC, 2022).

2.4.2. Study Area

The research took place in Dodoma City, Tanzania's capital, focusing on selected SACCOS. Dodoma was chosen due to a significant decline in registered SACCOS from 186 in 2017 to 59 in 2022 (TCDC, 2022).

2.5. Sample Size and Sampling Procedures

2.5.1. Sample Size

The sample size, determined using the Yamane (1967) formula, resulted in a sample of 51 SACCOS.

$n = N / (1 + N(e)^2)$ where $N = 59$ and $e = 0.05$.

2.5.2. Sampling Procedures

Simple random sampling was used to select SACCOS, ensuring unbiased respondent selection from a homogenous population (Kumar, 2019).

2.6. Data Type and Source

The study used secondary data from financial reports and primary data collected through questionnaires. Secondary data offer cost-effective trend analysis.

2.7. Data Collection Methods

Data collection involves gathering relevant information to address the research problem (Saunders et al., 2016). This study relied primarily on documentary review and surveys.

2.7.1. Documentary Review

Secondary data, such as audited financial statements, were used as a source for the study.

2.7.2 Survey (Questionnaires)

Structured questionnaires were distributed to key informants to collect data on NPLs from the selected SACCOS.

2.8. Data Collection Tools

Checklists and structured questionnaires were used to gather relevant numerical data on leverage, membership growth, and financial indicators.

2.9. Data Analysis

Data were organized using descriptive statistics, including percentages and means. Correlation analysis and Multiple linear regression were applied to analyze leverage, membership growth, and NPLs.

2.10. Reliability and Validity of Data

Cronbach's alpha was used to ensure reliability, evaluating the consistency of questionnaire items.

2.11 Ethical Considerations

Ethical principles were upheld, with informed consent sought from participants through detailed explanations and written consent forms.

3.0. Results

3.1. Descriptive Statistics

Table 1: Descriptive Statistics

<i>Variable</i>	<i>Obs</i>	<i>Mean</i>	<i>Std. Dev.</i>	<i>Min</i>	<i>Max</i>
Leveragede~a	251	0.443	0.1223	0.16	0.67

N0 of members	251	2107.033	1419.696	67	5121
Deposit-to-asset ratio	251	0.4325	0.109	0.12	0.61
Management efficiency	251	3.6917	1.1402	1.1	6.7
NPL gross	251	0.22267	0.3241	0	1

Table 1 Table 2 Leverage has a mean of 0.16 minimum and 0.67 Maximum while the overall mean was 0.443 and a standard deviation of 0.1223. On the other hand, the deposit-to-asset ratio has a minimum of 0.12 and a maximum of 0.61 and the overall mean was 0.4325 with the smallest standard deviation of 0.109%. The standard deviation was very large (0.109%). This observation implies that the mean of deposit to asset ratio had a small standard deviation because SACCOS had insignificant differences in terms of deposit-to-asset ratio, results revealed that the deposit-to-asset ratio influences the NPL of SACCOS. A number of members has a minimum mean of 67 and a maximum of 5121 while the overall mean was 2107.033 with standard deviation of 1419.696. This large standard deviation and broad range suggest significant diversity in membership size across the SACCOS. Such variability may play a key role in understanding how the number of members influences non-performing loans (NPLs), as larger or smaller membership bases could impact loan demand. The Management efficiency has minimum of 0.11 and maximum of 6.7, the overall mean was 3.6917 with the smallest standard deviation of the 1.1402%. The standard deviation was very large (1.1402%). This observation implies that the mean of the management efficiency had a small standard deviation because SACCOS had insignificant differences in terms of the management efficiency. These results revealed that Management efficiency influences the NPL gross of SACCOS. The NPL has minimum of 0 and maximum of 1.0 on the other hand, the overall mean was 0.22267 with the smallest standard deviation of the 1.14%. The standard deviation was very large (1.14%). This observation implies that the mean of the NPL loans had a small standard deviation because SACCOS had insignificant differences in terms of the NPL loans. Regardless the NPL loans of the SACCOS, results revealed that the NPL loans has changes as other variables change.

3.2. Correlation Analysis

Table 2: Correlation Analysis

	Leverage	N0. Members	Deposit Ratio	Management Efficiency	NPL Gross
Leverage	1				
N0. of Members	0.1269	1			
Deposit ratio	-0.4689	0.3687	1		

Management Efficiency	0.117	0.0478	-0.4246	1	
NPLs gross	0.3814	0.2354	-0.4093	-0.6713	1

Table 2 Correlation among independent variables and dependent variable

This study used Pearson's Correlation Coefficient to measure the strength and direction of the linear relationship between independent and dependent variables. Pearson's correlation values range from -1 to +1, where +1 indicates a perfect positive relationship, -1 signifies a perfect negative relationship, and 0 suggests no linear association. A weak correlation is identified with values between 0.1 and 0.29, a moderate correlation between 0.3 and 0.49, and a strong correlation with values greater than 0.5. The direction of the relationship depends on the sign of the coefficient; a positive sign indicates that both variables move in the same direction, while a negative sign means they move in opposite directions. Pearson's correlation was used in this research to assess the level and direction of association between the variables, with findings analyzed accordingly.

3.3 Multiple Linear Regression

Table 3: Regression analysis

(n = 251)

Source	SS	df	MS			
Model	.592871554	4	.148217888	Number of obs = 139		
Residual	.516089567	134	.003851415	F(4, 134) = 38.48		
Total	1.10896112	138	.00803595	Prob > F = 0.0000		
				R-squared = 0.5346		
				Adj R-squared = 0.5207		
				Root MSE = .06206		

<i>nplgross</i>	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]	
<i>leveragedebt</i>	-.1535006	.0440998	-3.48	0.001	-.2407223	-.0662788
<i>noofmembers</i>	-2.79e-07	3.61e-06	-0.08	0.939	-7.42e-06	6.86e-06
<i>deposittoassetratio</i>	.3906837	.0429512	9.10	0.000	.3057336	.4756337
<i>managementefficiency</i>	-.0206708	.0061302	-3.37	0.001	-.0327952	-.0085463
<i>_cons</i>	.3726263	.0321974	11.57	0.000	.3089454	.4363071

Table 3 The Multiple linear Regression

The multiple regression analysis for the determinants of non-performing loans (NPLs) indicates that leverage, deposit to asset ratio, and management efficiency are significant predictors of NPLs, while the number of members is not. Leverage has a negative and significant effect on NPLs (coefficient = -0.1535, p = 0.001), meaning that higher leverage reduces NPLs. The deposit to asset ratio has a positive and significant impact (coefficient = 0.3907, p = 0.000), showing that an increase in this ratio leads to higher NPLs. Management efficiency also has a significant negative effect (coefficient = -0.0207, p = 0.001), suggesting that improved management

efficiency lowers NPLs. However, the number of members does not have a significant influence on NPLs (coefficient = $-2.79e-07$, $p = 0.939$). Overall, the model explains 53.46% of the variance in NPLs,

3.4 Fixed effect Regression

This type of model is used to control for unobserved heterogeneity when this heterogeneity is constant over time and correlated with the independent variables. It essentially controls for time-invariant characteristics of the individuals or entities in the panel data. Table R of the fixed effect regression shows that the **Adjusted R-Squared (within) = 0.8085** whereas the overall probability was **$P > F = 0.0000$** . A p-value of 0.0000 indicates that the model is highly significant. This means that there is strong evidence against the null hypothesis, which shows that debt to assets and deposit to assets ratio had p-value of 0.0000. Therefore, these two predictors significantly associated with the NPL among selected SACCOS. An adjusted R-squared of 0.8085 means that approximately 80.85% of the variation in the NPLs within the groups is explained by the model

Table 4: Fixed effect Regression

Fixed-effects (within) regression			Number of obs = 95			
Group variable: comapanyid			Number of groups = 19			
R-sq: within = 0.8085			Obs per group: min = 5			
between = 0.0003			avg = 5.0			
overall = 0.0898			max = 5			
corr(u_i, Xb) = -0.8866			F(4, 72) = 75.99			
			Prob > F = 0.0000			
np1	Coef.	Std. Err.	t	P> t	[95% Conf. Interval]

F test that all u_i=0: F(18, 72) = 7.13 Prob > F = 0.0000						

3.5 Hausman Test

Furthermore, fixed effect regression cannot be conclusive without the Hausman test because In panel data analysis, the choice between fixed effects and random effects models depends on whether the unobserved individual effects are correlated with the regressors. The fixed effects model assumes that these individual-specific effects are correlated with the regressors, while the random effects model assumes they are not (Greene, 2018).

Table5: Hausman Test

<i>leveragede~a</i>	<i>-.5089033</i>	<i>-.2088806</i>	<i>-.3000227</i>	<i>.1240534</i>
<i>n0ofmembers</i>	<i>-.0001002</i>	<i>1.83e-06</i>	<i>-.0001021</i>	<i>.0000498</i>
<i>deposittoa~o</i>	<i>.3073951</i>	<i>.4534713</i>	<i>-.1460761</i>	<i>.0618714</i>
<i>management~y</i>	<i>-.0176849</i>	<i>-.0213051</i>	<i>.0036202</i>	<i>.0099415</i>
<i>_cons</i>	<i>.7032943</i>	<i>.3692387</i>	<i>.3340555</i>	<i>.1453103</i>

b = consistent under Ho and Ha; obtained from xtreg
B = inconsistent under Ha, efficient under Ho; obtained from xtreg

Test: Ho: difference in coefficients not systematic

$$\begin{aligned} \text{chi2}(4) &= (b-B)'[(V_b-V_B)^{-1}](b-B) \\ &= -8.25 \quad \text{chi2}<0 \implies \text{model fitted on these} \end{aligned}$$

To draw a final conclusion about whether the Random Effects model is appropriate, one would typically look at the test statistic and p-value associated with the Hausman test. If the p-value is less than a chosen significance level (e.g., 0.05), the null hypothesis is rejected in favor of the Fixed Effects model. In Table T of Hausman test shows that the p-value is 0.000 which is less than a significance level (0.05) therefore, the Fixed Effects model is appropriate model to address the determinants of the NPL

4.0. Conclusion and Recommendations

4.1. Conclusion

The study aimed to assess the determinants of non-performing loans (NPLs) in selected SACCOS within Dodoma District Council, focusing on SACCOS in Dodoma City. This research was driven by the significant burden of NPLs on these institutions, despite limited attention to the issue. The study highlights the need for solutions, as lax lending practices result in financial losses.

The findings, based on multiple regression analysis, revealed that management efficiency, deposit-to-asset ratio, number of members, and leverage had a negative but significant impact on NPLs. The study recommends that SACCOS adopt improved operational practices to address these challenges.

4.2. Recommendations

The study recommends the Ministry of Finance should enhance policies on NPLs in microfinance institutions to unlock untapped economic potential. Similarly, the researcher recommends that SACCOS management should implement skills and competencies from this study, focusing on training credit officers and improving lending practices to reduce NPLs.

Suggestion for Further Study

Future research could explore additional factors influencing NPLs among SACCOs instead of confining on the management efficiency, number of members, asset to debt ratio and leverage alone. Likewise, the ignoring the primary data and relying on the secondary data provides the avenue for conduction other studies based on primary data. Moreover, there is a possibility of using alternative analytical methods to verify the findings of study.

Abstract

This study investigated the effect of brand reputation on customer loyalty in Tanzania's steel roofing industry, focusing on how product quality, customer service, and brand image influence customer loyalty. Using Relationship Marketing Theory as a framework, the research employed a cross-sectional design and gathered data from 285 customers of Temeke iron sheet roofing products through structured questionnaires. Data analysis, conducted using Descriptive statistics and Linear regression in IBM SPSS Statistics 27, revealed significant positive relationships between product quality, customer service, brand image, and customer loyalty. The findings indicate that higher perceived product quality (coefficient 0.252, $p = 0.001$), effective customer service (coefficient 0.173, $p = 0.012$), and a strong brand image (coefficient 0.617, $p < 0.001$) are all strongly associated with increased customer loyalty. This research offers valuable insights for developing strategies that enhance customer loyalty, contributing to the long-term success of the iron sheet roofing industry in Tanzania.

Keywords: *Customer Loyalty, product quality, Brand image, customer service, Iron roofing Industry*

1.0 Introduction

The interplay between brand reputation and customer loyalty has long been recognized as a fundamental aspect of marketing and business strategy across various industries worldwide (Le, 2023). In today's competitive marketplace, a brand's

reputation holds immense significance in shaping consumer perceptions, attitudes, and purchasing behaviour. Brand reputation encompasses the collective image, credibility, and trustworthiness that a brand enjoys among its target audience (Foroudi, 2019). A positive reputation can cultivate customer loyalty, leading to repeat purchases, positive word-of-mouth, and increased customer retention. On the other hand, a tarnished reputation can result in customer defection, reduced sales, and damage to a brand's overall standing. Understanding the complex and dynamic relationship between brand reputation and customer loyalty is essential for businesses aiming to thrive and succeed in the ever-evolving global market (Foroudi, 2019).

Building and retaining customer loyalty as a subject has evolved for several years as businesses changed and shifted focus from quality alone to become customer centric prior 1980s' (Zeithaml et al., 2001). Nevertheless, when market competition became stiff in the late 1990s, ensuring the needs of customers are satisfied became a far more important goal for many businesses (Gonring, 2008). Since then, in an effort to increase revenues, individuals and corporations have become increasingly customer focused (Mao, 2010). Customer loyalty has been a subject of study and scholars have grouped them into four main kinds.

The importance of building grand reputation by meeting customer expectation has also gained an increasing interest within the roofing industry. This has been evidenced by a fast growth of market for steel/iron sheet globally. The steel roofing global market report has shown that the global steel roofing market size has grown from USD 4.15 billion in 2022 to USD 4.26 billion in 2023 at a compound annual growth rate (CAGR) of 2.8 percent (BRC, 2023). While the Russia-Ukraine war disrupted the likelihood of global economic recovery from the COVID-19 pandemic with mounting economic sanctions, the steel roofing market size is however anticipated to grow to USD 4.56 billion in 2027 at a CAGR of 1.7 percent.

In Africa, and specifically in Tanzania, a large and increasing proportion of individuals use corrugated steel iron as a roofing material, surpassing traditional methods. Local manufacturers, including ALAF Limited, Reed's Metals Inc., ATAS International Inc., and DECRA Roofing Systems Inc, play a significant role in fabricating a considerable portion of the nation's steel roofs (BRC, 2023). The quality and reliability of iron sheet roofing materials play a crucial role in shaping customer satisfaction. Moreover, the broader customer experience, encompassing aspects such as customer service responsiveness and adherence to industry standards, also contributes significantly. Customer trust is intricately linked to brand reputation and customer satisfaction, with a trustworthy brand engendering confidence, reinforcing positive attitudes, and fostering loyalty among customers (Delgado and Munuera, 2005).

However, the market is facing challenges as some manufacturers produce low-quality iron sheets at lower prices to gain short-term popularity (Mutoro, 2021). This practice, driven by increased demand and competition, has led to a decline in the quality of roofing materials, compromising brand reputation and long-term customer loyalty. Customers are often tempted by lower prices, but these come with trade-offs in durability and overall performance (Roy et al., 2022; Zulanas, 2017).

While previous research has explored the link between brand reputation and customer loyalty (Ewaldo et al., 2021; Kurhayadi et al., 2022; Seo & Park, 2017), few studies have focused on the iron sheet industry. Most research in this sector has centered on technical aspects like product sustainability, load stress reliability, and cost-cutting measures (Roy et al., 2022; Kozak & Liel, 2015; Kashiwagi et al., 2016; Zulanas, 2017). The impact of brand reputation on customer loyalty in the roofing industry remains underexplored. Given the importance of empirical evidence on brand reputation in Tanzania's rapidly growing construction sector, this study fills the research gap by examining how brand reputation affects customer loyalty in the iron sheet industry. The study evaluated the influence of product quality, customer service, and brand image on customer loyalty.

2.0 Literature review

2.1 Theoretical literature review

The study on "The effect of Brand Reputation on Customer Loyalty in the Iron Sheet Roofing Industry in Tanzania" have been guided by the Relationship Marketing Theory. Relationship Marketing is a comprehensive theoretical framework that focuses on building and maintaining long-term relationships with customers (Ahmmed et al., 2019). According to Möller & Halinen (2000), this theory emphasizes the importance of creating strong, mutually beneficial relationships between a brand and its customers to foster loyalty and customer retention.

In the context of the iron sheet roofing industry, Relationship Marketing Theory can provide valuable insights into how brand reputation influences customer loyalty. The theory posits that customer loyalty is a result of positive and ongoing interactions between the brand and its customers. Positive interactions, such as delivering high-quality products, excellent customer service, and consistent communication, create a positive brand image and reputation (Gilaninia et al., 2011). Relationship Marketing Theory also emphasizes the significance of customer trust and satisfaction in driving loyalty. A brand with a strong reputation for product quality, reliability, and customer support is more likely to earn the trust and satisfaction of customers, leading to higher levels of loyalty and repeat purchases.

Furthermore, the theory highlights the importance of customer retention and long-term customer relationships. By fostering a loyal customer base, roofing companies can benefit from customer advocacy, positive word-of-mouth, and reduced customer churn (Nasir, 2017). By adopting Relationship Marketing Theory as a guiding framework, the study can explore the dynamics between brand reputation and customer loyalty in the iron sheet roofing industry in Tanzania. It can help researchers understand how positive brand perceptions and experiences influence customer loyalty and how roofing companies can strengthen customer relationships to achieve sustainable growth and success in the market.

2.2 Empirical review

Empirical insights from various studies underscore the intricate interplay between brand reputation, customer satisfaction, customer trust, and customer loyalty. Walsh and Wiedmann (2004) along with Walsh et al. (2009) substantiate that a favorable brand reputation substantially mitigates perceived risks and catalyzes intensified intentions for customer loyalty. Lai's study in 2019 unveils an indirect and nuanced nexus between brand reputation and customer loyalty, facilitated through the lens of customer commitment. The pivotal role of a robust post-experience in cultivating firm reputation and engendering customer commitment is a salient point reiterated by Lai (2019). Furthermore, Lai (2019) accentuates that a brand's constructive reputation is meticulously homed in the aftermath of positive encounters, thereby potentially fostering heightened customer commitment.

Chang (2013), and Su et al. (2015) collectively validate that customer satisfaction acts as a mediator between brand reputation and customer loyalty. Further affirmed by Chang (2013), a noteworthy and indirect association between brand reputation and customer loyalty is mediated by both customer satisfaction and trust. These findings collectively underscore the intricate web of interactions, suggesting that a positive brand reputation, cultivated through positive experiences, can lead to customer commitment and loyalty, facilitated by the mediating roles of customer satisfaction and trust.

Ali, (2022) carried out an investigation aiming to elucidate the function of corporate brand reputation in fostering robust customer relationships. The study was conducted in Egypt and targeted users of household appliances. A meticulously designed structured questionnaire was employed to gather data from 357 participants. Statistical analyses were performed utilizing the Social Science Statistical Package (SPSS) version 16 and the Analysis of Moment Structure (AMOS) package version 18. The outcomes revealed that the brand reputation of a firm exerted a noteworthy influence on customer satisfaction. This customer satisfaction, in turn, emerged as a potent

determinant impacting customer trust. Moreover, both customer satisfaction and trust exhibited notable roles in shaping customer loyalty.

Seo & Park (2017) conducted an examination into the influence of corporate reputation within the airline sector on brand loyalty. An empirical analysis was carried out via a questionnaire survey of Korean airline passengers. The responses gathered from a sample size of 250 participants were analyzed using structural equation modeling. The findings underscored the substantial impact of airline corporate reputation on pivotal factors such as brand image, pricing, perceived service quality, and brand preference. Furthermore, the study revealed that elements like price, perceived service quality, and brand preference exhibited a statistically significant influence on both behavioral and attitudinal loyalty among customers.

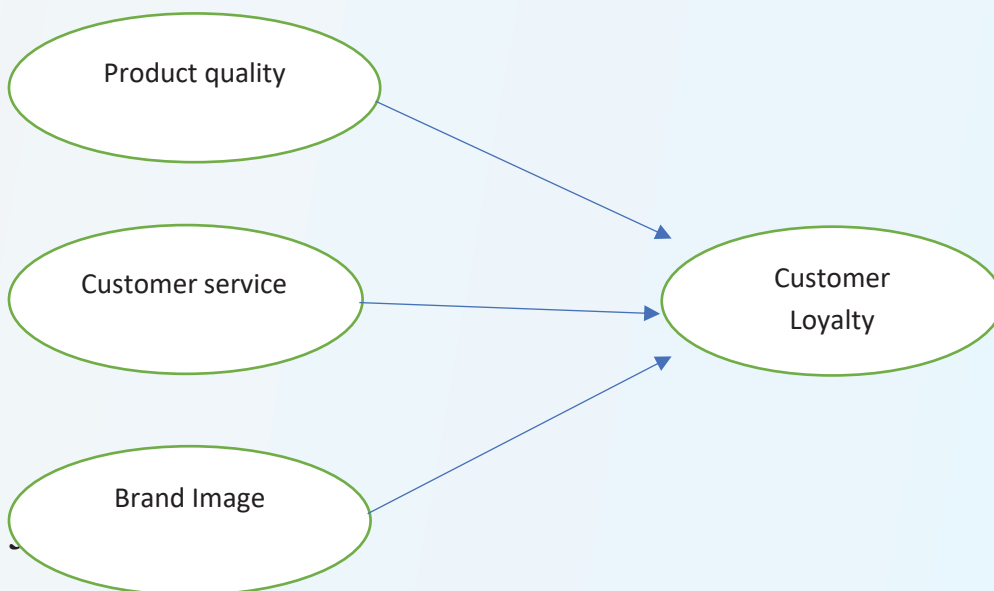

Alam & Arshad (2012) studied brand credibility, customer loyalty and the impact of religious orientation in the Pakistani setting. The study involved 263 participants, and researchers employed exploratory and confirmatory factor analyses to scrutinize data alignment and the potential presence of shared method bias. Moreover, correlation and hierarchical regression analyses were utilized to assess the presumed connections among the variables. The findings unveiled noteworthy and positive connections, such as those between trustworthiness and brand credibility, perceived quality and brand credibility, brand credibility and customer loyalty, as well as religious orientation and customer loyalty. Additionally, the study revealed that brand credibility acted as an intermediary element between trustworthiness, perceived quality, and customer loyalty. Furthermore, the research highlighted the role of religious orientation in moderating the relationship between trustworthiness and brand credibility.

Umair(Abbas et al., 2021) examined the impact of brand image on customer loyalty with the mediating role of customer satisfaction and brand awareness. A questionnaire is filled by the 300 respondents that were selected through non-probability to measure customer satisfaction and their loyalty to their favorite Brand. This was based on 22 statements and 5 points, Likert Scaled survey questionnaire. The results were made by using different methods. The result is based on the statistics test which displays that the Image of the brand and customer Loyalty is very significant with Customer Satisfaction and Brand Awareness, but Brand Image is insignificant with Brand Awareness.

Overall, empirical findings consistently emphasize that a favorable brand reputation plays a crucial role in shaping customer perceptions, attitudes, and behaviors, leading to enhanced customer loyalty. Brands that invest in building and maintaining a strong reputation are more likely to reap the benefits of loyal customer relationships, positive word-of-mouth, and sustainable business growth.

2.3 Conceptual framework

A conceptual framework is developed to show the relationship between independent and dependent variables. The independent variables namely product quality, customer service and brand image were derived from the Relationship marketing theory and empirical literature review. The conceptual framework of Figure 1 assumes that there is a relationship between the above-mentioned independent variable and dependent variable (Customer Loyalty).

3.1 Sampling, Questionnaire Design, and Data Collection

This study was conducted within the Temeke region in Dar es Salaam as the region is a growing presence of many construction companies, increasing number of construction activities, and iron sheet companies. Dar es Salaam exhibits a significant concentration of construction activities, making them central hubs for the iron sheet roofing industry. Simple random sampling was involved in selecting the sample from the given population. A sample of 285 was involved in the study as indicated by the Cochran formula where n represents the sample size, while Z denotes the critical value associated with a specific confidence level, such as 1.96 for a 95% confidence level. p signifies the proportion within the population of interest, which is 50% in this instance, and q is the complementary value to p , calculated as $1-p$. Lastly, e represents the acceptable margin of error, typically set at 0.05.

$$n = \frac{z^2}{e^2} * pq$$

$$n = \frac{1.96^2}{0.05^2} * 0.5 * 0.5 = 384 \text{ respondents}$$

Using the Cochran formula, a sample of 384 was obtained however only a total of 285 questionnaires were filled out correctly and handed back to the researcher for data recording and analysis. The total number of returned questionnaires indicates an overall success response rate of 75.0% enough to ensure that the research results are reliable and valid. According to Nulty (2008), a study involving a sample size of 500 necessitates 289 participants, which constitutes 58% of the total. The unreturned response of 25.0% was due to time constraints where some customers were in a hurry preventing them from completing the survey at that particular moment. Also, some customers were unwilling to fill out the given questionnaires while some customers did not complete filling out the given questionnaires.

The data collection process primarily involved gathering firsthand data using questionnaires. The questionnaires were designed firstly to capture the demographic features of the respondents such as age, gender and occupation. The second part of the questionnaire was capturing the variable information on the product quality, customer services and brand image focusing on capturing customers' expectation regarding iron roofing products in Temeke region. Questions were formulated as statements and rated on a five-point Likert-type scale, ranging from 1 for "strongly disagree" to 5 for "strongly agree".

3.2 Data Analysis

The study used both descriptive and inferential statistics. Descriptive statistics were used to describe the demographic information of respondents.

Objective i: A multiple linear regression equation to model the effect of product quality (material durability, weather resistance, thickness and gauge, coating quality, and compliance with manufacturing standards) on customer loyalty is expressed as follows:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \varepsilon$$

Where: Y represents customer loyalty, X_1 represents material durability, X_2 represents weather resistance, X_3 represents thickness and gauge, X_4 represents coating quality, X_5 represents compliance with manufacturing standards, β_0 is the intercept, $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5$ are the coefficients for each respective independent variable, and ε represents the error term.

Objective ii: A multiple linear regression equation to model the effect of customer service (addressing customer inquiries, accuracy of order processing, timely delivery, complaint resolution, installation support, and after-sales support) on customer loyalty is expressed as follows:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6 + \varepsilon$$

Where: Y represents customer loyalty, X_1 represents addressing customer inquiries, X_2 represents accuracy of order processing, X_3 represents timely delivery, X_4 represents complaint resolution, X_5 represents installation support, X_6 represents after-sales support, β_0 is the intercept, $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5, \beta_6$ are the coefficients for each respective independent variable, and ε represents the error term.

Objective iii: A multiple linear regression equation to model the effect of Brand image (Brand recognition, Brand visibility, Brand reputation, Brand associations, Complaint resolution, and Market positioning) on customer loyalty is expressed as:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6 + \varepsilon$$

Where: Y represents customer loyalty, X_1 represents Brand recognition, X_2 represents Brand visibility, X_3 represents Brand reputation, X_4 represents Brand associations, X_5 represents Complaint resolution, X_6 represents Market positioning, β_0 is the intercept, $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5, \beta_6$ are the coefficients for each respective independent variable, and ε represents the error term.

Overall multiple linear regression equation to model showing the effect of Product quality, Customer Service and Brand image on customer loyalty is expressed as:

$$Y = \beta_0 + \beta_1 \cdot X_1 + \beta_2 \cdot X_2 + \beta_3 \cdot X_3 + \varepsilon$$

Where: Y is the predicted customer loyalty. β_0 is the intercept (constant term). β_1, β_2 , and β_3 are the coefficients for Product Quality, Customer Service, and Brand Image, respectively, representing the change in Y for a one-unit change in each of the respective independent variables. X_1, X_2 , and X_3 are the independent variables (Product Quality, Customer Service, and Brand Image). ε is the error term, representing unobserved factors affecting customer loyalty that are not included in the model. Moreover, the Statistical Package for Social Science (SPSS) Version 27 software were used to analyse the quantitative data.

The reliability of data was computed through Cronbach's Alpha Value which was measured through perceptions and expectations of all three dimensions. The results showed that all of the dimensions had an Alpha value above the acceptable level of

0.7. Thus, the results in Table 1 confirm that the measurement instruments for the study were reliable.

Table 1: The Cronbach's Alpha Values

Construct	Number of items	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items
Product Quality	5	0.851	0.851
Customer Service	6	0.877	0.877
Brand Image	6	0.878	0.878

4.0 Findings and Discussion

4.1 Descriptive Results

A descriptive analysis test was run to examine the respondents' gender, age and occupation as shown in Table 2. Out of 285 respondents, 52.3% of the respondents were males and 47.7% were females. Our respondents were mostly between the ages of 26 and 45 (71.2%), followed by those between the ages of 46 years and above (23.2%). According to their occupation, homeowners were 54.4% of respondents followed by others with 28.1% of respondents.

Table 2: Descriptive Results

Attributes	Distribution	Frequency	%
Gender	Male	149	52.3
	Female	136	47.7
	Between 18-25	16	5.6
	Between 26-45	203	71.2
	46 and above	66	23.2
Occupation	Construction professional	50	17.5
	Homeowner	155	54.4
	Others	80	28.1

4.2 Influence of product quality on customer loyalty within the iron roofing industry in Dar es Salaam (Temeke region).

4.2.1 Consumers perception towards Product quality of the iron roofing products.

Table 3 shows that most customers are satisfied with the durability of the iron sheets, with 51.9% agreeing and 20.0% strongly agreeing, totaling 71.9% who have a positive view. Only 7.4% disagree or strongly disagree, indicating a generally favorable perception.

Regarding weather resistance, 43.5% of respondents agree and 10.5% strongly agree, resulting in a combined 54% positive response. However, 32.6% are neutral, and 13.4% disagree or strongly disagree, suggesting mixed opinions. For thickness and gauge, 48.4% agree and 17.2% strongly agree, giving a 65.6% satisfaction rate. Yet, 23.5% are neutral and 10.9% dissatisfied, indicating some room for improvement.

On coating quality, 38.9% agree and 14.0% strongly agree, totaling 52.9% satisfaction. Despite this, 30.5% are neutral and 16.5% dissatisfied, pointing to potential areas for enhancement.

Finally, 36.8% agree and 15.1% strongly agree that the iron sheets comply with manufacturing standards, totaling 51.9%. However, 30.2% are neutral and 17.9% disagree or strongly disagree, reflecting mixed perceptions about compliance.

Table 3: Consumer perception on Product Quality of iron roofing products

	(Brackets) represents Percentage, Without (Brackets) represents Frequency) N=285				
Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly agree
The material durability of the iron sheets I have used is satisfactory	8(2.8)	13(4.6)	59(20.7)	148(47.8)	65(51.9)
The iron sheets I have used are resistant to weather conditions	9(3.2)	29(10.2)	93(32.6)	124(43.5)	30(10.5)
The thickness and gauge of the iron sheets are adequate	13(4.6)	18(6.3)	67(23.5)	138(48.4)	49(17.2)
The coating quality of the iron sheets is satisfactory	13(4.6)	34(11.9)	87(30.5)	111(38.9)	40(14.0)

The iron sheets comply with manufacturing standards.	17(6.0)	34(11.9)	86(30.2)	105(36.8)	43(15.1)
--	---------	----------	----------	-----------	----------

4.2.2 Coefficient Regression Results on Significant Relationship that exists between elements of Product Quality with customer Loyalty

The regression analysis highlights key factors influencing customer loyalty in Tanzania's iron sheet roofing industry. All aspects—material durability, weather resistance, thickness and gauge, coating quality, and compliance with manufacturing standards—show significant positive impacts on customer loyalty ($p < 0.001$). Compliance with manufacturing standards is the strongest predictor, followed by coating quality. Material durability, weather resistance, and thickness/gauge also significantly affect customer loyalty. To boost customer satisfaction and strengthen brand reputation, manufacturers should focus on enhancing these areas.

Table 4: Coefficient Regression Results

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta				Lower Bound	Upper Bound
1(Constant)	.015	.005			2.976	.000	.025	.005
Material durability	.204	.002	.235		3.220	.000	.201	.207
Weather resistance	.202	.002	.239		2.031	.000	.199	.205
Thickness and gauge	.197	.002	.248		4.453	.000	.194	.200
Coating quality	.201	.001	.263		4.743	.000	.198	.204
Compliance with manufacturing standards	.200	.001	.274		4.856	.000	.197	.203

a. Dependent Variable: Customer Loyalty

4.3 Influence of product quality on customer loyalty within the iron roofing industry in Dar es Salaam (Temeke region).

4.3.1 Consumers perception towards customer services of the iron roofing companies

Responsiveness to Customer Inquiries: Customers rate the company's responsiveness moderately (Mean = 3.35). The low standard deviation indicates consistent perceptions, though the slight negative skewness (-0.359) suggests a tendency towards viewing the company as less responsive. This highlights a need for improved communication and responsiveness.

Accuracy of Order Processing: The accuracy of order processing is perceived positively (Mean = 3.56), with consistent ratings and low variability. The negative skewness (-0.626) indicates that while generally satisfactory, there is room for improvement in accuracy.

Timeliness of Deliveries: Customers rate delivery timeliness as moderately high (Mean = 3.46). Consistent perceptions are noted, but the negative skewness (-0.529) suggests that more customers view deliveries as less timely. Enhancing delivery efficiency could boost satisfaction.

Complaint Resolution Process: Satisfaction with complaint resolution is moderate (Mean = 3.48), with consistent but slightly negative skewed perceptions (-0.392). Improvements in this area could enhance customer satisfaction and loyalty.

Support During Installation: Support during installation is rated satisfactorily (Mean = 3.43), with minimal variability. The slight negative skewness (-0.282) indicates a need for improvement to elevate support levels.

After-Sales Support: After-sales support is highly rated (Mean = 3.73), with consistent perceptions and a negative skewness (-0.783) suggesting that while generally excellent, there is potential to further exceed customer expectations.

Overall: The company performs well in several customer service areas but has opportunities for improvement, particularly in responsiveness, order accuracy, delivery timeliness, and complaint resolution. Addressing these issues could enhance customer satisfaction and loyalty in Tanzania's iron roofing industry.

Table 5: Descriptive analysis on customer services of the iron roofing companies

Construct	Mean	Std.Deviation	Skewness	Kurtosis
-----------	------	---------------	----------	----------

Addressing customer inquiries	3.35	1.042	-.359	.441
Accuracy of order processing	3.56	1.035	-.626	.043
Timely delivery	3.46	1.033	-.529	.095
Complaint resolution	3.48	0.977	-.392	.082
Installation support	3.43	0.965	-.282	.155
After sales support	3.73	1.025	-.783	.341

4.3.2 Coefficient Regression Results on Significant Relationship that exists between elements of Customer Service with customer Loyalty

The regression analysis provides insights into factors affecting customer loyalty in Tanzania's iron sheet roofing industry. The constant term, representing baseline customer loyalty, is 1.670 ($p < 0.001$). Responsiveness to customer inquiries has a coefficient of -0.010 ($p = 0.827$), which is not statistically significant, indicating it does not notably impact loyalty. Accuracy of order processing has a significant positive coefficient of 0.180 ($p < 0.001$), showing that higher accuracy boosts loyalty. Timeliness of deliveries, with a coefficient of -0.107 ($p = 0.036$), negatively impacts loyalty when deliveries are delayed. Satisfaction with the complaint resolution process has a coefficient of 0.117 ($p = 0.063$), suggesting a potential positive effect, though not statistically significant. Support during installation, with a coefficient of 0.188 ($p < 0.001$), significantly enhances loyalty, and after-sales support, with the highest coefficient of 0.243 ($p < 0.001$), strongly correlates with increased customer loyalty. Thus, improving order processing accuracy, delivery timeliness, installation support, and after-sales support can effectively enhance customer loyalty.

Table 6: Coefficient Regression Results

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B
-------	-----------------------------	---------------------------	---	------	---------------------------------

	B	Std. Error	Beta			Lower Bound	Upper Bound
1(Constant)	1.670	.165		10.146	.000	1.346	1.994
Addressing customer inquiries	-.010	.047	-.014	-.219	.827	-.102	.081
Accuracy of order processing	.180	.047	.240	3.828	.000	.088	.273
Timely delivery	-.107	.051	-.142	-2.106	.036	-.208	-.007
Complaint resolution	.117	.062	.146	1.867	.063	-.006	.239
Installation support	.188	.053	.232	3.533	.000	.083	.292
After sales support	.243	.043	.320	5.603	.000	.157	.328

a. Dependent Variable: Customer Loyalty

4.4 The influence of brand image on customer loyalty within the iron roofing industry

4.4.1 Consumers perception towards brand image of the iron roofing products.

The findings in Table 6 reveal robust indicators of customer loyalty linked to brand recognition, visibility, and reputation within the iron sheet roofing industry. A significant 68.1% of customers recognize the brand, suggesting strong brand awareness. Market visibility is also high, with 74.1% of respondents perceiving the brand as highly visible, which likely boosts brand recall. Positive brand associations are prevalent, with 76.5% of customers holding favorable views, enhancing emotional connections and loyalty. The brand's reputation is viewed positively by 71.9% of customers, reinforcing trust and satisfaction. Customer satisfaction with the complaint resolution process stands at 71.2%, indicating effective issue handling. Lastly, the brand's strong market positioning, noted by 72.7% of respondents, reflects its leadership status and reinforces its value proposition. Collectively, these factors underscore the brand's solid standing and its impact on customer loyalty.

Table 6: Consumer perception on Brand Image of iron roofing products

	(Brackets) represents Percentage, Without (Brackets) represents Frequency) N=285				
Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly agree
I recognize the brand of the iron sheets I have used	9(3.2)	24(8.4)	58(20.4)	130(45.6)	64(22.5)
The brand of the iron sheets is highly visible in the market	11(3.9)	16(5.6)	47(16.5)	133(46.7)	78(27.4)
The reputation of the brand is positive.	8(2.8)	16(5.6)	56(19.6)	134(47.0)	71(24.9)
The associations I make with the brand are positive	9(3.2)	14(4.9)	44(15.4)	141(49.5)	77(27.0)
I am satisfied with the company's complaint resolution process.	7(2.5)	19(6.7)	59(19.6)	128(44.9)	75(28.3)
The market positioning of the brand is strong	5(1.8)	17(6.0)	56(19.6)	131(46.0)	76(26.7)

4.4.2 Coefficient Regression Results on Significant Relationship that exists between elements of brand image with customer Loyalty

The regression analysis in Table 7 reveals that brand recognition, positive brand reputation, effective complaint resolution, and strong market positioning are crucial determinants of customer loyalty within the iron sheet roofing industry in Tanzania. Specifically, brand recognition (coefficient of 0.181, $p < 0.001$) and a positive brand reputation (coefficient of 0.111, $p = 0.027$) significantly enhance customer loyalty, indicating that familiarity with and trust in the brand are essential. Effective complaint resolution also plays a vital role (coefficient of 0.177, $p < 0.001$), as addressing customer issues promptly fosters loyalty. Notably, strong market positioning has the most substantial impact (coefficient of 0.365, $p < 0.001$), highlighting that being perceived as a market leader is a key driver of loyalty. In

contrast, brand visibility and positive brand associations do not have a significant direct effect on loyalty, suggesting that while important for brand health, they are less critical in this context. Companies should focus on enhancing brand recognition, reputation, and market positioning, along with improving complaint resolution processes to effectively build and sustain customer loyalty.

Table 7: Coefficient Regression Results

Model	Unstandardized Coefficients		Standardized Coefficients Beta	t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error				Lower Bound	Upper Bound
1(Constant)	.789	.155		5.086	.000	.484	1.094
Brand recognition	.181	.044	.232	4.141	.874	.095	.267
Brand visibility	.007	.046	.009	.159	.027	-.084	.098
Brand reputation	.111	.050	.136	2.229	.456	.013	.210
Brand associations	-.044	.059	-.054	-.746	.000	-.160	.072
Complaint resolution	.177	.048	.220	3.703	.000	.083	.271
Market positioning	.365	.040	.432	9.196	.000	.287	.443

a. Dependent Variable: Customer Loyalty

4.5 Coefficient Regression Results

The aim of this study was to assess the effect of brand reputation on customer loyalty in iron sheet roofing industry in Tanzania. The study assessed the relationship between each of the independent variable with customer loyalty and the results are findings are presented below.

Table 8: Coefficient Regression Results

Model	Unstandardized Coefficients	Standardized Coefficients		t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta			Lower Bound	Upper Bound
1 (Constant)	.794	.176		4.515	.000	0.448	.141
Product quality	.252	.076	.229	3.334	.001	.104	.402
Customer Service	.173	.069	.177	2.515	.012	.038	.308
Brand image	.617	.054	.603	11.365	.000	0.510	0.724

a. Dependent Variable: Customer Loyalty

Results in table 8 reveals that; The coefficient for product quality is 0.252, with a standard error of 0.076, and it is statistically significant ($p = 0.001$). This positive coefficient indicates that higher perceived product quality is associated with increased customer loyalty. Customers are more likely to remain loyal to the brand when they perceive the product quality to be higher.

Regarding Customer Service: The coefficient for customer service is 0.173, with a standard error of 0.069, and it is statistically significant ($p = 0.012$). This positive coefficient suggests that better customer service is associated with increased customer loyalty. Effective customer service practices, such as responsiveness and complaint resolution, contribute to stronger customer loyalty.

Regarding Brand Image: The coefficient for brand image is 0.617, with a standard error of 0.054, and it is statistically significant ($p < 0.001$). This indicates that a positive brand image has a substantial impact on customer loyalty. A strong brand image, characterized by factors such as brand recognition, reputation, and associations, significantly enhances customer loyalty.

Overall, the regression analysis highlights the significant predictors of customer loyalty within the iron roofing industry in Tanzania. Perceived product quality, customer service, and brand image all have significant positive effects on customer loyalty. Specifically, higher product quality, better customer service, and a positive brand image contribute to increased customer loyalty. These findings underscore the

importance of maintaining product quality standards, providing excellent customer service, and cultivating a strong brand image to foster and sustain customer loyalty in the competitive market. Companies should prioritize investments and strategies aimed at enhancing these key factors to strengthen customer loyalty and maintain a competitive edge in the industry. Empirical insights all from various studies also supports these findings, Studies show the interplay between brand Product Quality, customer service and Brand Image and customer loyalty. Walsh and Wiedmann (2004) along with Walsh et al. (2009) substantiate that a favorable product quality, brand reputation and customer service substantially mitigates perceived risks and catalyzes intensified intentions for customer loyalty

5.0 Conclusion and Recommendation

5.1 Conclusion

The primary purpose of this study was to assess the influence of brand reputation on customer loyalty within the steel roofing industry in Tanzania, particularly focusing on how product quality, customer service, and brand image contribute to customer loyalty in the Dar es Salaam region, under the framework of Relationship Marketing Theory. The study's findings highlight significant relationships between these factors and customer loyalty. Regression analysis revealed that higher perceived product quality (coefficient of 0.252, $p = 0.001$) is strongly linked to increased customer loyalty, indicating that customers tend to remain loyal to brands offering superior quality products. Effective customer service (coefficient of 0.173, $p = 0.012$), particularly in responsiveness and complaint resolution, also positively impacts loyalty. Most notably, a positive brand image (coefficient of 0.617, $p < 0.001$) emerged as the most substantial driver of customer loyalty, underscoring the importance of brand recognition, reputation, and positive associations. The study confirms that businesses in the iron sheet roofing industry in Tanzania should prioritize maintaining high product quality, delivering exceptional customer service, and building a strong brand image to foster customer loyalty. These findings contribute to the existing literature by emphasizing the critical role of brand image in this industry and context. However, the study's focus on Dar es Salaam and the iron sheet roofing industry may limit the generalizability of the findings, suggesting the need for future research in different regions and industries to validate and expand upon these insights.

5.2 Recommendation

To enhance customer loyalty in Tanzania's iron roofing industry, the study offers recommendations for various stakeholders. Tanzanian policymakers should establish and enforce quality standards for iron roofing products, strengthen consumer protection laws, support local manufacturers, and launch public awareness campaigns.

Manufacturers must focus on enhancing product quality, improving customer service, strengthening brand presence, and creating effective feedback mechanisms. The public should prioritize purchasing quality products, report issues, stay informed about reputable brands, and support local manufacturers who adhere to quality standards. These collective efforts will significantly improve the quality and standards of iron roofing products in Tanzania.

5.3 Areas for Future Research

Areas for further studies could include exploring the impact of digital marketing strategies on customer loyalty in the iron roofing industry, particularly through social media and e-commerce platforms in Tanzania. Additionally, future research could investigate the role of corporate social responsibility (CSR) initiatives in enhancing brand reputation and customer loyalty within the industry. Comparative studies between the iron roofing industry and other construction material sectors could provide insights into industry-specific factors influencing customer loyalty. Lastly, examining the influence of economic and environmental factors, such as inflation or climate change, on customer preferences and loyalty in the roofing industry could offer valuable perspectives for manufacturers and policymakers.

Abstract

Globally, the police force enforces laws, protects civilians and property, responds to emergencies, and apprehends criminals. This requires police officers to have practical training to equip them with the necessary skills to perform their duties. This paper investigates the effect of on-the-job training programs, precisely the drill method and induction method, on the job performance of law enforcement officers in the Field Force Unit (FFU) of the Dodoma Regional Police in Tanzania. A mixed-methods approach is employed for a sample of 208 field force officers. The study employed a combination of probability and non-probability sampling techniques to ensure a comprehensive analysis. Multiple linear regression model analysis was used to determine the relationship between job performance and drill induction variables. The model's R-squared value of 0.521 indicates that over half of the variability in job performance can be attributed to the drill and induction methods. It revealed that the drill and induction methods positively affect job performance, with p-values of 0.032 and 0.042, respectively. The study concludes that the drill method, emphasizing practical, hands-on experience, notably enhances officers' problem-solving skills, adaptability, and overall job performance. It recommends that the drill and induction methods be continuously refined to meet the evolving needs of law enforcement personnel.

Keywords: *On-the-job training; Drill method; Induction Method; Job performance; Law enforcement officers.*

1.0 Introduction

Globally, the police force is responsible for enforcing laws, protecting civilian life and property, responding to emergency calls, and apprehending criminals. Law enforcement officers often face complex and high-risk situations requiring a high level of professional behavior (Kleygrewe et al., 2022). Effective on-the-job training is

crucial for equipping these officers with the necessary knowledge and skills. Police academies and law enforcement agencies play a key role in providing this training, ensuring that officers are prepared to meet the demands of their duties (Den & Brooks, 2022). Historically, policing focused on physical skills such as self-defence, arresting, shooting, and driving, reflecting an era when law enforcement primarily involved responding to immediate threats and maintaining order through force (Kleygrewe et al., 2022). However, modern policing has evolved to include community engagement, conflict resolution, and problem-solving (Yimam, 2022). This transformation requires a broader skill set, including effective communication, critical thinking, and ethical decision-making.

Worldwide, police departments prioritise on-the-job training to ensure officers can meet modern challenges. This training improves officers' self-confidence, skills, and public trust (Maina & Waithaka, 2018). In the police force, two prevalent on-the-job training methods are utilised: the drill and induction methods (Bello & Mela, 2022). The drill method provides employees with job-specific knowledge and skills through repetition, observation, and hands-on practice (Maina & Waithaka, 2018). The induction method involves familiarising new officers with organisational culture, policies, procedures, and job-specific tasks through structured orientation programs, mentoring, job shadowing, and workshops. This method helps recruits integrate smoothly into their roles and understand the expectations and standards of the police force (Vermeer et al., 2020).

In Sub-Saharan Africa, the police force has faced criticism for underperformance, corruption, and excessive use of force (Kunkel, 2019). In Tanzania, crime rates increased in the mid-1990s and early 2000s, decreasing public confidence in the police (Mount, 2014). A reform initiative from 2006 to 2009 aimed to enhance public perception, update policing mandates, and modernise facilities and equipment. Despite these efforts, challenges like inadequate monitoring and funding hindered the reform's success (Mount, 2014).

Generally, the Tanzania Police Force (TPF) continues to invest in on-the-job training, both locally and internationally, to improve the performance of Police Officers. In 2022-2023, TPF provided on-the-job training to 10,500 officers, focusing on skills development and promotional training (TPF, 2023). Moreover, the Tanzanian Government, through the Tanzania Police Force (TPF) under the Ministry of Home Affairs, allocates annual budgets for various training programs for in-service police officers, including on-the-job training (TPF, 2023).

Despite these efforts, there is a notable gap in understanding the actual effect of on-the-job training initiatives based on the drill and induction methods on officers' performance in real-world challenges. Many trainers within the police force lack

advanced instructional techniques, practical expertise, and proficiency in using technology effectively (Mazuki et al., 2021). Additionally, there are persistent concerns about police underperformance and the community's negative perceptions of trained officers (Modise, 2017; Blumberg et al., 2019; Hu, 2016). Thus, this study aims to address this gap by examining the actual effect of on-the-job training programs on the performance of law enforcement in Tanzania based on the aspect of drill and Induction methods. By focusing specifically on on-the-job training, the research seeks to provide insights into how these training interventions can enhance the effectiveness and efficiency of police operations in the Dodoma Region.

1.2 Study Objectives

The general aim of this study was to examine the effect of on-the-job training on the job performance of law enforcement officers in Dodoma Regional Police. Specifically, it examined the effect of the drill method on the job performance of law enforcement officers in the Dodoma Field Force Unit and evaluated the influence of the induction method on the job performance of law enforcement officers in the Dodoma Field Force Unit.

1.3 The Study Rationale

This study provides a guide to policy decisions and refine training strategies to improve the effectiveness and efficiency of police officers in performing their duties. The study offers actionable insights by assessing the drill method, which involves repetition, observation, and hands-on practice, and the induction method, which includes structured orientation programs, job instruction, and job rotation. These insights are intended to enhance the integration and performance of officers, particularly within the Field Force Unit (FFU) of the Dodoma Regional Police. Furthermore, it can contribute to the broader discourse on training methodologies and their effectiveness, providing a foundation for further research and theoretical development in this field.

2.0 Literature Review

Theoretical Literature Review

The theory adopted for this study is Human Capital Theory, introduced by Gary Becker in the 1960s. This theory views training as an investment that enhances productivity and organizational performance (Luo, 2000). According to Armstrong and Taylor (2020), investing in employees' skills and knowledge yields significant returns, making them valuable assets. In on-the-job training (OJT) for law enforcement officers, Human Capital Theory suggests that training programs enhance job performance by developing officers' skills, knowledge, and abilities (Kleygrewe et al., 2022). This study explicitly examines two OJT methods: the drill and induction methods.

The drill method, which involves repetition, observation, and hands-on practice, aligns with Human Capital Theory by focusing on practical, job-specific skills development through continuous, experiential learning. Conversely, the induction method includes structured orientation programs, job instruction, and job rotation, which support Human Capital Theory by facilitating comprehensive integration into the job role, thus enhancing immediate performance and long-term career growth.

By applying Human Capital Theory, this study evaluates how the drill and induction methods impact officers' job performance within the Dodoma Field Force Unit (FFU). The theory supports the notion that strategic investments in these training methods can lead to significant improvements in individual performance and overall unit effectiveness. This study aims to demonstrate how these OJT methods, as forms of human capital development, enhance immediate job performance and contribute to long-term career growth and organizational success.

Empirical Literature Review

Empirical research has focused on the role of on-the-job training (OJT) in enhancing job performance. This section reviews the literature examining how OJT influences job performance across various sectors. Kleygrewe et al. (2022) describe OJT as a structured or informal training method conducted in the workplace, which allows employees to gain hands-on experience relevant to their job roles. Armstrong and Taylor (2020) further detail common OJT methods such as drills, induction processes, case studies, and mentoring, highlighting their importance in practical training.

The drill method involves repetition, observation, and hands-on practice and is a critical component of OJT. Empirical studies have consistently shown that the drill method positively impacts employee performance. Nguyen et al. (2021) found that the drill method improves working conditions in Vietnam, although its effect on wages was not statistically significant. Na (2021) revealed that OJT methods, including drills and educational levels, positively influence innovation in Eastern Europe and Central Asia, suggesting that practical training fosters performance improvement and innovative capacity. Yimam (2022) investigated a technology-focused academic institution and concluded that well-designed drill programs significantly enhance employee performance. Somasundaram (2017) echoed these findings, noting that drills improve both performance and employees' knowledge, skills, and future roles.

The Induction method involves structured orientation programs, job instruction, and job rotation to help new employees integrate smoothly into their roles. This method familiarises new officers with organisational culture, policies, procedures, and job-specific tasks. Bafaneli and Setibi (2015) reported that while induction programs are generally perceived positively at Riley's Hotel in Botswana, challenges such as time

constraints and workload can limit their effectiveness. Jagero et al. (2012) found a strong positive correlation between induction programs and employee performance in Dar es Salaam's courier firms, emphasizing the importance of practical skills. Similarly, Tukunimulongo (2016) observed improved employee capabilities and productivity at Mumias Sugar Company due to effective induction programs.

In practical contexts, studies have highlighted OJT's benefits and challenges. Bafaneli and Setibi (2015) reported that while OJT is generally perceived positively at Riley's Hotel in Botswana, challenges such as time constraints and workload can limit its effectiveness. Jagero et al. (2012) found a strong positive correlation between OJT and employee performance in Dar es Salaam's courier firms, emphasizing the importance of practical skills. Similarly, Tukunimulongo (2016) observed improved employee capabilities and productivity at Mumias Sugar Company due to OJT. Conversely, Maina and Waithaka (2018) found that OJT had a positive but statistically insignificant effect on police officers' performance in Kenya, indicating that while OJT is beneficial, additional strategies may be required for more substantial improvements in job performance.

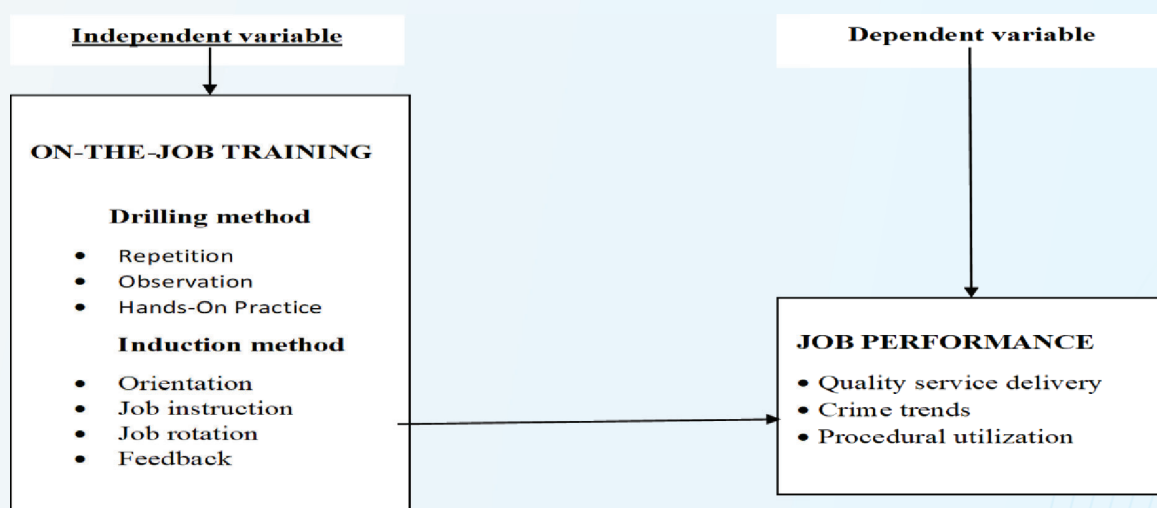

Generally, the empirical literature reveals a research gap in understanding the relationship between on-the-job training (OJT) and job performance, particularly in the Tanzanian context. While existing research extensively covers various OJT methods such as the drill method, involving repetition, observation, and hands-on practice, and the induction method, encompassing structured orientation programs, job instruction, and job rotation (Nguyen et al., 2021; Na, 2021; Yimam, 2022; Bafaneli & Setibi, 2015; Jagero et al., 2012; Tukunimulongo, 2016), studies explicitly focusing on these methods within the Tanzania Police Force (TPF) remain limited. Existing studies have not fully explored how these specific OJT methods impact job performance in the TPF, highlighting a notable gap in the literature. This study aims to address this gap by investigating the effects of both the drill and induction methods on job performance among law enforcement officers in the Dodoma Field Force Unit, Tanzania. By examining these methods, the study seeks to provide valuable insights for improving local training programs and enhancing the effectiveness of law enforcement training strategies

The Conceptual Framework

A conceptual framework demonstrates the variables of assessment and their interactions. Figure 1 shows the independent variables and their effect on the dependent variable. The independent variables in this study are the drilling method and the induction method. The dependent variable is job performance. Under the drilling method, repetition, observation, and hands-on practice are examined for their influence on job performance. The induction method includes orientation, job

instruction, job rotation, and feedback. Quality service delivery, crime trends, and procedural utilization measure job performance.

Figure 1: Conceptual framework

3.0 Methods and Material.

The Study Area

Dodoma Field Force Unit has been selected as a study area due to the increasing criminal offenses, cyber security threats, and human trafficking in the region. From December 2021 to November 2023, these crimes have risen by an average of 5.6% compared to other police regions in Tanzania (TPF, 2023). This alarming trend underscores the need for effective training programs to enhance the job performance of law enforcement officers in tackling these challenges. Additionally, the FFU Dodoma is the unit within the Police Force responsible for conducting on-the-job training. This makes it an ideal candidate for evaluating the impact of these training programs. *Sampling*

3.1 Research Approach

This study employed a mixed-methods research design, integrating both qualitative and quantitative approaches to comprehensively investigate the impact of on-the-job training on job performance within the Dodoma Field Force Unit (FFU). According to Creswell (2014), this approach harnesses the strengths of both methodologies to provide a richer analysis. Quantitative methods included structured surveys designed to quantify the extent and patterns of on-the-job training and its correlation with job performance metrics. Qualitative methods involved in-depth interviews and focus groups with selected police officers and key informants. These methods offered detailed insights into individual experiences and contextual factors influencing jobs.

3.2 Sample Size and Sampling Technique

This study employed a combination of probability and non-probability sampling techniques to ensure a comprehensive analysis. Random sampling was used to select non-managerial staff from the Dodoma Field Force Unit (FFU), ensuring that every member had an equal chance of selection. Purposive sampling was applied to select key informants, including senior police officers such as the Regional Police Commander and the Officer Commanding the Field Force Unit. This approach provided valuable insights into job performance and allowed a deeper understanding of the training's impact.

Yamane's (1973) formula was employed to determine the sample size. Given a total population of 436 and a margin of error of 0.05, the calculated sample size was approximately 208. However, the actual number of collected responses was 192, resulting in a shortfall of about 7.69%. This discrepancy was due to time constraints and incomplete questionnaires, which may affect the generalizability of the study's findings. Future research should consider selecting a larger initial sample and implementing measures to enhance response rates to address potential non-responses and improve the robustness of the results.

3.3 Data Collection Methods and Tools

Structured surveys were used for quantitative data collection. The tool employed was a questionnaire with both closed- and open-ended questions. This tool was designed to capture standardised responses from a large sample of non-managerial police officers, enabling a systematic analysis of training and performance-related variables (Blumberg et al., 2014). Semi-structured interviews were conducted for qualitative data collection. This involved interviewing key informants, including senior Dodoma Field Force Unit (FFU) officers. The tool used was an interview guide with open-ended questions, which allowed for an in-depth exploration of participants' perspectives and experiences related to on-the-job training (Kothari, 2014).

3.4 Data Analysis

Data analysis for this study utilized qualitative and quantitative approaches to comprehensively understand the research findings. Quantitative data analysis employed Statistical Packages for Social Science (SPSS Version 25) to examine trends, correlations, and statistical significance through frequencies and percentages. This method ensured the reliability and generalizability of the findings. Conversely, qualitative data were analyzed using content analysis, which provided deeper insights into participants' experiences, perceptions, and attitudes. This qualitative analysis complemented the quantitative results by explaining the context behind the numerical data and offering a richer understanding of the research questions.

To model the relationship between the dependent variable (job performance) and the independent variables (drill, induction, and case study), the following regression equation was used:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \varepsilon$$

Where:

- Y: Dependent variable (job performance)
- X1: Drill
- X2: Induction
- β_0 : Intercept
- β_1, β_2 : Regression coefficients
- ε : Error term at 95% Confidence level.

By integrating both quantitative and qualitative analyses, this study ensured a robust examination of the impact of training programs on job performance, addressed both the breadth and depth of the research questions and facilitated triangulation through multiple data sources and perspectives.

4.0 Results

Data Reliability and Validity testing

Data Reliability testing

This study assessed data reliability using Cronbach's alpha to demonstrate the internal consistency of the scale's reliability.

Table 42: Reliability Statistics

Cronbach's Alpha	Number of Items
0.941	47

Source: Field data (2024)

Table 1 presents the reliability statistics, specifically Cronbach's Alpha coefficient, which measures internal consistency reliability. The Cronbach's Alpha value of 0.941 indicates a high level of reliability for the set of items included in the measurement instrument. Cronbach's Alpha is interpreted based on its value range, which extends from 0 to 1. Higher values suggest greater internal consistency among the items in the scale. Typically, values above 0.70 are considered acceptable for research purposes, while values above 0.80 are considered excellent.

In this context, Cronbach's Alpha value of 0.941 indicates that the items included in the scale exhibit high internal consistency. This suggests that the items in the scale consistently and reliably measure the same underlying construct. Therefore, the measurement instrument used in this study demonstrates strong reliability, providing confidence in the accuracy and consistency of the data collected. Due to this high internal consistency, researchers and practitioners can use this reliable measurement instrument to make informed decisions based on the collected data.

4.1 Data Validity testing

The questionnaire was carefully constructed to ensure content validity. Data validity in this investigation was assessed using a 95% confidence interval, meaning that 5% represents the errors in both the sample estimate and the correlation analysis.

4.2 Regression Analysis

A multiple linear regression analysis was conducted to understand the impact of different training methods on job performance within the Dodoma Regional Police. This method determines the relative contribution of each training method to overall job performance. Previous studies (Brown, 2021; Taylor & Bowers, 2022) have highlighted the importance of comprehensive training programs in enhancing law enforcement performance, and this study builds on that foundation.

The model's R-squared value of 0.521 indicates that over half of the variability in job performance can be attributed to the drill method and induction method. This supports existing literature emphasizing the effectiveness of diverse training methods (Carter & Radelet, 2020). Though slightly lower, the adjusted R-squared value of 0.513 still demonstrates the model's robustness. This suggests that the training methods within the Dodoma Regional Police significantly impact job performance, aligning with findings by Carter and Radelet (2020) on the importance of both practical and theoretical training in police performance.

The F-statistic ($F = 68.073$, $p < 0.001$) confirms the statistical significance of the overall model, indicating that the predictors (drill method and induction method) are collectively significant in explaining variations in job performance. This is consistent

with White and Escobar's (2021) findings on the effectiveness of integrated training programs.

Model Summary

Table 2: Model summary

Model Summary									
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					Square Change	F Change	df1	df2	Sig. F Change
1	.722 ^a	0.521	0.513	0.376	0.521	68.073	3	188	0.000

a. Predictors: (Constant), Drill Method, Induction Method)

b. Dependent Variable: Job performance

Source: Field data (2024)

Results in Table 21 indicate that the coefficient of determination (R-squared) for the model is 0.521, meaning that approximately 52.1% of the variance in job performance can be explained by the combined effects of the three training methods included in the model. This suggests that the model provides a moderately good fit to the data, explaining a significant portion of the variability in job performance scores. Moreover, the adjusted R-squared value, which considers the number of predictors in the model, is 0.513. This slightly lower adjusted value suggests that the inclusion of the predictors has a marginal effect on the overall explanatory power of the model.

4.3 Statistical Significance of Result

Table 3 presents the ANOVA results for the regression model analysing the impact of different training methods on job performance within the Dodoma Regional Police.

Table 3: ANOVA

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	28.815	3	9.605	68.073	.000 ^b
	Residual	26.526	188	0.141		
	Total	55.341	191			

a. Dependent Variable: Job performance

b. Predictors: (Constant), Drill method, Induction Method)

Source: Field data (2024)

The significant F-statistic ($F = 68.073$, $p < 0.001$) indicates that the regression model significantly explains the variation in job performance. The sum of squares for the

regression (28.815) represents the variation explained by the Drill, Induction, and Case study methods. In contrast, the residual sum of squares (26.526) represents the unexplained variation. These findings suggest that the training methods collectively significantly impact job performance. This underscores the importance of investing in and continually evaluating these training methods to ensure they meet the evolving needs and challenges law enforcement personnel face.

5.0 Discussion of the Findings

This section provides a detailed analysis of the impact of the drill and induction methods on job performance, exploring their effectiveness, comparing their influences, and integrating both statistical results and qualitative insights.

5.1 The Influence of the Drill Method on Job Performance

The drill method significantly impacted job performance ($\beta = 0.389$, $p < 0.001$). This indicates that practical, hands-on training exercises are crucial for enhancing job performance. These findings align with the Training Effectiveness Theory, which emphasises the benefits of experiential learning (Kirkpatrick & Kirkpatrick, 2006). Interviews with employees revealed that the drill method effectively bridges the gap between theoretical knowledge and practical application. One participant noted, "Drill training allows us to practice our skills in a real environment, improving our job performance." This practical approach helps employees adapt to job-related challenges and enhances problem-solving skills and job efficiency, consistent with Adams and Johnson (2021). Incorporating visual aids, such as performance improvement charts, could further illustrate the effectiveness of the drill method.

5.2 The Influence of the Induction Method on Job Performance

The induction method also significantly impacted job performance ($\beta = 0.421$, $p < 0.001$). This suggests that structured, on-the-job experiences are essential for improving job performance. It supports the Training Effectiveness Theory and highlights the role of practical experience in accelerating employee integration (Kirkpatrick & Kirkpatrick, 2006). Participants emphasized that the induction method helps employees quickly adapt to their roles, leading to better performance outcomes. One participant stated, "Induction training provides us with the necessary skills and knowledge to excel in our positions." This method facilitates a smooth transition and improves job efficiency. These findings align with Brown and Green (2022), who observed that on-the-job training is critical for developing role-specific skills. Future research could explore how the induction method performs across different industries or job roles to provide a more comprehensive understanding of its effectiveness.

5.3 Comparative Analysis and Future Research

Comparing the drill and induction methods, both significantly impact job performance, though each offers unique benefits. The drill method excels in providing hands-on problem-solving experiences, while the induction method supports rapid integration and role-specific skill development. Future research should investigate the long-term effects of these methods and their applicability across various job contexts. Additionally, incorporating contrasting studies could provide a more balanced view of each method's effectiveness. Future studies should also explore how these methods can be optimised to address specific industry needs and job roles.

6.0 Conclusion and Recommendation

Conclusion

This study concludes that the drill method, emphasizing practical, hands-on experience, notably enhances officers' problem-solving skills, adaptability, and overall job performance. This method effectively translates theoretical knowledge into practical skills for complex real-world situations. Conversely, the induction method facilitates a smooth integration of recruits by aligning their skills with job requirements through structured orientation and mentoring, thus improving job performance.

Recommendations:

Based on the findings, the study recommends expanding and enhancing the drill method by integrating more practical scenarios and simulations to better prepare officers for real-world situations. Additionally, the induction method should be continuously updated to align with current job requirements and include ongoing support to integrate new skills effectively. Regular evaluation and refinement of these training methods are essential to ensure they remain relevant and impactful. Further research at a national level is also recommended to explore the broader applicability and effectiveness of these training approaches across different regions and context

Enhancing Labour Market Opportunities for Higher Learning Graduates: An Examination of Responsive Curriculum Strategies in Dodoma City

Lortha Libent¹ & Godson Robert Mtallo²

¹College of Business Education – Mwanza Campus, P.O. Box 3168, Mwanza-Tanzania

²College of Business Education – Dodoma Campus, P.O. Box 2077, Dodoma-Tanzania

Abstract

The transition from higher education to the labor market remains challenging for graduates, especially in rapidly evolving economies. This study investigates the effectiveness of responsive curriculum strategies aimed at aligning educational outputs with labor market demands in selected institutions in Dodoma City, Tanzania. Drawing on Human Capital Theory, which links education and skills acquisition to productivity and earnings, the research adopts a convergent parallel mixed-methods design to integrate quantitative and qualitative data from 160 participants, including students, graduates, lecturers, employers, and representatives from regulatory bodies such as the Ministry of Education, NACTVET, and TCU. Quantitative data analysis, using descriptive and inferential statistics, evaluated the impact of assessments and curriculum resources on labor market readiness, while qualitative content analysis explored themes related to assessment effectiveness and industry collaboration. The findings reveal a significant gap between academic preparation and market requirements, indicating the need for curriculum reforms that emphasize practical skills, modern technologies, and stronger partnerships between educational institutions and industry stakeholders. Key recommendations include regular curriculum updates, real-world challenges in assessments, and enhanced partnerships to support graduate employability and regional economic development. This research provides insights for Tanzanian policymakers and educators, underscoring the importance of adaptable curricula to meet labor market demands. The study also highlights potential implementation challenges. These include limited institutional funding, resistance to curriculum change, and insufficient resources for modern teaching technologies. Addressing these challenges will require concerted efforts from policymakers, academic institutions, and industry leaders. Future studies should explore the long-term impact of responsive curricula on career progression and the role of digital transformation in curriculum design.

Keywords: *Responsive Curriculum, Higher Learning Graduates, Labour Market Opportunities*

1.0 Introduction

1.1 Background of the Study

The labor market is continuously evolving, requiring higher learning institutions to adapt their responsive curricula to ensure graduates are well-prepared for employment opportunities (Ajjawi et al., 2018; Oraison et al., 2019). It is imperative to ensure that graduates have the skills and knowledge required to thrive in the labor market as digitalization and technological advancements change sectors and employment needs (Vreuls et al., 2022). In recent years, there have been substantial changes in the global labour market where The World Economic Forum (WEF) highlights the necessity of adaptable responsive curriculum strategies by highlighting the significance of matching education and training systems with the changing demands of the labour market (WEF, 2023).

The concept of a responsive curriculum emphasizes the alignment between educational programs and the changing demands of the labor market. It ensures that graduates possess the necessary skills, knowledge, and competencies to meet the evolving needs of employers (Gul & Khilji, 2021)). It entails creating and making modifications to learning practices, resources, and assessments to make sure they are inclusive and appropriate for every student (Biyela, 2019). By using a responsive curriculum strategy, trainers seek to provide a learning environment that respects and awards the many positions, cultures, and identities of their students.

In Africa, the challenges of unemployment and underemployment among higher-learning graduates are quite increasing despite increasing enrolment rates in higher-learning education, many graduates face difficulties in finding suitable employment (Ajjawi et al., 2018). In order to alleviate the unemployment issue, the African Development Bank (AfDB) emphasizes the significance of matching education and training programs with business demands (AFDB, 2023). Therefore, adopting responsive curricular techniques is essential to improving graduates' employment prospects in Africa.

Tanzania suffers substantial labour market difficulties, just like many other African nations despite initiatives taken by the government to broaden access to higher education. While the importance of responsive curricula has been recognized, there is a lack of specific research on how Dodoma City institutions can effectively implement these strategies to enhance labour market opportunities for higher-learning graduates. Existing studies, such as those conducted by Mbise (2017) and Munishi (2016), have explored employability and the factors contributing to the lack of skills among graduates in Tanzania. despite the recognized importance of responsive curricula in improving graduate employability, Tanzania's higher education sector, especially in

Dodoma, faces specific challenges that hinder the successful implementation of these strategies. While access to higher education has expanded, the lack of curriculum adaptation to current labor market needs remains a significant issue. Existing studies (Mbise, 2017; Munishi, 2016) have explored the challenges of graduate employability in Tanzania but have not sufficiently addressed the responsive curriculum strategies that could bridge the gap between education and the workforce in Dodoma.

The labor market in Dodoma faces unique challenges that require targeted solutions. Local industries often express dissatisfaction with the preparedness of graduates, pointing to a mismatch between academic learning and the practical skills needed in the workplace. The region also faces limited collaboration between educational institutions, industries, and government bodies, further exacerbating the issue of insufficient internship and apprenticeship opportunities. In addition, outdated teaching materials and lack of access to modern technologies prevent students from developing the necessary competencies to succeed in an increasingly digital world.

This study seeks to address these issues by investigating the responsiveness of curriculum strategies in Dodoma City's higher learning institutions. Specifically, it examines three key aspects: assessments, curriculum resources, and industry collaboration. First, assessments are essential in evaluating whether graduates possess the skills and competencies that align with industry demands. By improving assessments to incorporate real-world challenges, students can be better prepared for the labour market. Secondly, curriculum resources, including up-to-date teaching materials and access to modern technologies, are necessary to ensure that graduates are equipped with the practical knowledge and skills that employers value. Finally, fostering stronger partnerships between educational institutions and industry stakeholders is crucial for providing students with internships, apprenticeships, and experiential learning opportunities.

This research will provide valuable insights into how Dodoma's higher learning institutions can enhance their curricula to better prepare graduates for the labor market. By identifying practical strategies for updating curricula, strengthening collaborations, and improving assessments, the study aims to offer actionable recommendations for policymakers, educators, and industry leaders to improve the employability of graduates in Dodoma City. Ultimately, this study contributes to regional economic development by ensuring that graduates are well-prepared to meet the demands of the labor market, fostering a stronger link between education and employment in Tanzania's evolving economy.

The study also acknowledges the challenges in implementing these strategies, including limited resources, resistance to change, and the need for coordinated efforts among educational institutions, industry players, and government bodies. These barriers must be addressed to successfully enhance labor market opportunities for graduates and reduce the unemployment rate in Dodoma. Furthermore, ongoing research is necessary to assess the long-term impacts of these curriculum strategies on graduate employability and career progression, ensuring that Tanzania's education system remains responsive to labour market needs.

1.2 Statement of the Problem

Higher education institutions must continuously adjust their responsive curricula to ensure graduates are equipped with the necessary skills for employment, given the ever-evolving nature of the labour market (Cheng et al., 2022). A responsive curriculum serves as a connection between education and real-world work conditions, facilitating dynamic and ongoing learning encounters. It also encourages students to embrace learning and equips them to be active and meet their needs. In the efforts to enhance the implementation of responsive curriculum in higher learning institutions, the government of Tanzania provides finance to enhance availability and improvement of resources such as facilities, learning materials and allocating of instructors to different institutions. Moreover, Education policy developed is responsible for guiding the standards to be given to higher learning students so as to meet labour market needs.

Despite the efforts made by the government to improve labour market opportunities, Tanzania is still faced with a problem of unemployment by most of the graduates caused by most of graduates not meeting what the labour market needs (Mgaiwa, 2021). While the importance of responsive curricula is recognized, there is a lack of specific research on effective implementation strategies in Dodoma City. The failure to create labour market opportunities for Higher Education Institutions is likely to result in hindering progress and innovation in various industries, placing increased burdens on faculty members and compromising the quality of education. Existing studies have explored employability and skill gaps among graduates in Tanzania but have not directly addressed responsive curriculum strategies (Mbise, 2014; Munishi, 2016). To address this gap, this study examines responsive curriculum strategies in selected Dodoma City institutions and their effect on enhancing labour market opportunities. The unique context and challenges faced by graduates in this location are considered. The research explores assessments, curriculum resources, and collaboration as dimensions of responsive curriculum strategies. Assessments evaluate graduates' knowledge and skills in alignment with industry requirements. Curriculum resources, including up-to-date materials and relevant technologies, ensure graduates have the necessary tools for employment. Collaboration between institutions, industry

stakeholders, and organizations fosters partnerships, internships, and experiential learning opportunities. By examining these strategies, the study provides insights and recommendations to improve graduates' preparedness for the labour market. The goal is to enhance labour market opportunities, promote employability, and contribute to the region's economic development.

1.3 Research Objectives

1.3.1 General Objective

The primary objective of this study is to investigate the implementation of responsive curriculum strategies in enhancing labour market opportunities in Dodoma City, Tanzania.

1.3.2 Specific Objectives

1. To determine the role of current assessments adopted by higher education institutions to impart knowledge, skills and attitude in aligning graduates with industry requirements in Dodoma City.
2. To evaluate the influence of curriculum resources in enhancing graduates' preparedness for employment from Selected Higher Learning Institutions in Dodoma City.
3. To examine the influence of collaboration between higher Learning Institutions, industry stakeholders and government in enhancing employability opportunities for graduates in Dodoma City.

1.3.3 Research Questions/ Hypothesis

- i. What is the role of current assessments adopted by higher education institutions in imparting knowledge, skills and attitude to aligning graduates with industry requirements in Dodoma City?
- ii. What is the influence of curriculum resources in enhancing graduates' preparedness for employment from Selected Higher Learning Institutions in Dodoma City?
- iii. What is the influence of collaboration between higher Learning Institutions, industry stakeholders and government in enhancing employability opportunities of graduates in Dodoma City?

4 Significance of the study

The findings of this study offer targeted, practical benefits for multiple stakeholders, including policymakers, Higher Learning Institutions (HLIs), the public, and academicians, with a focus on addressing specific labor market conditions and educational frameworks in Tanzania, particularly within Dodoma. For policymakers, especially the Ministry of Education, Science, and Technology, the study provides actionable insights to guide the development of policies and initiatives aimed at enhancing academic infrastructure and resources, ensuring that

the education system meets the specific skill demands of the Tanzanian labor market. These insights can support regulatory changes that integrate job-ready skills into the national curriculum, promoting alignment with industry needs and addressing skill gaps that contribute to unemployment. For HLIs, the findings highlight best practices in adapting curricula to better prepare students for the job market, helping institutions develop targeted programs and partnerships with industry to improve graduates' readiness for employment. For the public, the study emphasizes the creation of graduates who are well-prepared to apply theoretical knowledge in practical contexts, thus contributing to economic growth and reducing unemployment by aligning educational outcomes with the workforce's needs. Finally, for academicians, the study opens avenues for further research on how curriculum design and educational policy can continuously evolve to support a dynamic labour market, offering an evidence-based foundation for ongoing improvements in education and workforce development across Tanzania.

2.0 Literature Review

2.1 Theoretical Framework

The study will be guided by Human Capital Theory as propounded by Becker (1962) and Rosen (1976). This is a widely recognized framework in labour economics and education. It suggests that individuals can increase their productivity and earnings potential through investments in education, training, and skills acquisition. In the context of the research, the theory can be applied to analyse how responsive curriculum strategies in Dodoma City institutions contribute to the development of graduates' human capital and, consequently, their labour market opportunities.

The study delves into key concepts derived from the Human Capital Theory, which hold great relevance in understanding the educational landscape in Dodoma City. One crucial aspect is education and training, examining how institutions of higher learning in the city invest in comprehensive educational programs and training initiatives. These endeavours aim to enhance the human capital of graduates, equipping them with the necessary skills and knowledge to thrive in their chosen fields. Another important consideration is the responsiveness of curriculum strategies to industry demands. By aligning educational offerings with the needs of the labour market, graduates are equipped with specific skills and knowledge that hold significant value in the job market. The study also explores the impact of these responsive curriculum strategies on labour market outcomes. As graduates' human capital improves through tailored education, their employability, earning potential, and opportunities for career advancement are positively affected. Finally, the research examines the Return on Investment for graduates. It investigates how their investment in education and the resources provided by Dodoma City institutions contribute to their future success in the labour market. By comprehensively analysing these key concepts, the study aims

to shed light on the intricate relationship between human capital development and educational institutions in Dodoma City.

By utilizing the Human Capital Theory as a theoretical framework, the research can explore the relationship between responsive curriculum strategies, graduates' human capital development, and their labour market opportunities, providing insights into the effectiveness of these strategies in enhancing graduates' employability and economic prospects in Dodoma City.

2.2 Empirical Review

2.2.1 Role of current assessments adopted by higher education institutions to impart knowledge, skills and attitudes in aligning graduates with industry requirements

Miller & Konstantinou (2022) conducted a study on how employability skills can be embedded through authentic assessments of business management undergraduate students in Central London. The study employed thematic and documentary analysis to obtain data from the selected sample. The study findings reveal the great importance of authentic assessment to provide opportunities for students to work on skills and projects which are relevant to them and recommends the establishment of modules and programs that can adopt a problem-based approach and not only solve a problem. Moreover, students should be able to engage with and reflect on the transferable skills developed through the assessments. However, the study conducted have only assessed on how authentic assessments can be used to embed employability and ignored the other assessment means such as performance assessment and formative assessments. Also, the study could have employed a large sample and not the small sample obtained from business management students only.

Also, (Mainga et al., 2022) conducted a study on graduate employability of business students through exploratory descriptive research study. The study considered communication skills, learning skills, positive attitudes and behavior and problem-solving skills as attributes towards employment. The findings indicate the importance of capturing students' views about their employability at graduation. Similarly, this study determines only the factors towards employability and does not point out on how those factors can be used towards meeting the needs of the market which will be covered by this study.

2.2.2 Influence of curriculum resources in enhancing graduates' Preparedness for Employment from Selected Higher Learning Institutions in Dodoma City.

A lack of technical and educational resources was identified as one of the reasons preventing technical graduates in Tanzania from reaching the demands of the labour market in a study done by (Munishi, 2016) in Tanzania. A study recommends an

adequate supply of teaching and learning resources from the government such as classrooms, well-equipped libraries, computer and ICT facilities. Moreover, the study suggests the review and improvement of curricula so as to meet the needs of the market. The study pointed out the factors and recommendations but did not assess on how the given factors can be used to enhance labour market opportunities which will be covered by this study at hand.

Another study done in Kenya on Resource Utilization and Curriculum Implementation in Community Colleges in Kenya (Kigwilu & Akala, 2017), found that these community colleges' insufficient physical facilities, teaching and learning resources, underutilization, and other core facility and resource deficiencies impede effective teaching and learning. The study employed a sample of 172 students 18 teachers and four directors of community colleges. Community colleges should therefore not only provide enough physical facilities and resources but also maximize their use in order to implement curricula effectively. Tanzania differs from other nations where research have been done in terms of institutional structure, demographics, economics, politics, and sociocultural practices. As a result, there is a need to conduct a study in Tanzania because the research findings are unrelated to the Tanzanian context.

2.2.3 Influence of collaboration between higher Learning Institutions, industry stakeholders and government on employability opportunities of graduates.

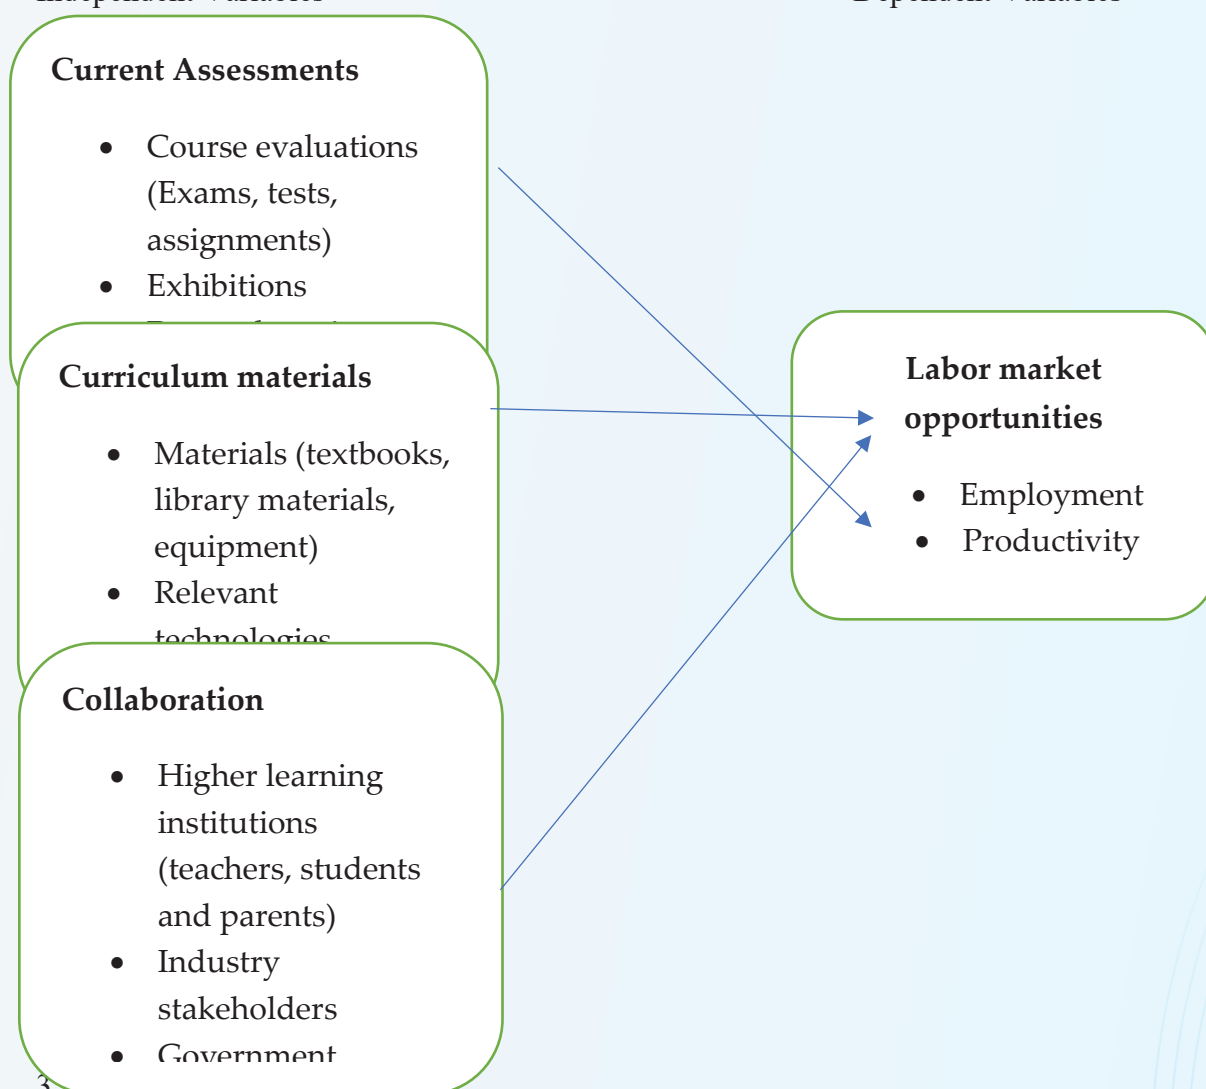

A study conducted in Australia by Oraison et al. (2019) on if universities prepare students for employment by examining university's graduate attributes with market needs. the study employed a thematic analysis and findings revealed differences between graduate attributes and the employability criteria in nursing, psychology and education courses at an Australian University. The study suggests on the development of future graduate attributes that better reflect preparedness for the workforce and collaboration with workplaces about the increasing need for entry-level positions. The study focused on attributes needed towards employment and did not examine how the said attributes can be used towards meeting the needs of the labour market which will be filled by this study. Also, the study employed qualitative data whereas the study at hand will employ both qualitative and quantitative data.

2.3 Conceptual framework

The study employs a conceptual framework that draws upon a comprehensive review of both theoretical and empirical literature. This framework establishes the anticipated relationship between the variables under investigation, providing a solid foundation for the research.

Figure 1: Conceptual framework
Independent Variables

Dependent Variables

The proposed study employed a mixed-methods approach to gather comprehensive and in-depth data on the responsive curriculum strategies implemented in selected higher learning institutions in Dodoma City and their impact on enhancing labour market opportunities for graduates. This approach enabled a thorough exploration of the research questions and provided a more holistic understanding of the topic (Creswell 2014). The quantitative approach involved questionnaires administered to graduates and students to gather quantitative data on the effectiveness and perceptions of the responsive curriculum strategies (Smith et al., 2022; Johnson, 2019). The qualitative approach involved interviews with key stakeholders, including lecturers, employers/ government, and graduates, to gain in-depth insights into their experiences, perspectives, and challenges related to responsive curriculum implementation (Jones,

2018; Davis & Wilson, 2021). The data obtained from the interviews were analyzed through content analysis to identify key themes and patterns (Miller, 2017).

3.1.1 Integration of Quantitative and Qualitative Data

The quantitative and qualitative data collected through the questionnaires and interviews/focus group discussions were integrated to provide a comprehensive understanding of the responsive curriculum strategies and their impact on enhancing labour market opportunities for graduates. This integration involved comparing and contrasting the findings from both data sources to gain a more holistic perspective on the research questions (Thomas & Johnson, 2023)

3.2 Research Design

The study adopted a convergent parallel mixed-methods design to give room for both quantitative and qualitative datasets to interact and to provide a deeper understanding of the phenomenon using both strands. The decision to use a convergent parallel mixed-methods design is built on Creswell (2014) that a convergent mixed-methods design should be considered when the focus is on gaining a deeper understanding of the phenomenon through both quantitative and qualitative strands, especially when data are collected using the same or parallel variables, constructs, or concepts. The present study used this design since similar variables were used on both qualitative and quantitative sides to yield comparable and easy-to-measure findings. In this regard, the same concepts measured through quantitative tools were also focused on during the qualitative data collection phase.

3.3 Participants and Study Area

The study was done in Dodoma region since it is the headquarters of most government stakeholders responsible for education and has both private and public higher learning institutions. The population of the study were students, graduates, and lecturers from the Institute of Rural and Development Planning and College of Business Education and regulatory authorities such as the NACTVET, and TCU. These institutions and stakeholders were purposefully chosen due to their roles in curriculum development, implementation, and advising on educational policies, making them directly relevant to the study's objectives. Moreover, the selection of Higher Education Institutions included both private and public universities together with a college which are very aware of the importance of a responsive curriculum in enhancing labour market opportunities.

3.4 Sampling Technique

The study used a purposive sampling technique to select higher learning institutions in Dodoma City that have implemented responsive curriculum strategies. The sample

size was 160 and includes students, graduates and lecturers participating in the study from Dodoma City. All respondents were purposively sampled to ensure representation from various disciplines and sectors (Brown & Wilson, 2019).

3.5 Data Collection Tools

An in-depth interview and questionnaires were employed to collect qualitative and quantitative data from students, graduates, HLIs lecturers, employers, and regulatory authorities such as the Ministry of Education, NACTVET, and TCU. The reason behind choosing the aforementioned entities is that they are either users, developers, or advisors on curriculum development. Interview guide questions were constructed and used to collect data because they explored detailed information and a deep understanding of a phenomenon under study that has not been explored or is difficult to be practically explain by existing theories (Creswell, 2014; Yin, 2014).

3.6 Data Analysis

The data analysis for the research objectives involved both quantitative and qualitative approaches.

For objective 1, the quantitative data collected through questionnaires were analysed using descriptive and inferential statistics to explore the role of assessments in aligning graduates' knowledge and skills with industry requirements (Smith et al., 2022). Descriptive statistics were used to analyse the demographic information including the sex of respondents, age, occupation and experience which were provided in the questionnaires. The qualitative data obtained through interviews were analysed through content analysis to gain deeper insights into the effectiveness of assessments. The raw data collected was transformed into themes in relation to the research objectives and conceptual framework of the study (Braun & Clarke, 2020). The descriptive and inferential outputs were presented in tables, figures and charts to elaborate the independent and dependent variables of the study.

For objective 2, the quantitative data collected through questionnaires were analysed descriptively and inferentially to evaluate the availability and utilization of curriculum resources in enhancing graduates' preparedness for employment (Brown & Lee, 2020).

Finally, for objective 3, the quantitative data collected through questionnaires were analysed descriptively and inferentially to investigate the extent of collaboration between higher education institutions, industry stakeholders, and organizations and its contribution to improving labour market opportunities for graduates (Johnson, 2019). The qualitative data obtained through interviews were analysed through content analysis to explore the processes and challenges of collaboration and its impact on graduates' labour market outcomes (Braun & Clarke, 2020).

4. Results And Discussion

4.1 Social demographic characteristics of respondents

The study looked at several variables on demographic characteristics, such as gender, education qualification, college, age, working experience and occupation as shown in Table 1. This section provides an overview of the respondents' demographic profile and provides insights into the distribution of important demographic variables within the study population. In terms of gender representation, the data reveal a notable gender balance, with the majority of respondents being female (55.2%), while males accounted for a slightly smaller proportion (44.8%). Examining the education qualification of respondents, the data revealed that most respondents (67.2%) have a diploma level followed by those with other qualifications accounting for 26.4%. Bachelor's and Master's degrees accounted for 2.4% and 4.0% of the total respondents respectively. It was also seen that the majority of respondents are unemployed (77.6%) while only 18.4% and 4.0% are self-employed and employed respectively. The average age of respondents was 23.49 with minimum age of 18 and maximum age of 30 years. Regarding working experience, the average is 0.62 years while the maximum was 10 and the minimum was 0 years. Since the study was conducted at two colleges, 50% of respondents were from Mipango while the remaining 50% were College of Business Education (CBE).

Table 1: Social demographic characteristics of respondents

Variable		Frequency (N)	Percent (%)
College	Mipango	125	50.0%
	CBE	125	50.0%
Sex of respondents	Male	112	44.8%
	Female	138	55.2%
Education level	Primary	0	0.0%
	Secondary	0	0.0%
	Diploma	168	67.2%
	Bachelor Degree	6	2.4%
	Master's Degree	10	4.0%
	PhD	0	0.0%
	Others	66	26.4%
Please indicate your occupation	Employed	10	4.0%
	Self-employed	46	18.4%
	Unemployed	194	77.6%
	Retired	0	0.0%

Age	Mean	23.49
	Std. Deviation	2.633
	Range	12
	Minimum	18
	Maximum	30
Experience	Mean	.62
	Std. Deviation	1.576
	Range	10
	Minimum	0
	Maximum	10

4.2 Assumption of regression

Generally, these steps were essential to validate the assumptions of regression analysis, ensuring that the data met the necessary conditions for reliable and interpretable results. By addressing each assumption, the researcher confirmed that the regression model was appropriate for examining the relationship between SME's growth and branding, providing a solid foundation for the subsequent analysis.

4.2.1 Normality of residuals

One of the most important assumptions in regression is the normality of residuals. To check this assumption, a histogram of residuals was used. A normal curve was added to check whether residuals are normally distributed (have bell-shaped curve). Figure 1 shows a histogram of residuals where the distribution of residuals has a rough bell shape as shown by a red line indicating that residuals are normally distributed.

Figure 1: Normality of residuals

4.2.2 Linear Relationship Between Explanatory Variables and Response Variable.

Regression analysis also assumes that there exists a linear relationship between each explanatory variable and response variable. P-P plots were plotted to check this assumption. To show a linear relationship, the value of residuals should fall around 45° lines. Figure 2 shows P-P plots where values of residuals fall around 45° indicating that there was a linear relationship between independent variables and response variables.

Figure 2: P-P plot for a linear relationship between variables

4.2.3 Multi-collinearity among explanatory variables

Multicollinearity occurs when two or more explanatory variables are highly correlated to each other, such that they do not provide unique or independent information in the regression model. If the degree of correlation is high enough between variables, it can cause problems when fitting and interpreting the model. To check that there is no severe multicollinearity among the explanatory variables, Variance Inflation Factor (VIF) was used. VIF values are obtained by taking the reciprocal of tolerance values. VIF values below 10 indicates that there is no multicollinearity between independent variables. The best option is to drop variables with VIF values of 10 and above since their contribution to the model are already represented by other variables. Table 2 shows that VIF values are below 10 indicating that there was no multicollinearity among independent variables in models.

Table 2: Variance Inflation Factor for multicollinearity assumptions

Variable	Collinearity Statistics	
	Tolerance	VIF
CA1	.497	2.010
CA2	.469	2.130
CA3	.501	1.994
CA4	.514	1.944

CA5	.494	2.023
CA6	.540	1.851
CA7	.498	2.009
CA8	.494	2.023
CM1	.495	2.022
CM2	.396	2.527
CM3	.690	1.450
CM4	.464	2.153
CM5	.531	1.882
CM6	.519	1.928
CM7	.620	1.613
CM8	.505	1.982
CH1	.795	1.258
CH2	.839	1.192
CH3	.641	1.561
CH4	.480	2.085
CH5	.593	1.686
CH6	.561	1.784
CH7	.660	1.514
CH8	.822	1.217

4.2.4 Autocorrelation

The autocorrelation assumption was checked using Durbin-Watson (DW) statistics. The DW statistic ranges from zero to four, with a value around 2.0 indicating zero autocorrelation. Values below 2.0 mean there is positive autocorrelation and above 2.0 indicates negative autocorrelation. The tolerable range of autocorrelation is valued between 1.5 and 2.5. Results in Table 3,4 and Table 5 show that the DW statistics of 1.854, 2.042 and 1.736 respectively (all of them being around 2.0) indicate that there was no autocorrelation.

4.3 Determining the role of current assessments adopted by higher education institutions to impart knowledge, skills and attitudes in aligning graduates with industry requirements in Dodoma City.

The full names of variables in Table 3 are CA1: The current assessments adequately prepare you to adapt to the rapidly changing market demands. CA2: The skills and knowledge gained through current assessments make you competitive in the job market. CA3: The skills assessed through tests align with what will be required in the industry market. CA4: Assignments are beneficial in deepening knowledge and skills.

CA5: Exhibitions and practical demonstrations are useful in applying theoretical concepts to real-world scenarios. CA6: Research projects are effective in sharpening analytical and problem-solving skills. CA7: Case study analyses are important in improving decision-making abilities in professional settings. CA8: The current assessment methods adequately prepare you for the practical aspects of your future career.

The summary of the regression model is presented in Table 3. The coefficient of determination (R-squared) measures the extent to which total variation in the dependent variable is explained by the model. As it can be observed from Table 3, an R-squared value of 0.353 was obtained. This means that 35.3% of the variation in labor market opportunities is explained by the model. Generally, the model was significant (F value=16.030, p value= 0.003) as shown in Table 3.

The coefficient values in regression Table 3 quantify the change in labour market opportunities as a result of a unit change in one independent variable provided other variables are kept constant. Only four variables: CA4, CA5, CA6 and CA8 were found to be significant predictors (p-value less than 0.05) of labor market opportunities. CA4 was found to be statistically significant at $p=0.000$ as shown in Table 3. The coefficient for CA4 is 2.550 meaning that a unit increase in CA4 results in a 2.550 increase in labour market opportunities provided other factors are held constant. Explanation for CA5, CA6 and CA8 is the same as those of CA4.

Table 3: Role of current assessments adopted by higher education institutions

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.
	B	Std. Error	Beta			
Constant	8.185	.819			9.998	.000
CA1	.125	.170	.055		.735	.463
CA2	.333	.184	.139		1.809	.072
CA3	.221	.182	.090		1.215	.226
CA4	2.550	.224	.180		2.461	.015
CA5	1.068	.195	.408		5.463	.000
CA6	1.774	.187	.296		4.141	.000
CA7	.277	.193	.107		1.441	.151
CA8	2.386	.192	.150		2.010	.046
R squared = 0.353			Durbin-Watson=1.854			
F value = 16.030			Sig=0.000			

These findings are consistent with Kessy's (2020) study, which highlighted that curricula often lack the practical components essential for success in the labour market.

Kessy's research identified the curriculum as a significant factor contributing to the challenges graduates face when entering the workforce. The absence of hands-on, industry-relevant training in educational programs leaves students ill-equipped to meet employers' expectations, underscoring the need for curriculum reform that integrates practical skills aligned with labour market demands.

4.4 Evaluating the influence of curriculum resources in enhancing graduates' preparedness for employment from Selected Higher Learning Institutions in Dodoma City.

The full names of variables in Table 4 are CM1: The course materials (textbooks, handouts, online resources) are sufficient for understanding the subject matter. CM2: The equipment and facilities provided by the institution are adequate for practical learning experiences. CM3: The lectures delivered are engaging and promote active participation from students. CM4: Integrating computer software and other relevant technologies in your curriculum prepares you for the demands of the workforce. CM5: Adequate training and support on how to effectively utilize computer software and other relevant technologies required in your field is provided. CM6: The technology used in the classroom (computers, projectors, interactive tools) enhances my learning experience. CM7: The support provided to students outside of scheduled class hours is sufficient for addressing their academic needs. CM8: Access to updated and comprehensive library materials has contributed to your preparedness for employment.

The summary of the regression model is presented in Table 4. The coefficient of determination (R-Squared) measures the extent to which total variation in dependent variable is explained by the model. As it can be observed from Table 4, R-Squared value of 0.482 was obtained. This means that 48.2% of the variation in labour market opportunities is explained by the model. Generally, the model was significant (F value=27.780, p value= 0.000) as shown in Table 4.

The coefficient values in regression Table 4 quantify the change in labour market opportunities as a result of a unit change in one independent variable provided other variables are kept constant. Only five variables: CM2, CM3, CM4, CM5 and CA8 were found to be significant predictors (p-value less than or equal to 0.05) of labour market opportunities. CM2 was found to be statistically significant at $p=0.008$ as shown in Table 4. The coefficient for CM2 is 2.492 meaning that a unit increase in CM2 results in a 2.492 increase in labour market opportunities provided other factors are held constants. Explanation for CM3, CM4, CM5 and CA8 is the same as those of CM2.

Table 4: Influence of curriculum resources in enhancing graduates' preparedness for employment

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.
	B	Std. Error	Beta			
Constant	7.369	.753			9.787	.000
CM1	.043	.164	.018		.265	.791
CM2	2.492	.183	.199		2.690	.008
CM3	3.628	.145	.243		4.332	.000
CM4	1.599	.158	.259		3.791	.000
CM5	1.384	.195	.126		1.970	.050
CM6	.118	.165	-.046		-.715	.475
CM7	.085	.152	-.033		-.557	.578
CM8	2.437	.200	.143		2.185	.030
R squared = 0.482			Durbin-Watson=2.042			
F value = 27.780			Sig=0.000			

The findings correspond with (Mgaya, 2023) study on the challenges facing learners in acquiring employability competencies under the Competency-Based Education and Training (CBET) approach in Tanzania's Vocational Education and Training Centres. Mgaya's research identified the lack of adequate learning resources as a key obstacle to effectively preparing students for the labour market. This shortage hampers the ability of vocational training institutions to provide students with the practical skills and hands-on experience necessary to meet the demands of employers in today's competitive job environment.

4.5 Examine the influence of collaboration between higher Learning Institutions, industry stakeholders and government in enhancing employability opportunities for graduates in Dodoma City.

The full names of variables in Table 5 are CH1: I am familiar with the collaborations between my institution and industry stakeholders. CH2: I have participated in internship or work placement programs facilitated by my institution. CH3: Practical experiences, such as internships or industry projects, are important for my future career. CH4: I have received guidance or support from my institution regarding career planning and job search strategies. CH5: I would be interested in more opportunities to interact with industry professionals during my academic studies. CH6: I believe that collaboration between my institution and industry enhances the quality of my education. CH7: Networking opportunities provided by my institution for connecting with potential employers are valuable. CH8: Opportunities for internships, apprenticeships, or industry projects during my academic tenure are valuable.

The summary of the regression model is presented in Table 5. The coefficient of determination (R-Squared) measures the extent to which total variation in dependent variable is explained by the model. As it can be observed from Table 5, R-Squared value of 0.419 was obtained. This means that 41.9% of the variation in labor market opportunities is explained by the model. Generally, the model was significant (F value=21.143, p value= 0.003) as shown in Table 5.

The coefficient values in regression Table 5 quantify the change in labour market opportunities as a result of a unit change in one independent variable provided other variables are kept constant. Only three variables: CH2, CH5 and CH8 were found to be significant predictors (p value less than 0.05) of labor market opportunities. CH2 was found to be statistically significant at $p=0.038$ as shown in Table 5. The coefficient for CH2 is 3.100 meaning that a unit increase in CH2 results to 3.100 increase in labor market opportunities provided other factors are held constants. Explanation for CH5 and CH8 is the same as those of CH2.

Table 5: the influence of collaboration between higher Learning Institutions, industry stakeholders and government

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.
	B	Std. Error	Beta			
Constant	9.825	.891			11.026	.000
CH1	.247	.190	.072		1.297	.196
CH2	3.100	.048	.113		2.083	.038
CH3	.222	.158	.087		1.402	.162
CH4	.250	.176	.102		1.419	.157
CH5	2.868	.158	.356		5.509	.000
CH6	1.176	.165	.071		1.069	.286
CH7	.068	.155	.027		.437	.662
CH8	1.374	.153	.492		8.961	.000
R squared = 0.419			Durbin-Watson=1.736			
F value = 21.143			Sig=0.000			

The findings align with Kamuhabwa (2019) study on the challenges of graduates' employability in Tanzania, which emphasized the importance of collaboration between various stakeholders to improve employability prospects for graduates. Kamuhabwa's research highlights the critical need for partnerships between educational institutions, government bodies, and industries to create more relevant and practical learning opportunities that equip graduates with the skills needed in the modern workforce. Such collaboration can bridge the gap between education and

employment, ensuring that graduates are well-prepared to meet the demands of the job market.

The interview responses reinforce these findings, with customers emphasizing the importance of practical demonstrations through exhibitions and research projects. One interviewee in Dodoma City expressed that these initiatives are highly effective in aligning graduates with the needs of the industry as:

"Exhibitions and hands-on research projects are essential because they help graduates gain the practical skills that our industry requires. These activities not only showcase graduates' abilities but also provide businesses with an opportunity to see how they can apply academic knowledge to solve real industry problems."

Another respondent said

"When graduates take part in practical demonstrations and research, it gives us a clear view of their abilities and how they can contribute to solving industry challenges. This kind of hands-on experience is exactly what employers are looking for, as it prepares graduates for the demands of the workplace and helps close the gap between what they learn and what we need."

The observation from another respondent was consistent to the above statement. During the interview respondent says:

"These activities are vital for graduates because they provide the hands-on experience that theory alone can't offer. When we see graduates involved in these projects, we know they're better prepared to tackle real-world problems. It's not just about knowledge; it's about applying that knowledge effectively in the industry, which is exactly what employers like us are looking for."

5.0 Conclusion and Recommendation

Conclusion

The study contributes to the body of knowledge by providing insights into how responsive curriculum strategies can enhance labour market opportunities for higher learning graduates in Dodoma City, Tanzania. The findings reveal that while assessments, curriculum resources, and collaboration between institutions and industry stakeholders have a positive impact, there is still a significant gap between academic outputs and market needs. By focusing on practical skills, up-to-date resources, and stronger industry collaborations, higher learning institutions can better prepare graduates for employment. This study emphasizes the importance of continuously updating curricula to reflect the dynamic labour market and highlights the need for stronger partnerships between educational institutions and industries. Furthermore, this research offers valuable recommendations for both academic institutions and policymakers in Tanzania, paving the way for further investigations into the long-term

effects of these curriculum strategies on graduate employability and career progression.

Recommendation and Areas for Further Studies

To enhance labour market opportunities for graduates, higher learning institutions should establish a systematic process for regularly updating curricula to align with specific, evolving industry requirements, ensuring that current technologies and practical skills are integrated. Moreover, forming more targeted and structured partnerships between institutions, industries, and government bodies is crucial for expanding quality internship and apprenticeship opportunities, thus providing graduates with essential hands-on experience. Additionally, assessment methods should incorporate real-world challenges, enabling students to develop competencies and problem-solving skills directly aligned with market demands. Furthermore, institutions must prioritize investments in state-of-the-art teaching resources, technologies, and practical facilities, ensuring that graduates are better equipped for employment. Finally, policymakers should introduce specific government incentives to support and incentivize collaboration efforts that promote graduate employability. Future studies could explore the long-term impact of responsive curricula on graduate career progression and the role of digital transformation in shaping curriculum strategies, emphasizing monitoring and evaluating these effects over time.

Abstract

This study focused on the effect of job analysis on the employees' performance at the SJUT. Specifically, the study aimed at examining the effect of job analysis (adaptability and innovation) on the employee's performance at St. John's University of Tanzania. The study adopted the mixed research approach and the case study research design. The study was conducted at the SJUT where the academic staff was involved and it was guided by the Resource-Based View (RBV) and Equity theory. The purposive sampling and the Yamane (1976) formula in sampling and sample size determination respectively. The survey methods, interview, and documentary review were used to gather data through tools like questionnaires, interview guides, and documentary checklists respectively. The data were analyzed by descriptive statistics, content analysis, and multiple regression with the aid of Statistical Package for Social Sciences (SPSS). The study revealed job analysis (adaptability and innovation) had a positive and significant effect on the employee's performance expressed in the form of task timely completion, meeting targets, and quality service delivered. The researcher recommended that the government should use the findings to improve educational policies. Meanwhile, the researchers recommend that SJUT management should use the findings to enhance the human resources policy and recruitment policies to secure better employees.

Keywords: *Recruitment Practices, St. Job University, Employees' Performance*

1.0 Introduction

1.1 Introduction to the Problem

Recruitment has been a significant focus of scholarly research in recent years. Recruitment practices play a pivotal role in the success of organizations. They are essential for attracting and selecting the right talent to meet organizational objectives. According to Johnson & Lee (2023) effective recruitment practices offer benefits such as improvement of organizational performance through hiring employees who possess the necessary skills and competencies, organizations can enhance productivity, innovation, and overall performance.

Likewise, effective recruitment practices enhance employee satisfaction by ensuring that individuals are placed in roles that align with their skills and interests. Additionally, Abbas et al. (2022) noted that effective recruitment shape and maintain a positive organizational culture by attracting candidates who share the company's values and mission and lower lower turnover rates, reducing the costs associated with hiring and training new staff.

The relationship between recruitment practices and employee performance is a complex and multifaceted issue that has been the subject of extensive research (Abbas *et al.*, 2022). Understanding this relationship is crucial for several reasons. Organizations that can effectively recruit and retain top talent are more likely to achieve their strategic goals and outperform their competitors (Arif *et al.*, 2021).

Moreover, effective recruitment practices can contribute to employee satisfaction, engagement, and overall well-being and play a positive role in promoting social equity and equality. The research on recruitment practices therefore, can inform the development of policies and regulations that support effective talent management. By understanding the role and rationale of recruitment practices and employee performance, organizations can develop effective strategies to attract and retain top talent, thereby driving organizational success.

Studies have shown that effective recruitment practices can significantly impact employee performance, including productivity, job satisfaction, and retention. According to Armstrong (2017) human resources are among the most important assets in organisations. Human resource management (HRM) practices, such as recruitment and selection, training and development, and compensation, play a crucial role in improving employee performance. Alkhalilah and Mjlae (2023) found this to be true in Ukrainian universities.

Recruitment is a process of identifying and attracting suitable candidates to fill vacant positions. It involves assessing organizational needs and finding the best individuals to meet those needs. Universities, as institutions of higher education, play a vital role in society. They educate future leaders, conduct research, and contribute to technological advancements. The success of universities depends largely on the performance of their staff.

Employee performance is a critical issue for organizations worldwide. It affects economic development, national income, and living standards. Organizations strive to improve employee performance at all levels to achieve their goals. Recruitment practices can significantly impact employee performance. However, this relationship has not been extensively studied in the Tanzanian context. This study aims to

investigate the effects of recruitment practices on educational quality at St. John's University of Tanzania.

1.2 Statement of the Problem

Studies have shown that the human resource is the most valuable asset in any organization (Armstrong, 2017). In this manner the topic is too important in describing the the connectedness of workforce and organisation goal achievement as effective and efficiency of the workforce is a driver of organisational performance. However, recruitment is overwhelmed with myriad of unethical practices (Chigozie *et al.*, 2018) such as selection bias, selection discrimination, and favouritism due to existence of lack of reliability and objectivity which attracts competent applicants. To address this problem, the government established the TCU and NACTE to oversee the HLIs and ensure quality education in HLIs of 2019. Additionally, SJUIT had HRM manual and policy of 2007 for fixing conditions towards quality education provision without significant achievement. As retaining trainees with higher GPA is one among recruitment practices. However, it does not assure the university to get competent workforce there are many other required attributes than written examination class-mark passes. Thus, even other, practices, like competencies, job analysis and diversity are applicable, yet without supporting researches.

Unless, proper recruitment practices are adhered to, attracted personnel will foster poor employees' performance. As such universities will undeniably fail to play its novel role in the country of producing graduates with capability of solving social problems. But to solve the recruitment problem among private universities requires researched facts which currently are lacking due to limitedness of literatures in Tanzanian context. Therefore, there is a need to conduct a national and comprehensive study to assess the effect of recruitment practices on private universities employee performance. This study was designed to assess the effect of recruitment practices on the private universities' employee performance in Tanzania.

1.3. Literature Review

1.3.1. Equity Theory

Equity Theory, proposed by John Stacey Adams, emphasizes the principle of fairness in the workplace. It posits that employees expect a fair return for their contributions, which is known as the equity norm. This theory suggests that individuals assess their job satisfaction based on a comparison of their inputs (effort, skills, time) and outcomes (salary, recognition) with those of their peers. This comparison process is termed "social comparison," where employees evaluate whether they are being treated equitably relative to others in similar roles. When employees perceive inequity, they may respond by altering their inputs or outcomes mentally, adjusting their work effort,

or even leaving the organization altogether. The theory highlights that perceived unfairness can lead to decreased motivation and engagement among employees. Critics argue that Equity Theory is overly simplistic, as it does not account for the complexities of workplace dynamics, such as procedural fairness and the broader context of social interactions.

Despite these weaknesses the theory is supported by Kim & Beehr (2022) who found that employees who experience fairness in resource distribution and recognition report lower levels of stress and burnout. This study highlights how Equity Theory contributes to understanding mental health and motivation in workplace settings, showing that equity positively affects employee well-being. Similarly, Cho & Lewis (2021) found that perceptions of equity in compensation and workload were directly linked to job satisfaction and organizational commitment. Equally, Lambert et al. (2023) found that employees' perceptions of equity regarding workload distribution and recognition correlated with lower turnover intentions. Likewise, Wang & Tsui (2021) found that employees who feel fairly treated are more likely to collaborate and engage in teamwork. This study supports the theory's assertion that perceived fairness increases motivation and commitment. Organizations therefore, are encouraged to adopt equal opportunity policies to foster a sense of fairness among employees. The theory also underscores the importance of transparent communication regarding rewards and recognition to mitigate feelings of inequity.

1.3.2. Resource-Based View (RBV) Theory

RBV Theory posits that a firm's competitive advantage stems from its unique resources and capabilities. This perspective emphasizes that organizations should continuously evaluate their workforce to ensure they possess individuals with the right skills and competencies necessary for sustained success. The RBV suggests that the quality of human capital significantly influences an organization's performance. A core tenet of RBV is the idea of "barriers to imitation," which refers to the need for firms to protect their valuable resources from being easily replicated by competitors. This includes fostering strong working relationships and cultivating a skilled workforce. However, critics point out that RBV does not adequately explain how organizations maintain competitive advantages in rapidly changing environments. Despite these criticisms, RBV provides valuable insights into organizational behavior and human resource practices.

1.4. Empirical review

Job analysis plays a crucial role in understanding how adaptability and innovation contribute to employee performance. Several empirical studies have investigated the relationship between job analysis dimensions and performance outcomes across

different sectors, highlighting the significance of adaptability and innovation in driving employee success. Adaptability refers to the ability of employees to adjust to changing conditions, tasks, and environments. Studies indicate that adaptability is a key determinant of employee performance. For instance, Ahmad *et al.* (2021) examined the impact of adaptability on performance in the banking sector and found that employees who demonstrated high adaptability were more efficient in handling dynamic work environments. Similarly, Singh and Verma (2022) in a study on manufacturing firms, revealed that adaptable employees could better handle organizational changes, leading to improved productivity and overall job performance.

In education, Nguyen *et al.* (2022) found that adaptability among academic staff in universities contributed to better engagement with technological advancements in teaching methods, leading to improved educational outcomes. The research demonstrated that adaptability fosters resilience and flexibility, enabling employees to overcome work challenges and deliver better results. Likewise, innovation is defined as the ability to develop and implement new ideas, processes, or products, is another critical factor influencing employee performance. Zhou and Li (2020) explored the link between innovation and performance in tech firms, concluding that innovative employees contributed significantly to organizational growth and competitiveness by offering fresh perspectives and improving processes. Employees who engage in innovative practices are often more proactive, leading to enhanced problem-solving abilities and higher performance levels.

In the higher learning sector like university such as SJUT, Garcia *et al.* (2023) showed that innovative employees improved service delivery and patient care through the development of new methods and technologies. The study highlighted that fostering innovation among employees not only boosts their performance but also benefits the organization by promoting continuous improvement. Research has also focused on the combined impact of adaptability and innovation on employee performance. Hussein and Hassan (2021) found that employees who exhibit both high adaptability and a propensity for innovation are better equipped to deal with complex and evolving tasks. Their study on IT companies revealed that such employees outperformed their peers, as they were able to adjust to new technologies while simultaneously contributing to the development of novel solutions. However, these studies did not confine to the St. John's university of Tanzania.

Empirical evidence suggests that both adaptability and innovation, as dimensions of job analysis, have a positive and significant impact on employee performance. Adaptability enables employees to respond effectively to changing environments, while innovation drives the development of new ideas and practices that enhance

organizational performance. Encouraging these qualities through job analysis can lead to greater employee productivity and overall success within an organization.

1.5. General Research Objective

The general objective was to assess the effect of recruitment practices on the employee's performance in HLIs a case of St. John's University of Tanzania.

2. Materials and Methods

2.1 Research Approach

This study employed a mixed-methods research (MMR) approach, incorporating both quantitative and qualitative data collection, analysis, and interpretation. MMR allows for the integration of different philosophical paradigms—post-positivism and interpretivism—leading to a more comprehensive understanding of the research problem (Creswell, 2018).

2.2 Research Design

The study adopted a case research design, particularly focusing on a private university in Dodoma, Tanzania—St. John's University of Tanzania (SJUT). A case design was selected for its ability to provide detailed, context-specific insights from a smaller, well-defined sample (Creswell & Poth, 2018).

2.3 Study Area and Population

The research was conducted at SJUT due to its unique status as the only private, religious-owned university in Dodoma, making it an ideal representative of higher learning institutions (HLIs) in Tanzania. The target population included staff from 31 private universities.

2.4 Sampling Procedure and Sample Size

Purposive sampling was employed to select knowledgeable respondents, ensuring vital information was captured (Kothari, 2014). A sample of 93 academic staff members was calculated using Yamane's (1967) formula, ensuring statistical significance while accounting for potential errors.

$$n = N / (1 + N e^2)$$

N = finite Population 123 staff; n = sample size; e = sampling error (10%)

$$n = 123 / (1 + 123 \times (0.1)^2) = 93 \text{ respondents (academic staff).}$$

2.5 Data Collection

Both primary and secondary data were utilized. Primary data were collected through structured questionnaires and interviews, chosen for their ability to gather a wide range of insights efficiently (Creswell, 2014; Saunders et al., 2019).

2.6 Data Analysis

Descriptive statistics was employed to summarize respondent characteristics, presented through tables and graphs for clarity (Kumar, 2019). qualitative data were subjected to content analysis to derive thematic insights. Quantitative data were analyzed using multiple regression model as shown: $Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon$

Where:

- Y = Employee's Performance; β_0, β_1 , and β_2 are coefficients or constants; X_1 = innovation, X_2 = adaptability, and ϵ = error level.

3.0. Results

3.1. Codification of Respondents

The respondents were codified and presented in Table 1 to cope with the ethical standards of the research. The researcher used P1.P2, P3,Pn to represent various participants for interview.

3.2. Multiple Regression

The adjusted R square was 69.4% while the Durbin-Watson was 2.081

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	0.353	0.092		3.83	0.000
	Applicant's Innovations	0.529	0.065	0.519	8.17	0.000
	Applicant's Adaptability	0.351	0.062	0.358	5.63	0.000
Adj. R ² = 0.694						

Source: Researcher (2024)

Table 1: The Beta Coefficients on the Job Analysis and the Employee's Performance at SJUT

3.3. Discussion of the Findings

Table show that Adjusted R square was 69.4% which implies that independent variable which is job analysis (applicants' innovation and adaptability) influenced the employees' performance by 69.4%. the remaining portion was constituted by the exogenous variables which are beyond this study.

Likewise, Table 3 results the respective beta coefficients and probabilities at the significant level of 0.05 for applicants' innovation ($\beta = 0.529$ and P value = 0.000) and adaptability ($\beta = 0.351$ and P value = 0.000).

With regard to the applicant innovation, results show that a unit change in the applicant innovation results into increase in the employees' performance by 52.9%. this calls for the government to consider the applicant innovation to attain the goals in performance among employees. These results are in harmony with Hanif et al. (2021) studied innovation and employee performance: the mediating role of psychological well-being. The study aimed to establish the relationship between organizational innovation and employee performance. The findings revealed that innovation had a positive effect on the employees; performance.

Correspondingly, these results of this study complement the narration of participant P6 who opined that:

".....The applicant's innovation and adaptability attributes are crucial in imparting skills and competencies crucial to an employee to eagerly work and trigger performance.....these attributes are of great importance to the employee as they foster the completion of tasks within the prescribed time.....It is from this context that, during recruitment processes, organizations should consider both the applicant's innovation and adaptability attributes before officiating the employment to the applicants. These qualities (applicant's innovation and adaptability attributes) govern the employees' ability to meet the target in the working environment based on this importance they should be given great values....." (Interview/P6/ 2024).

On the other hand, study results are consistent with the postulations of Resource Based View (RBV) theory which holds that the competitive advantage of a firm is brought by the uniqueness of the firm's resources. Based on the RBV, firms have to continually evaluate their workforce to ensure that the right people with the right skills in the right places are always present in the institutions to bring about a stable competitive advantage against their competitive rivalry competitors (Lyons & Brennan, 2019).

Comparable study findings affirm that a major part of any firm's strength or weakness is determined by the caliber of the people employed and the quality of their working relationships (Gonzalez, 2020). It is recommended that these people should be identified due to their valuable contribution and protected from being picked by other employers or imitating their competencies. The theory, therefore, stresses that employers should aim at recruiting applicants with desirable innovative and adaptive skills to perform well in the organizations.

Implicitly, this means that the institution is required to recruit applicants with extensive levels of adaptability, innovation, and creativity to become the solution to problem providers rather than being problem creators. This will not only help performance but also bring in the competitive advantage of the organization during stiff competition posed by their competitors in a similar industry. The SJUT is required to recruit candidates with the capacity to adapt and innovate in research, constancy, and teaching meanwhile such applicants are required to have the ability to discover new ways of doing things in the academicians arena. By so doing this the STUT will be able to become competitive in terms of the academic arena compared to other high learning institutions in Tanzania.

Equally, P9 had similar sentiment to the P5 by opining that:

“.....Applicant’s innovation and adaptability attributes are very significant to the interviewees as they guarantee the employers to access their expertise demand. Thus, despite, the adequacy of job seekers, yet, recruitment processes have to be based on the applicant’s innovation and adaptability attributes. Thus, hands-on innovation and adaptability relate to the extensive innovation and creativity an employee had from previous work in other institutions. The presence of such experience is crucial for lowering the cost of the institution to train the new applicant as employers get already equipped employees. These two applicant’s innovation and adaptability attributes are highly demanded pre-point the expected quality of services offered by employees so they should be taken care.....” (Interview/P9/ 2024).

From this narration of the participant, it is noticeable that the applicant’s innovation and adaptability attributes are very crucial to the employees’ performance as the world currently demands higher technologies of innovation like Artificial intelligence (AI) as equitably higher technologies increase the productivities at a given level of inputs (costs).

Besides, P5 supplemented to the P9 where it was stated that:

“.....Naturally, their organizations need both applicants’ innovation and adaptability competencies. This is because both attributes reveal the competencies shown in the applicant’s working life. It is from this context that I strongly commend for possession of both the applicant’s innovation and adaptability competencies to ensure the timely completion of task in the university. This becomes even more imperative when considering innovation and design, especially in natural sciences where innovative skills cannot be avoided to ensure resources are prudently utilized.

Thus, applicant’s innovation and adaptability competencies are of paramount importance in the performance of the employees.....” (Interview/P5/ 2024).

In this regard, P5 confesses that both the applicant's innovation and adaptability competencies have a great effect on the employees' performance in organizations. Therefore, it indicates that to applicant's innovation and adaptability competencies produce significant and positive effects on the employees' performance in the higher learning institutions in Tanzania.

Based on the applicant adaptability, results show that a unit change in the applicant adaptability results into increase in the employees' performance by 35.1%. This calls for the government to consider the applicant adaptability to attain the goals in performance among employees. These observations of this study concur with Mulyani and Nurhadian (2023) in Indonesia studied employee performance: effects of competence and compensation. The purpose of this research was to determine effect of the employee competency and employee compensation on employee performance. The research used descriptive where the study found that both employee competency and compensation influenced employee performance by 7.2% and 70% respectively.

Harmoniously, these study findings thoroughly tally with the assumptions of the Equity Theory with assumptions based on equating the employee's performance with an expected fair return for what contributes to their jobs, a concept referred to as the equity norm; their inputs and outcomes with those of their co-workers and employees' perception on the inequality treatment. The comparison of the return in terms of financial rewards is equated to the adaptability and innovation of the applicants. Thus, upon assessment, the results are reflected in the level of motivation in performance in the work environment.

4. Conclusion and Recommendations

Conclusion

The study findings on the effect of recruitment practice showed that independent variables (applicant's innovation and adaptability) produced positive and significant effects on the employee performance at St. John's University of Tanzania. These findings indicate that applicants' innovations are highly demanded nowadays as the prerequisite for consideration of the applicant for employment during recruitment processes. These findings hold as an employee is an asset it is of great importance to consider his/her ability to innovate and be creative. The rationale for these findings is that innovativeness adds value to organizations as various firms need to gain a competitive advantage from human resources. Similarly, Applicant's adaptability is imperative to the employing firm as dynamics affecting business firms dictate that employees should be able to adapt ever-changing business environment. These changes are sometimes caused by geopolitical interest or macroeconomics where the firm exists.

In the context of these findings, there is a growing need to consider the inclusion of both applicants' innovativeness and adaptability aspects during recruitment processes to recruit valuable human resources with the capacity to produce desired results in the institutions.

It is from findings setting that recruitment based on a job analysis (applicants' innovativeness and adaptability) is imperative to be considered as such applicants possess required the skills, competencies, and attitudes that will be revealed during the performance of the employees.

Recommendations

The researcher recommends that the government through TCU to execute education policies with emphasis on the adaptability and innovations. Adherence to such policy will produce applicants or graduates with experience and testimonial (track record) which are important for employability and performance. Similarly, the researcher recommends that students should strengthen the job analysis (innovation and adaptability) aspect in their studies. Acquisition of such traits enables out competition in the vibrant labour market.

Suggestions for Further Research

Since the current study relied on the case study research design. First, this provides an avenue for future studies to consider other research designs. In so doing, the future study should determine whether study research designs would produce analogous study findings. Secondly, the current study was based on the only one university which was Saint John's University of Tanzania out of many universities. It is suggested that future studies should incorporate other universities in the country to get the full picture concerning the topic at stake. Thirdly, the fact the St. John's University of Tanzania is a religious and privately-owned institution; thus, it is evident that this study has not covered the public university. It is in the future recommended that public universities study similar topics to produce comparable study findings. Fourthly, the fact that this study adopted the mixed research approach. This implies that the researcher disregarded other research approaches such as quantitative and qualitative independently. This suggests that future studies should consider either a qualitative or quantitative approach to ascertain whether current study findings will change or remain unchanged.

Abstract

Stakeholder participation in the fisheries supply chain in Dar es Salaam, Tanzania, is still very low despite the crucial role that stakeholders play, the efforts and initiatives taken by the government to improve fisheries business. This might have a significant detrimental impact on the fishing industry's supply chain, leading to tampered products and late product deliveries. The purpose of this study is to investigate how stakeholders are involved in the fisheries supply chain in Dar es Salaam, Tanzania, and to offer suggestions for how to increase their involvement. The study's main objectives are to determine the contributions of stakeholder participation, to look at the obstacles to stakeholder engagement, and to identify opportunities for stakeholder engagement in the Dar es Salaam fisheries supply chain. Based on the purposive and snowball sample size of 41 respondents, a qualitative case study design will be used with in-depth interviews, non-participant observation, open-ended questionnaires, and document reviews. The results reveal that a number of stakeholders are involved in the supply chain of fish. Among them include farmers, fishermen, collectors among others. Moreover, the study further reports that the entire fish supply chain is constrained by various constraints that when the government actively works with stakeholders will solve these challenges. The study recommends the institution of alternating fishing, cleaning the debris, and supporting fishermen and fish farmers financially.

Keywords: *Stakeholders, Engagement, Fisheries, Supply Chain*

1.1 Introduction

Globally, the participation of fishing industry stakeholders has a substantial impact on livelihood and, in particular, the availability of seafood (Issa et al., 2022). For instance, stakeholders, particularly fish dealers, fishermen, and collectors, participate in fishing activities in nations like Australia and Argentina by planning long-term for processing fisheries, sharing knowledge, and resolving conflicts between members who have

sustainable seafood certification (Kohne & Kohne, 2019). In a similar vein, since stakeholders in a nation like Norway are able to plan fish production and processing, sorting, facilitate transportation and storage, palletize, label, and sell a variety of fish, they become essential to those who are fully or partially engaged in the fishing industry (UNDP, 2022; SINTEF, 2022). However, a variety of obstacles have made it difficult for them to carry out a particular role in the fishing supply chain, including but not limited to a lack of coordination and interaction between agencies, a lack of reciprocity and trust between organizations, and power imbalances between stakeholders (Doria et al., 2021). Other challenges for managing fishery supply chains include overfishing, pollution, and habitat destruction (Wang & Wang, 2021); supplier innovation (Bergesen & Tveteras, 2019); pressure for industrial transformation; outdated technology; risks of extending the industrial chain; and a lack of discursive power (Yu & Yin, 2019).

Stakeholders in Africa are also active in the fish product supply chain by emphasizing the vital role that processing fish plays in transferring capital to end consumers, ensuring food security, supporting livelihoods, and advancing the continent's development goals (Chan et al., 2019). Fish supply and commerce, for example, are carried out in countries such as Kenya and Ghana to address national food security, employment possibilities, and poverty alleviation (Hasselberg et al., 2020). In accordance with this reality, fish play critical roles in countries like Burundi, Ethiopia, Rwanda, and Uganda in maintaining rising fish demand, enhancing earnings, enhancing food security, and enhancing nutrition for smallholder farmers, fishers, and consumers in rural and urban regions. In addition, fish farmers are assisted by supply chain processes in running their businesses smoothly and efficiently so that they can deliver fish products to individuals who depend on them, whether for a living or for consumption (Obiero et al., 2019).

In a similar situation, a nation like Nigeria also adopts a supply chain for fishing, but its contributions are constrained by significant issues like inadequate infrastructure, health and food safety measures, biosecurity measures on fish farms, inadequate access to refrigeration and clean water, poor hygiene among those handling the fish, inadequate fish inspection, failure to wear protective clothing, and limited medical monitoring of those handling the fish (Grema et al., 2020). In addition, the Ethiopian government suggests working with other stakeholders and offering seminars and training to increase capacity and understanding of financial management, resource exploitation, and environmental preservation (Mangesha, 2020), but stakeholder involvement in the fishery supply chain is still low.

Stakeholder participation is still in its infancy in Tanzania because the majority of fish farmers, fishermen, collectors, and processors cannot participate directly or indirectly

in the fishery supply chain (Charisiadou et al., 2022). However, they can be partially involved in certain supply chain functions of fish products in both urban and peri-urban areas. For instance, Food Agriculture Organization (2019) reports that Tanzania's fishing industry contributes more than 2% of the country's Growth Domestic Products through assisting in the survival of the traders. The fishing supply chain acts as a conduit between fish producers and customers to promote the flow of fish products and services (Obiero et al., 2019).

On the basis of the aforementioned activities, the Tanzanian government and other interested parties have launched a variety of projects and initiatives with the goal of promoting the fish industry, and in particular, fish supply chain management (Mbelle, 2020). Such initiatives include the national fisheries policy of 2020, the Bunda district fisheries investment plan, the national fisheries legislation of 2003 (no. 22 of 2003), the multi-stakeholder consultation for the Tanzanian anti-dynamite fishing campaign, and the national fisheries policy of 2003 (Issa et al., 2021).

In addition, the government removed 114 fees from the agriculture, livestock, and fishing sectors in 2017–18 to manage the flow of resources, particularly fish production (Ministry of Finance, 2020–21). Along with these, strengthening the management and control of fisheries resources to increase fish catch, launching a revamp of the Tanzania Fisheries Corporation (TAFICO), promoting aquaculture investment, and increasing the number of fish farmers in Tanzania are among the crucial steps for managing actively fish activities, whereby fish supply chain is crucial for all stakeholders (MOF, 2020/21).

Similar to this, the government's regulations in sections 24 (1) and (30) required stakeholders to follow fishing regulations and work with other pertinent government agencies like fisheries ministries, Tanzania Fisheries Research Institute, universities, and other stakeholders to produce or share information to ensure sustainable aquaculture practices in which fishing business and supply are within the bounds of the law (URT, 2009; 2018). Unfortunately, it appears that there are no official rules, distinct policies, or monitoring mechanisms to support aquaculture at the national level, which discourages stakeholders from participating in fish supply and demand (Charisiadou et al., 2022). Above all, the Tanzanian government is capable of setting quotas for initiatives like creating marine protected areas, passing legislation to end illegal, unreported, and unregulated (IUU) fishing, and working with stakeholders to ensure that the fishing industry is resilient and sustainable (FAO, 2019). However, the overall situation demonstrates that stakeholder engagement, such as that of fish wholesalers, retailers, collectors, and traders, is still low in this sector of the economy.

Unfortunately, despite the important contributions made by different stakeholders in relation to the policies, initiatives, and government support intended to boost the fish business, stakeholder engagement in the fishery supply chain falls short when it comes to carrying out fishing supply chain functions (Kamaylo et al., 2021a). Due to marketing restrictions, a lack of modern knowledge, inadequate harvesting and storage facilities, illegal fishing, and weak governance, it is difficult to manage the fish business and supply effectively (Eyayu et al., 2023; Orofino et al., 2023; Aceves-Bueno et al., 2021; Shalehin et al., 2022). While current literature from Tanzanian setting shows that government initiatives, policies, and procedures are quite rigid for most players to comply to and, as a result, take on the role of fishing supply chain (Kamaylo et al., 2021a). As a result, it is in the researcher's interest to investigate stakeholder engagement in the fishery supply chain in the Tanzania context in order to determine why stakeholders fail to be sufficiently engaged in the fishery supply chain in the context of Dar es Salaam and, finally, to suggest measures to alleviate the aforementioned situation.

Unfortunately, despite various perspectives and government initiatives such as fisheries legislation from 2003, national fisheries policy 2020, and government regulation in sections 24 (1) and (30) of fisheries, the level of engagement of various stakeholders in the fishery supply chain remains in its infancy, and to the best of the researchers' knowledge, their engagement has not been well captured, exhausted, and deemed sufficiently deep realized in the available literature. As a result, the goal of this study is to determine what the specific contributions of stakeholder participation in the Dar es Salaam fishing supply chain are. What exactly are the obstacles preventing them from participating in the Dar es Salaam fisheries supply chain? What opportunities for participation in the Dar es Salaam fisheries supply chain will be expanded? Finally, proposals to strengthen stakeholder engagement in the fisheries supply chain will be given.

1.2 Objectives of the study

The main objective of this study is to explore the stakeholders' engagement in the fisheries supply chain in Dar es Salaam with the view to establish why they fail to be engaged in this sector of economy. Specifically, the study intends: -

- a. To examine the structure of the fishery supply chain so as to identify key stakeholders and their functions
- b. To examine the constraints facing stakeholder's engagement in the fisheries supply chain in Dar es Salaam

2. Literature Review

2.1 Stakeholder theory

The stakeholder's theory was developed by Freeman in 1984. This is the most contentious management theories to be developed (Goyal, 2022). It suggests that the corporation is not only owned by its shareholders but is also a stakeholder in society and that management must consider the interests of all stakeholders in making decisions. Further, it has four types of academic field namely sociology, economic, politics and ethics (Wagner Mainardes et al., 2011). On the other hands, Freeman (1984, p. 46) defined the stakeholder as any group or individual who can affect or being affected by the achievement of the organization's objectives since it includes actors which is normally comes from outside the boundaries (Harrison et al., 2019; Kivits & Sawang, 2021) while Clarkson (1995) further argues that stakeholders are divided into two groups, namely primary stakeholders and secondary stakeholders (Mhlanga & Moloi, 2020).

Previous literature has analyzed stakeholders in business and firms to generate value for the company's stockholders if they are engaged in certain business function. This demonstrates the importance of stakeholders to a business operations and influence, and how managers must comprehend and account for each one (Beck & Storopoli, 2021). The theory was propounded by several studies since it makes a noticeable influence on strategy research for most of its existence on how stakeholders are influencers of organizational benefits (Bridoux & Stoelhorst, 2022). In addition, Mhlanga and Moloi (2020) state that both Donaldson and Preston (1995) and Friedman and Miles (2006) argue that the stakeholder theory should not be considered a singular theory, but rather a collection of theories that can be used to effectively manage stakeholders which is composed of three distinct approaches: normative, instrumental, and descriptive approaches for effectively managing business operations (Valentinov & Hajdu, 2021)

Accordingly, this study will adopt stakeholder theory to pinpoint objective one which talk to the contributions of stakeholders in the business operations specifically fish supply chain which require investigation so as to know how fish business is truly adopt and engaged by stakeholders (Freeman et al., 2017). Also, it is relevant to this study because stakeholders engagement usually follows the information strategy, response strategy, and involvement strategy where by this study involvement strategy is a critical point (Stocker et al., 2020)

2.2 Theory of constraints

The theory of constraints (TOC), created in 1984 by Eliyahu M. Goldratt, will also serve as a guide for this study, while naturally, it was originated in the mid of 1980s and published 1984 in the book of 'The Goal: Excellence in Manufacturing' (Urban & Rogowska, 2019). In order to deal with restrictions and constraints in particular, the

TOC is a management strategy that has been embraced. It has been created to put a strong emphasis on ongoing improvement in order to improve organizational performance (Mabin & Balderstone, 2020). It is a management philosophy that aims to continuously improve processes that it was developed as a way to implement a theory of ongoing enhancement (Urban & Rogowska, 2019). Also, it focuses on the weakest situation in the chain in order to improve system performance (Şimşit et al., 2014).

On the other hands, it has been derived be used to manage industrial planning, production control, project management, supply chain management, accounting, and performance measurement, as well as non-profit facilities such as hospitals and military depots (Blackstone, 2010). Further, it asserts the limits a system from achieving higher performance versus its goal"(Şimşit et al., 2014). Moreover, the main objective of TOC is to improve overall performance by identifying and addressing bottlenecks or constraints in a system (Blackstone, 2010)

According, the theory is in the line with objective two in viewing of constrains which hampering the stakeholder's engagement in fishing supply chain. In connection with TOC, the study involves various stakeholders such as Government officials, fishermen, collectors, processors, distributors, and consumers therefore any constraint or bottleneck in this system can result in complications that can affect stakeholder engagement.

2.3 The structure and the stakeholders' Functions in the Fisheries Supply Chain

The goal of this section is to determine the structure and the role of various stakeholders in the engagement of the fisheries supply chain. According to the available literature, various stakeholders can be directly and indirectly involved in fisheries trade and supply. Typical fishery supply chain is made up by number of stakeholders which include but are not limited to fishermen, dealers, collectors, agents, and consumers to obtain enough fish (Issa et al., 2022; Hjellnes et al., 2020). The structure is made up by groups of connected people that collaborate to deliver a fish-product to the consumer while simultaneously generating employment and advancing the economy (Jermsittiparsert et al., 2019).

In the similar way, stakeholders such as collectors, wholesalers, government, retailers and similar to this are undertake critical role in the fishery supply chain such as providing knowledge about farming and harvesting (Tamburini et al., 2020), packaging and handling facilities (Acharjee et al., 2021), facilitating distribution (Pascual-Fernández et al., 2019), and information storage and preservation (Hakimah et al., 2019). These engagements are examined below to assess the extent to which stakeholders carry them out as well as their ability to contribute as expected and

required.

Literature shows that fish collectors contribute relevant knowledge and awareness on fish farming and harvesting (McCluney et al., 2019; FAO, 2019). They also provide education and training on fish farming and harvesting techniques (Acharjee et al., 2021; FAO, 2019). Furthermore, fish traders were able to offer information regarding the adoption of innovative techniques for fish farming (Rajan et al., 2013; Wanja et al., 2020). Similarly, stakeholders such as private enterprises were able to conserve waters and nutrients for fish growth, as well as improve local climatic conditions (Francová et al., 2019) to contribute as expected and required.

Literature shows that fish collectors and processors are easing packing and handling of fish (Bedane et al., 2022). They carry out this job by selecting proper packaging facilities to keep fish fresh and safe during transportation (Almeida et al., 2022). This is also accomplished by choosing and determining handling devices such as buckets (Issa et al., 2022b; Tsironi & Taoukis, 2018; Jueseah et al., 2020). Furthermore, providing relevant knowledge regarding fish hygiene before and after packing is a critical obligation in this category (Edirisinghe et al., 2022).

2.4 Constraints to stakeholders Engagement in the Fisheries Supply Chain

The available literatures points to out a number of constraints of stakeholders when engaged in the fisheries supply chain. These constraints include climate change and marine debris (Ruiz-Salmón et al., 2020), unlawful fishing undermines the efforts of stakeholders such as fish exporters and traders to hold matured fish (Nahuelhual et al., 2018). Moreover, the rapid collapse of fish populations (Laso et al., 2018), water pollution (Sampantamit et al., 2020; Ali & Khan, 2018), Illegal fishing (Eyayu et al., 2023; Orofino et al., 2023; AcevesBueno et al., 2021; Shalehin et al., 2022) are also cited as constraints. A study by Kimani et al. (2020) notes that shortage of harvesting equipment and insufficient harvesting skills are a big challenge. In the same manner, inadequate fish handling facilities (Noman et al., 2022), weak government supervision and inspection of the handling system limits this feature (Kaleem & Bio Singou Sabi, 2021), inexperienced and untrained fishers to manage packaging and handling (Kumaran et al., 2021; Noman et al., 2022; Vanderroost et al., 2014).

Furthermore, poor management, illicit, unreported, and uncontrolled fishing are the problems, according to Orofino et al. (2023). Furthermore, due to a lack of contemporary equipment for fish preservation and storage, fishermen resort to traditional methods such as drying and smoking (Mangesha, 2020; Kamaylo et al., 2021).

3. Methodology

3.1 Study Area

The research was carried out at the Kivukoni and Kunduchi fish markets in Dar es Salaam, Tanzania, where the exploration of stakeholders' engagement in fisheries supply chain took place. Researcher chose these areas because there are more fishing stakeholders involved in the fishery supply chain in these areas than in other parts of Dar es Salaam. On the one hand, it was easier for researchers to gather accurate, dependable, and correct information from stakeholders involved in the fisheries supply chain.

3.2 The study approach

To fulfill the two objectives of the study, the researcher employed qualitative research approach with a case study design. A qualitative research approach is one that seeks to explore, clarify, investigate, uncover, and grasp a group of people's situations, feelings, perceptions, attitudes, values, beliefs, and experiences (Spinks & Canhoto, 2015; Jackson et al., 2007). This strategy employs inductive rather than deductive logic and either directly or implicitly communicates the purpose of the qualitative study and the data analysis technique (Mohajan & Mohajan, 2018; Astalin, 2013). The methodology is adaptive and emergent in character, with non-linear and non-sequential operationalization. As a result, the researcher used this technique to document people's experiences, actions, emotions, and feelings, as well as how they behave in their environments and the challenges they face while carrying out their tasks (Wisdom & Creswell, 2013; Mohajan & Mohajan, 2018; Almalki, 2016).

Following this approach, researchers selected a sample from an unlimited population using purposive and snowball sampling strategies. Considering the point of saturation, the overall sample size was 41 responders, with twenty-five respondents drawn from Kivukoni and Kunduchi fish markets and sixteen respondents were finally be selected from private fish farms. Through this sample, In-depth interviews were conducted with fisheries stakeholders, specifically those participating in the fisheries activities of the Kivukoni and Kunduchi fish markets, as well as private fish farms. The interviews were conducted based on the interview guide prepared. All participants were asked similar questions with an exception of when more probing was needed. The interviews lasted between 30 and 45 minutes and was conducted in Swahili language and later the transcriptions translated to English later on by a qualified translator. Moreover, the study used documentary review to obtain secondary data. This was through reviewing reports and other government publications on fisheries supply chain. As a result, the Fisheries Act No. 22 of 2003, the National Fisheries Policy, and the multi-stakeholder consultation for Tanzania's anti-dynamite fishing campaign was employed in this research to investigate stakeholder engagement in the fisheries supply chain.

3.3 Data analysis

Researchers employed content analysis, a method for evaluating qualitative data. In order to evaluate and analyze events and occurrences more effectively, it enables categorization (Harwood & Garry, 2003). In addition, the researcher used qualitative analytical framework to organize, analyze, and present the data in light of the objectives. Additionally, the study will interpret and evaluate the qualitative data using techniques for qualitative analysis (MAXQDA 20). Transcripts of handwritten notes were typed, and documents will be stored as Word documents. The transcribed data were carefully categorized based on the findings.

4. Findings

4.1 The structure of the fishery supply chain so as to identify key stakeholders and their functions

This was the first objective of the study. In the study the researcher was interested in itemising the stakeholders involved in the fish supply chain. The researchers were of the view that obtaining the stakeholders involved in the supply chain of fish would help to determine their roles and the entire structure of fish supply chain in the urban settings of the country. In the subsequent section a list of stakeholders involved in the fish supply chain is given.

Table 1: Stakeholders involved in the fish supply chain

No.	Stakeholder	Role
01.	Fishermen/ fish farmers	Farm and harvest fish from the water bodies, storage and preservation.
	Food manufacturers	Manufacture of fish feeds
02.	Collectors	Collect fish from different locations, storage and preservation
03.	Fish dealers	Sharing information among stakeholders, storage and preservation, monitoring and tracking fish, monitoring and tracking fish, facilitating distribution
04.	Agents	Sharing information among stakeholders, storage and preservation, monitoring and tracking fish, facilitating distribution
05.	Auctioneers	Collecting and selling fish
06.	Wholesaler	Handled and packaging, storage and preservation, facilitating distribution
07.	Retailers/ informal mongers	Selling fish

08.	Consumers	Buying fish
09.	Government	Creating rules that govern fishing

Findings report that a different number of stakeholders are involved in the supply chain of fish. Each of the mentioned stakeholder has specific tasks. These tasks include farming and harvesting fish, collecting fish and distributing the fish. Moreover, some stakeholders handle, store and find customers. These findings are in line with several existing literatures for example (Tamburini et al., 2020; Acharjee et al., 2021; Hakimah et al., 2019; McCluney et al., 2019; FAO, 2019, Acharjee et al., 2021; FAO, 2019).

Following these findings, the researcher was interested to sketch the structure of the fisheries supply chain the involves all stakeholders as given in Figure 1.

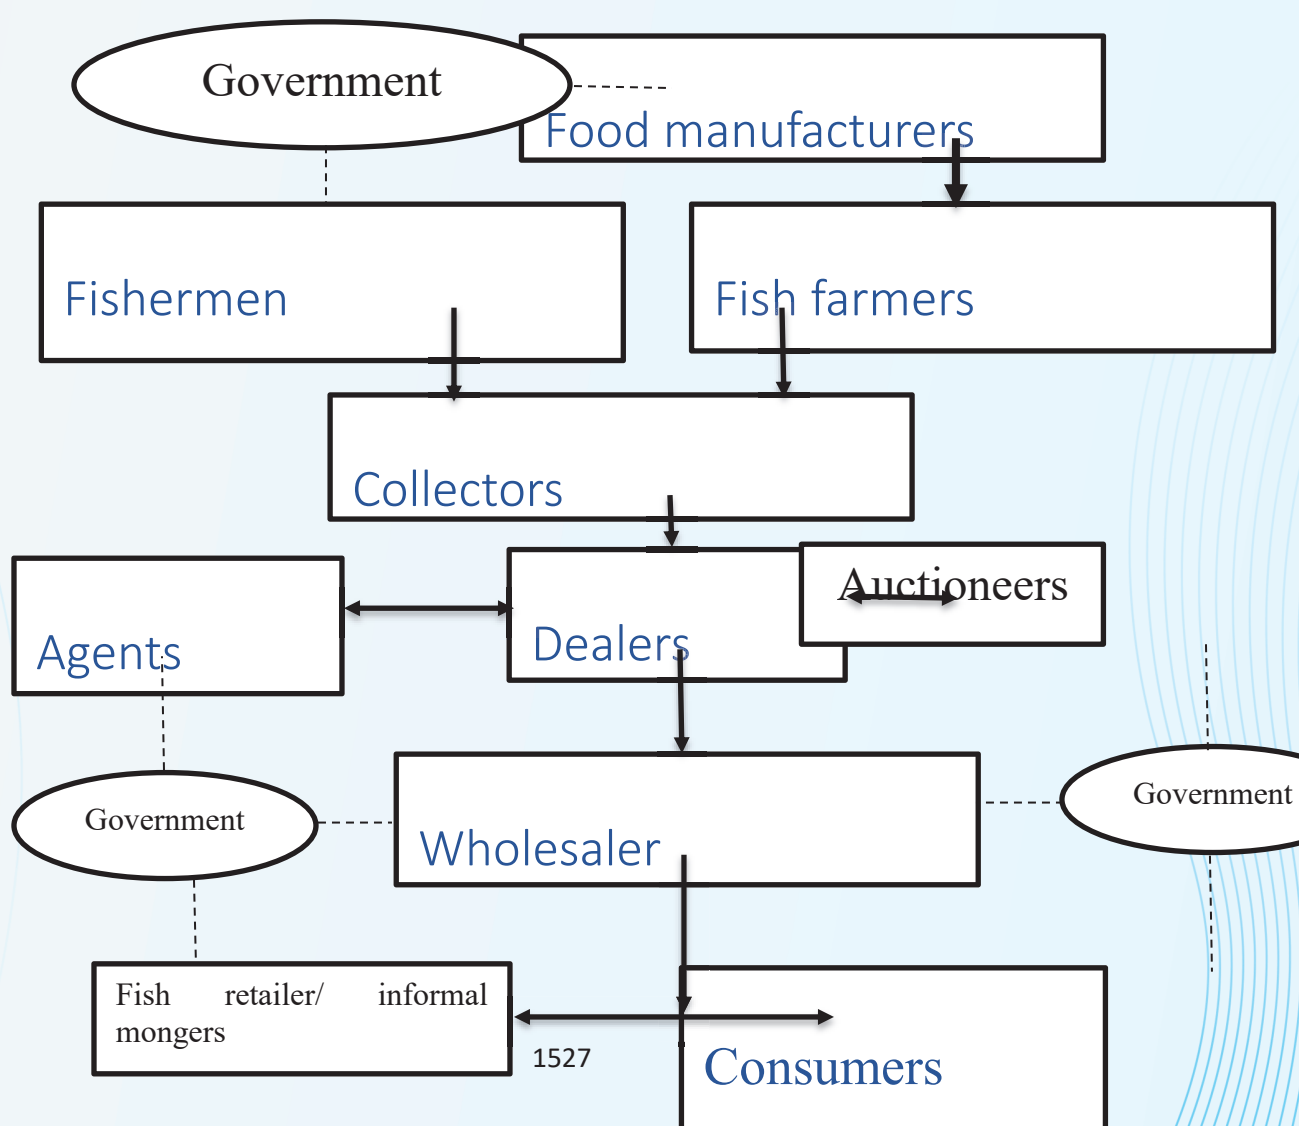

Figure 1: The structure of fish supply chain

4.2 The constraints facing stakeholder's engagement in the fisheries supply chain in Dar es Salaam

In this objective, the researchers were interested to find out what constrains stakeholders in clearly taking their responsibilities there by contributing to adequate fish supply chain in the urban settings of the country. In order to obtain the findings, the researcher asked a number of questions to the intended respondents. Questions like "What do you think constrains your operations and continuous fish supply in the urban settings of the country"? Several constraints were identified and thoroughly explained by respondents. Such constraints include climate change, decreasing marine population, market, rudimentary fishing methods and vessels, hiking prices of feeds, limited equipment techniques, poor fish handling techniques to mention but a few. A thorough clarification of these constraints is given in the subsequent sections.

Climate change

This was at the forefront during the interviews. To both fish farmers and those obtaining fish from the sea, the situation affected them. The raising sea level, scarcity of rains, overheating of the seas and ponds all were cited as resultants of climatic changes experienced in the world today. During an interview, one stakeholder said; *"...the situation is undetermined. We have increasing drought periods. During them, we have a little catch. The costs we incur and what we get are far different"*.

Another participant added, *"...the more we experience droughts the more the fish becomes scarce. As water gets hotter, they go deep the sea. We can't catch the fish till during rainy seasons"*.

As for fish farmers, the situation was also reported to be affecting them. One of them reported:

We technically dig our ponds 1.5 deep. As we experience prolonged droughts, constant heat affects the fish. They are stressed, cannot grow to the required size and sometimes die. But to some of us who depend on water from rivers, are affected because as ponds dry up, rivers dry up too and fish remains at the risk of either dying or being harvested prematurely (Fishfarmer, Kola).

Such quotations confirm the presence of the problem and how adversely climate change affects the stakeholders and the entire supply chain of fish in the urban settings.

The decreasing population of fish

It was revealed in this study that the population of fish has decreased drastically in the recent year. This is reported by fishermen along the coastal line of the country. This is also evidenced by the number of fish caught daily currently as compared to the ones caught in the previous years. The situation is attributed to unlawful fishing with the use of dynamites which not only kill all fish planktons but also damage coral reefs which are fish breeding grounds and habitats. One of the experienced auctioneer was quoted saying:

To be honest the population of fish has decreased drastically. We used to auction so much in the past years but since the beginning of illegal fishing, the number of fish has kept decreasing a year after the other. These days, it is not surprising for one to set to the sea and come back with less than 20 kg of fish was not common back then (Fisherman, Kunduchi).

During another session held at Kivukoni fish market, a fish collector said; “...I think the population of fish in the sea has decreased.... I used to collect even 50 tons of fish for just a day or two. But these days, collecting at least 5 tons is a tag of war and a greater achievement indeed”.

Simply putting it clear, another collector said; “...the untouchables (illegal fishers) kill the young and old fish, how do you expect the number to increase? It will always dwindle”

These quotations cement the idea of the presence of decrease in the population of fish in the sea. While the situation is regarded to be of that nature, the use of dynamites has been cited as the major cause of the situation and there is a feeling that those involved in the illegal fishing are known but are ‘untouchables’.

Fishing and harvesting methods

Stakeholders revealed that the entire supply chain of fish is constrained by the fish harvesting methods. It was revealed that the fishers are only using boats and canoes and only have access to shallow waters of the sea and cannot navigate in the deep-sea waters of the country. Moreover, it was revealed that respondents revealed that there are no advanced fishing methods. The use of normal nets and hooks are outdated but are still used in the Tanzanian context. This affects the amount of fish catches obtained on the daily basis and the amount of fish that enters the fish supply

chain. During the interview session, one of the fishermen was quoted saying: “...we only use normal boats, hooks and nets that only facilitate us to catch a little fish. This leads us into catching a small number of fish as compared to others who use advanced methods”.

With regard to fish farmers, they revealed that when it comes to harvesting, they also use buckets and other containers after drying all the water from the ponds that would have been used to farm other fish. One of them said; “...when it comes the harvesting season, we are forced to dry all ponds, and waste the water that would have been used for keeping other fish. As we dry the ponds, we also use buckets to harvest the fish”.

Water debris

This is yet another constraint that hinder stakeholders in the entire fish supply chain. Findings real that, with the presence of changes in the climatic changes and human activities, it has always been common for Marine debris to affect the entire fishing activities and the fish supply chain in the urban settings of the country. The presence of used plastic materials, abandoned nets and other littered materials are all hindering the process of fishing activities. In the same way, the debris affect the presence of fish, its health and the entire fishing activities. During an interview one of the fishermen reported that:

“...on a daily account, bottles and other litters are dumped in the sea. These are disastrous to fish and the fishing activities. We normally find the debris in most breeding and habitat grounds. Most of the debris contains chemicals and hazardous materials that pollute water, kill or repel the fish away”(Fisherman 7, Kunduchi).

Such realities presented by participants reveal that the presence of debris that pollute water, kill fish and at the same time minimise the amount of fish caught. Moreover, the limited number of fish caught affects the number of fish released in the entire fish supply chain.

Fish handling facilities

Findings of the study indicate that as fish is obtained from the water bodies, fishermen always use frozen ice to store the fish. This is because they do not have the required and special fishing ships which have inbuilt refrigeration facilities. Moreover, whenever the fish reaches the shore, the way it is handled shows that the procedure lacks handling facilities. It was revealed that the caught fish is transported in pick-up trucks, boxes, or even on motorcycles. One of the transporters said; “...this is my pick up that transports fish from Kunduchi to Kivukoni fish market”. Looking at the truck, it was a normal truck without any form of refrigeration facility at all. Moreover, the

way fish is handled during the actual auctioning process is yet depicting limited handling equipment. One of the auctioneers said: “...the boards and tables we do auction on are not what we should use. They attract dirtiness, and contaminate the fish itself and may endanger the consumers’ health”. In the same line, fish farmers also mentioned inadequacy of handling equipment and they mentioned that the use of boxes and buckets have been an order of the day in fish handling during harvesting and transporting to the market. With such quotations, findings reflect that reality that there is limited equipment for handling fish.

Poor packaging and storage facilities

The findings of the study indicate that while fish is consumed with in and outside the Tanzanian borders, the one sold internationally fetches low income because it is sold at cheaper prices in comparison to others from other nations. This is because they are poorly packaged and stored. For instance, fish to be transported out of Dar es salaam and to nearby countries is packaged in plastic bags or plastic containers, transported in less refrigerated trucks which, apart from considered of a poor quality, they fetch low prices. The fish sold from other countries are packaged in clean polythene bags and boxes which are labelled and transported in refrigerated trucks. While fish reaches the destination fresh, it also attracts more prices. During an interview one of the wholesalers said:

“The business is real and has greater potentials of accumulating cash but the limited equipment and facilitating environment are letting us down. If we had packaging materials and storing and refrigerated trucks, our fish would be fetching competitive prices than now” (Wholesaler 1, Kivukoni).

Moreover, fish farmers presented that, as they harvest their fish, they do not have special cooling places before they take fish to the market. The greatly stressed that they handle food through buckets, basins and sacks. This indicates that handling and storage equipment are a burning challenge.

Findings presented in this objective are in line with The available literatures which point that climate change and marine debris (Ruiz-Salmón et al., 2020), unlawful fishing (Nahuelhual et al., 2018), the rapid fall in the population of fish (Laso et al., 2018) and water pollution (Sampantamit et al., 2020; Ali & Khan, 2018) as great constraints to fish supply chain. Moreover, other studies report insufficiency of skills (Kimani et al., 2020) and inadequate fish handling facilities (Noman et al., 2022) as other constraints that not only affect the fishermen but the general fish supply chain.

5. 0 Conclusion and Recommendation

Conclusion

The supply chain of fish in the country is not a single persons' activity. It includes a collection of different individuals who at different times each plays special duties of ensuring that fish is supplied all over the country without delay. These stakeholders include fish food manufactures, fishermen, fish farmers, collectors, aents, among others. Each takes a role to ensure that fish reaches the required destination in time. Moreover, while stakeholders are trying their level best to take their responsibilities, they are hindered with a number of challenges including inadequacy of equipment, illegal fishing and marine debris. Such constraints restrict the way fishermen obtain fish and the entire supply chain of fish in the country.

Recommendations

The government through the marine police and marine section of the Tanzania Peoples' Defence Force (TPDF) are advised to keep a keen eye on the marine waters of the country. This will help in limiting illegal fishing which endangers the population of fish and the natural habitat and breeding grounds of fish. The study also recommends the government through the ministries of livestock and fisheries to implement restrictive fishing in some periods. This will allow the fish to breed and reproduce themselves and hence increase the number of fish in the sea. This can be implemented by allowing fishing to take place in certain months and restrict fishing in other months. The study recommends the government through the vice president's office to initiate continuous programmes of cleaning the sea debris. This involves the cleaning of the wasted bottles, nets and other containers that normally contaminate the sea waters. The study recommends the government to provide farmers and fishermen and fishing companies with loans that will facilitate them to buy advanced equipment for fishing activities. This will facilitate effective fishing, increase the amount of fish caught there by ensuring that there is sufficient fish supply in the market.

Abstract

This study aimed to evaluate the impact of fiscal policy on economic growth in Tanzania, focusing on government revenue, expenditure, inflation, and trade openness in relation to GDP. Conducted at the Bank of Tanzania (BoT) and the National Bureau of Statistics (NBS), the study used a quantitative, descriptive design based on secondary data from 1995 to 2023. Keynesian and Classical economic theories guided the research, which utilized trend analysis, correlation analysis and multiple regression. Findings revealed that government revenue and expenditure positively and significantly impacted GDP.

Keywords: *Fiscal policy, Economic growth, Government Revenue, Expenditure, Inflation, And Trade Openness.*

1.0 Introduction

Economic growth is a critical indicator of a country's development, helping to address macroeconomic issues like unemployment and income inequality. The debate around economic growth centers on its determinants, with fiscal policy and trade policy being key drivers of prosperity through investment and technology stimulation (Shah, 2022; Ubwani, 2023). In Tanzania, the relationship between fiscal policy, trade openness, and economic growth from 2020 to 2023 is especially relevant, with economic growth rising from 1.99% in 2020 to an estimated 5.2% in 2023, raising the need to examine which fiscal instruments drive this growth (Hassan, 2022; World Bank, 2010-2024). While empirical studies show fiscal policy and trade openness influence economic growth in developing countries, differences in findings arise due to varying fiscal instruments and trade openness measurements (Karingi and Biwott, 2021).

Fiscal policy, including government spending and taxation, is pivotal in shaping a nation's economy. While many studies have explored the relationship between fiscal policy and economic growth, gaps remain in understanding the mechanisms and causal

relationships (Kramer, 2021). Clarifying these aspects is vital for effective policy formulation. Additionally, challenges like prolonged budget deficits, public debt, and political dynamics hinder fiscal policy implementation and its potential for long-term growth (Holkagan, 2021; Halkalamari, 2021). Therefore, this study aims to explore under-researched control variables like inflation

The general objective of this study was to examine the impact of fiscal policy on economic growth in Tanzania. Specifically, this study intended: -

- i. To examine the impact of government revenue on gross domestic product in Tanzania.
- ii. To examine the impact of government expenditure on gross domestic product in Tanzania.

2.0. Literature Review

Keynesian economic theory posits that government intervention through fiscal policy—particularly increased public spending and tax adjustments—can stimulate aggregate demand and promote economic growth, especially during periods of economic downturns or recessions. In the context of Tanzania, this theory suggests that government expenditures, such as infrastructure development or social programs, can directly boost economic activity by increasing consumption and investment, which in turn raises GDP growth. Fiscal policies aimed at reducing unemployment and stimulating demand can be particularly relevant in developing economies like Tanzania, where demand-side constraints often hinder growth.

Classical economic theory, on the other hand, advocates for limited government intervention in the economy and emphasizes the self-regulating nature of free markets. According to this theory, long-term economic growth is driven by supply-side factors such as capital accumulation, technological innovation, and labor productivity, rather than short-term demand stimuli. In the Tanzanian context, classical theory would suggest that fiscal policies should focus on creating a stable macroeconomic environment, reducing government deficits, and promoting trade openness to encourage private sector investment and sustainable long-term growth. Tax reductions and budgetary discipline could also lead to efficient resource allocation, enhancing productivity and growth. Both theories provide contrasting but complementary views on how fiscal policy can influence economic growth in Tanzania, depending on the policy objectives and macroeconomic conditions.

Several studies have investigated the empirical relationship between fiscal policy—specifically government revenues and expenditures—and economic growth in Tanzania. For example, Kweka and Morrissey (2020) assessed the impact of

government spending on economic growth using data from 1970 to 2018. They found that while government expenditure had a positive, though slightly marginal, effect on economic growth, investments in infrastructure were particularly critical for improving economic performance. Similarly, Thorbecke (2020), in a comparative analysis of Tanzania and Zambia, highlighted that government spending in key areas like education and healthcare significantly contributed to long-term growth by improving human capital.

Ismael (2020) focused on the role of government revenues, particularly tax reforms, in fostering economic growth. The study concluded that improved tax collection mechanisms enhanced economic growth by increasing funds available for development projects, though excessive taxation could deter private investment, indicating a need for balanced fiscal measures.

Karingiri and Biwott (2021) also explored the effect of fiscal deficits on Tanzania's growth, finding that moderate deficits, if directed toward productive investments, could stimulate growth. However, large deficits risk inflation and debt accumulation, potentially hampering economic performance. Barro (2020), in a global panel study, similarly noted that while fiscal deficits could boost short-term growth, they might jeopardize long-term economic stability. These studies collectively highlight the complex role of fiscal policy, through revenues and expenditures, in influencing Tanzania's economic growth.

3.0 Methodology

This study adopts a quantitative research approach to investigate the impact of fiscal policy—specifically government revenues and expenditures—on economic growth in Tanzania. The quantitative method is appropriate for this analysis as it provides a numerical foundation for understanding relationships between variables, enabling the use of statistical tools to assess the impact of fiscal policies (Kumar, 2019). A cross-sectional research design is employed to collect data at a single point in time, which offers a snapshot of the current fiscal environment in Tanzania and highlights its immediate economic challenges (Kumar, 2019). Conducting the research in Tanzania is particularly relevant due to the country's evolving fiscal policies and their implications for economic growth, making it a critical context for this study (Mhando, 2023).

To ensure a representative sample, purposive sampling is utilized to select participants with specific expertise, including policymakers, economists, and financial analysts. This method is justified as it targets a long period data from 1995 to 2023). (Palinkas

et al., 2015; Etikan, 2023). Data is collected through documentary reviews in the government reports and economic indicators, providing a well-rounded view of the research topic (Fowler, 2014).

For data analysis, descriptive statistics and multiple regression analysis using SPSS version 23 are employed to examine the relationships between fiscal policy variables and economic growth, ensuring the findings are robust and statistically significant (Kothari, 2014). To ensure the reliability of the research instruments stable data sources were used (Tavakol & Dennick, 2011).

4.0 Findings and Discussion

The Descriptive Statistics (n=29)

Table 1: Government Revenues

Variable	Obs	Mean	Std. Dev.	Min	Max
lngovrev	29	13.01338	3.54e-07	12.01338	13.43338
lnexp	29	12.94925	6.51e-07	12.12925	12.98926
lngdp	29	15.12354	1.31e-06	15.69352	15.69353

The mean for the government revenue was 13.01338, indicating the average logged government revenue. On the other hand, Standard Deviation was 3.54e-07, suggesting minimal variability around the mean. Meanwhile the mean ranged from 12.01338 (minimum) to 13.43338 (maximum), showing a modest span in government revenue values. Concerning the expenditure, the mean was 12.94925, representing the average logged expenditure. Besides, standard deviation was 6.51e-07, indicating low variability. Moreover, the range moved from 12.12925 (minimum) to 12.98926 (maximum), reflecting slight differences in expenditure.

Furthermore, the GDP had a mean of 15.12354, reflecting the average logged GDP with a standard deviation of 1.31e-06, which is very small, indicating stable GDP values across the observations. Similarly, GDP had a range from 15.69352 (minimum) to 15.69353 (maximum), indicating limited fluctuation in GDP. Overall, these results suggest a consistent relationship among government revenue, expenditure, and GDP, with low variability indicating a relatively stable economic environment

These observations were in line with results of Abel et al. (2023), which analyze the relationship between government revenues, expenditures, and GDP, emphasize that a strong correlation between these variables supports the theory that fiscal policies influence economic stability and growth. Additionally, Kim and Seo (2022) suggest that government revenue and expenditure must align for sustainable GDP growth, further validating these results. Likewise, these results were in harmony with those of Bose & Akpan (2022) and Mishra & Singh (2023) who noted that fiscal policy and public expenditure.

Table 2. Correlation Analysis

	lngovrev	Lnexp	lngdp
lngovrev	1.0000		
lnexp	-0.1652	1.0000	
lngdp	0.6845	-0.0604	1.0000

The government revenue and GDP had a positive correlation coefficient of 0.6845 indicates a strong positive relationship, suggesting that increases in government revenue are associated with increases in GDP (Table 2). This aligns with findings by Bose & Akpan (2022), who emphasize that enhanced government revenue facilitates investment in infrastructure, driving economic growth. Likewise, government revenue and expenditure had a correlation coefficient of -0.1652 implies a weak negative relationship. This suggests that higher government revenue does not significantly correlate with higher expenditures. Mishra & Singh (2023) support this by indicating that inefficiencies in public spending can lead to a disconnect between revenue generation and expenditure levels.

Moreover, expenditure and GDP had the correlation of -0.0604 indicates a negligible negative relationship, implying that changes in expenditure have little impact on GDP growth in this dataset. This finding is consistent with Ayalew (2023), who highlights that excessive public expenditure without efficient allocation does not necessarily lead to GDP growth.

Table 3: Multiple Regression

Source	SS	df	MS	Number of obs =		29
Model	4.6281e-11	4	1.1570e-11	F (4, 24)	= 146.86	
Residual	1.8908e-12	24	7.8784e-14	Prob > F	= 0.0000	
				R-squared	= 0.6807	
				Adj R-squared	= 0.6542	
Total	4.8172e-11	28	1.7204e-12	Root MSE	= 2.8e-07	
lngdp	Coef.	Std. Err.	T	P>t	[95% Conf.	Interval]
lngovrev	.5032018	.1627033	1.37	0.008	-.1126012	.5590049
lnexp	.0496129	.0839085	0.35	0.007	-.1435657	.2027914
_cons	12.40541	2.566482	4.83	0.000	7.108455	17.70237

Results from the Table 2 show that F-statistic of 146.86 with a p-value < 0.0000 indicates that the overall regression model is statistically significant, suggesting that the predictors significantly explain the variability in GDP. This finding aligns with Abel et al. (2023), who found that fiscal policies significantly impact economic growth. Likewise, the R-squared value of 0.6807 indicates that approximately 68% of the variability in GDP can be explained by government revenue and expenditure. The Adjusted R-squared of 0.6542 suggests that the model remains robust after accounting for the number of predictors. Bose & Akpan (2022) note that strong R-squared values often indicate effective modelling in fiscal studies.

The coefficient for lngovrev is 0.5032 ($p = 0.008$), implying that a 1% increase in government revenue is associated with approximately a 50.32% increase in GDP, indicating a strong positive relationship. This supports findings by Ayalew (2023), which highlighted the crucial role of revenue generation in fostering economic growth.

Equally, the coefficient for lnexp is 0.0496 ($p = 0.007$), suggesting that a 1% increase in expenditure is associated with a 4.96% increase in GDP. While positive, the impact of expenditure is less pronounced compared to revenue. This resonates with Mishra & Singh (2023), who found that effective allocation of expenditures is essential for maximizing economic growth. These results underscore the significance of government revenue and expenditure in influencing GDP, highlighting the importance of efficient fiscal policies for sustainable economic development.

5. Conclusion and Recommendation

The study highlights the significant role of government policy, particularly government revenue and expenditure, in influencing the Gross Domestic Product

(GDP) of Tanzania. The positive relationships observed indicate that increased government revenue, through effective tax collection and public spending, can substantially boost economic growth. This underscores the necessity for the Tanzanian government to adopt strategies that enhance fiscal capacity while ensuring productive allocation of resources. Overall, the findings emphasize the importance of fiscal policy as a critical tool for economic development in Tanzania.

To optimize the impact of government policy on GDP, it is recommended that the Tanzanian government implement comprehensive tax reforms aimed at broadening the tax base and enhancing collection efficiency. Furthermore, public expenditure should be prioritized towards productive sectors such as infrastructure, health, and education, which have been shown to yield significant returns on investment. Continuous monitoring and evaluation of fiscal policies will also be crucial in adjusting strategies to ensure they remain effective in promoting economic growth. Lastly, engaging with stakeholders, including the private sector and civil society, can help foster a more inclusive approach to fiscal policy formulation.

Future research could explore the long-term effects of specific fiscal policy instruments on economic growth in Tanzania, focusing on the differential impacts of government expenditure in various sectors. Additionally, comparative studies involving other East African countries could provide valuable insights into best practices and strategies that enhance fiscal policy effectiveness. Investigating the role of informal economic activities and their contributions to government revenue could also offer a broader perspective on the dynamics of fiscal policy. Lastly, qualitative research could complement quantitative findings by capturing the perceptions and experiences of stakeholders regarding the impact of government policies on economic growth.

Abstract

The importance of management financial support on implementation of green procurement practices is influenced by management financial support that help to reduce environmental deterioration. Several studies have been conducted on the impact of management financial support on the implementation of green procurement practices in grape processing factories, and a link has been established between green procurement practices and management financial support. Therefore, the aim of this study is to assess the influence of management financial support on implementation of green procurement practices in five selected grape processing factories in Tanzania. This study was conducted in five selected grape processing factories in Dodoma which are Ceta Wico, Tawico, Aliko Vintage Company, Shubi Vintners Ltd., and Wendece Winery Industry Limited, hence a cross-sectional research design utilized, which involved gathering data from a large number of participants at a single point in time. The current study employed a mixed-method approach whereby both quantitative and qualitative methods were applied to explore this relationship and a focus on employee perspectives in grape processing factories in Dodoma. The target population was workers of selected grape processing factories in Dodoma which is approximately 300 that include all staffs that are employed at selected grape processing factories in Dodoma. A sample size of 171 of five selected grape processing factories in Dodoma were used in this study randomly selected from population of workers from five selected grape processing factories in Dodoma. Respondents expressed a strong understanding of green procurement practices, suggesting that management financial support is vital in addressing challenges and driving environmental conservation efforts. The questionnaire and interview methods were used in data collection and analyzed using SPSS software. The finding indicated that, budgetary allocation, financial incentives and green materials were suggested as factors that influence implementation of green procurement practices in five selected grape processing factories in Dodoma. Finally, study recommended that the factories management should pay much attention for the necessary step ahead for them to effectively

implementation of green procurement practices for the environmental freely production.

Keywords: *Financial support, green procurement, grapes processing*

1. Introduction

Green procurement is a global concern, with governments, businesses, and consumers recognizing its importance in mitigating environmental impacts and fostering sustainability. It involves incorporating ecological, social, and economic factors into purchasing choices to reduce negative consequences and promote a more sustainable future (Lee, Kim, Lee, Park, and Cho, 2019). On other hand China has demonstrated its commitment to green procurement by introducing a Green Procurement Law that mandates government agencies and state-owned enterprises to prioritize environmentally friendly products and services. This law is part of a broader strategy to encourage sustainable practices and contribute to the country's environmental goals (National Development and Reform Commission, 2018). In recent years, green procurement practices have been increasingly embraced in Africa, driven by a growing awareness of environmental responsibility and the need for sustainable development. Both governments and private sector organizations are recognizing the importance of reducing their ecological footprint and are taking steps toward more sustainable procurement practices (Adesina, 2018). Tanzania also takes some initiatives on green procurement practices to integrate environmental and procurement process. Tanzania has extended its commitment to sustainability by embracing green procurement practices, recognizing their alignment with the country's existing sustainability efforts. While the adoption of green procurement in Tanzania may be slower compared to other developing nations, it underscores the importance the country places on environmental conservation and sustainable development (Musangile, 2020). Although the Tanzania Public Procurement Act of 2023 acknowledges the importance of green procurement practices, there are still challenges in fully implementing sustainable green procurement practices across the country (PPA, 2023).

Management financial support is a critical factor in the implementation of green procurement practices in grape processing factories in Tanzania. With adequate management financial support, factories would be able to invest in sustainable technologies, train employees on environmentally friendly practices, and source materials from suppliers who adhere to environmental standards. This would enable factories to reduce their environmental footprint, improve their reputation, and contribute to the sustainable development of the industry (Qi, 2019). The grape processing factories that invested in sustainable technologies and practices experienced a significant reduction in their environmental impact, including a 25%

reduction in energy consumption and a 30% reduction in water usage. Moreover, the study found that factories that sourced green materials from suppliers who adhered to environmental standards experienced a significant improvement in their reputation, with 80% of customers indicating that they would be more likely to purchase products from factories that ordered sustainability (Wang, 2020).

In fact, some of grape processing factories in Tanzania face significant financial constraints that limit their ability to invest in green procurement practices. Studies indicated that, 70% of grape processing factories in Tanzania reported that financial constraints were a major barrier to adopting green procurement practices (Zhang,2020). Management financial support may be limited or non-existent, forcing factories to prioritize short-term cost savings over long-term sustainability (Li, 2022). This is found that factories that prioritized short-term cost savings were less likely to adopt green procurement practices, leading to increased environmental degradation and health problems (Wang,2020)

Despite the Tanzanian government's efforts to promote green procurement practices, challenges remain in implementing these sustainable policies. In 2018, the Ministry of Finance and Planning introduced the National Green Procurement Policy, aiming to integrate environmental considerations into public procurement processes (URT, 2018). This policy provides guidelines for procuring entities to reduce their environmental impact. Additionally, the Tanzania Public Procurement Act of 2023 acknowledged the importance of green procurement. However, the implementation of these practices faces obstacles, indicating a gap between policy and practice (PPA, 2023).

Various studies investigated supports on implementation of green procurement in grape processing factory. Kumar and Garg (2022) found significance of the link between financial support and the adoption of green procurement practices within the country's grape processing industry. It revealed that financial support from government and donor agencies was instrumental in encouraging sustainable procurement practices among grape processing factories. Sroufe and Mishra, (2020) reviewed that financial institutions can play a key role in promoting green procurement practices in the grape processing sector, Researchers highlight the challenge posed by limited access to financing, which acts as a significant barrier to the implementation of sustainable practices. Kolk (2018) revealed that the financial support had a positive impact on the adoption of green procurement practices in the EU wine industry. The wine producers who received financial support were more likely to adopt sustainable sourcing practices, such as sourcing grapes from certified sustainable vineyards, and to implement waste reduction and recycling programs (Lee, 2019)

The companies that received financial support were more likely to adopt green procurement practices, such as investing in renewable energy systems, implementing sustainable water management practices, and reducing waste. For example, one of the companies in the study received a government grant to install solar panels, which reduced their energy consumption and greenhouse gas emissions. O'Brien and Robertson (2020) stated that financial support enabled wine producers to invest in sustainable practices, such as solar panels, rainwater harvesting systems, and organic farming methods. Studies on financial support in developed countries focused mainly on financial support of which grape processing factories received from the government, financial institution to support green production and the way of which the wine producer can use financial support to invest in environmentally friendly technologies, waste reduction systems, and energy-efficient equipment, ultimately reducing their environmental footprint (Kumar and Garg 2022; Sroufe and Mishra 2020; Kolk 2018; Lee 2019; O'Brien and Robertson 2020). It is evident that previous scholars do not pay attention on how financial support from management can support practically workers and other staff who work professionally on implementation of green procurement practice in grape processing factories in Tanzania to produce green product. Thus, there is a need to conduct research on how management financial support can influence implementation of green procurement practices in grape processing factories in Tanzania.

2.0 Literature review

2.1 Theoretical review

The Resource-Based View (RBV) is a management and strategic management theory that emphasizes the internal resources and capabilities of a firm as the primary source of sustained competitive advantage.

The RBV analyze and interpret resources of the organizations to understand how organizations achieve sustainable competitive advantage. The RBV focuses on the concept of difficult-to-imitate attributes of the firm as sources of superior performance and competitive advantage (Barney, 1986; Hamel and Prahalad, 1996). Resources that cannot be easily transferred that require an extended learning curve or a major change in the organization climate and culture, are more likely to be unique to the organization and, therefore, more difficult to imitate by competitors.

The model suggests that a firm's sustained competitive advantage arises from its unique bundle of resources and capabilities. According to this theory, financial resources, technical expertise, and training programs are critical resources that can contribute to a firm's success. Financial support enables the acquisition and development of valuable resources, technical support helps leverage technology, expertise and training support enhances the capabilities of employees.

Resource-Based View (RBV) emphasis on locating, highlighting, and utilizing these special assets and competencies as the cornerstone of strategic management, which aims to direct businesses in gaining and maintaining a competitive advantage over time.

The emphasis placed by the Resource-Based View (RBV) on the value of intangible resources such as organizational culture, knowledge, and skills aligns with the realities of contemporary business environments, where these assets frequently have a significant impact on a firm's success.

Resource-Based View, has a number of drawbacks. One of the main criticisms is that it places too much emphasis on internal capabilities and resources as the only sources of competitive advantage. This can result in a limited strategic focus that undervalues the significance of external factors like industry structure, market dynamics, and technological advancements.

2.2 Empirical review

Kumar and Garg (2022) revealed that financial backing from government and donor agencies was instrumental in encouraging sustainable procurement practices among grape processing factories. A significant majority of respondents (80%) affirmed that management financial support influenced their decision to implement green procurement practices. Specifically, access to grants, loans, and other financial mechanisms allowed factories to invest in environmentally friendly technologies, waste reduction systems, and energy-efficient equipment, ultimately reducing their environmental footprint.

Sroufe and Mishra (2020) explained that financial institutions play a key role in promoting green procurement practices in the grape processing sector, Researchers highlight the challenge posed by limited access to financing, which acts as a significant barrier to the implementation of sustainable practices. Without adequate financing options, grape processing factories face difficulties in investing in eco-friendly technologies and processes crucial for environmental sustainability. This finding emphasizes the need for financial institutions to offer affordable and accessible financing solutions, thereby removing obstacles and incentivizing the adoption of green procurement practices within the industry.

Kolk (2018) elucidated that financial support had a positive impact on the adoption of green procurement practices in the EU wine industry. The wine producers who received financial support were more likely to adopt sustainable sourcing practices, such as sourcing grapes from certified sustainable vineyards, and to implement waste reduction and recycling programs. The study's findings suggest that financial support

can play an important role in encouraging the adoption of green procurement practices in the EU wine industry, which can help reduce the industry's environmental impact and improve its sustainability.

Lee (2019) reported that companies that received financial support were more likely to adopt green procurement practices, such as investing in renewable energy systems, implementing sustainable water management practices, and reducing waste. For example, one of the companies in the study received a government grant to install solar panels, which reduced their energy consumption and greenhouse gas emissions. Another company received a loan to implement a sustainable grape sourcing program, which improved the sustainability of their supply chain.

O'Brien, and Robertson (2020) described that financial support enabled wine producers to invest in sustainable practices, such as solar panels, rainwater harvesting systems, and organic farming methods. The study's results also showed that wine producers who adopted green procurement practices experienced improved environmental performance, including reduced energy consumption, water usage, and waste generation. By providing financial incentives, governments and industry associations can promote sustainable practices, reduce the industry's environmental impact, and contribute to a more sustainable future.

Conceptual framework figure

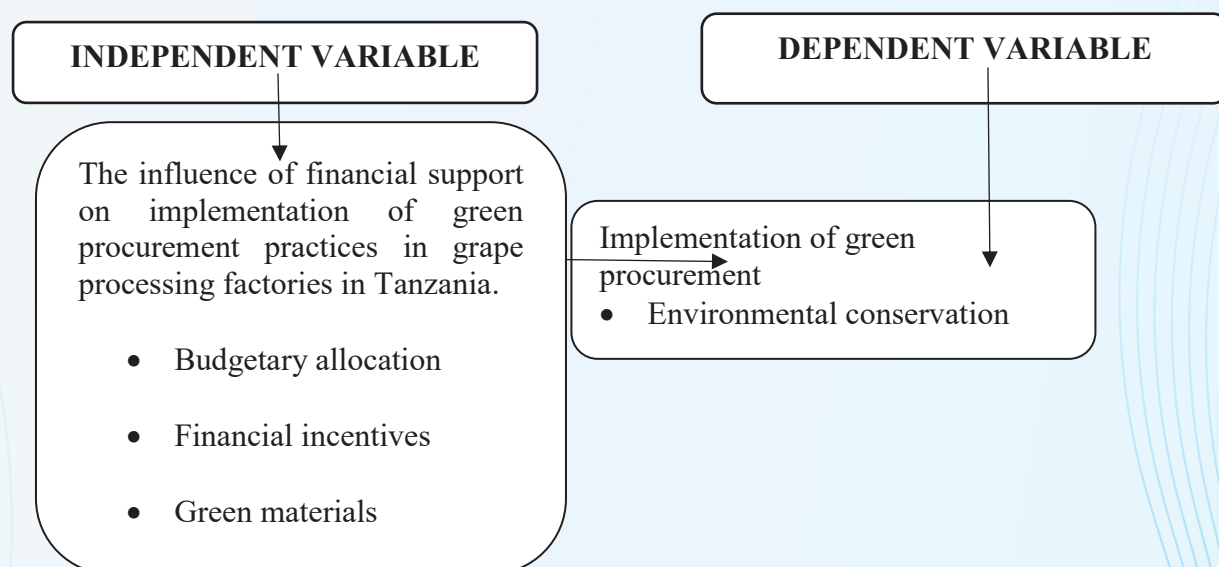

Figure 1: Conceptual framework figure

Source: Field data 2023

3.0 Methodology

3.1 Research Area

The study was conducted in Dodoma region, Tanzania at five selected grape processing factories in Dodoma, Tanzania, including Ceta Wico, Tawico, Aliko Vintage Company, Shubi Vintners Ltd., and Wendece Winery Industry Limited. By examining these factories, researchers can gain insights into minimizing environmental impacts and promoting sustainable practices within the grape processing industry, contributing to eco-friendly production methods and a reduced ecological footprint (Williams and Schneider, 2018).

3.2 Research design

The study utilized a cross-sectional research design, which involves gathering data from a large number of participants at a single point in time. This design is suitable for examining relationships between variables at a specific moment rather than over an extended period. (Cresswell, 2018). This cross-sectional study, help researcher to collect data from a sample of participants at a single point in time, which means that the data is collected at one specific minute, rather than over a period of time. This allows researchers to get a picture of the features and relationships between variables at that particular point in time (Hinkley, 2020).

3.3 Research Approach

Mixed research Approach was being applied because it involves collecting and analyzing both qualitative and quantitative data to provide a more comprehensive understanding of the research topic. (Johnson, Levine, and Smith (2018). Mixed methods research was offering a powerful tool for reducing bias in research by combining the strengths of both quantitative and qualitative methods. By leveraging the balancing nature of these methods, researchers can increase the validity and reliability of their findings and better understand complex research problems (Creswell, 2018).

3.4 Population of the Study

Population of the study were people who are working in selected grape processing factories in Dodoma that targeted as respondent in collection of accurate data that are relevant to the research question. In study population sample can be obtained because, it should be representative of the population of interest and it should reflect the features of the population in terms of relevant variables (Polit, and Beck, 2020).

3.4.1 Sample Size

The study was using all targeted population of 300 that include management and other staffs. For this study, five selected grape processing factories in Dodoma that have been in operation for at least 5 years were included in the sampling frame. The study used simple random sampling to obtain the study sample. The simplified formula put forward by Yamane's (1967) was used in calculating the study sample. The formula is $n = N / (1 + Ne^2)$,

Where N = Target population = 300, n = Sample size, e = Standard error = 0.05

$$n = 300 / (1 + (300 (0.05)^2)) = 171$$

$$n = 171$$

3.4.2 Sampling Techniques

Simple random sampling technique

Simple random sampling technique was selected because it helps to ensure that the sample is representative of the population in a way that each member of the population has an equal chance of being selected. (Kish, 2018). Simple random sampling is unique in that each member of the population has an equal chance of being selected, reducing the possibility of bias and ensuring that the sample reflects the diversity of the population (Liu and Li, 2020)

Purposive sampling technique

Purposive sampling as a technique was used in qualitative research to select participants who own specific features or experiences that align with the research question or study objectives (Polit, and Beck, 2018). Purposive sampling was enabling researchers to collect data from participants who are most likely to provide rich and nuanced insights into the research topic. By selecting participants with specific characteristics or experiences, researchers can gather data that is directly relevant to their research questions. (Patton, 2018).

3.5 Data collection methods

3.5.1 Questionnaire

A questionnaire is a data collection tool used in research to gather information from respondents through a series of question. Researcher distributed questionnaires to workers of five selected grape processing factories in Dodoma in order to obtain accurate and reliable information from them, also questionnaire is commonly used in social sciences, marketing, and other fields to collect self-reported data from a large number of participants (Martin, and O'Connor, 2022). Questionnaires can be managed comparatively quickly and easily compared to other data collection methods, such as interviews or focus groups. This is because questionnaires can also be distributed to a large number of participants simultaneously, and participants can

complete them at their own step, without the need for a researcher to be present (Cooper, and Schindler, 2018)

3.5.2 Interview

This study was collecting data in the interview by using a structured interview guide. Interviews can take various forms, including face to face, telephone, video conference, or written exchanges. They can be structured, semi structured, or unstructured, depending on the level of formality and guidance provided by the researcher (Bryman, 2018). The researcher asked questions and recorded accurate information from key informant in a note book during data collection because Interview is a powerful tool for gathering rich, contextualized data that can help researchers better understand phenomena and develop theory (Patton,2020)

3.6 Data analysis

Analytical model

Qualitative data was analyzed using thematic analysis. Thematic analysis involves identifying, coding, and organizing patterns and themes within the data. In this process is to become familiar with the data through repeated reading and listening normally codes was developed and applied to the data to identify patterns and themes (Creswell, 2018).

The linear regression model was used to analyze quantitative, The influence of Management financial support on implementation of green procurement practices in grape processing factories in TZ. The model was chosen because dependent variables was implementation of green procurement practices that was the value of assigned five selected grape processing fac tories in Dodoma. Descriptive and inferential statistics were used to summarize and describe the basic features of the data, such as measures of central tendency (mean, median, mode) and variability (range, variance, standard deviation). Before running multiple linear regression, all variables captured using Likert scale was converted into factor score with aid of principle component analysis tools in SPSS Software. (Leech and Onwuegbuzie2 018).

The liner regression was specified as:

$$Y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \epsilon \dots \dots \dots (i)$$

Whereby:

Y= To examine the contribution of management financial support

X1= Budget allocation

X2= Financial incentives

X3= Green materials

4. Finding and discussion

4.1 Reliability test

To ensure the data's credibility, the study assessed its internal consistency and meaningful contribution to existing literature. Cronbach's alpha was used to evaluate the reliability of the data, which measures how well a set of items captures a single, underlying aspect of individuals. This implies that there is an adequate fit of the data to model and that the covariates are significantly related to the outcome variables.

The table below present reliability of data in this study.

Table: Reliability statistics

Cronbach's Alpha	N of Items
.750	26

Source: Field Data (2024)

4.2 Descriptive statistics

4.2.1 Budgetary allocation

Table 1 below, show that through questionnaire administered to 130 respondents the researcher sought for opinion on proper budgetary allocation for implementation of green procurement practice in grape processing factories in Dodoma. Out of 130 respondents 31.5% strong agreed that proper budgetary allocation can influence the implementation of green procurement practice in grape processing factories in Dodoma. 35.4% agree, 21.5% strongly disagree, 6.9% Disagree while 4.6% respond neutral.

Table 1: Budgetary allocation

Opinion	Frequency	Percentage (%)
Strong Disagree	28	21.5
Disagree	9	6.9
Neutral	6	4.6
Agree	46	35.4
Strong Agree	41	31.5
Total	130	100.0

Source: Field Data (2024)

The finding from interview with interviewee y as well as support from those questionnaire as it was from their experience they consider much on proper budget allocation for the green procurement implementation with the intention of green

production. The interviewees argued that proper budget allocation enhance green production by increasing financial capacity to pay those skilled labour who's their production skills enhance green production and purchasing the quality materials which may results to quality products which can not affect environment impact at large compare with the poor which is not environment friendly.

“.....In fact, environment conservation is very important for our sustainability for this case everyone is responsible to ensure that budget allocation is sufficiency to employ skilled labour and purchase quality raw materials for production process because our intention is to conserve our environment for this generation and future generation.....” (interviewee y)

This implies that the proper budget allocation in grape processing factories in Dodoma already in progress to conserve the environment through green procurement implementation.

4.3 Financial incentives

Table 2 below show that, through questionnaire administered to 130 respondents the researcher sought for opinion on financial incentives for implementation of green procurement practice in grape processing factories in Dodoma. Out of 130 respondents 37.7% strong agreed that financial incentives are suitable for implementation of green procurement practice in grape processing factories in Dodoma. 16.2% agree, 22.3% strongly disagree, 17.7% Disagree while 6.2% respond neutral.

Table 2: Financial incentives

Opinion	Frequency	Percentage (%)
Strong Disagree	29	22.3
Disagree	23	17.7
Neutral	8	6.2
Agree	21	16.2
Strong Agree	49	37.7
Total	130	100.0

Source: Field Data (2024)

The finding from interview with interviewee m as well as support from those questionnaire as it was from their experience they normally depend on financial incentives so that to implement green procurement practices. Financial Planning contributes a lot due to employee salaries, equipment maintenance cost, purchasing

quality raw materials, purchasing new equipment if required as well as administration cost that incurred for production operation in grape processing factories in Dodoma. The interviewees argued that financial incentives enable green production for those products produced in grape processing factories due to the fact that skilled staff and efficiency machine that normally used in production process for this case may reduce environment impact at large.

“.....You know there so many environments impact may resulted from unskilled labour due to lack of skills in the production process and unfortunately most of the people in our community are not aware on such kind of skills of the workers in particular factories it is very shame. Therefore, proper Financial Planning enhance green production in grape processing factories purposely to conserve the Environmental because environmental conservation starts with you not anybody else” (interviewee m)

This implies that the production manager and management in grape processing factories in Dodoma are so much committed to ensure that our environment remain safe through green procurement implementation.

4.4 Green material

Table 3 below show that through questionnaire administered to 130 respondents the researcher sought for opinion on green material for implementation of green procurement practice in grape processing factories in Dodoma. Out of 130 respondents 31.5% strong agreed that green material can influence implementation of green procurement practice in grape processing factories in Dodoma. 25.4% agree, 26.2% strongly disagree, 10.8% Disagree while 6.2% respond neutral.

Table 3: Green material

Opinion	Frequency	Percentage (%)
Strong Disagree	34	26.2
Disagree	14	10.8
Neutral	8	6.2
Agree	33	25.4
Strong Agree	41	31.5
Total	130	100.0

Source: Field Data (2024)

The finding from interview with interviewee k on grape processing factory in Dodoma concern with the importance of green material in grape processing factory on implementation of green procurement practices. The production manager from his own

experience declared that green material can contribute to green production which increasing the efficiency production because it determines quality production in grape processing factories in Dodoma. By opting for green material, grape processing factories can also satisfy customer.

“..... Green material had contribution in green production which is environmentally friendly in grape processing factories in Dodoma. Green material provides increasing the efficiency production because it determines quality production in grape processing factories in Dodoma.....” (interviewee k)

This implies that the management in grape processing factories in Dodoma apply the green material as the way to conserve the environment through green procurement implementation and encourage the use of quality materials which are environmentally friendly in the production process which are acceptable in green production.

4.3 inferential statistics

Table 4 indicates the influence of management financial support on implementation of green procurement practices in grape processing factories. The linear regression model was used to estimate the influence of such support.

Table 4: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients		Sig.
		B	Std. Error	Beta	t	
1	(Constant)	3.427	.274		12.510	.000
	larger budget	.078	.038	1.161	2.019	.046
	Budget allocation	.182	.035	.390	5.141	.000
	Financial planning	.127	.036	.273	3.517	.001
	Inadequate financial	2.073	.033	1.162	2.192	.030
	Green material	2.062	.033	2.136	1.867	.064
	Eco-friendly practices	.037	.041	.072	.890	.375

a. Dependent Variable: Green Procurement Practices

The table above indicates that every unit change of a larger budget had positive effects by 0.078 on the implementation of green procurement practice with a significant value of ($P < 0.046$). Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.046 which was less than 0.05.

The table above, indicates that every unit change of budget allocation by (0.182) effects positively the implementation of green procurement practices with a significant value of ($P < 0.0001$). Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.0001 which was less than 0.05. In fact, five selected grape processing factories in Dodoma can provide a sufficient budget for green procurement implementation, the ability of the factories to prepare good financial planning that could be able to pay staff salaries, as well as technological investment by purchasing the modern machine which can produce the quality products that environmentally friendly.

The table above, indicates that every unit change of financial planning by (0.127) effects positively the implementation of green procurement practices with a significant value of ($P < 0.001$). Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.001 which was less than 0.05. Five selected grape processing factories in Dodoma can provide sufficient financial incentives to support staff and other workers for green production, This increases the ability of the factories to prepare good financial planning that could be able to pay staff salaries, transport, and house allowances this will become a motivation to all staff to work seriously and efficient on using the modern machine which can produce the quality products that environmentally friendly.

From Table above, indicated that every unit change of inadequate financial effects positively by 2.073 the implementation of green procurement practice with significant value of ($P < 0.030$). Therefore, the analysis showed that the relationship was statistically significant since p-value was 0.030 which was less than 0.05.

From Table above, indicated that every unit change of green material effects positively by 2.062 the implementation of green procurement practice with significant value of ($P < 0.064$). Therefore, the analysis showed that the relationship was not statistically significant since p-value was 0.064 which was greater than 0.05. However five selected grape processing factories in Dodoma have challenges of availability of green materials to be used in green production process so that to implement green procurement practices. Most of staff and workers were somehow satisfied with management effort on purchasing green materials which are very crucial in green production towards implementation of green procurement practices

From Table above, indicated that every unit change of eco-friendly practices by (0.037) effects positively the implementation of green procurement practice with significant value of ($P < 0.375$). Therefore, the analysis showed that the relationship was not statistically significant since p-value was 0.375 which was greater than 0.054.

5. Conclusion and Recommendation

Conclusion

Generally, five selected grape processing factories in Dodoma have the ability to provide sufficient budget allocation for green procurement implementation, the ability of the factories to prepare good financial incentives that could be able to pay staff salaries, as well as the use of green materials that facilitate green production to produce the product that is environmental free regardless shortage availability. This green production will enhance environmental conservation and ensure its sustainability as far as the National Environmental Management Council (NEMC) and Tanzania Bureau Standards (TBS) regulatory requirements are concerned. In this case, staff workers were somehow satisfied with management financial support from five selected grape processing factories towards the implementation of green procurement practices.

Recommendation

The researcher recommended that the factory management should pay much attention to the necessary step ahead for them to maintain effective eco-friendly practices on the implementation of green procurement practices in grape processing factories in Tanzania. With respect to the shortage of green materials in the grape processing factories on implementation of green procurement practices, management should address those challenges to ensure that green materials are easily available to ensure factory performance to meet its environmental goals and objectives.

Areas for Further Research

This study looked at the influence of management financial support on implementation of green procurement practices in Tanzania. The researcher suggest further studies can be carried out on the influence of management support on implementation of green procurement practices in plastic manufacturing industries in Tanzania.

Abstract

This article explores the role of the inventory regulatory framework on the performance of public entities. Inventory management practices are crucial for minimizing stockout risks, reducing carrying costs, improving customer satisfaction, and enhancing market competitiveness. However, public organizations encounter various challenges that affect their inventory management performance. This study aims to assess how the regulatory framework influences the performance of public entities within TANESCO Dodoma. To gather data cross-sectional design and mixed research approach were utilized. Where researcher, employed interviews with key informants to obtain qualitative information which was later complemented by quantitative data obtained through survey questionnaires. The findings indicate that the regulatory framework, organizational strategies, government regulations, staff qualifications, modern ICT tools, and reliable networks significantly impact the performance of public entities at a 5% level of significance. To enhance inventory management performance, it is recommended that TANESCO establish a dedicated unit to evaluate compliance with relevant laws, improve specialized expertise, and increase automation.

Keywords: *Inventory regulatory framework, performance of public entities*

1.0 Introduction

Inventory Regulatory Framework is a set of formal rules, guidelines, and policies established by governing authorities to regulate the management, control, and monitoring of inventories in organizations. These frameworks ensure compliance with legal, financial, and operational standards, helping to optimize the inventory process, minimize risks, and ensure accountability in public and private sectors.

The performance of public entities is often evaluated based on regulatory compliance standard, transparency financial management, resource utilization among others. It reflects how well public entities achieve their intended outcomes and serve the public interest.

Effective inventory management is essential for the smooth operation of public entities, especially in sectors such as energy where timely access to materials and spare parts ensures continuity of services. Effective inventory management can be achieved where there is establishment and adherence to a robust regulatory framework. As regulatory framework provides guidelines, policies, and procedures for handling, storing, and purchasing inventory, ensuring compliance with national standards and operational efficiency (Chan, 2022).

In public entities, inventory management faces unique challenges due to bureaucratic processes, political interference, and reliance on governmental budgets and procurement cycles (Ragasa et al., 2019). Unlike private companies, public utilities operate under stricter oversight, requiring a structured framework to ensure accountability and minimize inefficiencies. As such, regulatory frameworks play a critical role in mitigating risks like stockouts, excess inventory, theft, and wastage. They also ensure the alignment of procurement with the specific demands of the organization and market conditions (Narayanapillai, 2022).

In Tanzania, the importance of an inventory regulatory framework is particularly evident at TANESCO (Tanzania Electric Supply Company), the national power utility, which has struggled with inventory-related issues in its operations. TANESCO's ability to provide reliable electricity has been severely hampered by poor inventory practices, including the absence of critical spare parts and maintenance supplies (Kaijage, 2020). The CAG report (2021) highlighted significant mismanagement, identifying issues such as inadequate warehousing, stock imbalances, and delays in procurement as key contributors to frequent power outages and maintenance delays in Dodoma region.

By enhancing regulatory framework will streamline inventory processes at TANESCO, performance of the organization, ensuring timely procurement, accurate record-keeping, and minimizing stockouts and surplus inventory (Ignacio et al., 2019). Such frameworks have been proven to optimize performance in various public utilities globally, enabling smoother operations by ensuring compliance with policies that dictate inventory levels, procurement methods, and storage standards (Mugabe, 2019).

This study, therefore, examines the role of the inventory regulatory framework in improving the performance of public entities, focusing specifically on TANESCO Dodoma Region. Given the critical need for reliable electricity in Dodoma city, for

government operations, businesses, and households, the implementation of effective inventory management regulatory framework is crucial (Mwakabuta, 2022). By focusing on regulatory practices, this study contributes to ongoing efforts for addressing inventory challenges at TANESCO Dodoma and provide insights for potential reforms in the energy sector.

2.0 Literature Review

The study is grounded on Contingency Theory and Bureaucracy Theory. The Contingency Theory emphasizes that organizational processes, including inventory management, must be adapted to specific contextual factors such as regulatory frameworks, environmental instability, and internal dynamics (Van de Ven & Drazin, 1985). In public entities like TANESCO, the public sector regulatory environment introduces uncertainty from factors like fluctuating government funding, political interference, and skills shortages, necessitating flexible inventory management approaches (Kpundeh, 1998). In contrast, Bureaucracy Theory highlights the impact of formal rules, centralized control, and strict procedural adherence on public entities (Weber, 1922). TANESCO's inventory practices are likely influenced by bureaucracy, resulting from centralized systems which may result into rigid control and resistance to change and affect the organization operational performance.

The literature review plays a pivotal role in shaping the study, Makongo (2020) examined the impact of inventory management practices on the financial performance of gas manufacturing companies in Africa. The study focused on both private and public gas manufacturing firms across various countries, with data spanning from 2010 to 2020. The findings revealed a significant positive relationship between inventory management practices and financial performance. However, the study noted that maintaining higher inventory levels negatively affects financial performance due to increased carrying costs. Consequently, the study recommended that companies should maintain optimal inventory levels to avoid issues related to overstocking or understocking of inventory.

Penny et al, (2021) conducted a study to assess the effectiveness of inventory policy implementation in selected State-Owned Enterprises (SOEs) within Gauteng Province. The study identified four key themes that highlight the degree of inventory policy enforcement and its impact on inventory costs at each SOE. These themes encompassed compliance with inventory policies, instances of policy violations, the extent of policy implementation, the rate of inventory growth and its effect on carrying costs, and a shortage of planning skills among inventory planners.

Meanwhile, Seman (2021) conducted a study to assess the inventory management system at Habesha Cement Share Company. The findings indicated that while the

company's inventory management system was somewhat effective in controlling inventory levels, there were areas needing improvement, such as physical inventory counting, handling overstock and understock issues, ensuring data accuracy, and preparing real-time reports. The company primarily uses a perpetual inventory system to forecast customer demand. Key challenges identified included a lack of management support, insufficient qualified personnel, and inadequate training. Based on the results, the study recommended that management should establish clear standards and policies for inventory management, review and redesign current practices, monitor inventory carrying costs, and ensure only qualified, well-trained staff manage inventory control.

The conceptual framework for this study examines the relationship between the inventory regulatory framework and the performance of public entities, specifically focusing on TANESCO Dodoma Region. The inventory management regulatory framework, which serves as the independent variable, is measured through critical elements such as policies, regulations, laws, and replenishment strategies. These regulatory mechanisms guide inventory control and management within public institutions. The dependent variables, which represent the performance of public entities, are evaluated through key performance indicators such as economy, efficiency, and effectiveness. This framework hypothesizes that a robust regulatory framework for inventory management influences the performance of public entities by optimizing resource utilization, reducing wastage, and ensuring timely and efficient service delivery. According to Garrison (2018), conceptual frameworks offer a structured approach to systematically explore relationships between empirical properties, and this framework seeks to establish the link between regulatory frameworks and organizational performance.

3.0 Research Methodology

The study employed a mixed-method approach, incorporating both qualitative and quantitative techniques. This approach was chosen because it is well-suited for exploring complex relationships, enabling the investigation of both personal experiences and perceptions as well as numerical data relating to the subject under study.

The study focused on TANESCO in Dodoma Region, which was selected as the research area due to its increase in energy demand as the city is highly growing. Also, TANESCO is the sole provider of electricity, responsible for the generation, transmission, and distribution across the country, making it a prime entity to assess challenges relating to inventory management and performance. The focus is on the inventory regulatory framework in TANESCO Dodoma, as it is not only the capital

city where government decisions are made but also the main office for the Tanzania parliament and ruling party all these increase the population and energy demand.

For the purpose of accurate data/information about the problem the study adopted a Case-Control Study design. Case studies allow an in-depth investigation of a phenomenon within its real-world context, enabling a better understanding of complex organizational processes (Yin, 2014). The exploratory approach is optimal given the limited prior research focused specifically on inventory management practices on public entities. The single case study was facilitated thorough examination of Inventory management procedures, systems (technologies) and challenges at TANESCO Dodoma Region. . As a public organization responsible for electricity provision, the findings could offer insights for other organizations facing similar external constraints and internal dynamics.

The population for this study consisted of employees involved in inventory management at TANESCO Region Dodoma, focusing on those engaged in planning, decision-making, execution, and oversight of inventory functions (Msangi, 2021). The study involved employees, including procurement managers, inventory supervisors, storekeepers, warehouse supervisors, maintenance technicians, and accounts staff. For the sample, the study employed the Yamane formula to get proper sample of participants. This sample aimed to capture a diverse range of perspectives, ensuring representation from all key roles related to inventory management processes. The study employed both simple random sampling for participant selection and purposive sampling to ensure information-rich cases were selected for in-depth analysis. This non-probability purposive sampling approach was particularly useful in targeting roles critical to inventory regulatory frameworks, such as procurement managers and inventory supervisors, for deeper investigation (Mesele, 2021; Kothari, 2014). This study used both primary and secondary data.

A comprehensive approach was employed for data collection and analysis. The data was gathered through structured questionnaires, designed to systematically collect information on attitudes, opinions, and behaviors of the target population, facilitating efficient outreach to a diverse respondent base (Floyd & Fowler, 2014). Additionally, in-depth interviews provided a platform for direct engagement with participants, enabling the researcher to delve into their perspectives and motivations, thus enriching the qualitative data obtained (Yin, 2019). Furthermore, a documentary review was conducted to analyze existing datasets and reports, allowing for historical context and validation of findings through established literature. Data analysis involved thematic analysis to identify recurring themes and insights from qualitative data, while content analysis systematically extracted pertinent details from organizational documents related to inventory management.

4.0 Findings and Discussion

This section provides an analysis and discussion of the study's findings. The study considered demographic characteristics of the respondents for the purpose of responding to, specific objectives and addressing the research questions.

The comprehensive demographic overview underscores the potential influence of respondent characteristics on the study's findings and highlights their relevance in assessing inventory management practices in public entities (Rajab et al, 2017).

To examine the role of inventory regulatory framework on the performance of public entities at TANESCO Region Dodoma

Descriptive statistics for Inventory regulatory framework

This section examines, presents, and discusses the Inventory regulatory framework, which focuses on the role of inventory management practices on the performance of public entities in TANESCO. The results are reported using descriptive statistics, including measures of central tendency and variability such as mean and standard deviation to show the visualization of respondents on Inventory regulatory framework. From the findings revealed a mean of 2.42, 2.21, 2.01 and 2.08 which show the agreement of respondents towards the existence of regulatory requirements, compliance with relevant laws, organization's replenishment strategies and policies is low performed. These results imply that there is low roles of inventor regulatory framework in TANESCO that are used for public entities Performance as shown in table 5 below:

Table 43: Descriptive Statistics on the Inventory regulatory framework

	A	B	C	D
		N	Mea n	Std. Deviation
1	Adhering to regulatory requirements is essential for effective Inventory management	109	2.42	.699
2	compliance with relevant laws greatly influences our Inventory management practices	109	2.21	.589
3	Organization's replenishment strategies contribute significantly to maintaining optimal inventory levels.	109	2.01	.031
4	Government regulations and guidelines are helpful in shaping our inventory management policies.	109	2.08	.721

5	Valid N (listwise)	109
---	--------------------	-----

Furthermore, the researcher uses logistic regression to get depth information on the Role of inventory regulatory framework on public entity performance and the findings are elaborated here below; -

Role of inventory regulatory framework on public entities performance.

The logistic regression model goodness of fit was used to see the role of Inventory management regulatory framework on inventory management performance. The below shows the omnibus tests of model coefficients, model summary, Hosmer and Lemeshow Test and variables in the equation of the role of inventory management policies factors included in the model.

Table 44: Omnibus Tests of Model Coefficients

		Chi-square	Do	Sig.
Step 1	Step	11.528	4	.020
	Block	11.528	4	.020
	Model	11.528	4	.020

The omnibus test is a likelihood-ratio chi-square test that compares the current model to the null model. A significance value below 0.05 suggests that the current model is superior to the null model. In this instance, the current model has a p-value of 0.020 and a chi-square value of 11.528.

Table 45: Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square	R
1	53.162 ^a	.205	.278	

The analysis revealed that both the Cox & Snell R square and Nagelkerke R square values were positive, at 0.205 and 0.278, respectively. These findings suggest that the model accounts for 21.5% and 28.8% of the total variation, as indicated by the coefficients of determination.

Table 46: Hosmer and Lemeshow Test

Step	Chi-square	Df	Sig.
1	7.220	7	.296

The Hosmer and Lemeshow test assesses the goodness of fit and calibration of logistic regression models. In this case, the test statistic was 7.220, with a p-value of 0.296 (greater than 0.05). This indicates that the model is a good fit for the dataset.

Table 47: Variables in the Equation

	B	S.E.	Wald	df	Sig.	Exp(B)
Regulatory requirement	1.173	.441	5.430	1	.018	3.472
Compliance with relevant laws	-.249	.505	.233	1	.563	.605
Organization strategies	1.460	.637	4.380	1	.033	4.661
Policy	-1.740	.785	4.224	1	.037	.149
Constant	-1.242	2.423	.183	1	.594	.251

The findings as presented in Table 9 revealed that, regulatory requirement has a positive significant influence on public entities performance ($\beta=1.173$), and is statistically significant at 5% (p-value=0.018). This means that 1 unit increasing of Regulatory requirement increases on public entities' performance of TANESCO by 1.173 times. This also has been indicated by the odd ratio of 3.472 implying that having an organization with the regulatory requirement in inventories is 3.472 times more likely to increase the on public entities performance of TANESCO than having an organization with no regulatory requirement.

Compliance with relevant laws, has a negative significant influence on public entity's performance ($\beta=-.249$), and are statistically insignificant at 5% (p-value=0.563). This means that 1 unit increasing of Compliance with relevant laws decreases the on public entities performance in TANESCO by 0.249 times. This also has been indicated by the odd ratio of 0.605 implying that having an organization with Compliance with relevant laws public entities performance is 0.249 times more likely to decrease the on public entities performance of TANESCO than having an organization with no Compliance with relevant laws.

Organisation strategies, have a positive significant influence on public entities performance ($\beta=1.460$), and are statistically significant at 5% (p-value=0.033). This means that 1 unit increase in Organisation strategies increases on public entities performance of TANESCO by 1.460 times. This also has been indicated by the odd ratio of 4.661 implying that having an organization with Organisation strategies in construction projects is 4.661 times more likely to increase the on public entities performance of TANESCO than having an organization with no Organisation strategies.

Policies, have a negative significant influence on public entities performance ($\beta=-1.740$), and are statistically significant at 5% (p-value=0.038). This means that 1 unit increasing of policies decreases the on public entities performance in TANESCO by

1.173 times. This also has been indicated by the odd ratio of 1.740 implying that having an organization with policies inventory performance is 1.740 times more likely to decrease the on public entities performance of TANESCO than having an organization with no policies.

From the above discussions, the findings reveal inventory regulatory framework is very important for the organization to perform better in inventory management and institutional performance. To support the above findings the researcher conducted an interview session with the heads of departments, who was interviewed to comment on whether regulatory requirements, Compliance with relevant laws, Organisation strategies and policies have a significant role in public entity performance. The respondent/interviewees had these to say:-

“I believe that adhering to the regulatory requirement is important and very effective in ensuring inventory performance also existence of well outlined procedures and guidelines give guidance for decision making and streamline internal process.” (Key Informant Interview).

“ I believe that adhering to the laws is important and ensuring inventory performance, compliance with government laws contribute to the performance of the inventories, regardless this is not enough without the government interventions.” (Key Informant Interview).

*“I believe that a government regulations and guidelines are helpful in shaping our inventory management **policies**, these policy is a set of guidelines that a company follows to determine when, how much, and what type of inventory should be ordered or produced to meet customer demand while minimizing costs.”* (Key Informant Interview)

The results are also similar to (Aloyce, Luvara & Monko 2023), which emphasize that the role of Inventory regulatory framework in Tanzania underscoring its influence on public entities performances. The same scenario is supported by Cao and Lumineau (2021) who on the same issue argued that, Inventory regulatory framework enables organisations to monitor inventory from acquisition to sale, thereby minimising surplus inventory and guaranteeing that there is sufficient inventory to fulfil customer orders.

The study responds to CAG reports, internal audit report and TANESCO annual report (2021/2022) which indicate that despite the fact that TANESCO have inventory regulatory framework and guidelines still there challenges sported in these reports. These challenges include inventory management practices, under implementation of Annual Procurement Plan contrary to Regulation 69(3) of public Procurement Regulation 2013 by TANESCO Dodoma region and other challenges that may affect

overall performance. The study observed that the highlighted challenges reduced TANESCO abilities to maintain reliable electricity supply, affecting service delivery and customer satisfaction.

According to the Public Procurement Act of 2011 and its accompanying regulations (Public Procurement (Goods, Works, Non-Consultant Services and Disposal of Public Assets) Regulations, 2013), public entities like TANESCO are mandated to adhere to established inventory management practices. Section 68 of the Public Procurement Act emphasizes that public entities must develop and maintain procurement management systems to ensure proper inventory management. Regulation 69(3) specifically requires that public entities prepare and implement Annual Procurement Plans to ensure compliance with inventory regulations. Despite these provisions, challenges persist, including: **Insufficient Training:** Many staff members are not adequately trained in inventory management practices, leading to poor compliance with the existing laws and regulations. **Lack of Awareness:** There is a general lack of awareness regarding the importance of these regulations among the employees, resulting in non-compliance. **Inadequate Monitoring and Evaluation:** There is a gap in monitoring the implementation of the procurement plans, leading to deviations from the regulatory framework. However, the study has noted meaningful improvements in addressing inventory regulatory framework challenge including; formulating approved performance management policy which provides for improving employees competence, professionalism and motivation, and company intercorporate strategies plan 2021/2022, Interim Corporate Strategic Plan (ICSP) 2021-2024 all focus on solving existing challenges and capitalizing available opportunities),the take-off the Enterprise Resource Planning coded project DUMA have marked an incredible steps towards digital transformation of the company.

5.0 Conclusion and Recommendation

Conclusion

The role of the inventory regulatory framework is crucial for the performance of public entities at TANESCO in the Dodoma region. The findings indicate that adherence to inventory management practices significantly enhances organizational performance, suggesting that entities compliant with regulatory requirements experience greater improvements compared to those that do not. Additionally, the implementation of staff competence within TANESCO is pivotal, as specialized knowledge and qualifications directly correlate with enhanced operational effectiveness. Furthermore, the integration of technology and modern ICT equipment is essential for efficient inventory management. This high level of automation supports better inventory practices, reinforcing the notion that organizations leveraging reliable networks and advanced technology are more likely to achieve improved performance in inventory

management. Overall, these elements underscore the importance of a robust inventory regulatory framework in enhancing public entity performance at TANESCO.

Recommendations

The study recommends the government to reinforce the implementation of existing policies, as adherence to these regulations as they are likely to yield a positive and significant impact on the performance of public organizations. Also, TANESCO should consider establishing a strong and dedicated unit tasked with assessing the challenges related to inventory management practices and proposing effective solutions. Further, the unit should be staffed by professionals with relevant experience to ensure the ongoing improvement and management of inventory practices.

In additional, examining the interplay between organizational culture and leadership styles in implementing inventory management practices could yield valuable findings. Comparative analyses across different industries or regions may also enhance the understanding of best practices and challenges in inventory management, ultimately contributing to operational excellence.

The Effect of Supplier's Commitment on Implementations of the Procurement Framework Agreement Contract for Common Used Items in LGAS.

Clemence .A. Mushi^{1*} & Barnabas Maagi²

¹ College of Business Education-Dodoma Campus, P.O. Box 2077, Dodoma.

mushiclemence0@gmail.com.

² College of Business Education-Dodoma Campus, P.O. Box 2077, Dodoma.

Abstract

The paper's main goal was to examine the effect of supplier's commitment on implementations of the procurement framework agreement contract for common used items in local government authorities. The study employed Cross section design and a population of 350 staffs, and the sample size was 187 staff selected through simple random sampling. A questionnaire was used as a tool for data collection while data was analysed by using descriptive analysis and liner regression by using Statistical Package for Social Sciences version 23. The study showed that, there was a positive and statistically significant relationship between following through with timely delivery, (0.000), product quality (0.000) and product quantity (0.000). This was determined through analysis, as the p-value for all variables was less than 0.05. The results suggest that there is a positive and substantial correlation between supplier's commitments on implementations of the procurement framework agreement contract. The study concluded that supplier's commitment affects implementations of the procurement framework agreement contract for common used items in local government authorities. The study recommended that the to develop strong policies regarding framework agreement contracts for common used items to improve the effective applicability to government authorities. Management should ensure that employees and stakeholders such suppliers are well provided with adequate training related to the adoption and application of framework contracts.

Keywords: *Supplier's commitment, implementations, procurement framework agreement contract, common used items, LGAs.*

1.0 Introduction

Framework agreements involve the agreement between one or more contracting authorities and one or more economic operators, the purpose of which is to establish the terms governing contracts to be awarded during a given period, in particular with regard to price and, where appropriate, the quantity envisaged, intended to reduce procurement costs and enable procuring entities to access relevant information (Altho, 2019). According to World Bank (2019),Frame work Agreements is an agreement with

one or more firms that establishes the terms and conditions that will govern any contract awarded during the term of the Framework Agreement. As Per Reg. 131 of PPR 2019 its states clearly the conditions on which the PEs engaged to the frame work Agreements shall supposed to follows in order to procure the CUIs.

Olivares et al, (2023) claimed that when government and organization design rules for framework agreement it is important to consider the level of price competition to optimize required target. Bednárová (2021) explained that FWAs were awarded €85 billion in 2010 in the European Union only, accounting for 17% of the total value of all contracts awarded, and their use has increased in the European Union (EU) at an average rate of 18% since 2006.

In Africa, the adoption of FWAs is credited to the potentials of the approach in addressing the key failings of short-term and fragmentation of the production team and processes of traditional contracting practices in response to the challenges of complexities and uncertainties in construction (Ayegba, 2020). It was explained that framework contracts allow organization to establish the terms for supply of series of repeated procurement for specific period of time without the need for tendering (Eyo, 2020).

Okoth and Kongere (2018) argued that framework agreements is a procurement strategy that adopted in recent years and tend to bring benefits on significant cost saving, procurement time and other resources. In addition, the study established that capacity of procuring entity, pricing, nature of procurement, legislative provision and urgency of procurement needs affect the adoption of framework agreements contract. Berhie (2022) discussed that the application of framework agreement requires skill and experience to look at the broad view of the received benefits at all level of procurement rather than looking on price reduction alone. Ahmed et al, (2022) argued that organization face lot of problems when conducting public procurement using framework agreement where the major challenges identified were on time delivery of product, poor standard of product and effective budget.

Tanzania as one of Sub-Saharan countries also adopted a framework agreement for the common use items and services which are procured by procuring entities through Government Procurement Services Agent (GPSA). The Agency is mandated to monitor the framework agreements in Tanzania Mainland (GPSA, 2021). Framework Agreement Information exchange mechanism system introduced by GPSA which is known as GPSA PMIS (GPSA, 2022) where by public organization access the name of the suppliers or service providers who are registered under framework agreements at their region.

According to Adam, (2020) the determinants influencing the Execution of Procurement Framework Agreements in Local Government Authorities: particularly in Moshi Co-operative University includes supplier performance, information exchange methods, employee proficiency, and adherence to public procurement regulatory standards. Ahmed et al (2022) postulated that, Factors Affecting Framework Agreement includes, (economic, commercial, technological, political, social, and legal) and internal factors (organisational knowledge, experience, project characteristics, cost, and time constraints) that influence the adoption of framework agreements at the national level.

Mboma (2022) identified several challenges on framework agreement procurement such as limited financial capacity and inadequate human resources to effectively procurement functions management. Altho (2019) discussed that sometimes variations happens because of inadequate contract management and failure to evaluate supplier's performance effectively. Therefore the study assessed the factors affecting implementation of the framework agreement contract for common used items in public procurement in Local Government Authorities in Dodoma, Tanzania.

1.1 Statement of the Problem

Procurements framework agreements reduce tendering procedures, ensure the efficiency, and effectiveness of the entire procurement process and reduce costs associated with buying and selling goods and services (PPA 2022) as Amended. Despite the Tanzanian government's efforts to improve public procurement accountability and effectiveness through procurement framework agreements for CUIS, some challenges remain in Local Government Authorities (LGAs) (Lawson, Hedvall, Thue-Hansen and Contreras, 2019).

LGAs procured goods and services from unauthorized suppliers and procured goods from suppliers that did not have framework agreements with the GPSA (NAOT, 2020). CAG reports of 2019/2020 in the audit of local government authority revealed that LGAs procured goods and services from suppliers without having framework agreements from GPSA worth TZS 5,130,195,752, also CAG report of 2021/2022 found out those 27 LGAs made procurement of goods and services worth TZS 5.68billion from suppliers not shortlisted by GPSA. The study related to factors affecting implementation of the framework agreement contract in public procurement in Local Government Authorities was conducted but the problem are still available as reported by CAG(NAOT, 2020).

Previous studies showed mixed views, such as Mboma (2022) who found that factors such as delivery of goods and services on time; delivery of goods and services as per local purchase order; delivery of right quality as per specification; delivery of right

quantity; provision of corrective actions for defective items; offering of technical support for goods sold to the implementation of framework agreements in local government's authorities. A study by Omari (2020) found that employee competency (staff awareness, knowledge, skills, training and support respectively) has significant influence on implementation of framework agreements. Another study showed that, the supplier selected by GPSA does not meet contract terms and conditions of framework agreement when they offer a higher price than market price (Altho, 2019). However, these studies did not conduct study on factors affecting implementation of framework agreement contract for common used items in public procurement. Therefore, this researcher filled the gap by assessing on the selected Dodoma local government's authorities.

2.0 Literature Review

Berhie (2022) explain that suppliers who involved in framework contract agreements are called framework contract suppliers and are obligated to deliver the requirements. The main justification for this agreement is to gain efficiency although delivery of poor quality goods is the problem to the efficiency of framework agreement in public procurement. Also the delivery of goods in right quantity has been challenge on framework agreement procurement where stock-out identified as one of main reasons why procuring entity forced to order unnecessary quantity to avoid under delivery.

Ahmed et al, (2022) conducted study on the factor influencing framework agreement in public procurement. On the study it was explained that the firm reduce the number of suppliers as it can use its purchasing power with few selected suppliers to negotiate best lowest price in exchange for acquiring large quantity of product. However it was argued that organization face lot of problems when conducting public procurement using framework agreement where the major challenges identified were on time delivery of product, poor standard of product and effective budget.

Mboma (2022) conducted a study and revealed that suppliers sometimes were not aware of the demand when it was tendered which likely to find difficult to secure business to cover requirements by the framework agreement. It was discussed that is better idea for suppliers to investigate what framework agreement comprises, what is already exist and when they might be up for tender. Suppliers included in framework agreement should not take business for granted to fulfill the requirements for procuring entities.

Eyo (2020) explained that framework contracts allow organization to establish the terms for supply of series of repeated procurement for specific period of time without the need for tendering. The study identified significant challenges in framework agreement procurement such as delays of product as entities fail to set framework of

time to use. Also there were supplier's related problems such as some suppliers accepted on the framework agreement failed to sufficiently honor purchase orders from procuring entities. Bawole & Adjei-Bamfo (2019) also identified challenges faced framework agreement such as delays in the delivery, stock out of goods and delivery of goods and services under standard or below to the specification.

3.0 Research Methods

This study employed a Cross-sectional research design. The researcher obtained a study sample through stratified random sampling. The sampling process resulted in the collection of respondents from various sectors such as procurement, accounting, administration, internal audit, and tender board. This study was conducted in the Dodoma city council and Chamwino District council in Dodoma region, because these three LGAs are more involved in procurement of common used items under FWAs than other entities and also are among public entities that were found with more irregularities of buying from unapproved suppliers (CAG, 2022). Data collection processes were done using questionnaires; the primary data collection entailed getting information straight from the participants. Conversely, Questionnaires served as the primary data gathering tool, providing quantitative insights into the effect of supplier's commitment on implementations of the procurement framework agreement contract for common used items in LGAs. While closed-ended questions provide background information, open-ended questions permit further in-depth research. Questionnaires have the advantage of being economical, impartial, and giving respondents enough time to respond. The questionnaire utilized a five-score Likert scale, identifying the extremes of strongly disagree and strongly agree.

3.1 Data Analysis

This method was important for the researcher because it allowed for the acquisition of multiple data points. A structured questionnaire assisted a researcher in gathering data and formulates a detailed conclusion. Data analysis involved, looking over, classifying, adding up, or reorganizing the information gathered for a study to answer the original research question. In this work, the researcher analysed data gathered from a statistical population on effect of supplier's commitment on implementations of the procurement framework agreement contract for common used items in LGAs. Preparing, organising, and reporting are the components of data analysis, as stated in Eloet al. (2014). To ascertain response frequencies and perform percentage-based comparisons, the gathered data were subjected to analysis utilising SPSS Version 23 and descriptive statistics. Measures like percentage and frequency were used in descriptive statistical analysis on the information gathered from the surveys while the inferential statistics was employed to examine the influence of the independent variable over the dependent variable. See Table 1

Table 1: Data Analysis Matrix

Objectives	Indicators	Measurement	Analysis
To examine the effect of supplier's commitment on implementations of the procurement framework agreement	<ul style="list-style-type: none"> • On time delivery • Quality of products • Right quantity 	Five point likert scale	Frequency Distribution and Regression analysis
Dependent variable			
Framework agreement implementation	<ul style="list-style-type: none"> • Cost Effectiveness • Timely delivery 	Five point likert scale	Frequency Distribution and Regression analysis

Source: Field Data (2024)

To determine the relationship between the dependent and independent variables, the method used was linear regression.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon \quad (1)$$

Where:

The Dependent Variable Y = Framework agreement implementation is measured by

- i. Cost Effectiveness ii. Timely delivery

β_0 = Constant coefficient

The independent variable (X) = Supplier's commitment which is measured by

X_1 = On time delivery

X_2 = Quality of products

X_3 = Right quantity

3.2 Findings and Discussion

The collected data indicated the following results

Supplier Commitment on FAC Implementation for Common Used Items

The objective was to examine the effect of supplier's commitment on implementations of the procurement framework agreement contract for common used items in three selected LGAs, Dodoma. The objective was measured through timely delivery of products, quality of products and ability to supply required quantity by the suppliers.

Inadequate Timely Delivery of the Product

The purpose of the statement was to examine the opinions from respondents on if the inadequate timely delivery of products from suppliers hinder effective implementation of FAC on common used items in LGAs. The responses have been revealed on the table below;

Table 23: Inadequate Timely Delivery of the Product;

Responses	Frequency	Percent
Strongly Disagree	13	7.0
Disagree	27	14.4
Neutral	12	6.4
Agree	82	43.9
Strongly agree	53	28.3
Total	187	100.0

Source: Survey Data (2024)

Results on Table 2 shows the descriptive analysis on opinions of respondents if inadequate timely delivery of products from suppliers hinders effective implementation of FAC on common used items in LGAs. Study revealed that 7% (n=13) of the respondents were strongly disagreed, 14.4% (n=27) of respondents have disagreed, 6.4% (n=12) were neutral, 43.9% (n=82) of the respondents were agreed, and 28.3% (n=53) of the respondents were strong agreed to the question. The results of findings revealed that majority which evidenced by 43.9% of the respondents agreed on statement that inadequate timely delivery of products from suppliers hinder effective implementation of FAC on common used items. Therefore the results implied

inadequate timely delivery of products from suppliers is factor affecting the implementation of FAC for common used items in LGAs.

Inadequate Quality of Products Delivery from Suppliers;

The purpose of the statement was to examine the opinions from respondents on if the inadequate quality of delivered products from suppliers hinder effective implementation of FAC on common used items in LGAs. The responses have been revealed on the table below;

Table 34: Inadequate Quality;

Responses	Frequency	Percent
Strongly Disagree	22	11.8
Disagree	40	21.4
Neutral	20	10.7
Agree	68	36.3
Strongly agree	37	19.8
Total	187	100.0

Source: Survey Data (2024)

Results on Table 3 shows the descriptive analysis on opinions of respondents if inadequate quality of delivered products from suppliers hinders effective implementation of FAC on common used items in LGAs. Study revealed that 11.8% (n=22) of the respondents were strong disagreed, 21.4% (n=40) of the respondents have disagreed, 10.7% (n=20) were neutral, 36.3% (n=68) of the respondents were agreed, and 19.8% (n=37) of the respondents were strong agreed to the question.

The results of findings revealed that majority which evidenced by 36.3% of the respondents agreed on statement that inadequate quality of delivered products from suppliers hinder effective implementation of FAC on common used items. Therefore the results implied inadequate quality of delivered products from suppliers is factor affecting the implementation of FAC for common used items in LGAs.

The findings supported Ahmed et al, (2022) identified poor standard of product delivered from the suppliers as one of the major challenges facing organization when conducting procurement by using the framework agreement contracts. Berhie (2022) explain framework contract suppliers are obligated to deliver the requirements with

justification to gain efficiency although delivery of poor quality goods turned to be the problem to the efficiency of framework agreement in public procurement.

Inadequate Quantity of Products Delivery from Suppliers;

The purpose of the statement was to examine the opinions from respondents on if the inadequate quantity of delivered products from suppliers hinders effective implementation of FAC on common used items in LGAs. The responses have been revealed on the table below;

Table 45: Inadequate Quantity;

Responses	Frequency	Percent
Strongly Disagree	25	13.4
Disagree	38	20.3
Neutral	24	12.8
Agree	60	32.1
Strongly agree	40	21.4
Total	187	100.0

Source: Survey Data (2024);

Results on Table 4 shows the descriptive analysis on opinions of respondents if inadequate quantity of delivered products from suppliers hinders effective implementation of FAC on common used items in LGAs. Study revealed that 13.4% (n=25) of the respondents were strong disagreed, 20.3% (n=38) of the respondents have disagreed, 12.8% (n=24) were neutral, 32.1% (n=60) of the respondents were agreed, and 21.4% (n=40) of the respondents were strong agreed to the question.

The results of findings revealed that majority which evidenced by 32.1% of the respondents agreed on statement that inadequate quantity of delivered products from suppliers hinder effective implementation of FAC on common used items. Therefore the results implied inadequate quantity of delivered products from suppliers is factor affecting the implementation of FAC for common used items in LGAs.

Regression Analysis of Supplier Commitment and FCA Implementation

Table 5: Model Analysis

	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.789 ^a	.623	.617	.50417

a. Predictors: (Constant), Timely Delivery of Products, Product Quality and Product Quantity.

Results in Table 5 above shows above shows the amount of variation on the dependent variable explained by the independent variables. The independent variable supplier commitment is reported with R value of 0.789 and $R^2 = 0.623$ which means that 62.3% of corresponding variations in effective framework agreement contract implementation. Thus inadequate timely delivery, quality and quantity of products by suppliers cause variations on effective FAC implementation by 62.3%. The remaining percentage of variations that is 37.7% can be explained by other factors that were not included in the study.

Table 6: ANOVA^a

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	76.869	3	25.623	100.803	.000 ^b
	Residual	49.516	183	.254		
	Total	123.385	186			

a. Dependent Variable: FAC Implementation

b. Predictors: (Constant), Timely Delivery of Products, Product Quality and Product Quantity.

The ANOVA results indicated a level of significance of 0.00 and F test gave a value of $F = 100.803$ for supplier commitment which is relatively large enough to support the goodness of fit model. That is to say if obtained sig value is within researcher predetermined significant value 0.05, then the model has capability of predicting. This implied that the model is significant in demonstrating that supplier commitment is a useful predictor of the implementation of framework agreement contracts.

Table 7: Coefficient

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1	(Constant)	2.783	.180	15.420	.000
	Timely Delivery	.275	.036	.412	7.726 .000
	Product Quality	.373	.031	.607	12.010 .000
	Product Quantity	.265	.029	.442	9.149 .000

a. Dependent Variable: FAC Implementation

The results obtained in Table 7 show that the magnitude of the coefficient for inadequate timely delivery of products by supplier is significant with significant level of 0.000, and by having beta value of 0.412 which implies that for any unit of delay in delivery of products by supplier it would contribute to ineffectiveness approximately by 41.2% on FAC implementation. Also, analysis showed coefficient for inadequate quality of products from supplier is significant with significant level of 0.000, and by having beta value of 0.607 implies that for any unit of poor products quality from supplier it would contribute to ineffectiveness approximately by 60.7% on FAC implementation. For the third predictor variable, study indicates magnitude of the coefficient for inadequate quantity of products delivered from supplier is significant with significant level of 0.000, and by having beta value of 0.442 implies that for any unit shortage in quantity delivered from supplier it would contribute to ineffectiveness approximately by 44.2% on FAC implementation. The study results above indicates that time delivery, quality and quantity attribute have strong statistical significance to the implementation of FA. It also implies that, the commitment of the suppliers plays a tremendous role in the implementation of FAC.

4.0 Discussion of the findings

The findings supports the study of Ahmed et al, (2022) who argued that organization face lot of problems when conducting public procurement using framework agreement where one of the major challenges identified were on time delivery of product from suppliers. Also Eyo (2020) identified significant challenges in framework agreement procurement such as delays of product as entities fail to set framework of time to allow terms for supplies for specific period of time without the need for tendering. Adjei-Bamfo (2019) furthermore revealed several challenges faced framework agreement

such as delays in the delivery, stock out of goods and delivery of goods and services under standard or below to the specification.

The findings supported by Berhie (2022) where it was claimed that the delivery of goods in right quantity has been challenge on framework agreement procurement where stock-out identified as one of main reasons why procuring entity forced to order unnecessary quantity to avoid under delivery. Mboma (2022) also discussed that suppliers sometimes were not aware of the demand when it was tendered which likely to find difficult to secure business to cover requirements by the framework agreement. Therefore the study suggested that is better idea for suppliers to investigate what framework agreement comprises, what is already exist and when they might be up for tender.

The study is linked to the study of Berhie (2022) who explained that suppliers who involved in framework contract agreements are called framework contract suppliers and are obligated to deliver the requirements. The main justification for this agreement is to gain efficiency although delivery of poor quality goods is the problem to the efficiency of framework agreement in public procurement. Also the delivery of goods in right quantity has been challenge on framework agreement procurement where stock-out identified as one of main reasons why procuring entity forced to order unnecessary quantity to avoid under delivery.

5.0 Conclusion, Implications, Area for Further Research and Limitations of the study

5.1 Conclusion

The study concluded that the effective implementation of framework agreement contracts for common used items has been affected by the availability of inadequate supplier commitment, inadequate employee's competence and price variation. The capacity of suppliers to deliver items punctually, in the appropriate quality and quantity, while offering essential technical support and corrective measures, profoundly influences the effective execution of framework agreements. Efficient communication and information transfer between procurement organisations and suppliers, including the utilisation of technological platforms such as TANePS (Tanzania National e-Procurement System), are essential. The integration of novel technology and information exchange channels improves the efficiency and transparency of the procurement process. The expertise, competencies, and training of procurement personnel are crucial. Ongoing training and assistance for personnel guarantee their proficiency in managing and executing framework agreements efficiently. The successful implementation of framework agreement contracts in public procurement depends on a combination of supplier performance, efficient

information exchange, skilled personnel, and compliance with legal frameworks, supportive organisational factors, and anti-corruption measures. By concentrating on these domains, public procurement institutions can improve the efficiency, transparency, and efficacy of their procurement procedures. Also, the researcher made a conclusion based on every specific objective as explained below.

5.2 Implications

5.2.1 Practical Implication

The research study conducted at Ministry of Home Affairs Headquarter. Findings revealed that regulatory compliance, affect procurement audit performance. Therefore, the study made recommendation thus commitment of suppliers is critical to the successful implementation of procurement framework agreements for frequently used commodities in Local Government Authorities. Suppliers who are committed are more likely to provide items on time and with consistency. This eliminates the possibility of stockouts and ensures that LGAs have the appropriate supplies when required. Committed vendors are more likely to meet quality criteria. This guarantees that the purchased items fit the required requirements and avoids the possibility of receiving substandard goods. Committed suppliers assist reduce procurement risks such as delays, noncompliance, and quality difficulties. This enables smoother operations and decreases the administrative burden for LGAs. Suppliers who are committed are more likely to follow the terms and conditions of the framework agreement. This involves conforming to delivery schedules, maintaining quality standards, and complying with procurement requirements. Commitment improves communication and collaboration between suppliers and LGAs. This can result in more effective problem-solving and faster resolution of any difficulties that may emerge during the contract duration. A strong commitment from suppliers might result in improved pricing and cost efficiency. Suppliers who prioritise long-term relationships may offer more competitive rates and better terms, which help the LGAs financially.

5.2.2 Managerial Implication

Based on the findings, the study made recommendations to policy makers to develop strong policies regarding framework agreement contracts for common used items to improve the effective applicability to government authorities. Adequate policies can help to provide right direction on how government authorities and suppliers can minimize the problems such as price variations on framework contracts. Development alone does not work, also policy makers should effective plans to advice and convincing government on immediately and adequate implementation of developed policies for better performance of national procurement system.

5.3 Areas of Further Studies

The study was carried out in order to assess the factors affecting implementation of the framework agreement contract in Local Government Authorities where Bahi, Dodoma City and Chamwino district councils were used as study areas. The study suggests that future studies be conducted on challenges hindering supplier's performance in framework agreement contracts for common used items. Also studies concerned with factors for the effectiveness of framework contracts implication for central government can be carried as well.

5.4 Limitations of the study

The study focused primarily on the variables of transparency and data access. The majority of respondents expressed hesitation to share their thoughts due to fears of prospective enquiries. The inquiry was constrained by a small sample size, with just a few respondents available during the data collection process. However, this constraint had no effect on the study's reliability or validity. Certain data were classed as confidential, limiting the study's data accessibility. As a result, the study's data was gathered entirely through interviews and questionnaires.

Acknowledgement

Writing this research report has not been an easy task, but a challenging one emotionally and academically. The researcher is grateful to God and the following helpful people who contributed, at large, to reduce the challenges while doing this work. The researcher extends sincere thanks to her supervisor DR. BARNABAS MAAGI for her tireless efforts, patience, encouragement, and continuous suggestions and comments while supervising the researcher throughout the time. The researcher also wishes to thank her family, friends and relatives for their support and inspiration until the completion of this research report.

Abstract

This study explores the impact of professional development on employee retention within the PSSSF in the Dodoma Region, Tanzania. Utilizing a survey design and cluster sampling, the study gathered data from 93 Human Resource Management staff members. Data collection involved a structured questionnaire, and analysis was conducted using multiple linear regression. The results indicate that factors such as worker's skills development, mentorship programs, cross-functional training, and participation in conferences or networking events significantly influence employee retention. Notably, worker's skills development ($B = 0.331$, $p < 0.001$) was identified as the most significant predictor of retention, underscoring the crucial role of continuous skill enhancement in maintaining employee commitment. Mentorship programs ($B = 0.056$, $p < 0.001$) and cross-functional training ($B = 0.072$, $p < 0.001$) were also found to positively impact retention, highlighting their importance in fostering a supportive work environment and broadening employee skills. Although career advancement equality ($B = 0.057$, $p = 0.249$) and participation in conferences or networking events ($B = 0.040$, $p = 0.011$) had a positive but less pronounced effect, they nonetheless contribute to overall retention. The model's high R Square value of 0.672 indicates that these factors collectively explain a significant portion of the variance in employee retention. These findings suggest that organizations should prioritize and invest in skill development, mentorship, cross-functional training, and networking opportunities to enhance employee satisfaction and retention. This study provides valuable insights for developing effective professional development strategies aimed at improving workforce stability and organizational performance.

Keywords: *Professional Development, Employee's Retention, Skills Development, Mentorship Programs, Cross-Functional, Networking Events.*

1. Introduction

Professional development is crucial in improving employee retention in different industries worldwide. Recent research shows that companies globally see professional growth as essential for keeping talented staff, promoting job happiness, and boosting organizational success (Smith & Lee, 2021). The connection between professional growth and staff retention is crucial in the face of growing worldwide talent competition and changing work dynamics (Johnson & Chen, 2023). Investing in the growth and development of employees has become a strategic necessity for organizations as they work to retain competitive edges (Adams & Brown, 2022).

Professional development programs are becoming more common in North America as organizations seek to combat high turnover rates and enhance employee satisfaction by embedding them into their strategies (Williams & Davis, 2022). One example is the adoption of ongoing educational programs by American businesses to improve employee abilities and keep talented workers in light of a swiftly evolving labor market (Harris & Martinez, 2023). Likewise, research in Europe emphasizes that workers in nations such as Germany and the UK place a high importance on chances for career progression and development, influencing greatly their choice to remain in their existing jobs (Roberts & Taylor, 2021).

Looking towards Asia, Japan and China have shown the significance of employee professional development for retaining staff in competitive sectors (Kim & Lee, 2022). In Japan, companies have always valued ongoing training and skill enhancement as a key aspect of their corporate ethos, leading to strong employee commitment (Tanaka & Nakagawa, 2023). In China, companies are investing significantly in professional development programs due to rapid economic growth and intense competition in the labor market in order to retain and satisfy employees (Zhang & Liu, 2021).

In Africa, the situation differs greatly throughout the continent. In South Africa, there is a growing acknowledgment of the importance of professional development programs in enhancing employee retention in the public and private sectors (Nkosi & Moyo, 2022). Yet, in numerous other African nations such as Tanzania, there exists a requirement for more organized and extensive professional growth initiatives to tackle employee turnover and improve job contentment (Juma & Suleiman, 2023).

In Tanzania, the Public Service Social Security Fund (PSSSF) encounters distinct issues concerning the retention of employees and their professional growth. The PSSSF is vital for upholding a steady workforce and guaranteeing quality service delivery by providing social security benefits to public sector employees (Mwangosi & Mbaria, 2024). Despite being important, there is a lack of empirical studies on the

impact of professional development on employee retention in the Dodoma Region's PSSSF. Prior research has predominantly concentrated on general areas of public sector staff administration and have not sufficiently tackled the particular requirements and obstacles encountered by the PSSSF (Kikula & Sanga, 2023).

This research aims to address the gap by investigating how professional development is linked to employee retention in the PSSSF in Dodoma Region, Tanzania. The study aims to offer insights on developing and implementing professional development initiatives in Tanzanian public sector organizations to improve employee retention. Comprehending this connection is essential for creating plans that enhance employee happiness and loyalty, ultimately bolstering the overall efficiency of the PSSSF in providing social security services.

2.0 Literature Review

Different sectors and organizations have implemented a range of retention strategies to secure employee loyalty. An important method for keeping employees is investing in the professional growth of employees. Researchers believe that professional development plays a key role in increasing employee retention in modern organizations. Muturn & Mose (2019) suggested that in America, promoting professional development and offering promotions to employees is necessary to improve rewards and job responsibilities for important tasks. This also shows the organization's commitment to motivating employees to achieve the company's goals. A study in Asia by Ferdiana & Ray (2023) examined the impact of career growth on employee loyalty in Indonesia. The results showed a significant simultaneous effect of career growth on employee engagement. These findings support the expectancy theory and social exchange theory, indicating that organizations can improve employee retention by offering opportunities for career growth to their employees.

Studies carried out in Africa have demonstrated the important impact that professional growth has on increasing employee retention. In an example, Ndiritu (2022) conducted research on how career advancement is linked to employee turnover in insurance firms in Nairobi City County, Kenya. The research results showed a significant and favorable connection between career advancement programs and the retention of employees, highlighting the impact of these strategies on keeping personnel. The findings indicate that it would be beneficial for management in these insurance companies to implement career development programs in order to improve employee retention rates strategically. By incorporating chances for career growth, companies can encourage a more dedicated and involved staff, ultimately leading to better employee retention results.

Given that professional development is a common practice in many Tanzanian organizations, worker retention is a crucial factor that is closely tied to the success of the organizations. Mndeme (2015) explored the significance of career advancement within the setting of TANESCO in Tanzania. Research results indicated that there was potential for career advancement within TANESCO, but not through its current organizational framework. The study also showed that career advancement played a key role in keeping employees at the company. This was because providing employees with such a development program made them feel cared for, included in the organization, and valued. In order to improve career development programs, the study outlines the need to increase the duration of time dedicated to career development, as well as for HR to collaborate with user departments in conducting career development activities.

3. Methods

3.1 Research Design and Sampling

This research utilized a survey methodology to collect data from staff members based at the PSSSF main office in the Dodoma area. The survey layout is suitable for gathering the views and encounters of a sizable number of participants, enabling the gathering of numerical information on the connection between career growth and staff turnover. The method of cluster sampling was used, with a specific focus on the PSSSF headquarters in Dodoma. Cluster sampling was chosen based on the way PSSSF is organized, with employees grouped into different clusters or departments. This approach guaranteed a fair sample from every department, allowing for a thorough look at the impact of professional development programs on employee turnover throughout the company.

3.2. Participants

The key informants for this study were selected from the employees of PSSSF in the Dodoma Region. More precisely, the research focused on 123 employees who are employed in Human Resource Management (HRM) departments. These people were chosen because they are directly involved in programs that develop and keep employees, giving them the ability to offer insights on how professional growth links to retaining employees. A survey was conducted with 93 individuals from the population to ensure a representative and adequate sample size for analysis.

3.3. Data Collection Instruments

The structured questionnaire served as the main tool for gathering data in this research. The survey aimed to collect numerical information on different aspects of professional growth and staff retention. The survey consisted of a combination of closed-ended and Likert scale inquiries designed to evaluate important aspects like employee skill growth, equal opportunities for career progression, mentorship initiatives, comprehensive training across different functions, and involvement in industry events or networking sessions. The decision to use a survey was made because of its effectiveness in gathering consistent information from numerous participants, enabling simple evaluation and comparison of various factors linked to career growth and employee retention.

3.4. Data Analysis

Multiple linear regression was utilized for data analysis in this study. This statistical technique was utilized to investigate how various independent variables regarding professional growth (such as enhancing worker skills, promoting career equality, implementing mentorship programs, offering cross-functional training, and engaging in conferences or networking events) are correlated with employee retention, the dependent variable. Multiple linear regression was used to evaluate the impact of individual variables on employee retention, while accounting for the influence of other variables. This method gave a thorough insight into which components of professional growth had the greatest influence on staff retention at PSSSF in the Dodoma Region.

4. 0 Results and Discussion

4.1. Results

Multiple linear regression was employed to evaluate how professional development aspects like skill enhancement, equal opportunities for career growth, mentorship initiatives, cross-training, and attendance at conferences or networking functions influence employee retention. This approach enabled the examination of the impact of each individual variable on employee retention, taking into account the effects of the other variables. The results of the regression analysis are shown below.

4.2 Model Summary Results

Table 4.1 contains the summarized outcomes of the multiple linear regression analysis model. The model shows a good overall fit, with an R value of 0.820, demonstrating a significant relationship between the predictors and employee retention. The R Square of 0.672 indicates that about 67.2% of the variation in employee retention is accounted for by the independent variables in the model. This significant percentage indicates that the elements being examined—such as worker's

skill enhancement, equal opportunities for career growth, mentorship initiatives, cross-training, and involvement in events like conferences or networking—greatly affect the retention of employees.

The Adjusted R Square value of 0.662 takes into account the number of predictors in the model, reinforcing the model's strength by confirming that the predictors explain a substantial amount of the variation in employee retention while accounting for degrees of freedom. The estimate's standard error is 0.18141, indicating the average deviation of observed values from the regression line, implying a strong model fit to the data.

The statistical changes show a notable enhancement in model fitting with an R Square Change of 0.672 and an F Change of 69.134, along with 5 degrees of freedom (df1) and 169 degrees of freedom (df2), and a significance level (Sig. There was no change in the value. The significance level is much lower than the typical alpha level of 0.05, indicating that the model's predictors together offer a statistically significant reason for the variance in employee retention. This discovery highlights the importance and influence of professional development elements on staff retention in PSSSF in the Dodoma Region.

Table 4.1 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.820 ^a	.672	.662	.18141	.672	69.134	5	169	.000
a. Predictors: (Constant), worker's skills development, career advancement equality, mentorship programs, cross-functional training, participation in conferences or networking events									

4.3 Coefficient of Regression

The regression coefficient results provide important information on how different factors in professional development influence employee retention in PSSSF in Dodoma Region. Improving workers' skills has a notable beneficial effect on employee retention. This factor is highly correlated with increased retention rates, with an unstandardized coefficient of 0.331 and a standardized beta of 0.772. The fact that the p-value is less than 0.001 shows that investing in programs to develop skills greatly impacts the retention of employees. This indicates that providing

employees with chances to improve their skills increases the likelihood of them staying with the company, emphasizing the important role of ongoing skill development in strategies to retain employees.

However, career advancement equality has a positive correlation with employee retention, however, it is not statistically significant, with unstandardized coefficient of 0.057 and standardized beta of 0.135 ($p = 0.249$). This means that although equal chances for career growth are advantageous, they may not have a strong impact on employee retention in this scenario. The absence of statistical significance indicates that other variables may have a stronger influence on employee retention than career advancement equality.

Mentorship programs have a positive impact on employee retention, with an unstandardized coefficient of 0.056 and a standardized beta of 0.209. The importance of retaining employees is highlighted by the significance level ($p < 0.001$) of effective mentorship. This discovery shows that organized mentoring programs are beneficial for aiding in employee growth and contentment, ultimately leading to increased employee engagement and dedication to the company.

Cross-disciplinary training is also an important element, showing an unstandardized coefficient of 0.072 and a standardized beta of 0.246, proving to be statistically significant ($p < 0.001$). This implies that offering training in various functions or positions improves employee engagement and retention. Workers who participate in cross-functional training to acquire a wider range of skills and experience are more likely to feel appreciated and stay loyal to the company.

Attending conferences or networking events positively impacts employee retention, with an unstandardized coefficient of 0.040, a standardized beta of 0.114, and significant results ($p = 0.011$). This suggests that higher retention rates are linked to opportunities for external networking and professional development. Participating in these activities enables employees to establish important relationships and acquire fresh perspectives, leading to higher levels of job contentment and commitment.

In conclusion, the regression analysis shows the significant influence of professional development factors on employee retention. Improvements in skills development, mentorship initiatives, cross-functional training, and networking opportunities play a major role in employee retention at PSSSF. The results indicate that by concentrating on these areas, retention strategies and overall organizational effectiveness can be enhanced.

Table 4.2 Coefficient of Regression

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta			Lower Bound	Upper Bound
1 (Constant)	.068	.120		.566	.572	.170	.306
Worker's skills development	.331	.050	.772	6.557	.000	.231	.430
Career advancement equality	.057	.050	.135	1.157	.249	.155	.040
Mentorship programs	.056	.014	.209	3.922	.000	.028	.084
Cross-functional training	.072	.013	.246	5.445	.000	.046	.098
Participation in conferences or networking events	.040	.015	.114	2.583	.011	.009	.070
a. Dependent Variable: Employee Retention							

4.4 ANOVA Results

The findings from the ANOVA indicate that the regression model is statistically important, showing an F-statistic of 4.187 and a p-value of 0.000. This shows that the model, which considers elements like worker's skill enhancement, equal opportunities for career growth, mentorship initiatives, interdepartmental training, and involvement in conferences or networking activities, greatly accounts for the differences in employee retention. The Regression Sum of Squares is 14.995, indicating the portion of variance explained by the model, whereas the Residual Sum of Squares is 62.317, signifying the unexplained variance. The Regression and Residuals have Mean Square values of 2.999 and 0.716, respectively, which adds

more evidence to the model's efficiency. In general, the findings support the idea that the chosen professional development factors play a part in comprehending staff retention at PSSSF in Dodoma Region.

Table 4.3 ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	14.995	5	2.999	4.187	.000 ^b
	Residual	62.317	87	.716		
	Total	77.312	92			
a. Dependent Variable: Employee Retention						
b. Predictors: (Constant), worker's skills development, career advancement equality, mentorship programs, cross-functional training, participation in conferences or networking events						

4.5. Discussion

The results of this research on how professional development impacts employee retention in PSSSF in the Dodoma Region are consistent with the viewpoints found in different sources.

Muturn & Mose (2019) stress the importance of on-the-job professional growth and resulting advancements in keeping employees motivated and meeting work responsibilities, showcasing a company's dedication to its staff. The study's findings back this perspective, showing that employee retention is greatly influenced by the improvement of worker's skills ($B = 0.331$, $p < 0.001$). The research results indicate that investing in skill development meets employees' professional needs and boosts their loyalty to the organization, supporting Muturn & Mose's claim that these investments are vital for employee retention and achieving organizational objectives.

In Asia, Ferdiana & Ray (2023) discovered a significant influence of career advancement on employee loyalty, aligning with expectancy theory and social exchange theory. The research showed that opportunities for career growth impact employees' choice to remain at a company. This is in line with the results of the research, which showed that mentorship programs ($B = 0.056$, $p < 0.001$) and cross-functional training ($B = 0.072$, $p < 0.001$) were important factors in predicting retention. These findings support Ferdiana & Ray's claim that offering career growth

chances can boost employee retention by meeting employees' expectations and reinforcing their relationships with the organization.

Studies conducted in Africa, like Ndiritu's (2022) research on insurance firms in Nairobi, highlight the significant link between career advancement programs and staff retention. Ndiritu's research indicates that it is crucial to have effective career development programs in place to retain employees. The findings of this research align with this view, especially highlighting the importance of cross-functional training ($B = 0.072$, $p < 0.001$) and involvement in conferences or networking events ($B = 0.040$, $p = 0.011$). These factors show that career development programs, like those mentioned by Ndiritu, are essential for improving employee retention through creating a more involved and dedicated staff.

Mndeme (2015) studied career development at TANESCO in Tanzania and found that while there were opportunities for career advancement, they were limited by structural constraints. The research discovered that career growth initiatives played a major role in retaining employees by giving them feelings of appreciation and inclusion. The results of this research align with Mndeme's insights, especially highlighting the significance of enhancing employees' skills ($B = 0.331$, $p < 0.001$) and implementing mentorship initiatives ($B = 0.056$, $p < 0.001$) to create a nurturing workplace. The findings indicate that like TANESCO, PSSSF's focus on investing in employees' career development is crucial for employee retention and improving their level of involvement.

In general, the findings of the study are consistent with previous research, indicating that training and growth opportunities play a crucial role in keeping employees in different environments. The significance of strong professional development programs is underscored by this consistency in enhancing employee retention and organizational effectiveness.

5.0 Conclusion and Implications

This research has shown that professional growth has a substantial impact on staff retention in PSSSF in Dodoma Region. The study has shown that retention rates are positively influenced by worker's skill enhancement, mentoring programs, cross-functional training, and involvement in conferences or networking events. Out of all these factors, the development of workers' skills stood out as the most important predictor, underscoring the crucial role of ongoing learning and improving skills in ensuring that employees remain motivated and dedicated. The strong relationship between skill enhancement and employee retention highlights the importance of organizations prioritizing and investing in thorough training initiatives to promote employee development and happiness.

Participation in mentorship programs and cross-functional training was found to be essential for keeping employees on board. Organized mentorship boosts employee morale and provides necessary support, while diverse training enhances their skills and exposure, leading to higher levels of job satisfaction and commitment. These results are consistent with the overall body of research, which highlights the significance of these training opportunities in promoting a positive and stimulating workplace atmosphere. Therefore, it is important for organizations to concentrate on establishing strong mentorship systems and offering chances for employees to acquire a variety of experiences within the company.

Attending conferences or networking events, while not as significant as other factors, still contributes positively to retention. This indicates that although networking opportunities are not the main factor in employee retention, they still contribute to improving professional growth and organizational connection. Offering these opportunities can enhance a comprehensive professional growth plan, aiding in employees' career advancement and maintaining their interest in their jobs.

In general, the research emphasizes the importance of adopting a strategic method for professional growth. Focusing on improving skills, advancing mentorship programs, encouraging cross-functional training, and providing networking opportunities can help organizations like PSSSF enhance employee retention and cultivate a committed and motivated workforce. This research offers practical information for creating successful training programs to keep important staff members and meeting company objectives.

Abstract

This study assessed the effect of procurement risk identification practice on performance of construction projects at Tanzania building agency in Dodoma. The study used a cross sectional research design and a sample of 80 respondents was selected using a stratified sampling followed by simple randomly sampling technique. Data collection methods include questionnaire and interview. Quantitative data were analyzed using both descriptive statistics and multiple linear regressions model. The study found that the procurement risk identification practices, in terms of preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences were positive and significant related to performance of construction projects at Tanzania building agency in Dodoma. The study concludes that procurement risk identification practices such as performance of construction projects at Tanzania building agency in Dodoma were important in performance of construction projects at the Tanzania Building Agency in Dodoma region in terms of cost saving, timely delivery of goods and delivery quality goods.. Therefore, the study recommends that, Tanzania Building Agency (TBA) should implement procurement risk management procedures and control proactively during procurement process also ensure that there is joint participation with all stakeholder especially user department in the implementation of these procedures.

Keywords: *Procurement Risk, Identification Practice, Performance, Tanzania Building Agency, Dodoma*

1.0 Introduction

Globally, risk management practices have been acknowledged for their direct correlation with outcome measures, including enhanced decision-making, program stability, and problem-solving, as highlighted by Oehemen *et al.* (2019). Moreover, these practices are indirectly associated with other outcome measures, such as the success of projects and products. According to Chaponda (2020) on his study revealed a significant in risk identification stage and proposed pre-identification stage which helps procurement stakeholders and practitioners to identify procurement risk and deal with it proactively. Furthermore, it was suggested that most of procurement risk assessment have not done effectively in mitigating the risk consequences and its solution in risk management should be prioritized. Kuempell *et al.* (2012) recognized that escaping from effective risk management best practices will have a significant impact on procurement and organization performance.

Findings from study by Huma *et al.* (2020) found that, in Africa, there was a delay in delivery of goods, poor contract management and poor procurement planning due to unrealistic risk management, procurement timing and poor information management in procurement process of goods. Also, the study observed existence of poor need assessment, unethical practices in the procurement process, improper records management and poor supplier's management and these were the risks associated with procurement of goods

Similarly, in Tanzania Uswege & Yamlinga (2021) noted that, awareness of risk management process; team work and communication as well as management style were the key critical success factors while cooperative culture; customer requirement and positive human dynamics were the least critical success factor for implementing risk assessment and risk management in construction projects in Tanzania.

In addition, Kikwasi *et al.* (2013) recognized that, in Tanzania there is a little awareness of procurement risk management process, lack of experience and lack of information as the major barriers and cost implementation and time constrains as the minor barriers of implementing risk management in construction project which affects project performance negatively. The implementation of procurement risk management is still a debate among researchers due to lack of effective procurement risk management such as lack of stakeholders' involvement during execution of procurement functions which implies that procurement stakeholders knowingly or unknowingly ignores the benefits of effective risk management best practices on procurement performance.

Moreover, the significance of effective risk management practices cannot be overstated, particularly within the context of the Tanzania Building Agency, a crucial Executive Agency under the Ministry of Works. However, the agency grapples with substantial challenges (Josephina 2019). Notably, ineffective procurement practices and delays in completing construction projects

hinder the agency's ability to realize its objectives and achieve optimal Value for Money. The impact of these challenges is evident in both financial and temporal terms. For instance, procurement inefficiencies may lead to increased project costs, while delays in project completion can result in additional expenditures and missed opportunities for revenue generation. Addressing these issues is paramount for the Tanzania Building Agency to enhance its overall effectiveness and ensure the successful implementation of construction projects. Figures from relevant studies underscore the urgency of these challenges and emphasize the need for strategic interventions in risk management practices within the agency.

Chileshe & Kikwasi (2014) argued that there are number of challenges facing effective implementation of procurement risks management practices in the Tanzania Public Sectors including Tanzania Building Agencies such as lack of procurement stakeholder's involvement in procurement risk implementation, poor cooperation of participation, non-availability of financial resources for implementation of procurement risk management which results into poor procurement performance in terms of quality, time, cost and delivery.

To overcome the challenges, the Tanzanian government has implemented a comprehensive framework of Laws and Regulations, such as the Public Procurement Act of 2011 and the Public Private Partnership (PPP) Act of 2010, authored respectively by the Tanzanian government in 2011 and 2010. These regulations aim to enhance the efficiency and quality of work within contractual arrangements. These measures, as outlined in the legal texts [Public Procurement Act, 2011] and [PPP Act, 2010], are specifically designed to mitigate risks associated with the procurement process, reflecting a commitment to fostering a more secure and transparent environment for both public and private entities involved. (URT, 2016)

Despite of the efforts made by government and various scholars to address the challenges on effective implementation of procurement risks management, there are still various risks existing in construction project such as corruptions, quality risk, cost risks and delays in public procurement construction project which need attention from scholarly findings (CAG, 2019).

Similarly,, construction projects managed by the Tanzania Building Agency (TBA) have been marred by significant challenges, leading to poor performance trends. Notably, cost overruns have been observed at an alarming rate, averaging 30% over the past five years (Mwakisunga, 2020). Project delays was reported as another critical issue which have consistently exceeded initial timelines by 25%, causing disruptions in project delivery schedules (TBA, 2022). These challenges not only hinder project success but also contribute to a strained financial environment and diminished public trust in the agency.

Based on the reviewed literature, it has been observed that there is a scarcity of studies concerning procurement risk management practices in construction projects, particularly within the public sector in Tanzania. Most studies have focused on the relationship between procurement risk

management practices and the performance of procurement and supply chain operations (Mbuyuni & Lusinde, 2023; Ochieng et al., 2022), while others have explored the perceived barriers to effectively implementing risk management policies (Mushi & Kazimoto, 2022). However, these studies did not address the effect of procurement risk management practices on the performance of construction projects in Tanzania's public sector procurement. Therefore, this study addresses this gap by assessing the influence of procurement risk management on the performance of construction projects at the Tanzania Building Agency in Dodoma Region. Specifically, the study focused on the effect of procurement risk identification practices on the performance of construction projects at the Tanzania Building Agency in Dodoma.

2.0 Literature Review

2.1 Theoretical Literature Review

2.1.1 Conceptual framework

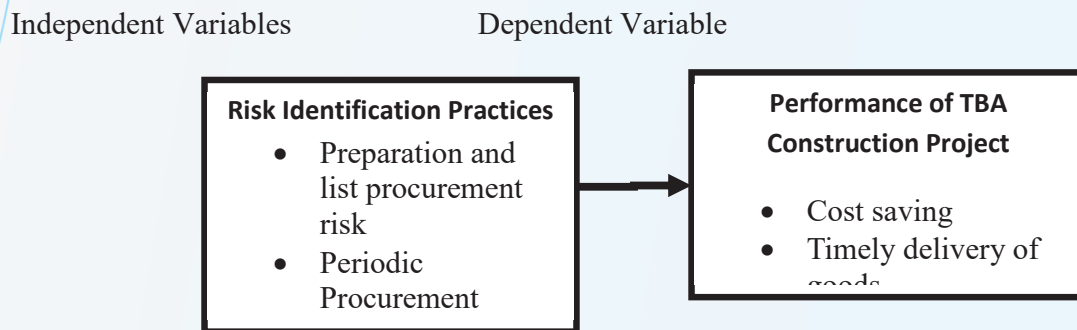

Contingency theory is the organizational management theory developed by Fred Fiedler in 1960s, the theory, revealed that, regardless of how carefully a plan is written, the organization's success is contingent on contingency conditions or situations arising from external and internal circumstances. Management contingency theory educates managers on the critical nature of comprehending uncertainties in order to build suitable responses. Contingency theory to enable managers to adapt their policies, leadership style, choices, and processes to the existing environment (Ogola, 2015).

According to this theory, organizational management has no choice but to take action based on the prevailing circumstances, as this is the most effective way to decide, lead, and organize an organization in an uncertain environment; thus, the organization should manage procurement risks by adopting this theory (McAdam, *et al.*, 2019).

Because procurement risk management such risk identification practices is dynamic as a result of technological advancements, changes in procurement laws and guidelines, and changes in market conditions, all of which are uncertain, this theory is relevant to this study and is associated with specific objectives, namely procurement risk identification procedures, risk evaluation procedures, and risk control procedures, and thus the theory enables management to appreciate the critical nature of identifying procurement risk in construction project (Huma et al., 2020).

The conceptual framework presented in Figure 1 shows the diagrammatical representation of the interrelationship among variables of the study. The framework shows that achievement of procurement performance Tanzania Building Agency construction project depends on effectiveness of risk management practices. In this study, conceptual framework indicates the relationship between independent variables such as risk identification practices, while dependent variable is performance of construction projects.

Figure 1: Conceptual Framework of the study variables

2.1.2 Empirical Literature Review

In the global context, procurement risk identification and performance have been extensively studied. For instance, a study by Knight et al. (2017) titled "Global Procurement Risk Management" utilized a mixed-methods approach combining surveys and case studies across multiple industries worldwide. The findings revealed that robust risk identification practices significantly enhance procurement performance by reducing the incidence of supply chain disruptions and cost overruns (Knight et al., 2017). The study concluded that companies with well-defined risk management frameworks are better positioned to achieve competitive advantage in the global market (Knight et al., 2017). Additionally, it emphasized the importance of integrating risk management into the overall strategic planning of procurement functions (Knight et al., 2017).

In Europe, a notable study by Wagner and Bode (2018) titled "Managing Risk and Performance in European Supply Chains" employed a survey methodology targeting procurement professionals across various European countries. The research identified that proactive risk identification practices correlate with improved procurement performance, especially in terms of supplier reliability and cost efficiency (Wagner & Bode, 2018). The study highlighted that European firms prioritize risk management due to the complex regulatory environment and the need to ensure supply chain resilience (Wagner & Bode, 2018). Moreover, the findings suggested that firms with advanced risk identification mechanisms report higher levels of procurement performance, evidenced by fewer disruptions and better supplier relationships (Wagner & Bode, 2018).

In the American context, Johnson and Flynn (2019) conducted a study titled "Procurement Risk Identification and Performance in the US Manufacturing Sector" using a longitudinal survey method. Their research found that American manufacturing firms with systematic risk identification practices experience significant improvements in procurement performance, including reduced lead times and lower costs (Johnson & Flynn, 2019). The study concluded that risk identification is a key driver of procurement efficiency and effectiveness in the highly competitive American market (Johnson & Flynn, 2019). Furthermore, it was noted that firms that

invest in advanced risk assessment tools and technologies tend to outperform their peers in terms of procurement outcomes (Johnson & Flynn, 2019).

In Asia, Chen and Wu (2020) examined procurement risk identification practices in their study titled "Risk Management and Procurement Performance in Asian Supply Chains" using a case study approach across several industries. The research concluded that Asian firms that adopt comprehensive risk identification frameworks achieve superior procurement performance, particularly in terms of supply chain agility and cost control (Chen & Wu, 2020). The study found that cultural factors and varying levels of economic development influence the adoption and effectiveness of risk management practices (Chen & Wu, 2020). Additionally, the research highlighted that firms in technologically advanced Asian countries tend to have more sophisticated risk management practices, leading to better procurement outcomes (Chen & Wu, 2020).

in East Africa, Kiage (2018) examined the impact of procurement risk identification on procurement performance in his study titled "Risk Management and Procurement Performance in East African Community" using a cross-sectional survey method. The study found that East African firms that implement structured risk identification processes report better procurement performance, evidenced by improved supplier performance and cost savings (Kiage, 2018). The research concluded that risk identification is a critical component of procurement strategy in East Africa, where supply chain disruptions are common (Kiage, 2018). Furthermore, the study highlighted the role of regional integration efforts in enhancing procurement practices and reducing risks (Kiage, 2018).

In Tanzania, a study by Mrope and Iravo (2017) titled "Procurement Risk Management and Performance of Public Institutions in Tanzania" utilized a case study methodology focusing on public sector institutions. The findings indicated that Tanzanian public institutions with effective risk identification practices experience improved procurement performance, including higher efficiency and transparency (Mrope & Iravo, 2017). The study concluded that risk management is essential for public procurement in Tanzania, given the prevalent issues of corruption and inefficiency (Mrope & Iravo, 2017). Additionally, the research suggested that institutional capacity building and adherence to regulatory frameworks are critical for enhancing procurement outcomes (Mrope & Iravo, 2017).

3.0 Research Methodology

3.1 Research Design

This study adopted a cross-sectional research design since cross-sectional design allowed a collection of data from the population at a specific point in time.

3.2 Study Area

This study was conducted at the Tanzania Building Agency (TBA) in the Dodoma region, chosen for its central role in managing key government construction projects, particularly as Dodoma continues to grow as Tanzania's capital city. The region has experienced a significant increase in public and private construction activities due to the government's relocation efforts, making it a hub for infrastructure development. However, these construction projects, managed by TBA, have faced persistent challenges that negatively affect project outcomes. Notably, cost overruns have averaged 30% over the past five years, contributing to budget inefficiencies (Mwakisunga, 2020). Additionally, project delays have consistently exceeded initial timelines by 25%, severely impacting the timely delivery of public infrastructure (TBA, 2022). Given the critical role of TBA in the development of Dodoma and the ongoing issues in project execution, the region provides a rich source of data to examine the effect of procurement risk management on the performance of construction projects. These challenges underscore the need for targeted research to improve project performance and ensure sustainable development in the area.

3.3 Targeted Population

The targeted population of the study were 100 staffs of the TBA Dodoma, from the following units, Procurement department, Accounts department, and Administration, construction, real estate, and consultancy departments. Kothari and Garg (2014), defined population as the total number of elements through which the sample size is drawn and target population normally consists of elements or individuals having similar characterizes where sample is drawn to represent other elements.

3.4 Sample Size and Sampling Procedure

3.4.1 Sample size

Sample size of the study was selected from population of 100 staff of the Tanzania Building Agency Dodoma and was calculated using Yamane formula of 1967 since the targeted population is known. The formula for sample size calculation presented as follows

$$n = \frac{N}{1 + Ne^2} \dots\dots\dots (1)$$

Where;

n = Sample size

N= Targeted study population (100)

1 = Constant and

e = Acceptable sampling error (5%)

$$\text{Sample size} = n = \frac{100}{1 + 100(0.5)^2} = 80$$

$$\text{Unit sample size} = \frac{\text{Unit population} \times \text{Sample size}}{\text{Target Population}}$$

Table 1: Distribution of Sample size

	S/N	Department	Targeted Population	Sample Size
3.4.2 Sampling procedures The study employed both probability and non- probability sampling techniques in selection of the respondents.	1	Procurement	15	12
	2	Accounting	10	8
	3	Administration	10	8
	4	Construction	30	24
	5	Real Estate	15	12
	6	Consultancy	20	16
		Departments		
	Total		100	80

In probability sampling, a stratified sampling technique was used to categorize the respondents based on their professional departments, then followed by simple random sampling technique which was used to select 80 staffs (See Table 1).

In non-probability sampling, purposive sampling technique which involves deliberate selection of a particular unit of the universe for constituting a sample which represents a universe (Kothari, 2009).. In this study, purposive sampling techniques were used to select key informants (Five head of departments) and the study area. These key informants were selected on the basis of their expertise and position in the implementation of procurement practices in their departments.

3.5 Data Collection Methods

In order to obtain quantitative data, questionnaire tool was employed in the collection the relevant information. Close-ended questions (statements) with Likert scale ranked was used to obtain information that meet research objectives. The questionnaire was employed because give the respondent's freedom to answer questions related to research specific objective also helps the researcher, with minimal efforts, to obtain required information in a timely manner. Under this study questionnaire was prepared and administered to the targeted respondents that were employees from the Tanzania Building Agencies who involves in procurement process related to construction projects.

3.6 Data Analysis Method

To assess effect of risk identification practice on performance of construction projects. Data for this objective were analyzed by using descriptive statistics and multiple linear regression analysis using the following regression equations;

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon \dots\dots\dots (1)$$

Y= Dependent variable (Performance of construction projects)

Where;

β_0 = intercept

β_1, β_2 , and β_3 = Regression coefficients for risk identification practice

X_1 = Preparation and list procurement risk

X_2 = Periodic Procurement audits

X_3 = List of procurement risk consequences

ε = Error term

4.0 Findings and Discussion

This section attempts to discuss the findings that were obtained from the field extensively. The section includes discussion on the respondent's characteristics, major findings interpretation of findings and compares the results with the related studies.

4.1 Characteristics of Respondents

The characteristics of the respondents were sought to help researchers to have background information of the respondent. These characteristics include sex, age, education level and years of experience.

Findings in Table 2 show that, the males (61.3%) were more represented than females (38.8%), implying a preference for recruiting men by the agency. Regarding age, the majority (46.3%) of respondents were aged 26-35, followed by 33.8% in the 36-45 age group, indicating that most participants were in their prime working years. In terms of education, majority (63.8%) held a bachelor's degree, with a smaller percentage having master's degrees (21.3%), diplomas (10%), and certificates (5%), signifying a well-educated workforce. Lastly, 42.5% of respondents had 3-6 years of work experience, while 32.5% had 7-10 years, demonstrating a workforce with significant experience relevant to procurement risk management practices.

Table 2: Characteristics of Respondents (n=80)

Sex	Frequency	Percent
Male	49	61.3
Female	31	38.8
Age category (Years)		
18-25	16	20.0
26-35	37	46.3
36-45	27	33.8
Level of Education		
Certificate	4	5.0
Diploma	8	10.0
Bachelor Degree	51	63.8
Master Degree	17	21.3
Years of Experience (Years)		
Less than 3	14	17.5
3-6	34	42.5
	1623	

7-10	26	32.5
Above 10	6	7.5

Source: Research Findings (2024)

4.2 Descriptive statistics Results for Risk Identification Practices

Descriptive statistics were used to assess the level of respondent's agreement. The mean and standard deviation (S.D.) were calculated to establish the findings from the data that were generated using a Likert scale of 1-5 where 5= strongly Agree, 4=Agree, 3= Neutral, 2= Disagree and 1= Strongly Disagree. The findings were presented in Table 3 using mean score and the standard deviation.

Table 3 : Descriptive results on risk identification Practices(n=80)

Risk Identification Practices	Mean	SD
Preparation and list procurement risk	3.887	0.826
Periodic Procurement audits	3.912	0.874
List of procurement risk consequences	4.125	0.623

Source: Research Findings (2024)

The Results presented in Table 3 revealed that majority of the respondents agreed that risk identification practices is a factor of procurement risk management affecting procurement performance (mean=3.887, Std=0.826). The respondents also agreed that periodic procurement audits is a component of procurement risk management that influence procurement performance (mean=3.912, Std=0.874). In addition, respondents agreed that list of procurement risk consequences are likely to enhance procurement performance (mean=4.125, Std=0.623).

The study findings concur with those of Rostami (2022) who suggested that, risk identification is the key success factors for effective procurement risk management and failure to identify risk earlier affects the whole process of procurement risk management which will negatively affects the achievement of the organizational objectives. The most common risk identification adopted by the organization includes documentary review, checklist analysis, expert judgment, information gathering while other tools for risk identification which is not obvious used are brainstorming, Delphi techniques due to inadequate knowledge and organizational resources.

4.3. Effect of Risk Identification Practices on Performance of construction project

The study employed multiple linear regression analysis to determine significance relationship between independent variables (Preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences) and dependent variables (Performance of construction projects at the Tanzania Building Agency)

Results from Table 4 shows a positive influence of procurement risk identification practice on performance of construction projects at Tanzania building agency. The value of adjusted R^2 of procurement risk identification practice was 0.56 indicates that risk identification practice (Preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences) explain 56% variability in performance of construction projects at Tanzania building agency. Likewise, the F-value shows that the independent variables (Preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences) statistically significantly predict the dependent variable (Performance of construction projects at the Tanzania Building Agency) since $p\text{-value} < 0.05$.

Table 4: Effect of Risk Identification Practices on Performance of construction project

Variable	Unstandardized Coefficients		Standardized t-value Coefficients		Sig.
	B	Std. Error	Beta		
(Constant)	0.069	1.680	-	0.041	0.968
Preparation and list procurement risk	0.331	0.284	0.261	4.164	0.029
Periodic procurement audits	0.148	0.067	0.129	3.208	0.036
List of procurement risk consequences	0.159	0.065	0.164	5.465	0.019

Dependent Variable: Performance of construction projects

Adjusted R squared = 0.56

F-value =17.9

Findings in Table 4 indicate that, preparation and list procurement risk were found to be positive and significant related to performance of construction projects at the Tanzania Building Agency ($\beta=0.331$ and $p\text{-value} < 0.05$). The findings imply that, a unit increase in preparation and list

procurement risk within risk identification practices could results to increase performance of construction projects at the Tanzania Building Agency by 33.1 percent.

Moreover, findings in Table 4 show that, periodic procurement audits were found to have positive and significant related to performance of construction projects at the Tanzania Building Agency ($\beta=0.148$ and $p\text{-value} < 0.05$). The findings imply that, a unit increase of periodic procurement audits within risk identification practices could results to increase performance of construction projects at the Tanzania Building Agency by 14.8 percent.

Furthermore, findings in Table 4 revealed that, list of procurement risk consequences were found positive and significant related to performance of construction projects at the Tanzania Building Agency ($\beta=0.159$ and $p\text{-value} < 0.05$). The findings imply that, a unit increase of list of procurement risk consequences within risk identification practices could results to increase performance of construction projects at the Tanzania Building Agency by 15.9 percent.

These findings is in line with those of Sriyalatha (2016) who argue that, risk identification practices in procurement practices lead to positively significant impact on procurement performance. Furthermore, findings are similar with those of Renault *et al.* (2016) and PPRA (2020) found a significant effect of procurement risk identification and procurement performance by explain that procurement risk identification is critical and first step in procurement risk management process that need to be well considered

5.0 Conclusion and Recommendations

The study concludes that procurement risk identification practices such as preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences were important in procurement performance in terms of cost saving, timely delivery of goods and delivery quality goods. at the Tanzania Building Agency in Dodoma region

Therefore, the study recommends Tanzania Building Agency to consider the components of procurement risk identification such as preparation and list procurement risk, periodic procurement audits and list of procurement risk consequences during public procurement process. This will enhance public procurement performance

Since the study was limited in one component that influence of procurement risk management practices on the public procurement performance of Tanzania Building Agency. Further studies may be carried out to find out others factors that influence of procurement risk management practices on the public procurement performance in other construction industry sectors in Tanzania.

The Effect of Procurement Contract Management on Water Project Lead Time Management at RUWASA-Dodoma Region Tanzania

Deodatus Mushumbusi^{1*} & Boniface E. Mwalukasa²

^{1*} Department of Procurement and Supplies Management, College of Business Education, Dodoma

² Department of Procurement and Supplies Management, College of Business Education, Dar es Salaam

Abstract

The problem addressed in this study is the persistent delays in managing project timelines for water projects at RUWASA. Have resulted in extended lead times, negatively impacting project outcomes and service delivery. Water projects face challenges in managing project timelines, resulting in extended lead times and negative effects on project outcomes.

Therefore, the study aimed to investigate the effect of procurement contract management, on water project lead time management at RUWASA-Dodoma region. The research applied the principal-agent theory to understand the dynamics between stakeholders in procurement and used a cross-sectional research design targeting a population of 150 individuals, with 109 respondents selected through simple random. Data collection included questionnaires and the analysis employed descriptive statistics and multiple regression analysis to provide comprehensive insights. The findings revealed significant relationships between procurement efficiency and project lead time management. Descriptive statistics highlighted trends such as delays in contract execution while regression analysis demonstrated that effective procurement strategies positively impacted project timelines. The study concluded that procurement contract management has a significant effect on water project lead time management at RUWASA-Dodoma Region, Tanzania. The study recommended that RUWASA should improve contract management by focusing on clearer and more specific terms in procurement contracts, as this would help address the challenges and inefficiencies hindering project timelines.

Keywords: *Procurement, Contract, Procurement Contract, Procurement Contract Management, Lead Time and Lead Time Management.*

1.0 Introduction

Public projects are initiatives managed by the government or state aimed at addressing community needs globally, effective procurement contract management is crucial for ensuring the timely and successful implementation of water projects. It involves a series of processes, including drafting, negotiation, execution, and monitoring of contracts to achieve project objectives within the set timeframes and budgets (Anderson, & White, 2023). According to Ankrah (2020), poor contract

management is one of the primary reasons for delays in infrastructure projects, including those in the water sector, leading to cost overruns and compromised quality. In developed countries like the United States and Germany, advanced contract management systems, supported by robust legal frameworks and digital tools, have significantly reduced project delays and enhanced efficiency (Aputo, 2023). Conversely, in developing countries, challenges such as inadequate contract documentation, lack of enforcement mechanisms, and limited expertise often hinder effective contract management, resulting in prolonged project lead times.

In Africa, water projects are critical for addressing the continent's water scarcity challenges and improving access to clean water. Effective procurement contract management in this sector is pivotal to overcoming obstacles such as funding limitations, inadequate infrastructure, and administrative inefficiencies. A study by Julius and Gershon (2019) highlighted that 65% of water projects in sub-Saharan Africa experienced delays primarily due to poor contract management practices, including unclear contract terms, inadequate risk allocation, and weak monitoring mechanisms. Countries like South Africa and Kenya have made strides in improving procurement contract management by adopting comprehensive legal frameworks and capacity-building initiatives. However, many other countries continue to struggle with challenges related to corruption, inadequate contractor performance, and lack of transparency, which significantly affect project timelines and outcomes.

Focusing on East Africa, countries such as Kenya, Uganda, and Tanzania have undertaken numerous water projects to improve water accessibility and sanitation including The Western Kenya project in Kenya, WATSAN water project in Uganda and Water projects in Tanzania in Bahi town, Kondoa town, Chamwino town and Dodoma city (Mwega, 2023). Despite these efforts, contract management remains a significant bottleneck in achieving project completion within the planned timelines. Studies by Aputo (2023) show that delayed water projects in East Africa are often linked to issues such as contract disputes, poor contractor performance, and delays in payments. Additionally, the lack of standardized contract management practices and inadequate oversight further exacerbate these issues, leading to increased project lead times and cost escalations (Kijaji & Rwekaza, 2023). This calls for the adoption of more robust procurement contract management systems, including improved contractor evaluation processes, clearer contractual obligations, and enhanced capacity for contract monitoring and enforcement.

In Tanzania, the management of procurement contracts in water projects has been a topic of growing concern due to its impact on the timely delivery of these essential services (Msanga, 2020). The Rural Water Supply and Sanitation Agency (RUWASA) is at the forefront of implementing water projects aimed at improving rural water supply. However, despite efforts to streamline procurement processes, contract management issues have led to significant project delays (Kijaji & Rwekaza, 2023). A study by the Public Procurement Regulatory Authority (PPRA) revealed that 40% of water projects under RUWASA faced delays due to contract

management inefficiencies, highlighting the need for improved contract administration, risk management, and performance evaluation mechanisms (PPRA, 2023).

Several factors contribute to the challenges faced in procurement contract management for water projects in Tanzania. Key among these are the lack of skilled personnel, inadequate use of contract management tools, and the absence of a robust legal framework to enforce compliance (Mgawe & Masanja, 2023). Mwega (2023) noted that while Tanzania has made progress in strengthening its procurement processes through reforms and capacity-building programs, the translation of these efforts into improved contract management practices remains limited. Therefore, this study intends to investigate the effect of procurement contract management, on water project lead time management at RUWASA-Dodoma region.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 The Principal-Agent Theory

The foundational concepts of Principal-Agent Theory can be traced back to earlier thinkers like Adam Smith and John Stuart Mill, and explored relationships of power and control between parties. However, the modern formulation of Principal-Agent Theory, which focuses on the dynamics between principals and agents, gained prominence in the 1970s and 1980s with key contributions from Jensen and Meckling (Belay, 2023). This theory is fundamental to economics and organizational behavior, as it addresses the conflicts of interest that may arise between a principal (such as an employer or investor) and an agent (such as a manager or contractor) due to differences in information, risk preferences, and incentives. It explores the risks of moral hazard and adverse selection and offers mechanisms to mitigate these issues through contracts, monitoring, and performance-based incentives (Nguyen, 2023).

One of the major strengths of Principal-Agent Theory is its versatility across a wide range of disciplines. The theory has been applied to corporate governance, policymaking, international relations, and even interpersonal dynamics (Kim & Lee, 2023). It offers critical insights into the design of incentive systems, helping to align the interests of principals and agents to improve organizational efficiency and reduce conflicts. Specifically, the theory allows for the structuring of contracts and monitoring frameworks that promote accountability and performance across different settings, from business to government operations.

However, Principal-Agent Theory has faced criticism, particularly concerning its assumptions and the challenges of applying it to complex human behavior. The theory assumes rationality in agents and principals, which may not fully capture real-world social dynamics, trust, or cultural nuances that influence relationships between parties (Riley & Zhang, 2023). Additionally, scholars such as Williamson (2023) have noted that the theory's focus on formal mechanisms, such as contracts

and incentives, often overlooks informal factors like interpersonal trust, power asymmetry, and relational governance that shape principal-agent interactions. The theory also struggles with empirical validation in some contexts due to its abstract nature, which can make testing certain assumptions difficult.

Principal-Agent Theory (PAT) is highly relevant to this study, offering a theoretical framework to explore the relationship between RUWASA, as the principal, and contractors, as agents in water infrastructure projects. Efficient procurement and lead time management hinge on the alignment of interests between these parties. The theory highlights the importance of clearly defined contracts, effective monitoring mechanisms, and appropriate incentives to foster cooperation and minimize delays (John & Ochieng, 2023). Other studies, such as those by Msanga (2021) on road projects in Tanzania and Kagiri (2023) on government infrastructure in Kenya, have used Principal-Agent Theory to analyze procurement and project management, emphasizing how aligning agent behaviors with principal goals improves performance.

2.3 Empirical Literature

Recent studies have explored the relationship between procurement practices and project performance across various sectors, with findings highlighting key areas of improvement. For instance, Aputo (2023) re-examined the effects of procurement functions on project outcomes in NGOs in Nairobi County. Using an updated descriptive research design and a larger sample size, the study reinforced previous findings that need assessment, supplier sourcing, contract management, and inventory management remain critical to project success. Aputo emphasized that the consistent application of these functions significantly improves project performance in NGO operations. Similarly, Fore (2023) assessed the procurement processes in a project management company in Cape Town, South Africa, and found that corruption, favoritism, fraud, and supplier delays continued to be key contributors to procurement inefficiencies. However, the study introduced new insights, emphasizing the need for advanced digital systems and better training for procurement officers. Fore's findings align with recent literature stressing the importance of technology adoption, ethical practices, and policy compliance in procurement processes to ensure successful project execution.

Karimi (2023) revisited the issue of lead time in procurement management within Uganda's motor industry, finding that while fixed lead times had minimal impact, the management of pre-processing, processing, and post-processing lead times remained crucial for effective procurement outcomes. The study advocated for greater attention to dynamic lead time management to enhance procurement efficiency in the motor industry. Mgawe and Masanja (2023) conducted an updated assessment of procurement practices in Tanzania, focusing on the National Housing Corporation (NHC). The study found that effective contract monitoring and control significantly enhanced project performance. The authors recommended the integration of real-time monitoring systems

to ensure timely procurement execution, a development from previous studies that mainly focused on manual methods.

On the other hand, Msanga (2023) expanded on earlier research by examining procurement procedures in road construction projects within the Temeke Municipality, Dar es Salaam. The study confirmed that procurement procedures, particularly bid evaluation and supplier selection, had a significant effect on the cost, quality, and time performance of public infrastructure projects. This study underscores the ongoing need for transparent and streamlined procurement processes to optimize public sector project outcomes. Kotu (2023) provided a comprehensive analysis of procurement management practices in Ethiopia, focusing on public health institute projects. The study reiterated that procurement practices such as contract management, supplier sourcing, and need assessment play a direct role in enhancing project performance. However, Kotu introduced new recommendations, advocating for policy reforms to improve procurement transparency and capacity building for procurement staff in the Ethiopian public sector.

2.4 Conceptual Framework

This study was guided by independent variable and dependent variable whereas water project lead time management is influenced by procurement contract management focused on clarity, specificity as well as contract performance. In that case, there is the relationship between procurement contract management and water project lead time management.

Risk Management

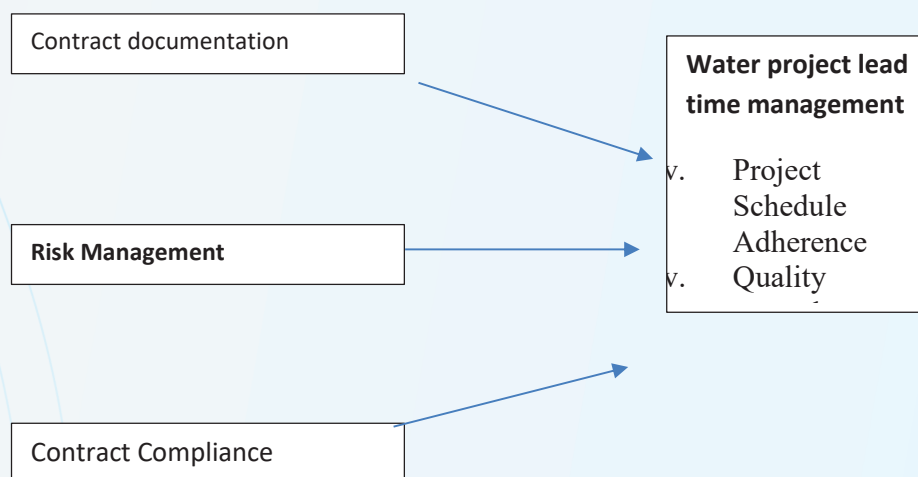

Figure 1.1 Conceptual Framework, 2024

Source: Field Data, 2024

Operationalization of the Variables

2.4.1 Contract Documentation

In the context of water projects, contract documentation plays a crucial role in defining the lead time necessary for project execution. Lead time refers to the period required to complete all preparatory activities before actual construction begins. This includes planning, permitting, procurement, and mobilization phases (Ankrah, 2020).

2.4.2 Risk Management

Risk management in projects is a critical process that involves identifying, assessing, and prioritizing risks associated with the planning, execution, and completion of infrastructure projects. The lead time for these projects can be significantly affected by various risk factors, which can delay timelines and increase costs (Aputo, 2023).

2.4.3 Contract Compliance

In the context of projects, which often involve significant infrastructure development and long lead times, ensuring compliance is critical for successful project execution. The complexities associated with projects can include regulatory requirements, environmental considerations, and financial obligations, all of which necessitate a robust compliance framework (Belay, 2023).

3.0 Methodology

3.1 Research Design

A cross-sectional design was adopted, capturing and analyzing data at a single point in time to identify patterns and relationships between various factors affecting project timelines.

3.2 Research Approach

The study used quantitative approach. Quantitative research allowed for the collection of numerical data that can be statistically analyzed (Bryman & Bell, 2015). A quantitative approach lends itself to objectivity, minimizing biases that might arise from subjective interpretations. This is crucial when assessing the effectiveness of procurement processes and their impact on project timelines. Quantitative methods enable the use of statistical tests to determine the significance of the relationships between procurement contract management practices and lead time management, offering strong conclusions.

3.3 Study Area

The study was conducted at RUWASA-Dodoma Region. This is due to the fact that there have been the delays of water projects in rural areas particularly in Dodoma rural areas. For example, 53 out of 58 water projects (equivalent to 91%) were not completed on time, and the average delayed time for completion of implemented water projects in rural areas was 480 days (HR, 2023).

3.4 Study Population

The research population included 150 RUWASA staff members, comprising both senior and operational staff involved in the procurement process.

3.5 Sample Size

The sample size of the study was justified using Yamane formula (1967), divided into 11 senior staff members (10.1%) and 98 operational staff members (89.9%).

$$n = \frac{N}{1 + Ne^2}$$

Where;

n= is number of sample (required)

N = Total population (150) and

e = Error tolerance (level) or margin of error (0.05)

$$150 / (1 + 150(0.05)^2) = 150 / 1.375 = 109$$

3.6 Data Collection Instruments

Data collection was conducted through structured questionnaires. Operational staff received questionnaires designed to gather quantitative data on procurement practices, distributed both electronically and in physical form to maximize participation. The collected data was analyzed using descriptive analysis and multiple linear regression.

3.7 Sampling Techniques

The study used two different sampling strategies to select its participants: and then proportionate stratified sampling to group staff into strata, simple random sampling selecting individuals from each stratum. Simple random sampling is a probability-based method where each member of the population has an equal chance of being selected (Bryman, & Bell, 2015). In the context of this study, operational staff refers to employees who perform day-to-day tasks and duties within an organization. The use of simple random sampling ensures that all operational staff members have

an equal opportunity to be selected for the study, regardless of their position, tenure, or any other factors.

3.8 Validity and Reliability of the Data

3.8.1 Validity of Data

This is referred to a degree to which the outcomes of a measurement truly reflect the targeted variable, as outlined by Cohen et al. (2014). To evaluate the reliability of the research instruments, the study sought guidance from a field expert, particularly the supervisor. This approach facilitated the modification and adjustment of the study tools as necessary, thereby enhancing the validity of the research.

3.8.2 Reliability of Data

The ability of a tool to consistently and accurately measure the intended phenomenon is referred to as reliability (Alvi, 2016). To evaluate the scale's reliability for each variable, the study analyzed the internal consistency of the variables (items) through Cronbach's Alpha. Cronbach's Alpha reliability measure operates under the assumption that all items and questions are equally reliable. A minimum acceptable value of 0.7 or above is set for each indicator. The assessment criteria were based on the smallest acceptable value of the alpha coefficient, which is established at 0.7.

Table 1: Reliability Statistics

Variables	Cronbach's Alpha
Contract documentation	0.781
Risk management	0.827
Contract compliance	0.821
Water project lead time management	0.920

Source: Field Data, 2024

The table presents reliability statistics for various variables associated with project management in the context of water projects, measured using Cronbach's Alpha. This statistical measure assesses the internal consistency of a set of items, indicating how closely related they are as a group. A higher alpha value suggests a higher level of reliability.

Starting with contract documentation which has a Cronbach's Alpha of 0.781, this indicates a good level of reliability. This suggests that the items measuring contract documentation are consistently portraying a coherent concept, which is crucial for ensuring that all contractual obligations are clear and well understood among stakeholders. Risk management follows with an alpha of 0.827, demonstrating even stronger reliability. This high score implies that the measures related to identifying, assessing, and mitigating risks in water projects are well-aligned and can be trusted to provide valuable insights. Effective risk management is vital in project execution, as it helps to anticipate and address potential issues before they impact project outcomes.

For contract compliance, the Cronbach's Alpha is 0.821, also indicating good reliability. This suggests that the metrics used to evaluate adherence to contractual terms are consistent. High contract compliance is essential for maintaining project integrity and ensuring that all parties fulfill their obligations, thus minimizing disputes and enhancing project success. The variable with the highest reliability is water project lead time management, which boasts a Cronbach's Alpha of 0.920. This exceptional score indicates a very high level of internal consistency among the items measuring lead time management. Efficient management of project timelines is critical, particularly in water projects where delays can have significant implications for resource availability and community impact. In summary, the implications of these reliability statistics suggest that the measured variables are reliable indicators of their respective constructs within the context of water project management. The high levels of internal consistency, particularly in lead time management, highlight the importance of these factors in ensuring successful project execution. Stakeholders can trust that the data derived from these measures will provide a solid foundation for decision-making and strategic planning in future water projects.

3.9 Data Analysis

The study used descriptive analysis and multiple linear regression analysis to analyze data. The reason behind to use multiple linear regression analysis was to establish relationship between independent variables and dependent variable. The regression model is as follows

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e$$

Where by

Y = Water project lead time management

β_0 = Constant factor

X_1 = Contract documentation

X_2 = Risk management

X_3 = Contract compliance

e = Error term

4.0 Results

4.1 Descriptive Analysis

Descriptive statistics in this objective was to assess the effect of procurement contract management on water project lead time management at RUWASA-Dodoma Region, Tanzania.

The objective of this analysis was to assess the effect of procurement contract management on the lead time management of water projects at RUWASA in Dodoma Region, Tanzania. Descriptive statistics were used to analyze responses from 101 individuals regarding various aspects of procurement contract management and its impact on project lead times.

The clarity of procurement contracts was assessed with a mean score of 4.18 and a standard deviation of 1.053. This high mean score indicates that respondents generally agreed that clear procurement contracts significantly enhance the efficiency of water project lead time management. The statement "The procurement contracts for water projects are clear and easily understandable" received a mean score of 4.09 with a standard deviation of 1.123. This result suggests that respondents generally found the contracts to be understandable, which is essential for ensuring that all stakeholders can effectively interpret and execute the contract terms. Respondents rated the clarity of project deliverables and milestones in procurement contracts with a mean score of 3.34 and a standard deviation of 1.478. This lower mean indicates some variability in perceptions, suggesting that while some contracts clearly define deliverables and milestones, others may not.

The inclusion of specific requirements in procurement contracts had a mean score of 3.52 and a standard deviation of 1.270. This score reflects a moderate agreement that specific requirements in contracts contribute to better lead time management. The adherence of project stakeholders to the terms and conditions outlined in procurement contracts was rated with a mean score of 4.09 and a standard deviation of 1.141. High adherence to contract terms is crucial for maintaining project timelines, as deviations can lead to delays and increased costs.

The enforcement of contract compliance measures received the highest mean score of 4.35 with a standard deviation of 0.910. This indicates a strong agreement that effective enforcement of compliance measures is critical for managing project lead times.

Table 2 Procurement contract management

	N	Minimum	Maximum	Mean	Std. Deviation
Clarity of procurement contracts impact the efficiency of water project lead time management at RUWASA-Dodoma Region	101	1	5	4.18	1.053
The procurement contracts for water projects are clear and easily understandable	101	1	5	4.09	1.123
Procurement contracts for water projects clearly define project deliverables and milestones.	101	1	5	3.34	1.478
The inclusion of specific requirements in procurement contracts contributes to better lead time management.	101	1	5	3.52	1.270
Project stakeholders adhere to the terms and conditions outlined in procurement contracts.	101	1	5	4.09	1.141

The enforcement of contract compliance measures is effective in managing project lead time.

Source: Field Data, 2024

4.2 Regression Analysis

4.2.1 Model Summary

Table 3 presents a summary of a statistical model, providing essential metrics that help evaluate its performance. The first column lists the model number, which in this case is labeled as "Model 1." The subsequent columns include various statistical values that assess the model's fit and predictive capability.

Table 3 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.900 ^a	.810	.804	.303

a. Predictors: (Constant), Contract documentation, risk management, contract compliance

Source: Field Data, 2024

Table 3 presents a summary of a regression model that evaluates the relationships between several predictor variables and an outcome of interest. The model includes three predictors: contract documentation, risk management, and contract compliance. The statistics provided indicate the effectiveness of these predictors in explaining the variance in the dependent variable. The R value of 0.900 signifies a strong positive correlation between the predictors and the dependent variable, suggesting that as the predictor variables increase, the dependent outcome also tends to increase. This strong correlation is further supported by the R Square value of 0.810, which indicates that approximately 81% of the variance in the dependent variable can be explained by the model. This high percentage suggests that the model is quite effective in capturing the relationships within the data.

The Adjusted R Square value of 0.804 takes into account the number of predictors in the model, providing a more accurate assessment of the goodness-of-fit when multiple predictors are involved. The slight decrease from the R Square value indicates that the model remains robust even after adjusting for the number of predictors. Finally, the Standard Error of the Estimate is 0.303, which gives an indication of the average distance that the observed values fall from the regression line. A lower standard error suggests that the predictions made by the model are relatively close to the actual data points. The implications of this model summary are significant for stakeholders involved in contract management and compliance. The strong predictive capability of the model underscores the importance of effective contract documentation, robust risk management practices, and adherence to contract compliance. Organizations may use these insights to prioritize improvements in these areas, potentially leading to better project outcomes and minimized risks. Additionally, the data suggests that further exploration into these variables could yield even more refined strategies for enhancing contract performance and overall organizational efficiency.

4.2.2 Analysis for Variance (ANOVA)

The ANOVA table presented summarizes the results of a statistical analysis assessing the relationship between various predictors and the dependent variable, which in this case is "Water project lead time management." The table is structured to display key metrics that help evaluate the overall significance of the regression model.

Table 4 ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	37.809	3	12.603	137.602	.000 ^b
	Residual	8.884	97	.092		
	Total	46.693	100			

a. Dependent Variable: Water project lead time management

b. Predictors: (Constant), Contract Documentation, Risk Management, Contract Compliance

Source: Field Data, 2024

Table 4 presents the results of an Analysis of Variance (ANOVA) conducted to evaluate the effectiveness of several predictors on the dependent variable, which is the management of water project lead times. The table provides key statistical metrics that help in understanding the

relationships between the variables involved. The Sum of Squares for the regression model is 37.809, indicating the variation explained by the predictors (Contract Documentation, Risk Management, and Contract Compliance). With three degrees of freedom (df), the Mean Square for regression is calculated as 12.603. This value reflects the average variation explained by each predictor in the model. The F-statistic of 137.602 is significantly high, suggesting that the model is a good fit for the data. The associated p-value (Sig.) of .000 indicates that the relationship between the predictors and the dependent variable is statistically significant, meaning there is a very low probability that the observed results occurred by chance.

On the other hand, the Residual Sum of Squares is 8.884, with 97 degrees of freedom, resulting in a Mean Square of .092. This part of the table represents the variation in lead time management that is not explained by the predictors. The relatively low residual sum suggests that the model accounts for a substantial amount of the variability in the data. The total sum of squares for the model is 46.693, which combines both the explained and unexplained variation. The strong performance of the regression model, as indicated by the F-statistic and the p-value, implies that the selected predictors are influential in managing lead times for water projects. This has practical implications for project management, highlighting the importance of effective contract documentation, risk management, and compliance in improving project outcomes.

4.2.3 Coefficient

In the analysis presented in Table 5, several coefficients are reported for a model evaluating water project lead time management.

Table 5 Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	.081	.218		.370	.712
Contract documentation	.309	.144	.296	2.145	.034
Risk management	.314	.148	.287	2.127	.036
Contract compliance	.352	.144	.338	2.439	.017

a. Dependent Variable: Water project lead time management

Source: Field Data, 2024

Table 5 presents the coefficients from a regression analysis aimed at understanding factors that influence water project lead time management. The table includes both unstandardized and standardized coefficients, along with their respective standard errors, t-values, and significance levels. The unstandardized coefficients indicate the amount of change in the dependent variable—water project lead time management—resulting from a one-unit change in the independent variables, while the standardized coefficients (Beta) allow for comparison across different predictors. The constant term is 0.081, with a standard error of 0.218, yielding a t-value of 0.370 and a significance level of 0.712. This suggests that the constant is not statistically significant in predicting lead time management, indicating that other factors should be considered. Among the independent variables, contract documentation shows an unstandardized coefficient of 0.309 and a standardized coefficient of 0.296. The t-value of 2.145 and significance level of 0.034 imply that this variable has a statistically significant impact on lead time management at the 0.05 significance level. Risk management also has a notable effect, with an unstandardized coefficient of 0.314 and a standardized coefficient of 0.287. The t-value of 2.127 and significance level of 0.036 further confirm its significance, suggesting that effective risk management practices are essential for improving project timelines. Lastly, contract compliance yields the highest unstandardized coefficient at 0.352 and a standardized coefficient of 0.338. With a t-value of 2.439 and a significance level of 0.017, contract compliance emerges as a critical factor influencing lead time management, indicating that adherence to contractual terms may play a pivotal role in project efficiency.

The findings from this analysis have several implications for project management in the water sector. First, the significant roles of contract documentation, risk management, and contract compliance highlight the necessity for robust project planning and execution strategies. Stakeholders should prioritize enhancing these areas to mitigate delays and improve overall project performance. Moreover, the statistical significance of these factors suggests that investments in training and systems that bolster documentation, risk assessment, and compliance monitoring could lead to tangible improvements in project timelines. This could be especially relevant for policymakers and project managers seeking to optimize resource allocation and enhance the effectiveness of water projects.

Then from this formula

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e$$

Where by

Y = Water project lead time management

β_0 = Constant factor

X_1 = Contract documentation

X_2 = Risk management

X_3 = Contract compliance

e = Error term

Regression equation was

Water project lead time management = 0.309 Contract documentation + 0.314 Risk management + 0.352 Contract compliance – 0.081

5.0 Discussion

The clarity of procurement contracts was assessed with a mean score of 4.18 and a standard deviation of 1.053. This high mean score indicates that respondents generally agreed that clear procurement contracts significantly enhance the efficiency of water project lead time management. Clarity in contracts at RUWASA Dodoma region ensures that all parties have a mutual understanding of the requirements and expectations, reducing ambiguities that can lead to delays. Contracts that clearly outline roles, responsibilities, and timelines enable smoother project execution and reduce the likelihood of disputes. The importance of clear contracts in project management has been widely recognized in academic literature, which emphasizes that detailed and precise contract terms are critical for effective project management. Moreover, clear contracts help in setting realistic expectations and provide a framework for accountability, thereby enhancing overall project efficiency.

The study findings are supported by Msanga (2020) that procurement contracts that lack clarity can lead to ambiguity regarding the scope of work. This ambiguity can result in misunderstandings between the parties involved, leading to delays in project execution. A clear and detailed scope of work outlined in the contract ensures that all parties have a common understanding of what needs to be done, reducing the likelihood of disputes and streamlining project management processes. Clarity in procurement contracts is essential for effective risk management. Unclear contracts may leave room for interpretation, increasing the risk of disputes, claims, and potential legal issues. Through clearly defining roles, responsibilities, deliverables, timelines, and performance metrics in the contract, risks associated with the project can be identified and mitigated early on. This proactive approach to risk management helps in maintaining project timelines and ensuring efficient delivery of water projects.

The statement "The procurement contracts for water projects are clear and easily understandable" received a mean score of 4.09 with a standard deviation of 1.123. This result suggests that respondents generally found the contracts to be understandable, which is essential for ensuring that all stakeholders can effectively interpret and execute the contract terms. Contracts that are easy to

understand help prevent misunderstandings and misinterpretations that can cause project delays. Simple and straightforward language in contracts facilitates better communication among all parties involved, including contractors, suppliers, and project managers. Effective communication is crucial for the successful implementation of projects, as it ensures that everyone is on the same page and reduces the potential for errors and delays. This finding aligns with previous studies that highlight the importance of clear and comprehensible contracts in preventing project delays and improving overall project outcomes.

The study findings are supported by Aputo (2023), who emphasizes that clear contracts are crucial for ensuring transparency in procurement processes. By explicitly outlining all terms, conditions, and requirements, clear contracts minimize the risk of misunderstandings and misinterpretations, thereby promoting fairness and reducing opportunities for corruption, favoritism, or unethical practices. This is particularly important in water projects, which often have intricate technical specifications, deadlines, payment terms, and legal obligations. A well-defined contract ensures that all parties involved are aware of their rights and responsibilities. Conversely, ambiguous contracts can lead to disputes, project delays, and costly legal conflicts, which undermine the efficiency and success of procurement activities. Respondents rated the clarity of project deliverables and milestones in procurement contracts with a mean score of 3.34 and a standard deviation of 1.478. This lower mean indicates some variability in perceptions, suggesting that while some contracts clearly define deliverables and milestones, others may not.

Clearly defined deliverables and milestones are crucial for tracking progress and ensuring timely completion of project phases. When project deliverables and milestones are explicitly stated, it allows for better monitoring and evaluation of the project's progress, making it easier to identify any deviations from the plan and take corrective actions promptly. The variability highlighted by this score points to the need for more consistent detailing in contracts to improve lead time management. Inconsistent definitions can lead to confusion and misalignment among project stakeholders, which can result in delays and increased project costs.

The study findings are linked to the study by Mgawe and Masanja (2018) that through clearly outlining project deliverables and milestones, procurement contracts help in managing risks associated with the project. When all parties involved understand what is expected at each stage of the project, it becomes easier to identify potential risks early on and take necessary actions to mitigate them. Defining clear project deliverables and milestones provides a basis for measuring the performance of the project. It allows for tracking progress, evaluating whether the project is on schedule, and assessing if the quality of deliverables meets the agreed-upon standards. This measurement is essential for ensuring accountability and successful project completion.

The inclusion of specific requirements in procurement contracts had a mean score of 3.52 and a standard deviation of 1.270. This score reflects a moderate agreement that specific requirements in contracts contribute to better lead time management. Specific requirements help ensure that all

necessary elements are accounted for, reducing the risk of oversights that can delay projects. Through specifying detailed requirements, contracts can provide clear guidelines on the expected quality, scope, and timeline of the project, which helps in aligning the efforts of all stakeholders towards achieving the project goals. However, the moderate mean suggests room for improvement in detailing these requirements. The inclusion of specific, measurable, achievable, relevant, and time-bound (SMART) requirements can enhance the effectiveness of procurement contracts and contribute to more efficient project management.

The study findings are linked to the study by Karimi (2018) that when specific requirements are clearly outlined in procurement contracts, it helps in enhancing clarity and communication between the buyer and the supplier. Through specifying details such as quality standards, delivery schedules, quantities, and any other relevant terms, both parties have a clear understanding of what is expected. This clarity reduces ambiguity and minimizes the chances of misunderstandings or disputes that could potentially lead to delays in the procurement process. Having specific requirements in procurement contracts also aids in streamlining processes throughout the supply chain.

The adherence of project stakeholders to the terms and conditions outlined in procurement contracts was rated with a mean score of 4.09 and a standard deviation of 1.141. High adherence to contract terms is crucial for maintaining project timelines, as deviations can lead to delays and increased costs. When stakeholders strictly adhere to the agreed terms and conditions, it ensures that the project progresses as planned and reduces the likelihood of disputes and renegotiations. This high mean score indicates that respondents generally perceive strong adherence to contract terms, which positively impacts lead time management. The contracts often include provisions that outline how risks will be allocated between the parties involved. Through following these terms, stakeholders can reduce uncertainties and ensure that potential risks are appropriately managed throughout the project lifecycle. Procurement contracts typically involve multiple parties, such as buyers, suppliers, contractors, and subcontractors. Adhering to the agreed-upon terms fosters trust and collaboration among these stakeholders.

The enforcement of contract compliance measures received the highest mean score of 4.35 with a standard deviation of 0.910. This indicates a strong agreement that effective enforcement of compliance measures is critical for managing project lead times. Effective enforcement ensures that all parties meet their obligations, thus preventing delays and ensuring smooth project progression. Enforcement mechanisms such as regular audits, progress reports, and penalty clauses for non-compliance play a vital role in ensuring that project activities are carried out as per the contract terms. This finding supports the view that robust contract management practices are essential for successful project delivery. Through implementing stringent compliance measures, project managers can mitigate risks and ensure that projects are completed within the stipulated timelines and budget.

The analysis of procurement contract management at RUWASA in Dodoma Region reveals that clear, understandable contracts and effective enforcement of compliance measures are critical for managing lead times in water projects. While the clarity and specificity of project deliverables and milestones show some variability, overall, the findings suggest that strong contract management practices contribute significantly to efficient project timelines. These insights can guide improvements in procurement practices to further enhance the effectiveness of water project management. Through addressing the identified gaps and strengthening contract management processes, RUWASA can improve project outcomes and ensure the timely delivery of water projects, ultimately benefiting the communities they serve.

6.0 Conclusion and Recommendations

The study has highlighted the significant impact of procurement practices on the lead time management of water projects at RUWASA-Dodoma Region. Delays in water project completion are prevalent, with the majority of projects failing to meet deadlines. The research findings indicate that efficient procurement contract management, prompt order confirmation, and effective supplier communication are crucial for timely project delivery. Addressing these factors can reduce delays, thereby improving the overall efficiency of water project implementation in rural areas.

RUWASA should enhance procurement contract management by implementing rigorous monitoring and evaluation of supplier performance, streamline order confirmation processes by adopting digital tools to reduce bureaucratic delays, and improve supplier communication through clear and consistent channels. Additionally, continuous training and capacity building for staff in procurement and project management, along with the adoption of technology solutions for better tracking and transparency, are essential for reducing delays and improving project lead times.

6.1 Areas for Further Studies

Although this study provides valuable insights into the effect of procurement practices on lead time management for water projects, further research is recommended to explore the role of digital technologies in enhancing procurement efficiency. Specifically, future studies could investigate how the adoption of e-procurement systems, artificial intelligence, and blockchain technology might mitigate procurement-related delays and improve transparency. Additionally, examining procurement practices in other sectors, such as health or education, could offer a broader understanding of procurement challenges and solutions across different industries.

6.2. Limitation

The study was limited by the scope of its focus on the Dodoma Region, which may not reflect the procurement practices and challenges faced by other regions or sectors in Tanzania. Furthermore, data collection was constrained by the availability and responsiveness of participants, which could have influenced the representativeness of the findings. The cross-sectional nature of the study also

means that changes over time were not captured, and future longitudinal studies could provide deeper insights into how procurement practices evolve and impact lead time management.

6.3 Acknowledgment

The authors of this paper, Deodatus Mushumbusi and Dr. Boniface E. Mwalukasa, would like to express their heartfelt gratitude to all the individuals and institutions who supported the successful completion of this study. Special thanks go to the Rural Water Supply and Sanitation Agency (RUWASA) Dodoma Region for granting access to crucial data and facilitating interviews with key personnel. Their cooperation and openness made this research possible.

We would also like to extend our appreciation to the staff of the Dodoma Region Water Authority, who provided valuable insights and shared their experiences regarding the challenges and successes in managing procurement for water projects. Their candidness helped enrich the findings of this study. Lastly, we are grateful to our families and colleagues for their continued encouragement and support throughout this research. Their patience and understanding were instrumental in enabling us to focus on producing this work, and we dedicate this paper to them.

Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this paper. All efforts were made to ensure that the research process and the presentation of findings were objective and free from any external influences or biases that could compromise the integrity of the study. The views expressed in this paper are solely those of the authors and do not necessarily reflect the positions of the organizations or individuals involved.

Abstract

This study examines the impact of staff competence on procurement contract performance at Dodoma City Council. Utilizing a mixed-methods approach, quantitative data were collected through a structured questionnaire administered to 135 respondents, while qualitative insights were obtained from interviews with key informants. The findings reveal that a well-educated and experienced workforce significantly contributes to enhanced procurement outcomes, with over 55% of respondents holding bachelor's degrees and a majority possessing 6 to 10 years of experience. The analysis indicates a strong positive correlation between staff competence and procurement contract performance, evidenced by a regression coefficient of 0.65 ($p < 0.001$). Qualitative data further support these results, highlighting that knowledgeable staff navigate procurement processes more effectively, resulting in fewer disputes and delays. The study emphasizes the necessity for continuous professional development and training programs to maintain staff competence. Recommendations include implementing robust training initiatives and fostering a supportive management culture to optimize procurement practices. Overall, this research underscores the essential role of staff competence in public procurement, suggesting that enhancing staff capabilities can lead to improved contract performance.

Keywords: *Staff Competence, Procurement Performance, Dodoma City Council*

1.0 Introduction

Effective procurement practices are crucial for enhancing the performance of public sector institutions globally. Research indicates that the competence of staff involved in procurement processes significantly influences the outcomes of procurement contracts. This problem is important as it directly impacts the efficiency, accountability, and quality of services delivered by public institutions. The World Bank (2020) has demonstrated that countries prioritizing staff training and development in procurement management experience improved contract performance, reduced corruption, and enhanced service delivery. This trend is particularly evident in high-income countries, where advanced training programs and certifications have been established to elevate professional standards within the procurement sector.

However, in Africa, including Tanzania, the relationship between staff competence and procurement performance has gained increasing attention. Studies reveal that many African countries face challenges in procurement management due to inadequate staff skills and knowledge. For instance, Kamanga and Mwaura (2022) highlight that the lack of training among procurement staff in various African nations leads to inefficiencies and project delays. Furthermore, the African Development Bank (2021) emphasizes that enhancing human capital

through targeted training programs can significantly improve procurement practices and contract outcomes across the continent.

In Tanzania, the procurement landscape has undergone significant reforms aimed at improving efficiency and accountability. The Public Procurement Act of 2011 introduced measures to enhance the capacity of procurement professionals through training and certification. However, a report by the Tanzania Public Procurement Regulatory Authority (2023) indicates that despite these efforts, many public institutions still grapple with staff competence issues, leading to suboptimal contract performance. This gap highlights the need for a focused examination of how staff competence directly impacts procurement outcomes in Tanzanian local government authorities, such as the Dodoma City Council.

1.1 Importance of the Problem

This study deserves new research due to the ongoing challenges faced by public institutions in Tanzania, particularly regarding procurement contract performance. While previous studies have explored the significance of staff competence, there remains a lack of comprehensive research specifically addressing the impact of staff training and skills on procurement outcomes within local government authorities. Given the critical role of procurement in public service delivery, understanding these dynamics is essential for informing policy recommendations aimed at improving human resource development in procurement. Such insights can lead to better contract management practices and improved service delivery, thus contributing to overall public sector efficiency.

2.0 Empirical Review

The reviewed literature section synthesizes findings from global, regional, and local studies on the influence of electronic procurement on procurement contract performance, management support, staff competence, and regulatory compliance. This section provides the basis for understanding the gaps in existing research and developing hypotheses for this study.

2.1 Staff Competence

Wang and Li (2018) emphasize that staff competence significantly contributes to the efficient use of e-procurement tools, thereby improving procurement contract performance. Their study revealed that well-trained and knowledgeable staff improved contract management outcomes in public procurement organizations.

In the context of Tanzania, Msangi et al. (2020) assessed the level of staff competence in local government authorities, including Dodoma City Council. While their findings showed progress in staff training, gaps remain in skills development related to e-procurement. This gap calls for

further research to determine the specific influence of staff competence on the success of electronic procurement in Dodoma City Council.

2.2 Regulatory Compliance

Jones and Kim (2019) studied regulatory compliance and its effect on e-procurement across various countries, concluding that compliance with legal frameworks improves contract management performance. However, limited research has focused on how well e-procurement systems align with the local regulatory framework in Tanzania.

Kassim and Mushi (2021) examined the challenges of aligning e-procurement with local regulations in Tanzanian public procurement entities. Their findings indicated that regulatory compliance challenges remain, particularly at the local government level, but more research is needed to understand how these challenges specifically affect Dodoma City Council's e-procurement performance.

H2: Staff competence has a significant positive effect on the performance of the electronic procurement system on procurement contract performance at Dodoma City Council.

This study seeks to fill the gaps identified in the existing literature by examining these relationships in the context of Dodoma City Council, Tanzania.

2.3 Theoretical Literature

2.3.1 Resource-Based View (RBV)

The Resource-Based View (RBV) theory posits that an organization's competitive advantage is primarily derived from its unique resources and capabilities. In the context of procurement, staff competence is considered a critical resource that directly influences the performance of procurement contracts. By focusing on internal resources—such as knowledge, skills, and expertise—organizations can effectively manage their procurement processes to achieve superior outcomes. The RBV suggests that organizations that invest in developing their human capital are better positioned to respond to challenges and leverage opportunities in the procurement landscape (Barney, 1991).

The underlying assumption of the RBV is that not all resources are equally valuable; rather, it is the unique attributes of these resources that lead to sustained competitive advantage. In procurement, staff competence encompasses a range of skills, including negotiation, contract management, and regulatory knowledge, which contribute to effective contract execution. According to a study by Wang and Ahmed (2020), organizations that prioritize employee training and development tend to experience higher levels of procurement efficiency and effectiveness. This assumption emphasizes the need for local government entities, like Dodoma City Council, to cultivate a skilled workforce to enhance procurement contract performance.

Applying the RBV to this study underscores the importance of investing in staff competence as a strategic resource for improving procurement outcomes at Dodoma City Council. By recognizing that competent staff can lead to better decision-making, reduced contract disputes, and improved compliance with procurement regulations, the study aims to highlight the correlation between staff skills and contract performance. Recent research supports this view, indicating that organizations with well-trained procurement professionals achieve better project delivery and greater satisfaction among stakeholders (Musa, 2022). Ultimately, this study seeks to demonstrate that enhancing staff competence is not merely an operational necessity but a strategic imperative for fostering effective procurement practices in the public sector.

3.0 Methodology

This study adopted a pragmatic research philosophy, as outlined by Creswell (2013), which allows for the use of mixed methods to address complex research questions effectively. Pragmatism enables researchers to select methods that align with their objectives, combining qualitative and quantitative approaches to gain a comprehensive understanding of the problem. The research design utilized an explanatory approach, incorporating both correlational and descriptive elements to examine the influence of management support, staff competence, and regulatory compliance on procurement contract performance at Dodoma City Council (Creswell & Creswell, 2017).

3.1 Population

The population for this study included 223 procurement staff from various departments at Dodoma City Council. To ensure a comprehensive understanding of the impact of staff competence on procurement outcomes, the study focused on procurement staff who were involved in the contract management process. Eligibility criteria included having at least one year of experience in procurement, while those in supervisory roles were prioritized to provide insights into management support and regulatory compliance.

3.2 Sampling Procedures

A sample of 143 respondents was determined using the Yamane (1967) formula for a 95% confidence level. The sampling procedures included:

Sampling Method: Simple random sampling was employed for quantitative data collection, while purposive sampling was used for qualitative data to target eight key informants with specific expertise in procurement management (Bryman & Bell, 2015).

Participation Rate: Out of the 223 procurement staff approached, 143 completed the survey, resulting in a response rate of approximately 64%. The qualitative sample consisted of eight key

informants selected for their experience and knowledge of the procurement processes at Dodoma City Council.

Setting and Agreements: Data were collected in a naturalistic setting at Dodoma City Council, where participants were informed about the study's purpose and consent was obtained before participation. The study adhered to ethical standards, including obtaining approval from the institutional review board and ensuring confidentiality of the respondents' information.

3.3 Sample Size, Power, and Precision

The achieved sample size of 143 was appropriate for the statistical analyses planned, allowing for sufficient power to detect meaningful effects. The sample was representative of the broader population of procurement staff at Dodoma City Council in terms of gender, education level, and work experience. The majority of respondents (60%) were male and primarily aged between 31-40 years, with 55% holding a bachelor's degree and 45% having 5 to 10 years of work experience in procurement.

3.4 Measures and Covariates

Data were collected through structured questionnaires and in-depth interviews:

Primary Outcome Measures: The study measured procurement contract performance through indicators such as contract execution efficiency, compliance with timelines, and quality of goods/services delivered.

Covariates: Staff competence, management support, and regulatory compliance were also assessed using validated scales to ensure consistency and reliability.

Data Collection Methods: Reliability was assessed using Cronbach's alpha, which indicated strong internal consistency across all variables (Table 2). Qualitative data were obtained through interviews with key informants, focusing on their insights regarding the influence of the aforementioned factors on procurement outcomes.

3.5 Research Design

This study employed a mixed-methods research design:

Observational Design: The study included both quantitative and qualitative elements, where quantitative data were collected through surveys, and qualitative insights were gathered from interviews with key informants. Participants were not assigned to manipulated conditions; instead, the research examined naturally occurring variables. The research design allowed for a comprehensive analysis of the relationships between management support, staff competence, regulatory compliance, and procurement contract performance.

3.6 Data Analysis

Data analysis for this study was carried out using both quantitative and qualitative approaches, consistent with the pragmatic research philosophy:

Quantitative Analysis: Descriptive statistics and regression analysis were utilized to determine the influence of management support, staff competence, and regulatory compliance on procurement contract performance. The regression model indicated an R-squared value of 0.67, showing that 67% of the variance in procurement contract performance could be explained by the independent variables.

Qualitative Analysis: Qualitative data were analyzed thematically to gain deeper insights from the perspectives of key informants, identifying three major themes: the importance of continuous professional development, leadership and management support, and challenges with regulatory compliance.

4. 0 Findings and Discussion

4.1 Demographic Features

The demographic characteristics of the 135 respondents from Dodoma City Council are summarized in Table 1 below. This table provides insights into the age, gender, educational background, and years of experience of the respondents.

Table 1: Demographic Features of Respondents

Demographic Feature	Category	Frequency	Percentage (%)
Age	20-30 years	30	22.2
	31-40 years	45	33.3
	41-50 years	35	25.9
	51 years and above	25	18.5
Gender	Male	81	60.0
	Female	54	40.0
Educational Background	Diploma	40	29.6
	Bachelor's Degree	75	55.6
	Master's Degree	20	14.8

Years of Experience	1-5 years	20	14.8
	6-10 years	67	49.6
	11-15 years	30	22.2
	16 years and above	18	13.3

4.2 Influence of Staff Competence on Procurement Contract Performance

To assess the influence of staff competence on procurement contract performance, respondents evaluated various statements on a 5-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree). The results are presented in Table 2 below.

Table 2: Summary of Likert Scale Responses

Statement	Mean Score	Standard Deviation
Staff training programs enhance procurement skills.	4.20	0.81
Competent staff contributes to effective contract management.	4.35	0.78
Knowledge of procurement regulations positively impacts performance.	4.30	0.74
Staff competence is critical for timely contract execution.	4.25	0.76

4.2.1 Regression Analysis

A regression analysis was conducted to further investigate the relationship between staff competence and procurement contract performance. The results are summarized in Table 3 below.

Table 3 The Influence of staff competence

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.400	.433		10.169	.000
	Staff training programs enhance procurement skills.	.258	.085	.458	3.030	.003
	Competent staff contributes to effective contract management.	.119	.091	.203	1.302	.019
	Knowledge of procurement regulations positively impacts performance.	.127	.100	.145	2.269	.049
	Staff competence is critical for timely contract execution.	.201	.102	.200	1.008	.043

a. Dependent Variable: Procurement contract performance

Source: Field Data, 2024

The data presented in Table 3 illustrates the significant impact that staff competence has on procurement contract performance. The coefficients indicate how various aspects of staff competence contribute to the overall effectiveness of procurement processes. Each coefficient represents the relationship between a specific variable and the dependent variable, which in this case is procurement contract performance. Firstly, the constant term is reported as 4.40 with a significance level (Sig.) of .000, indicating that when all other variables are held constant, there is a baseline level of procurement contract performance. This suggests that even without considering staff competence factors, there exists a foundational level of performance.

Baseline Procurement Contract Performance: The constant term in the regression model is 4.40 with a significance level (Sig.) of .000, indicating a baseline level of procurement contract performance even when no specific competence-related variables are considered. This suggests

that procurement processes inherently have a foundational level of performance, which can be enhanced through targeted improvements in staff competence. The baseline level of performance indicates that procurement processes will continue to function at a basic level even without additional interventions, but staff competence can raise this baseline and improve overall contract outcomes.

Staff Training Programs and Procurement Skills: One of the most significant findings is the impact of staff training programs on procurement skills. The unstandardized coefficient (B) is .258, with a significance level of .003, demonstrating a strong positive relationship between effective training programs and improved procurement skills. The standardized coefficient (Beta) of .458 further confirms this, suggesting that as staff training programs increase, procurement contract performance significantly improves. The strong positive relationship shows that staff training directly enhances procurement skills, making training programs a key lever for improving procurement performance. The significant Beta value underscores the necessity for continuous professional development to optimize procurement processes.

Competent Staff and Effective Contract Management: The results show that competent staff members play a crucial role in managing contracts effectively. The unstandardized coefficient for this variable is .119, with a significance level of .019, indicating a statistically significant relationship. The Beta value of .203 reveals a moderate positive effect, suggesting that skilled personnel can navigate the complexities of contract management more effectively. Competent staff improve contract management efficiency by reducing errors and managing contracts effectively. This highlights the importance of investing in recruiting and training staff with the right skills to manage complex procurement contracts, ensuring better outcomes and fewer disputes.

Knowledge of Procurement Regulations and Performance: Understanding procurement regulations is another factor that significantly affects procurement performance. The unstandardized coefficient for this variable is .127, with a significance level of .049, highlighting its importance in enhancing overall procurement outcomes. The Beta value of .145 indicates a moderate positive impact. Staff knowledgeable in procurement regulations ensure compliance and reduce risks associated with legal non-conformance, leading to smoother procurement processes. This finding emphasizes the need for regular training on regulatory updates to maintain high performance in contract execution.

Staff Competence and Timely Contract Execution: Lastly, the analysis demonstrates that staff competence is critical for ensuring timely execution of contracts. The unstandardized coefficient for this variable is .201, with a significance level of .043, indicating that competent staff significantly contribute to completing contracts within stipulated deadlines. The Beta value of .200 further supports this finding. Competent staff are pivotal in minimizing delays in contract execution, directly contributing to improved timelines and overall operational efficiency.

Organizations should prioritize developing staff competence to ensure timely and successful contract completion, thereby reducing operational bottlenecks.

5.0 Discussion

5.1 Discussion of the findings

The demographic data from the study reveal a well-educated workforce, with 55.6% of respondents holding bachelor's degrees. The majority (49.6%) possess 6 to 10 years of experience, indicating a knowledgeable group capable of providing valuable insights into procurement practices. This aligns with findings by Zhao et al. (2018), who emphasized that experienced and educated personnel contribute significantly to the effectiveness of procurement processes by applying their knowledge to mitigate risks and enhance decision-making.

The Likert scale responses indicate a strong belief in the positive influence of staff competence on procurement contract performance, with mean scores above 4 for most statements. The statement regarding the contribution of competent staff to effective contract management received the highest mean score (4.35), reinforcing the critical role of staff competence in enhancing procurement outcomes. This aligns with the work of Ogunyinka and Ogundipe (2020), who found that staff competence directly impacts procurement efficiency, resulting in fewer contract disputes and improved compliance with regulations.

Moreover, the regression analysis reveals that staff competence significantly influences procurement contract performance, with a coefficient of 0.65 ($p < 0.001$). This finding supports the hypothesis that staff competence is essential for successful procurement processes. Similar conclusions were drawn by Laryea and Hughes (2011), who demonstrated that enhanced staff capabilities lead to superior procurement performance. Additionally, the positive contributions of management support and regulatory compliance further highlight the necessity for a comprehensive approach to improving procurement outcomes, as suggested by Kauffman and Schwartz (2019), who advocate for an integrated framework to optimize procurement effectiveness in public organizations.

The qualitative data from the interviews with key informants highlighted the significant role of staff competence in influencing procurement contract performance at Dodoma City Council. One respondent, the head of the procurement unit, emphasized; "Competent staff are crucial for navigating complex procurement processes. Their ability to understand and apply regulations directly impacts our contract execution success." This sentiment was echoed by another key informant, a planning officer, who noted, "When staff are well-trained and knowledgeable, we see fewer delays and disputes in contract management. It creates a more efficient environment." These insights align with empirical studies, such as those by Kettunen and Kallio (2020), which found that skilled personnel positively correlate with enhanced procurement outcomes by reducing errors and improving compliance.

Furthermore, the interviews revealed that ongoing professional development is vital for maintaining staff competence. The head of the human resources department stated, “Investing in continuous training not only equips our staff with the latest procurement skills but also boosts their confidence and motivation.” This aligns with findings by Hanzl and Radvansky (2019), which indicated that organizations that prioritize staff training tend to report higher levels of procurement performance. The emphasis on staff competence as a key driver for effective procurement practices suggests that local government authorities, like Dodoma City Council, must implement robust training programs to ensure staff are equipped to meet the demands of their roles effectively.

6. Conclusion, Implications, and the area for further research

In conclusion, the study underscores the critical role of staff competence in enhancing procurement contract performance at Dodoma City Council. The findings, supported by both quantitative and qualitative data, illustrate that knowledgeable and skilled personnel are instrumental in navigating complex procurement processes, leading to improved contract execution and reduced disputes. The strong correlation identified between staff competence and procurement outcomes highlights the necessity for local government authorities to prioritize the recruitment and continuous development of competent staff, as this directly influences organizational efficiency and effectiveness in procurement practices.

To enhance procurement performance further, it is recommended that Dodoma City Council implement comprehensive training and professional development programs tailored to the specific needs of procurement staff. Regular workshops and training sessions should be established to keep staff updated on the latest procurement regulations and best practices. Additionally, management should foster a supportive environment that encourages knowledge sharing and collaboration among staff. By investing in staff competence, the council can improve procurement outcomes, reduce risks associated with contract management, and ultimately deliver better services to the community.

6.1 Study Implications

6.1.1 Practical Implications

The practical implications of this study are significant for improving procurement performance in local government authorities. The results suggest that enhancing staff competence through targeted training and development programs directly contributes to better procurement outcomes. By adopting comprehensive capacity-building initiatives, Dodoma City Council can ensure that its staff are well-equipped to handle evolving procurement challenges, resulting in more efficient contract management and timely service delivery to the community. This reinforces the importance of investing in procurement personnel to maintain compliance with regulations and achieve best practices in public procurement.

6.1.2 Managerial Implications

From a managerial perspective, the study suggests that effective leadership is critical in fostering a culture that values continuous learning and professional development. Management at Dodoma City Council should prioritize the creation of an environment that encourages ongoing training, mentorship, and collaboration among staff. This can be achieved by implementing formal training programs, facilitating workshops, and establishing platforms for knowledge sharing. Additionally, leadership should focus on setting performance benchmarks tied to staff competence, which would improve accountability and drive improvements in procurement contract performance.

6.1.3 Social Implications

Socially, the findings imply that improving procurement performance has a direct impact on the quality of public services provided to the community. By ensuring that procurement contracts are executed efficiently and with minimal disputes, Dodoma City Council can enhance its ability to deliver essential services such as infrastructure development, healthcare, and education. This ultimately contributes to the social well-being of the community, as better procurement outcomes lead to improved public services, reduced project delays, and more effective use of public resources.

6.2 Study Limitations

One limitation of this study is its focus on a single local government authority, Dodoma City Council, which may limit the generalizability of the findings to other regions or sectors. While the study provides valuable insights into the relationship between staff competence and procurement performance, the specific context of Dodoma may differ from other local governments in Tanzania, particularly in terms of resource availability, organizational structure, and external challenges. Additionally, the study primarily relied on self-reported data, which may be subject to bias or inaccuracies in reflecting actual procurement practices.

6.3 Areas for Further Study

Future research could explore similar investigations across a broader range of local government authorities in Tanzania to enhance the generalizability of findings. Comparative studies between urban and rural councils, as well as across different sectors such as healthcare, education, and infrastructure, would provide a more comprehensive understanding of how staff competence influences procurement performance. Furthermore, longitudinal studies tracking the long-term effects of training programs on procurement outcomes would provide deeper insights into the sustainability and effectiveness of capacity-building initiatives in local government procurement practices.

The Influence of Strategic Supplier Partnership on Healthcare Performance: Experience from Ministry of Health, TANZANIA

Edwin Elias^{1*} & Hamisi Sama²

^{1*}College of Business Education (CBE), P.O. Box2077 Dodoma, Tanzania;
edwin_elias@rocketmail.com

² College of Business Education, Department of Procurement and Supplies Management, P.O. Box 2077, Dodoma, Tanzania, Email: samakicheche@yahoo.com.

Abstract

Organizations face challenges in maintaining strong supplier relationships that directly impact their overall performance. Ineffective strategic partnerships with suppliers can lead to disruptions in service delivery, inefficiencies in procurement processes, and reduced competitiveness. The study determined the influence of Strategic Supplier Partnerships on healthcare performance, with a focus on the Ministry of Health. Methodologically, a descriptive research design was employed, involving 163 respondents. Data were collected using questionnaires and interviews, and the analysis was conducted using quantitative data analysis and regression methods through SPSS. The findings highlighted key elements that significantly impact organizational performance across various areas. Strategic supplier relationships are influenced by factors such as commitment, execution, collaboration, and trust. The study found a positive correlation between these relationships and organizational performance, reinforcing their importance. The study concluded that organizations can foster stronger partnerships by recognizing the critical roles of commitment, collaboration, and trust in strategic supplier relationships. It emphasizes the need for organizations to prioritize customer satisfaction, strengthen supplier relationships, improve information-sharing processes, and streamline supply chain and procurement management. These efforts are essential for maintaining competitiveness and ensuring long-term performance.

Keywords: *Healthcare performance, strategic supplier partnership, performance*

1.0 Introduction

In today's quickly changing world economy, efficient management of the supply chain is essential for organizational achievement, particularly within the healthcare sector. As multinational corporations expand and globalization accelerates, the reliance on strong supply chain strategies becomes critical for maintaining competitiveness and efficiency of operations (Warrier, 2020). This is especially true in healthcare, where the timely delivery of medical commodities and services is vital for patient care. However, the complexities and high costs associated with the healthcare supply chain, coupled with reliance on various stakeholders, pose significant challenges that can hinder optimal service delivery (Ruhago et al., 2022). One promising approach to mitigate these challenges is the establishment of strategic supplier partnerships, which can enhance collaboration streamline processes, and influence organizational performance positively (Refera, 2019).

The concept of strategic supplier partnership (SSP) transcends traditional transactional interactions, focusing instead on collaborative alliances that enhance mutual value creation (Tarigan et al., 2020.) These partnerships involve a commitment to long-term relationships, shared goals, and joint problem-solving, which can lead to significant improvements in operational efficiency, innovation, and responsiveness to market demands. The significance of strategic supplier partnerships lies in their potential to enhance various dimensions of organizational performance (Chae et al., 2017). By aligning closely with suppliers, firms can tap into new capabilities and knowledge that may not be available internally. This collaborative approach allows organizations to adapt more swiftly to evolving consumer demands and technological advancements, positioning them favorably in a competitive marketplace (Ghadimi et al., 2018). Trust and communication are fundamental elements of successful strategic supplier partnerships. Trust fosters an environment where both parties feel secure in sharing sensitive information, leading to more effective problem-solving and innovation (Tarigan et al., 2020). Open lines of communication ensure that both suppliers and organizations remain aligned in their objectives, facilitating quicker responses to market fluctuations and operational challenges (Mitrega., 2017).

Globally, healthcare systems are under constant pressure to deliver quality services efficiently and effectively (Mathur et al., 2018). One critical aspect of healthcare performance is ensuring the availability of essential medicines and medical supplies, which directly impacts patient care and outcomes. However, many healthcare systems worldwide, especially in low and middle-income countries, struggle with supply chain inefficiencies that lead to frequent stockouts, delayed deliveries, and overall poor performance (Goodarzian, et al., 2021). These challenges often result from weak supplier relationships, poor coordination, and inadequate infrastructure, which collectively undermine healthcare performance.

In Africa, the healthcare sector faces even greater challenges, exacerbated by economic constraints, political instability, and insufficient infrastructure. Many African countries experience frequent medicine shortages, leading to disruptions in healthcare services and deteriorating patient outcomes (Jæger et al., 2021). The World Health Organization (WHO) has noted that Africa carries a significant disease burden, but healthcare systems across the continent often struggle to meet patient needs due to unreliable medicine supplies. Supply chain disruptions, high procurement costs, and a lack of strategic collaboration between healthcare providers and suppliers have further compounded the problem (Kessy et al., 2022). As a result, healthcare facilities across the continent are frequently unable to meet demand, leading to preventable deaths and prolonged suffering.

In Tanzania, the healthcare system faces similar challenges, particularly in the area of medicine supply (Ruhago et al., 2022). Despite government efforts to improve healthcare access, many health facilities continue to suffer from frequent stockouts of essential medicines and medical supplies (Kessy et al., 2024). These supply failures have significantly undermined healthcare performance, leading to inefficiencies, increased patient wait times, and reduced quality of care (Mwaiseje and Mwangi, 2019). One of the major contributing factors to these failures is the lack of effective strategic supplier partnerships, which are essential for ensuring a reliable and timely supply of medicines and medical equipment.

This study focuses on examining the influence of strategic supplier partnerships on healthcare performance in Tanzania. By investigating the impact of these partnerships, particularly in addressing medicine supply failures, the study aims to identify strategic supplier partnerships as the key factors that can enhance healthcare performance. Tanzania serves as an important case study for examining these issues, guided by comprehensive policies aimed at ensuring equitable access to quality healthcare services (Al-Madi et al., 2021). By analyzing current practices and identifying areas for improvement, the findings inform policymakers about effective strategies to enhance supply chain efficiency, demonstrating how strategic collaborations can lead to better health outcomes for citizens (Khan, 2015).

2.0 Literature Review

2.1 Theoretical perspectives

This study is governed by the resource-based view (RBV) which provides a foundational framework for understanding how firms can achieve competitive advantage through the effective management of internal and external resources (Barney, 1991). Within this context, strategic supplier partnerships emerge as vital resources that can enhance organizational performance (Ghadimi et al., 2018). By cultivating strong relationships with suppliers, firms can tap into unique competencies and capabilities that these partners offer, such as advanced technologies, innovative practices, and specialized knowledge. This synergy not only bolsters a firm's resource

base but also enables it to respond more adeptly to market dynamics, thus enhancing its overall competitive positioning.

Key variables such as collaboration, trust, commitment, and sufficient execution play critical roles in the effectiveness of strategic supplier partnerships. Collaboration facilitates the sharing of information and resources, leading to joint innovations and streamlined processes. Trust, on the other hand, reduces transaction costs and fosters a cooperative environment, allowing for more effective problem-solving and risk management (Tarigan et al., 2020). When both parties demonstrate commitment, it deepens the relationship, encouraging investments in joint initiatives that can drive efficiency and product quality. These relational dynamics are instrumental in transforming supplier partnerships into strategic assets that contribute significantly to enhanced organizational performance. By integrating these variables collaboration, trust, commitment, and execution firms can leverage strategic supplier partnerships not only to optimize their operations but also to innovate and adapt, thereby securing a more favorable position in the competitive landscape.

2.2 Empirical review

2.2.1 Strategic Supplier Partnership on Organizational Performance

A study by Fikadu (2018), examined the variables affecting the success of Ethiopia's Public Financial Services Authority, placing a focus on technology and supplier collaboration methods. They conducted a study with PFSA workers using multiple regression analyses, and the results showed that supply chain performance and relationships with startup suppliers were positively correlated. Likewise, Samuel et al. (2018) explored the relationship between organizational success and strategic procurement in East Java, Indonesia, including 80 enterprises. Through supplier connections and negotiation methods, they discovered that strategic procurement had a direct impact on performance through the use of a questionnaire and the partial least squares approach. The study concluded that the company could profit from the adoption of strategic purchasing inside the organization. Apart from the significance of strategic purchasing, the development of a suitable buyer-supplier relationship and the implementation of an adequate negotiation strategy also contribute to the performance of the organization. Furthermore, Khan et al. (2015). They looked into how the supply chain could be made better by integrating information and encouraging relationships between buyers and suppliers. Their study, which used structural equation modeling and involved more than 200 Chinese manufacturing companies, found that supplier-buyer collaborations and information integration have a favorable impact on the supply chain's efficiency. Moreover, guanxi, or social connections, and trust are essential for sustaining robust partnerships between companies and their suppliers.

3.0 Research Methodology

3.1 Research Design and Study Area

In this study, a descriptive research methodology was employed to gather comprehensive data on a particular circumstance and to develop a deep grasp of the topics under investigation. This study is conducted at the Ministry of Health in Tanzania, which plays a central role in coordinating and overseeing the delivery of healthcare services across the country. The Ministry is responsible for managing the procurement, distribution, and availability of essential medicines and medical supplies, making it a critical stakeholder in the healthcare supply chain. Given the widespread challenges of medicine shortages and supply chain inefficiencies affecting healthcare performance, selecting the Ministry of Health as the study area is highly relevant.

3.2 Target population and sample

The researcher chose a sample from this group to ascertain the study's conclusions. The study's participant population included all Ministry of Health (MOH) employees who work in the supply chain departments: warehouse, store, distribution, procurement, user department, accounting, and management team. The study's total population was made up of about 275 employees. According to Pandey, Prabhat, and Pandey (2014), a sample is a representative subset of the population that enables the researcher to get precise data. Staff members chosen from Tanzania's Ministry of Health's supply chain management divisions made up the study's sample. By applying Slovin's formula and setting a 5% margin of error, the sample size was 163 staff. Purposive sampling was employed to select respondents from different departments within the ministry based on their expertise and experience in the procurement and supply chain of healthcare facilities. The only factors considered are the researcher's expertise and judgment. The results should be extremely precise because the researcher's expertise aids in the sample's design (Pandey, Prabhat & Pandey, 2014).

3.3 Data collection method

This study employed a questionnaire as the primary data collection tool, a method deemed convenient and effective for reaching a large number of respondents. As Downs (2017) noted, questionnaires are commonly used in research to gather important information about specific populations, allowing researchers to systematically compare and contrast responses. The structured nature of questionnaires helps ensure consistency in data collection, minimizing researcher bias and providing high-quality, reliable data that can be used to draw meaningful conclusions. A key feature of the questionnaire used in this study is the incorporation of a 5-point Likert scale, which allows respondents to express the degree of their agreement or disagreement with specific statements related to strategic supplier partnerships and healthcare performance. The Likert scale, which typically ranges from 1 (strongly disagree) to 5 (strongly agree), was used.

3.4 Data analysis

Descriptive statistics were employed in this study to analyze the data collected from the questionnaire. Descriptive statistics are essential in summarizing and organizing the data, making it easier to interpret the patterns and trends within the responses. The study used measures of central tendency, such as the mean (average), to summarize the overall trends in the responses. For example, the mean response to a Likert scale question about the reliability of medicine supplies might indicate the general perception of supply chain efficiency among healthcare providers. The median and mode were also calculated to further understand the most common responses and whether the data were skewed in any particular direction. Furthermore, in addition to descriptive statistics, inferential statistics linear regression analysis is used to further investigate correlations and make conclusions from the data. The study's objective was to examine how the independent and dependent variables related to one another.

4.0 Study Results and Findings

4.1 Descriptive Analysis of Strategic Supplier Partnership on Organizational Performance

The findings indicated that respondents believe commitment significantly influences strategic supplier relationships and organizational performance, with a mean of 3.83 and a standard deviation of 1.147. Similarly, sufficient execution was viewed as a key factor, reflected in a mean of 3.71 and a standard deviation of 1.076. Collaboration also emerged as important, with a mean of 3.90 and a standard deviation of 1.120. Finally, strong trust was known as a crucial element, with a mean of 3.81 and a standard deviation of 1.194. Overall, these results suggest the consent of those surveyed about the effects of these factors on strategic supplier relationships.

Table 1: Strategic Supplier Partnership on Healthcare Performance

	N	Minimum	Maximum	Mean	Std. Deviation
Commitment	163	1	5	3.83	1.147
Sufficient Execution	163	1	5	3.71	1.076
Collaboration	163	1	5	3.90	1.120
Strong Trust	163	1	5	3.81	1.194
Valid N (listwise)	163				

4.2 Diagnostic Tests

The internal consistency measurement method The Cronbach's alpha measure was employed to evaluate the scale's reliability. A Cronbach's alpha of higher than 0.6 indicates that the internal consistency of the scale's components is poor. However, when Cronbach's alpha is more than 0.7

but less than 0.8, it implies good internal consistency. Finally, strong internal consistency is indicated by a Cronbach's alpha of more than 0.8 and less than 0.9 (Castillio, 2009).

Table 2: Reliability Statistics

Cronbach's Alpha	N of Things
.951	5

Source: SPSS Output 2024

Table 2 of the SPSS findings showed that the Cronbach's alpha for the four variables was 951. Commitment, Adequate Execution, Collaboration, Solid Trust, and organizational performance were the four factors with Cronbach alpha values more than 0.7. The data's satisfactory internal consistency demonstrated their reliability, allowing for the confident performance of additional research.

4.3 Regression Analysis

The purpose of the study was to examine the linkages that exist between supplier relationships, customer encounters, information sharing, and organizational performance. Regression analysis was used to evaluate the connection between the dependent and independent variables.

Table 3 Model Summary

Model	R	R Square	Adjusted R Square	Std. Slip-up of the Measure
1	.841a	.708	.706	.61325

a. Pointers: (Steady), Strategic supplier relationship

Source: SPSS Output 2024

Table 3 presents the results. An R-value of 0.841 shows a strong positive correlation between the performance of the company and strategic supplier relationships. Strategic supplier relationships account for around 70.8% of the variance in organization performance, with the error term accounting for the remaining 61.3%, according to the R-squared value of 0.708. This shows that the data and the model match properly.

Table 4 Analysis of variance

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	146.858	1	146.858	390.505	.000 ^b
	Residual	60.548	161	.376		
	Total	207.406	162			

a. Subordinate Variable: Organization execution

b. Indicators: (Consistent), Strategic supplier relationship

Source: SPSS Output 2024

The results shown in Table 4 confirm the general regression model's applicability for the provided data. The significance of the data is shown at the 5% level of significance by the ANOVA (F-statistic) value of 390.505 and the associated probability value of .000 ($F = 390.505$, $p = 0.000$).

Table 5 Coefficients

		Unstandardized Coefficients		Standardized Coefficients	
Model		B	Std. Error	Beta	t
1	(Constant)	.404	.183		2.210
	Strategic supplier relationship	.913	.046	.841	19.761

a. Dependent Variable: Organizational performance

Source: SPSS Output 2024

5.0 Discussion

The study's findings highlight that strategic supplier relationships, as measured by factors such as commitment, sufficient execution, collaboration, and strong trust, have a positive impact on organizational performance. Specifically, organizations should prioritize fostering commitment among all stakeholders in supplier relationships and focus on the effective execution of supplier management strategies. This emphasis on commitment and execution can lead to better

collaboration, communication, and problem-solving, ultimately improving organizational outcomes. The study's findings revealed a mean score of 3.83 and a standard deviation of 1.147, indicating that respondents generally agreed that commitment significantly influences strategic supplier relationships and organizational performance. This suggests that commitment is seen as a key factor in shaping strategic supplier partnerships, which in turn enhances organizational success. Organizations are, therefore, encouraged to foster a strong sense of commitment among all parties involved in their supplier relationships to achieve improved performance.

The findings align with the work of Doe and Johnson (2023), who stressed the importance of commitment in mitigating risks within supplier relationships and enhancing alliance performance. They argued that committed partners are more likely to invest resources, share knowledge, and collaborate effectively, which leads to stronger alliance outcomes. This suggests that organizations should prioritize building committed relationships with their suppliers to ensure long-term success and stability.

Further findings showed a mean of 3.71 and a standard deviation of 1.076; this indicated that respondents agreed that sufficient execution is among the factors which influence strategic supplier relationships toward organizational performance. The finding implies that respondents perceive sufficient execution as a significant factor in shaping strategic supplier relationships, which subsequently impacts organizational performance positively. Therefore, organizations should prioritize ensuring the effective execution of strategies and processes related to supplier management to enhance overall performance. Finding aligns with Handfield et al., (2019), who emphasize the significance of execution excellence in supplier relationship management, particularly in the context of achieving strategic objectives. They argue that organizations must develop the capability to execute strategies effectively, ensuring alignment with supplier requirements and fostering collaborative partnerships that drive mutual value creation.

Also, findings showed a mean of 3.90 and a standard deviation of 1.120. This indicated that respondents agreed that collaboration is one of the factors that influence strategic supplier relationships and organizational performance. This finding implies the critical role of collaboration in shaping strategic supplier relationships and driving organizational performance. Organizations prioritize fostering collaborative partnerships with suppliers to capitalize on the benefits of enhanced cooperation, communication, and joint problem-solving.

These findings align with Monczka (2015), who argues that collaborative partnerships enable organizations to leverage the expertise and resources of their suppliers, resulting in increased efficiency, flexibility, and innovation, which ultimately contribute to enhanced organizational performance.

Likewise, findings showed a mean of 3.81 and a standard deviation of 1.194; this indicated that respondents agreed that strong trust is among the factors that influence strategic supplier

relationships toward organizational performance. The finding implies the significance of trust in shaping strategic supplier relationships and driving organizational performance. The trust serves as a foundation for effective collaboration, cooperation, and mutual value creation between buyers and suppliers, ultimately contributing to improved performance and competitiveness. Findings aligned with Kosgei and Gitau (2016), who emphasize the importance of trust in interfirm relationships, particularly in strategic alliances and supplier partnerships. They argue that trust enables partners to rely on each other, share sensitive information, and collaborate effectively, ultimately leading to improved performance and competitive advantage.

The idea that an organization's strategic supplier connections and performance are favorably and strongly connected is supported by other study ($B = 0.913$ and $p\text{-value} = .000$). According to this, when a key supplier relationship is altered, an organization's performance increases by an average of 0.913 units. These findings align with those of Monczka (2015), who emphasized the strategic importance of supplier relationships in improving organizational performance through higher levels of quality, cost reduction, and inventiveness. As a result, the statistical findings demonstrate a favorable correlation between strategic supplier partnerships and organizational success.

6.0 Conclusion, Implication & Limitation of study

6.1 Conclusion

The study investigated the influence of strategic supplier partnerships on healthcare performance, with a focus on the Ministry of Health in Tanzania. The findings indicated that key factors such as commitment, sufficient execution, collaboration, and trust significantly affect the success of strategic supplier relationships, which in turn influence organizational performance. The positive correlation between these elements and organizational outcomes highlights the importance of nurturing strong supplier partnerships to improve efficiency, service delivery, and overall performance. In conclusion, healthcare organizations, especially in Tanzania, should focus on strengthening their supplier relationships to address ongoing challenges such as medicine shortages and supply chain inefficiencies, which are detrimental to healthcare performance.

6.2 Practical implication

The study presents several practical implications for organizations seeking to enhance their performance through better supplier management. Firstly, organizations should prioritize commitment and effective execution in supplier relationships. Long-term partnerships based on shared goals foster deeper collaboration, communication, and joint problem-solving, leading to better performance outcomes. Additionally, fostering collaboration and trust with suppliers is essential. By encouraging cooperative partnerships, organizations can ensure better information

sharing, joint decision-making, and quicker problem resolution, which ultimately leads to improved organizational performance. For healthcare institutions, particularly, strengthening supply chain management practices will help address key issues like medicine shortages and delays, thus improving overall service delivery.

6.3 Managerial Implications

The study highlights key managerial implications for enhancing organizational performance through supplier management. Managers should focus on developing long-term relationships with suppliers, emphasizing commitment and shared goals. This requires strategic planning to identify suppliers that align with the organization's objectives. Implementing collaborative practices, such as joint problem-solving workshops and regular communication, fosters trust and improves supply chain efficiency. Additionally, investing in training programs for negotiation and relationship management equips employees with necessary skills. Establishing clear performance metrics for supplier management enables organizations to track partnership effectiveness and make informed decisions.

6.4 Social Implications

Socially, strengthening supplier relationships cultivates trust and collaboration that positively impacts community relations. Improved supply chain practices, particularly in healthcare, enhance access to medical supplies, addressing critical issues like shortages and delays. As organizations expand their networks, they may create new job opportunities, benefiting local economies. Furthermore, collaboration with suppliers can promote ethical sourcing and sustainability, influencing societal norms and consumer expectations for responsible business conduct.

6.5 Theoretical Implications

Theoretically, this study contributes to supplier relationship management literature by highlighting the roles of commitment and collaboration in impacting performance. It supports behavioral theories related to trust and cooperation, indicating that psychological factors are

crucial in supplier interactions. Additionally, the research informs frameworks on supply chain resilience, showing how strong supplier relationships enhance adaptability in crises. Linking collaborative relationships to specific outcomes, the study encourages the development of new performance measurement models that incorporate relational metrics alongside traditional financial assessments.

6.6 Study Limitations

Despite the valuable insights gained, the study has notable limitations. Firstly, the geographical focus is limited to Tanzania, specifically within the Ministry of Health, which restricts the generalizability of the findings to other sectors or countries with different supply chain dynamics. Secondly, the sample size of 163 respondents, while adequate for the context, may not fully capture the diversity of perspectives across various healthcare institutions or industries.

6.7 Areas for Further Study

There are several potential areas for future research. One direction could involve expanding the scope to include sectors beyond healthcare, such as manufacturing, to assess how strategic supplier partnerships influence performance in different industries. Additionally, further research could explore the impact of relationship management practices, such as conflict resolution and communication strategies, on the effectiveness of supplier partnerships and overall supply chain performance.

²College of Business Education (CBE Dodoma), P.O. Box 2077, Dodoma Tanzania.

Abstract

This study aimed to determine the effects of management support towards green recycling adoption among the slaughterhouse processing industry in Dodoma city. The study employed a cross-sectional design using interviews, questionnaires, Observation, and documentary reviews. Data was collected from 78 respondents in three slaughterhouses namely; Kizota, Veta, and Msalato. The study used non-probability sampling techniques specifically purposively sampling as it involved key respondents who were animal owners and workers of slaughterhouses. The data were analysed using binary logistic regression and descriptive analysis. Results revealed that, recycling facilities variable had an odds ratio (OR) of 3.5304 ($p=0.009$) suggests that animal owners with access to recycling facilities are approximately 3.5304 times more likely to adopt these practices compared to those without access. On the other hand, training variable had an odds ratio (OR) of 2.2958 ($p=0.006$) suggests that animal owners with training are approximately 2.2958 times more likely to adopt these practices compared to those without training. Furthermore, financial resources had an odds ratio (OR) of 3.1960 ($p=0.001$) indicates that animal owners with financial resources are approximately 3.1960 times more likely to adopt these practices compared to those without financial resources. The study recommends allocation of infrastructure facilities, financial resources, incentives, training and promote market development to support the implementation of green recycling initiatives in slaughterhouses industry in Dodoma city and all over Tanzania. The rationale for this study was rooted in the urgent need to mitigate the environmental impacts of slaughterhouse waste and to promote sustainability within the industry.

Keywords: *Green recycling, Slaughterhouses, Adaptation determinants*

1.0 Introduction

1.1 Background information

Globally, recycling is used to address the challenges of waste management particularly, limiting the amount of waste sent to landfills and mitigating environmental issues from open burning and

uncontrolled disposal, which have negative effects on the environment and public health (Godfrey et al., 2020). Across different industries, there has been a global trend in the 21st century toward environmentally friendly and sustainable methods (Lutfi et al., 2023). Different businesses in the world are adopting green initiatives at an increasing rate due to increased worries about climate change, resource depletion, and environmental deterioration (Jasin et al., 2023). For Small and Medium-size Enterprises looking to diminish their ecological footprint and line with global sustainability goals, adopting green recycling techniques has become a priority.

Africa in particular, environmental problems are made worse by the fast-paced urbanization and industrialization of the region. African are realizing the importance of incorporating sustainable practices into their business operations, particularly those in the Agri-processing industry (Andersen et al., 2022). A key component of sustainable waste management is green recycling, which is especially important for protecting Africa's varied ecosystems and mitigating the negative environmental effects of economic activity (Akinyi & Kathambi, 2023).

The rapid urbanization of Africa explicates the need for urgency in reviewing and equipping the waste management infrastructure by adopting the 3Rs (Reduce, Re-use, and Recycle) paying more attention on recycling (Ogutu & Kathambi, 2022). Moreover, recycling can be the first step toward sustainable development because of the high rate of population increase in Africa, the continent's increasing urbanization which is expected to reach 160 million tons by 2025 (Abubakar, 2020).

East Africa, Tanzania is experiencing economic growth and industrial development. The agricultural and Agri-processing sectors, such as the slaughterhouse industry, play a crucial role in the country's economy (UNIDO, 2022). With an increasing focus on sustainable development, there is a growing imperative for industries in Tanzania, including slaughterhouses, to adopt green recycling practices. This is not only driven by global trends but also by the recognition of the local environmental challenges faced by the nation (Palfreman, 2018).

Green recycling refers to the process of collecting, processing and re-use of waste materials that would otherwise be discarded as waste and create negative impacts to human health and the environment if left un-attended. It involves providing alternative uses such as by-products can be making a variety of products like gelatin, glues, fertilizers, pet food, calcium nutritional supplements for animal decorative items, tools musical instruments. Furthermore, skin can be used to make clothing, shoes, furniture also manure to make biogas (Mozhiarasi & Sivakumar, 2022). Some of the products made from green recycling are shown by Figure 1.

Figure 37: Green recycling products

In Dodoma Tanzania, being it a capital city it represents a significant hub for economic activities, including the Agri-processing industry (URT, 2023). Since, Dodoma undergoes urbanization and industrial growth, there is a need to address the environmental implications of industrial processes particularly, in sectors like slaughterhouse processing (Seluhinga, 2022). However, the green recycling has not been adopted in slaughterhouse in Dodoma city and disposal of animal byproducts are done in environmentally unfriendly manner as shown in Figure 1. By understanding the dynamics of green recycling adoption among slaughterhouse industry in Dodoma, it is crucial to promote sustainable practices at the local level (URT, 2019).

Figure 38: Current dumping practices for animal by-products from slaughterhouses in Dodoma city

Moreover, the Agri-processing sector like slaughterhouse processing, is known for generating significant waste streams that can have adverse environmental effects if not managed properly (Mozhiarasi & Sivakumar, 2022). SMEs in Dodoma is likely to face challenges and opportunities in adopting green recycling practices (Lwesya, 2021).

1.2 Statement of the problem

In Tanzania, the slaughterhouse processing business is a major contributor of the region's economy. However, slaughterhouse processing businesses are facing serious environmental problems that stem from waste management. (Nyampundu et al., 2020). Despite the government of Tanzania to come up with different regulations in environmental conservation for public health including slaughterhouse practices, still there is a problem with the implementations of effective adoption of green recycling practices especially in slaughterhouses including poor disposal of animal byproducts like horns, skin and hooves (Ogutu & Kathambi, 2023). Moreover slaughterhouse often operate with limited resources, making it challenging to invest in the necessary infrastructure and technologies required for efficient green recycling and also the increasing costs in implementing eco-friendly practices act as a limiting factor (Gamba et al., 2019). Although past studies have made effort in addressing issues of green procurement practices, most of them concentrated to study the challenges of green procurement in a general perspective and ignored to address the practices and challenges used in animal slaughterhouse processing as an area that has a unique structures, procedures and conditions.

Therefore, this study intended to fill the knowledge gap by determining the influence of management support toward effective implementation of green recycling practices.

2.0 Methods

2.1 Study Area

The study was conducted in Dodoma City, Tanzania involved three slaughterhouse processing industry which are Kizota, VETA and Msalato slaughterhouse. As a capital City of Tanzania, is experiencing economic growth, urbanization and economic activities, including the agro-processing industry which facing a serious environmental problems stem from waste management. (Nyampundu et al., 2020).

2.2 Research Design

This study employed a cross-sectional design. This design was preferred by the researcher as it allowed to collect data on more than one case at a single point in time and detection of patterns of association among variables. According to (Kothari & Garg, 2019), research design is the conceptual blueprint that guides the execution of the research, encompassing the strategy for data collection, measurement, and data analysis.

2.3 Research Approach

Mixed research approach combines both qualitative and quantitative data, the qualitative data were opinions, and altitude of the respondents while quantitative data were from the answers in the questionnaire like age, number of experts in green recycling in the study area and etc.

2.4 Population and sample size

The population for this study comprised all animal owners and government employees working in the three selected animal slaughterhouses in Dodoma City which amounted to 78 people whole population. According to Human resource officers at slaughterhouse processing industries in Dodoma City, there were 78 registered animal owners. In Kizota, there were (53), VETA abattoir (15) and Msalato slaughterhouse (10) as shown in Table 1. The formula for sample size was not applied rather than involved all 78 purposely as shown in the Table below and the key informants who are trade officer, livestock officer, representative of the Tanzania meat Board, Health officer public and environmental officer- Public servants was for gain additional information.

Table 48: Sample size of all respondents

No	Respondents	Sample size
1	Kizota Abattoir animal owners	53
2	VETA abattoir animal owners	15

3	Msalato slaughterhouse animal owners	10
	Total	78

2.5 Data Collection Methods

Data were collected through interview, observation, questionnaire and documentary review. The use of multiple data collection methods helped in triangulation of the information received from each of the data collection methods.

2.6. Data analysis

Data were analysed using descriptive, inferential statistics. The data were quantitatively analysed with the help of the computer software Statistical Package for Social Sciences (SPSS) and Stata. The quantitative methods applied were descriptive and inferential statistics to assess the adoption of green recycling practices among slaughterhouse processing industry in Dodoma City, Tanzania. Descriptive statistics in frequency were used to explain the demographic information of animal owners and dependent variables as well as challenges. Then, inferential statistics employed the binary logistic regression model assesses the adoption of green recycling practices among slaughterhouse processing industry in Dodoma city at 0.05 level of significance, Tanzania. It is important to note that before performing the logistic regression Model, the 5-point Likert scale data on adopting green recycling practices were transformed into an index scale using the overall mean scores. Thus, the mean score greater or equal to the overall mean was termed high green recycling practice while the score below the overall mean was termed as low green recycling practice.

3.0 Results and Discussion

3.1 Description of the Respondents' Demographic Characteristics

This section serves as a foundational exploration into the demographic profile of the respondents, offering insights into the distribution of key demographic factors within the study population. The analysis of demographic characteristics as shown in Table 2 was crucial as it provided a contextual understanding of the sample population which was essential for interpreting subsequent findings and drawing meaningful conclusions. By examining demographic variables such as gender, age, marital status, and education level, this study aims to contextualize the research findings within the demographically context of the study population, thereby enhancing the overall understanding of the factors influencing the adoption of green recycling practices among slaughterhouse in Tanzania.

Table 2: Demographic characteristics of animal owners

Characteristics	Frequency (f)	Percent (%)
Gender		
Male	72	92.3
Female	6	7.7
Age		
18- 27 years	1	1.3
28-37 years	9	11.5
38-47 years	21	26.9
48+ years and above	47	60.3
Education Level		
Primary level	9	11.5
Secondary level	67	85.9
Collage level	2	2.6
University level	0	0.0
Marital status		
Single	5	6.4
Married	69	88.5
Divorced	4	5.1
Other	0	0.0

Source: Field Data, 2024

The demographic characteristics outlined in Table 2 provide valuable insights into the composition of the respondent population and shed light on their gender distribution, age demographics, educational background, and marital status. In terms of gender representation, the data reveal a notable gender disparity, with the majority of respondents being male (92.3%), while females accounted for a significantly smaller proportion (7.7%). Examining the age distribution of respondents, the data indicate a predominance of older individuals, with 60.3% falling within the

48 years and above. Regarding educational background, majority of the respondents in this study had completed secondary education (85.9%), indicating a relatively high level of educational attainment within the population as shown in Table 2. Marital status among respondents revealed that the majority number of the respondents were married (88.5%), while smaller proportions were not married (6.4%) or divorced (5.1%) as shown in Table 2.

3.2 Effects of management support towards green recycling adoption among slaughterhouse processing industry in Dodoma City.

Table 3: Logistic Regression Analysis

Green recycling	Coef.	Odds Ratio	z	P> z
Recycling facilities				
Yes	1.2614	3.5304	10.274	0.009
No (Reference)				
Financial resources

Prob > Chi2 = 0.000		Pseudo R2 = 0.5971		

Source: Authors compilation from STATA 17

The binary logistic regression analysis aimed at determining the management support effects towards green recycling adoption among animal owners in Dodoma City as shown in Table 3. The analysis includes several predictor variables related to management support: "Recycling facilities," "Financial resources," and "Training," along with their corresponding coefficients, odds ratios, z-values, and p-values. Additionally, the table provides information on the constant term, number of observations, likelihood ratio chi-square statistic, probability associated with the chi-square statistic, and pseudo-R-squared value. Starting with the "Recycling facilities" variable, the coefficient of 1.2614 indicates that for every one-unit increase in the availability of recycling facilities ("No" and "Yes"), the log-odds of adopting green recycling practices increase by 1.2614 units. The odds ratio of 3.5304 suggests that animal owners with access to recycling facilities are approximately 3.5304 times more likely to adopt these practices compared to those without access. The associated z-value of 10.274 and p-value of 0.009 indicate that this effect is statistically significant at the 0.05 level, highlighting the importance of recycling facilities in promoting the adoption of green recycling practices. During the interview with one of the key informants replied that:

“Our infrastructures are still poor compared to developed countries who practice green recycling, although we are receiving many animal owners who need green recycling facilities” (Key Informant, 2024). Training variable had a coefficient of 0.8311 indicates that for every one-unit increase in the training ("No" and "Yes"), the log-odds of adopting green recycling practices increase by 0.8311 units. The odds ratio of 2.2958 suggests that animal owners with training are approximately 2.2958 times more likely to adopt these practices compared to those without access. The associated z-value of 12.05 and p-value of 0.001 indicate that this effect is statistically significant at the 0.05 level, underscoring the significance of training in facilitating the adoption of green recycling practices. This was evidenced by respondents from key informants who replied:

“Most of the animal owners who get training are willing to adopt green recycling. They see the benefits in income generation, environmental conservation,” (Key Informant, 2024).

Moving on to the "Financial resources" variable, similar patterns emerge. The coefficient of 1.1619 suggests that for every one-unit increase in the availability of financial resources ("No" and "Yes"), the log-odds of adopting green recycling practices increase by 1.1619 units. The odds ratio of 3.1960 indicates that animal owners with financial resources are approximately 3.1960 times more likely to adopt these practices compared to those without financial resources. The associated z-value of 13.0111 and p-value of 0.006 indicate that this effect is statistically significant at the 0.05 level, underscoring the significance of financial support in facilitating the adoption of green recycling practices. The constant term of 0.069 represents the log odds of adopting green recycling practices when all predictor variables are zero. In support of these results, one key informant said that:

“I’m willing to adopt green recycling but when I look at the financial resources required are discouraging....” (key informant 2024)

The number of observations is 78, and the likelihood ratio chi-square statistic is 66.025, with a probability associated with the chi-square statistic of 0.000, indicating that the model is statistically significant. The pseudo-R-squared value of 0.5971 suggests that the model explains approximately 59.71% of the variance in the adoption of green recycling practices among animal owners in the study area. In summary, the results of the binary logistic regression analysis highlight the significant influence of recycling facilities, financial resources and training on the adoption of green recycling practices among animal owners in Dodoma City. These findings underscore the importance of providing adequate infrastructure, training, and financial support to promote environmentally friendly behaviours within this community.

4.0 Conclusion & Recommendations

4.1 Conclusion

In conclusion, this study provides valuable insights into the adoption of green recycling practices among animal owners in slaughterhouse operations in Tanzania. The findings highlight the management support in integrating sustainable waste management practices within this industry. Moreover, the study reveals a mixed landscape of management support towards green recycling adoption, with some aspects such as the provision of recycling facilities, financial resources and training lagging behind. Strengthening managerial commitment, investing in infrastructure, and capacity-building efforts are essential to overcome these barriers and facilitate the integration of green recycling practices within slaughterhouse operations. Ultimately, this study serves as a foundational step towards promoting sustainable waste management practices within the slaughterhouse industry in Tanzania. Continued research, collaboration, and concerted efforts are necessary to realize the full potential of green recycling adoption and foster a culture of sustainability within slaughterhouse operations in Tanzania and beyond.

4.2 Recommendations

Based on the findings of this study, the following are the recommendations for the government who are policymakers, Ministry of Livestock and Fisheries, and other stakeholders. Enhance Regulatory Frameworks: Government policymakers should strengthen environmental regulations related to green recycling practices in the slaughterhouse industry to ensure compliance and accountability. This includes setting clear standards for waste management, establishing penalties for non-compliance, and providing incentives for sustainable practices.

Provide Financial Support: Government policymakers should allocate financial resources and incentives to support the implementation of green recycling initiatives in slaughterhouses. This

could involve subsidies for equipment and infrastructure, grants for pilot projects, or tax incentives for environmentally sustainable practices.

Invest in Research and Innovation: Allocate funding for research and development initiatives aimed at advancing green recycling technologies and solutions tailored to the needs of the slaughterhouse industry.

Promote capacity building this can involve workshops, training sessions to create awareness.

Abstract

The study focused on assessing effects of quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City, Tanzania. The population comprised 1473 management and staff members, with a sample size 314 respondents. Data were collected using questionnaires and interviews, with qualitative and quantitative data analysed through descriptive and inferential statistics, including binary logistic regression and Chi square. The data were quantitatively analyzed with the help of the computer software Statistical Package for Social Sciences (SPSS) and Stata. It is important to note that before performing the Logistic Regression Model, the 5-point Likert scale data on Project performance were transformed into an index scale using the overall mean scores. Thus, the mean score greater or equal to the overall mean was termed as high-project performance while the score below the overall mean was termed as lower-project performance. The Logistic regression analysis revealed that approximately 60.3% of the overall performance of government secondary schools' construction projects can be explained by the quality assurance measures alone (Pseudo R-squared = 0.603), with a highly significant LR Chi (3) (LR = 138.4, $p < 0.001$). Based on this logistic regression analysis, adherence to standards and continuous improvement initiatives are statistically significance on project performance., while Inspection frequency shows a statistically insignificant at 0.05 level of significance.

Keywords: *quality assurance measures, Project performance, Inspection frequency, adherence to standards and continuous improvement initiatives.*

1.0 Introduction

The construction industry is a vital component of national development, playing a crucial role in enhancing infrastructure and facilitating economic growth. Government-sponsored construction projects, particularly in the education sector, are essential for providing quality learning environments and contributing to the overall well-being of society (Paci-Green et al., 2020). However, the success of these projects is contingent upon effective project management, with a focus on quality management practices.

Across the globe, advanced economies have successfully leveraged QMP to achieve exceptional results in education construction projects. In Singapore for instance, where stringent quality standards are enforced, education infrastructure is renowned for its efficiency, durability, and sustainability. The meticulous application of QMP ensures that schools are not only completed on time but also adhere to high-quality standards, contributing to a positive and conducive learning environment (Tan, 2017). In Germany and Japan, the integration of advanced QMP has led to the creation of technologically advanced and resilient educational facilities. These countries prioritize quality assurance measures, resulting in construction projects that withstand the test of time and evolving educational needs (Nakano et al, 2016).

In the developing world, QMP have been instrumental in overcoming challenges associated with resource constraints and varying levels of infrastructure development (Guarara, et al., 2018). For instance, in India, the implementation of QMP in the construction of educational facilities has contributed to cost-effectiveness and timely project completion. By emphasizing quality control, Indian authorities have successfully managed to optimize limited resources and ensure the delivery of sustainable and functional learning spaces. In Sub-Saharan Africa, where infrastructure development is a critical need, countries like Rwanda have demonstrated the transformative power of QMP in education construction. Through strategic planning and rigorous quality management, Rwanda has been able to build schools that not only meet international standards but also address local needs, fostering an environment conducive to teach (De Shano-Dasilva et al., 2022).

Across the board, a commitment to regulatory compliance, stakeholder engagement, skilled workforce training, and the use of technology for efficient project monitoring have been central to successful cases of QMP in education construction projects. These factors collectively contribute to the creation of educational infrastructure that aligns with global standards and local needs. The construction industry has faced widespread criticism for its consistent delivery of low-quality construction projects. To address this issue and meet client demands, construction firms must adopt robust quality management practices (Oke, 2017). Globally, the building construction sector is recognized as a fundamental pillar upon which a country's development depends. The quality of construction projects by global firms is inherently linked to the practices they adopt. Over the past three decades, a multitude of construction companies worldwide has

encountered significant challenges, including workmanship defects, delays, and cost overruns in completing their projects.

The adoption of a Quality assurance measures culture has proven to enhance the productivity of firms on a global scale. International, regional, and local construction firms consistently strive to gain a competitive edge in building projects through customer-centric Quality Management initiatives (Alawag et al., 2023). In Africa, building collapses have been attributed to weak foundations, substandard construction materials, poor material mixing, excessive load on building strength, and inadequate testing of building strength. Many construction industries, especially in terms of productivity and quality systems, have faced criticism for prioritizing cost and time over quality in construction projects. Collapsed buildings are becoming an increasing problem, particularly in major cities under construction or renovation. Research indicates that Kenya has witnessed a high number of building collapses in the last decade due to a lack of quality control and the use of poor construction materials. In one such instance, despite a stoppage order and violation of construction regulations, work continued, leading to the eventual collapse.

In Tanzania, the Dar es Salaam building collapse in 2013 resulted in 36 fatalities, revealing poor building design as the suspected cause. The collapse was exacerbated by a shift in oversight responsibility and the disregard of approved floor plans. Substandard concrete and steel bar reinforcement further underscored the issue of quality mismanagement. The Tanzanian government has been implementing school construction projects under various programs, such as the Socioeconomic Response and Recovery Plan (TCRP) and the Secondary Education Quality Improvement Project (SEQUIP). Despite substantial funding, secondary school construction projects in Dodoma Region have experienced numerous shortcomings, including inadequate planning, non-compliance with procurement procedures, insufficient contract supervision, a lack of qualified personnel, inadequate equipment, and improper cost recording. The Government of The United Republic of Tanzania have been issuing various guidelines to ensure the quality of Secondary School Construction Projects whereby respective Council in collaboration with the School Board/School Construction Committee, are responsible for the day-to-day monitoring of works. They ensure that no material is lost, the contractor attends the site regularly and the works are done satisfactorily. The Regional Engineer/Council Engineer or supervisor of building works assigned or contracted by the Region/Council, is responsible to visit the site at least at the stages of works considered for the payments. They control the quality and progress of work, give the necessary instructions to the contractor in the school site book. The supervisor prepares the certificate of works to certify that work has been accomplished according to the standards set-up in the specifications. If they observe sub-standard work, which cannot be improved (example foundations, floor slab or block walls with weak concrete mix), they should instruct, in writing, the contractor to demolish the sub-standard work and to restart them following the technical handbook, at the contractor's expense (Education Sector Development Plan 2016/17 – 2020/21).

Despite the significant efforts of the Government of ensuring quality in construction projects, the effectiveness of quality assurance measures in the context of government secondary schools construction projects in Tanzania remains inadequately understood. According to Annual General report of the Controller and Auditor General report of 2022 for the local Government Authorities, under the classrooms, school facilities buildings and healthcare facilities projects assessed how procurement and management of building materials were done by LGAs, the capacity of LGAs in supervising projects implemented through force account method and the quality of the physical structures developed revealed payments of TZS 947.92 million made to local artisans without legally binding contracts and implementation of construction projects worth TZS 4.78 billion by 17 LGAs without preparation of bills of quantities and schedules of materials for works executed (URT, 2023). The report also noted that LGAs at lower level are not adequately staffed, primarily depending on teachers and healthcare workers. Further, using teachers and Healthcare workers as committee members to implement various Force Account construction projects which has led to the construction of substandard building structures.

Moreover, CAG Report (2022) found 10 LGAs implemented substandard construction projects due to poor workmanship and noncompliance to technical designs and specifications. Also, there were LGAs that used untreated timbers for roofing and undried timber for fabrication of doors leading to shrinking, swelling, twisting, cracking, and bending of doors over time. Similarly, report from Dodoma City revealed that the construction of Iwondo, Chipogoro, and Ipera Secondary Schools Dodoma, as part of the Secondary Education Quality Improvement Project (SEQUIP), encountered various issues in quality management. These challenges ultimately resulted into schools being constructed with subpar quality (Ras Office Dodoma, 2022)

Therefore, it is evident that the construction industry in Tanzania, faces numerous challenges that may hinder optimal project performance. One critical aspect that requires thorough investigation is the influence of quality management practices on the performance of government secondary school construction projects since there is a notable gap in the existing literature regarding how quality management practices impact the overall performance of construction projects of Government Secondary School Construction Projects.

This study aims to address the inadequate implementation of Quality assurance Practices through assessing the deficiency in the implementation of quality insurance practices within the construction processes of government secondary schools, considering Dodoma City as the area of study.

2.0 Empirical Literature Review

According to study by Hammed, Musib, & Pelumi, (2023), it was revealed that an organization with effective project quality management strategies would be more likely to fulfill the needs of clients, which could ultimately lead to client's satisfaction.

Baleche (2023), conducted research on Effects of Total Quality Management on Performance of Construction Industry in Tanzania. The findings indicate that the project's senior staff takes accountability for quality work and offers suitable and effective leadership. Based on the results, it can be said that strong leadership improves construction projects' success in Construction Company. The study suggests that policies pertaining to construction projects should include leadership.

Shirandula (2018) conducted the research on influence of total quality management practices on the performance of the construction industry in Mombasa County, Kenya. The study found that management commitment, employee involvement, continuous involvement and customer focus influences firm performance of building construction industry positively.

Oni, O.Z. and colleagues (2019) conducted research on the factors influencing quality management practices on building construction sites in Nigeria. The study revealed that top among the factors affecting quality management on construction sites both in public and private organizations in Oyo State were lack of adequate sanction by the standard assurance organization, non-implementation of the National Building Code, lack of proper inspection at every construction stage, award of contract to an unqualified contractor, Lack of construction quality control inspection program; lack of effective quality policy implementation; Inadequate personnel and craftsman training, poor specification, bribery and corruption, and professional role usurpation.

Beneficiaries are referred to as an ultimate judge of quality, beneficiaries' requirements and expectations represent the success of project outputs or deliverable. Subjective criteria are sometimes used by beneficiary to describe quality. Although, there are other dimensions that makes quality objective. Quality characteristics are to be determined by one or more metrics, which could be collected to mirror its specific objectives. Reduction of errors in the features of product quality is one its major component in quality management. This could be determined by taking account of errors and defects after using the product. High-quality products or services are results of an adequate quality management process but no just an event.

Quality management ensures that an organization, product or service consistently functions well. It has four main components: quality planning, quality assurance, quality control and quality improvement. Quality management is focused not only on product and service quality, but also on the means to achieve it. Quality management, therefore, uses quality assurance and control of processes as well as products to achieve more consistent quality. Quality control is also part of quality management. What a customer wants and is willing to pay for it, determines quality. It is a written or unwritten commitment to a known or unknown consumer in the market. Quality can be defined as how well the product performs its intended function Chen and Wu, (2019).

3.0 Methodology

This chapter presents the methodological techniques that were employed in conducting this study. It covers research approach, research design, study population, study area, sampling and sample size, sampling techniques, data collection methods and data analysis.

3.1 Research Approach

To assess the assessing effects of quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City, Tanzania mixed research approach has been used. Mixed methods research is research design that includes both qualitative and quantitative research elements, with the aim of integrating or combining the strengths of both approaches to gain a more comprehensive understanding of the research problem (Creswell & Plano, 2018). Mixed methods research allows combining the strengths of both quantitative and qualitative approaches. By integrating these approaches, we can achieve a deeper and more comprehensive understanding of research questions than would be possible with either me.

3.2 Research Design

This research design serves as a framework for collecting and analysing data (Burns and Burns, 2008). Kothari (2004), defined research design as the arrangement of conditions for collection and analysis of data in a manner that aims to combine relevance to the research purpose with economy in procedure. It is the plan, structure and strategy of investigation conceived to obtain answers to research question and to control variances. This study employs a cross-sectional research design, in which data was gathered in one point in time (one month) from the school construction projects undertaken in Dodoma.

3.3 Study Population

As stated by Creswell (2009), the population refers to the specific group that holds the researcher's interest, and it is the group to which the researcher aims to extend the study's conclusions. The population encompasses all the individuals, events, or objects that share a common observable characteristic. The population of this study will include Project Stakeholders involved in the construction of government secondary schools: The population frame includes Dodoma City council officials, construction experts (Architects, Engineers, and Quantity Surveyors) and other professionals directly involved in the planning and execution of secondary school construction projects. School Administrators: Principals, teachers, and staff of the government secondary schools affected by the construction projects. Quality Management Practitioners: Individuals responsible for implementing and overseeing quality management practices in the context of construction projects, this will include Architects and Quantity Surveyors Registration Board (AQRB), Engineers Registration Board (ERB) and Public Procurement Regulatory Authority (PPRA).

3.4 Area of study

This study was conducted in Dodoma City in Dodoma region due to the fact that there is a rapid increase of construction activities in Dodoma including the Construction of Government Secondary Schools.

3.5 Sampling Techniques

This study intends to employ simple random sampling technique in drawing a representative sample of Government Officials from individuals involved in the Construction of Government Secondary Schools and experts such as Architects, Quantity Surveyors and Engineers and Heads of School where the Projects took place. Adam and Kamuzora (2008), described simple random sampling as a sampling technique whereby the total population have equal chance to compute a sample size. Simple random sampling process involve dividing the population into subgroups based on certain characteristics will be used to randomly selecting samples from different sub population of wards where the Government Secondary Schools Construction Projects have been undertaken. After stratification, respective schools within the wards were randomly selected. Dodoma City was stratified in different wards to account for potential variations in construction practices and project performance. The schools within he wards also further be Stratified by the scale of construction projects, such as small renovations, medium-sized expansions, and large-scale new constructions. Once stratification factors have been identified, data collection process include representation from each subgroup. This might involve selecting a proportional number of schools or projects from each subpopulation. In the sampling process, all members of the strata were having equal chance of selection. There population of the study comprises of 1473 individuals, thus, to draw a representative sample from the strata, the study adopts Yamane (1973) formula for proportions to determine sample size, which is as follows:

$$n = \frac{N}{1 + Ne^2}$$

Where, n is the Sample, N is the Total population of the area under study, 1 = 1 is constant, and e is the error limit or

Margin of error. It's usually accepted at 5% or 0.05. Therefore,

$$n = \frac{1473}{1 + 1473(0.05)^2} = 314$$

Thus, the study will intend to collect data from 314 respondents.

3.6 Data Collection Methods

Using interview guides, in-depth interviews conducted with a purposively selected group of Architects and Quantity Surveyors Registration Board, Engineers Registration Board and Public Procurement Regulatory Authority to gather an in-depth expert opinion. The method is preferred as it has the capacity to gather in-depth information (Kumar, 2019). The interviews will be semi-structured, allowing for flexibility to explore emergent themes.

Survey questionnaires as the main survey tool generated based on each individual research objective, which contain both closed- and open-ended questions. According to Blumberg et al. (2014), questionnaires are crucial instruments for data collecting since they accurately obtain information while taking up little time. Closed-ended questions enable respondents to react in their own terms, enabling the researcher to gather unanticipated information and strengthen the process. The answers to open-ended questions can be chosen from a list by the replies. The survey questionnaire is chosen as the quantitative data collection method for this study due to its efficiency in gathering standardized and structured responses from a large sample.

3.7 Variable Measurements and Data Analysis

3.7.1 Variable Measurements

Variable	Measurement
Quality assurance measures (Independent Variable 1)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Office Layout	
Adherence to Standards	
Inspection Frequency	
Continuous Improvement Initiatives	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Source: Researcher (2024)

3.7.2 Transformation of Employee satisfaction

The 5-point Likert scale data on project performance were transformed into an index scale using the overall mean scores. Thus, the mean score greater or equal to the overall mean was termed as high performance while the score below the overall mean was termed low performance.

3.7.3 Distribution of Project Performance

The distribution of performance levels among secondary school construction projects, categorized into low performance and high performance, is based on certain criteria or metrics. Low Performance, out of the total projects analyzed, 88 projects, accounting for 66.67% of the sample, fall under the category of low performance.

This suggests that a significant portion of the projects did not meet the expected standards or criteria for high performance based on the evaluation criteria used. High Performance: Conversely, 44 projects, constituting 33.33% of the sample, are classified as high performance.

These projects have demonstrated excellence or superior performance according to the evaluation metrics employed. Overall, the table illustrates the distribution of project performance levels, indicating a majority of projects falling into the low-performance category. This distribution can prompt further investigation into the factors influencing performance disparities among projects, leading to targeted interventions or improvements aimed at enhancing overall project outcomes and achieving higher levels of performance across the board.

Figure 1. Distribution of Secondary School Construction Project Performance.

Source: Researcher (2024)

3.7.4 Data Analysis

Both qualitative and quantitative data analysis were employed in this study. Qualitative data analysis was supported from the information of documentary review whereas quantitative data analysis was supported statistical tools like logistic regression. Logistic regression analysis was employed to assessing effects of quality assurance measures on the overall performance of

government secondary schools' construction projects in Dodoma City. The Logistic regression equation used for this analysis encapsulates this relationship below;

$$p = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}$$

$$\text{logit}(1 - p) = 1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}$$

Where:

Logit = logistic link function

p = probability that there is the influence of quality assurance measures and overall performance of

government secondary schools' construction projects in Dodoma City.

1-p = probability that there is no influence of quality assurance measures and overall performance of

government secondary schools' construction projects in Dodoma City.

β_0 = intercept

β_1 – β_3 = parameter estimates or logit coefficients y =Project performance

X_1 – X_3 = Inspection frequency (X_1), adherence to standards (X_2) continuous improvement initiatives (X_3).

3.8 Validity and Reliability of Data

To enhance validity, a preliminary study was carried out to improve the research's credibility by testing the research tools on a small group of participants beforehand. This initial assessment was designed to verify that the tools accurately capture the desired variables.

The reliability of the data was evaluated using Cronbach's Alpha test. This test was selected for its effectiveness in identifying and eliminating unreliable elements, thereby ensuring data quality before delving into detailed analysis. A higher Cronbach's Alpha (closer to 1) indicates better reliability. Adherence to Standards, this variable shows a high level of internal consistency with a Cronbach's Alpha of 0.914, based on 5 items. It suggests that the items measuring adherence to standards are reliably measuring the same concept. Inspection Frequency, The Cronbach's Alpha for inspection frequency is 0.786, indicating a good level of internal consistency but slightly lower than some other variables in the table. Continuous Improvement Initiatives, this variable has a Cronbach's Alpha of 0.844, demonstrating a good level of internal consistency similar to

inspection frequency. Project Performance, these variables show moderate to good levels of internal consistency, with Cronbach's Alpha of 0.821.

Table 3.7.1

Physical environment		
Adherence to Standards	0.914	5
Inspection Frequency	0.786	5
Continuous Improvement Initiatives	0.844	5
Dependent variable		
Project Performance	0.821	5

3.9 Ethical Consideration

In this study, ethical considerations played a crucial role, ensuring that all participants gave informed consent. They were provided with comprehensive details about the study's objective, data collection techniques, and how their data would be used. Participants were reassured that their involvement was voluntary, and they had the right to withdraw from the study at any point without any consequences. Additionally, strict measures were implemented to maintain the privacy and confidentiality of participants' information. These ethical practices not only upheld the integrity of the research but also respected the rights and well-being of the individuals involved, fostering a trusting relationship between the researchers and participants.

4.0 Results

Before performing the effects of quality management practices on the performance of government secondary school construction, the data first were tested to see if they fit the logistic regression and then chi square applied to check for the association between quality management practices and the performance of government secondary school construction projects.

4.1 Omnibus tests of model coefficients

Quality Assurance Measures on Project Performance, with a chi-square value of 32.1153 and a p-value of 0.00, there is a significant relationship between quality assurance measures and project performance. This implies that implementing effective quality assurance practices contributes significantly to better project outcomes.

Table 3. 1 Omnibus tests of model coefficients

Logistic regression model	Chi square	Degree of freedom	significance
Quality assurance measures on Project performance	32.1153	3	0.00

4.2 Hosmer and Lemashow model test

The logistic regression model examining the Quality assurance measures on Project performance, the p- values are well above the threshold for rejecting the idea that the models fit the data well. There is no statistically significant evidence to suggest that the models' predicted probabilities of successful project performance differ from the actual observed success rates across different subgroups within the data. Based on the Hosmer-Lemeshow test, all three models appear to have a good fit with the data. This suggests that quality assurance measures might be good predictors of project performance. However, it's important to remember that this test only indicates a good fit.

Table 3.2 Hosmer and Lemashow model test

Logistic regression model	Chi square	Degree of freedom	significance
Quality assurance measures on Project performance	2.5842	4	0.551

4.3 To Examine the Association between quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City.

The association between quality assurance measures and the overall performance of government secondary schools' construction projects in Dodoma City, with significance tested at the 0.05 level. Adherence to Standards, the chi-square value of 51.0012 with a p-value of 0.00 indicates a significant association between adherence to standards and project performance. Among low-performing projects, 44 (60.27%) did not adhere to standards, while 29 (39.73%) did. In contrast, among high-performing projects, 44 (74.58%) adhered to standards, while only 15 (25.42%) did not. This suggests that projects adhering to standards are more likely to achieve high performance.

Inspection Frequency, the chi-square value of 39.1026 with a p-value of 0.00 reveals a significant association between inspection frequency and project performance. Low-performing projects had 38 (58.46%) with low inspection frequency and 27 (41.54%) with high frequency. In contrast, high-performing projects had 50 (74.63%) with high inspection frequency and 17 (25.37%) with low frequency. This indicates that projects with higher inspection frequency tend to perform better.

Continuous Improvement Initiatives, the chi-square value of 44.6136 with a p-value of 0.00 demonstrates a significant association between continuous improvement initiatives and project performance. Among low-performing projects, 41 (62.12%) did not implement continuous improvement initiatives, while 25 (37.88%) did. For high-performing projects, 47 (71.21%) implemented such initiatives, while 19 (28.79%) did not. This suggests that continuous improvement efforts contribute positively to project performance. Overall, the significant chi-square values and low p-values across all variables indicate strong associations between quality assurance measures (adherence to standards, inspection frequency, and continuous improvement initiatives) and the overall performance of government secondary schools' construction projects in Dodoma City.

These findings underscore the importance of robust quality assurance practices in achieving high project performance standards.

Table 3.3 The Association between quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City.

Variable	Low performance	High performance	Chi-square	P-Value
Adherence to Standards			51.0012	0.00
No	44(60.27)	29(39.73)		
Yes	44(74.58)	15(25.42)

c) To examine the effects of quality assurance measures on the overall performance of government Secondary schools' construction projects in Dodoma City.

These results of a logistic regression analysis examining the effects of quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City, with significance assessed at the 0.05 level. Adherence to Standards, Projects that adhered to standards had a coefficient of 1.621, indicating that they were 2.137 times more likely to have high performance compared to projects that did not adhere to standards. The z-value of 16.434 and a p-value of 0.006 show that this relationship is statistically significant.

Inspection Frequency, the coefficient for inspection frequency was 0.3122, suggesting a slight increase in the odds of high performance for projects with more frequent inspections, although this result was not statistically significant (p-value = 0.141). Continuous Improvement Initiatives:

Projects that implemented continuous improvement initiatives had a coefficient of 1.831, indicating that they were 3.613 times more likely to achieve high performance compared to those without such initiatives. The z-value of 14.54 and a p-value of 0.000 indicate a highly significant association between continuous improvement initiatives and high project performance.

The constant term in the regression model (-0.9631) represents the log odds of high performance when all other predictors are zero. The overall model fit is indicated by the LR Chi2 value of 138.4, with a significant p-value of 0.000, suggesting that the model as a whole is a good fit for the data.

The Pseudo R2 value of 0.603 indicates that approximately 60.3% of the variation in project performance can be explained by the predictors included in the model.

Table: 3.3 Logistic Regression Analysis showing the effects of quality assurance measures on the overall performance of government secondary schools' construction projects in Dodoma City.

Project performance	Coef.	Odds	z	P> z
		Ratio		
Low (base outcome)

Source: Authors compilation from STATA 17

In summary, this analysis highlights the substantial impact of adherence to standards and continuous improvement initiatives on enhancing the overall performance of government secondary schools' construction projects in Dodoma City, emphasizing the importance of quality assurance measures in project management.

When the Official from the Architects and Quantity Surveyors Registration Board was Interviewed on his understanding of Quality Assurance and whether there is Adherence to Quality assurance Measures in the Construction of Government Secondary Schools Projects in Dodoma City, he responded

"Quality assurance (QA) is crucial in ensuring that projects, including construction projects, meet the required standards and specifications. It involves systematic activities and processes designed to prevent defects, ensure compliance, and enhance overall performance. However, in many Governments' Secondary school Construction Projects Quality assurance measures are not well enhanced".

5. Discussion & Conclusion

5.1 Discussion

The logistic regression analysis conducted on government secondary school construction projects in Dodoma City reveals significant insights into the impact of quality assurance measures on overall project performance. Notably, adherence to established standards emerged as a critical factor, with projects adhering to these standards being 2.137 times more likely to achieve high performance, as indicated by a coefficient of 1.621, a z-value of 16.434, and a statistically

significant p-value of 0.006. This finding aligns with the work of Zhang et al. (2021), who emphasize that adherence to quality standards is fundamental to enhancing project outcomes. Furthermore, while the analysis shows that more frequent inspections correlate with a slight increase in performance odds (coefficient of 0.3122), this relationship did not reach statistical significance (p-value = 0.141). This suggests that merely increasing inspection frequency may not improve outcomes, a point echoed by Khosravi et al. (2019), who argue that the effectiveness of inspections depends on the systematic implementation of quality assurance processes.

Moreover, the role of continuous improvement initiatives in driving project performance cannot be understated. Projects that implemented such initiatives were found to be 3.613 times more likely to achieve high performance, with a coefficient of 1.831, a z-value of 14.54, and a highly significant p-value of 0.000. This underscores the importance of fostering a culture of continuous improvement, as highlighted by Khosravi and Esfandiari (2023), who posit that continuous improvement is essential for long-term project success. The regression model itself demonstrated a strong overall fit, with an LR Chi2 value of 138.4 and a Pseudo R2 value of 0.603, suggesting that approximately 60.3% of the variation in project performance can be attributed to the examined predictors.

However, Insights from interviews further reinforce these findings. An official from the Architects and Quantity Surveyors Registration Board emphasized the importance of quality assurance (QA), stating, "Quality assurance is crucial in ensuring that projects, including construction projects, meet the required standards and specifications." He noted that while QA measures are critical, their implementation in government secondary school construction projects often falls short. This sentiment resonates with the logistic regression results, which highlight the need for robust adherence to quality assurance measures to enhance project performance. Together, these findings underscore the necessity for a more systematic approach to quality assurance in construction projects, particularly in the context of government-funded initiatives.

5.2 Conclusion

The logistic regression analysis highlights the critical role of quality assurance measures in enhancing the performance of government secondary school construction projects in Dodoma City. The significant relationship between adherence to standards and high project performance underscores the necessity for strict compliance with quality protocols, as supported by recent scholarly findings. Although increased inspection frequency did not yield statistically significant results, the importance of systematic quality processes remains evident. Moreover, the substantial positive impact of continuous improvement initiatives further emphasizes the need for a proactive approach to quality management. Insights from interviews corroborate these findings, revealing a gap in the implementation of quality assurance measures despite their

acknowledged importance. Collectively, these results advocate for a comprehensive and systematic strategy to improve quality assurance practices in construction projects, ultimately aiming for better project outcomes in the public sector.

5.3 Recommendations

These findings suggest several recommendations to enhance the performance of government secondary school construction projects in Dodoma City, several key recommendations can be made for stakeholders, including government authorities and project managers. First, the government should prioritize the development and enforcement of stringent quality assurance regulations, ensuring that all construction projects adhere to established standards. This can be achieved by providing training and resources to both government officials and construction teams to foster a culture of quality compliance. Project managers, on the other hand, should implement continuous improvement initiatives that encourage feedback and learning throughout the project lifecycle. By actively engaging with teams and stakeholders to identify areas for enhancement, project managers can cultivate an environment that supports innovation and accountability. Additionally, increasing the frequency and effectiveness of inspections, coupled with clear communication of quality expectations, will help to reinforce adherence to standards. Together, these measures can significantly improve project outcomes, ensuring that government-funded construction projects meet the desired quality benchmarks and serve the needs of the community effectively.

Abstract

Physical environment plays a crucial role in shaping employee satisfaction within organizations. This study assesses the influence of the physical environment on employee satisfaction at the National Food Reserve Agency in Tanzania. The study employed a cross-sectional design and quantitative approach, collecting data from a sample of 152 NFRA employees across various zones in Tanzania. Data were collected using structured questionnaires and analyzed using descriptive statistics and logistic regression. The descriptive results show that the overall mean score for employee satisfaction was moderate, with job security being the highest-rated factor. Also, the logistic regression results show a significant association between the physical environment and employee satisfaction, with office layout, cleanliness, and noise levels being significant predictors. The study results underscore the importance of the physical environment in enhancing job satisfaction in the procuring, storing and distributing food agencies like NFRA in Tanzania. The study concludes that the physical environment plays a crucial role in employee satisfaction at NFRA. Improvements in office layout, cleanliness, and noise control are recommended to enhance overall satisfaction and organizational performance. Also, it is recommended that NFRA should prioritize investments in improving the physical work environment, implement policies promoting employee well-being, and encourage active employee engagement in maintaining a conducive workplace.

Keywords: *Physical Environment, Employee Satisfaction, National Food Reserve Agency, Tanzania.*

1.0 Introduction

The over-increasing changes in globalisation, science and technology, and employee demands have occasioned an organisation's paradigm shift from traditional processes that regarded employees as working machines into new practices that regard employees as potential catalysts toward the achievement of organizational goals and vision (Armstrong, 2022). Subsequently, managers in contemporary organisations have been investing heavily on employees, principally in

providing conducive workplace environment so as to enhance employee's satisfaction and improve organisational performance. Investing in the physical workplace environment is crucial as it significantly impacts employee well-being and productivity (Linon & Swai, 2022). A well-designed and comfortable workspace can reduce stress and fatigue, leading to higher levels of engagement and efficiency (Stone, Cox, and Gavin, 2020). Additionally, a positive physical environment fosters collaboration and creativity, essential for innovation and organizational success (Murimi, 2020).

Rodríguez (2021) defines physical environment as the physical atmosphere in which organization's employees work and may perceive it as emotionally favorable or unfavorable. A favorable physical environment includes giving employees space and privacy to do their work, making the office more comfortable, and improving communication. Moreover, upholding a positive workplace environment helps boost employee morale, retention, and productivity (Lameck, 2021). Freedman (2022) argues that, physical environment for employees impacts the mood, drive, mental health and performance. If employees work in a tedious office setting with unfriendly workers, they likely won't have enough confidence or job satisfaction. A safe workplace environment has been addressed by the International Labor Organization (ILO). The ILO Constitution sets forth the principle that workers must be protected from sickness, disease and injury arising from their employment (ILO, 2022). Henceforth, organizations across the world are bound to adhere to the ILO constitution by enforcing effective policies that ensure safe and conducive workplace environment for employees.

Globally, it has been reported that a conducive physical environment for employees plays a crucial role in employees' satisfaction. In the United States of America, physical environment factors that were reported to enhance employee satisfaction include; psychosocial variables such as work demands; work organization including influence, freedom, meaning of work, and possibilities for development; interpersonal relations such as leadership and coworkers, a sense of community, role clarity, feedback, and support; and individual health and personal factors, including one's ability to cope and family supports (Donley, 2021). In Asia, evidence from Pakistan reveals that physical environment has a positive impact on the employees' satisfaction, whereby bad working conditions limit employees from showcasing their competencies and attain full potential, so it is important that organizations should realize the potential of good physical environment towards employee satisfaction and performance (Raziq & Maulabakhsh, 2015). Likewise, In China, Zhejiang et al. (2022) report that a positive physical work environment has improved employee satisfaction, commitment level, and achievement-striving ability, leading to improved organizational performance.

In Africa, a majority of organizations have not lagged behind on the provision of conducive physical environment in enhancing employee satisfaction. Evidence shows that African organizations have been implementing workplace environment strategies for decades, as reported by a study done in Ghana, which reported that workplace environment, particularly physical work

environment, significantly affects employees' satisfaction (Agbozo et al., 2017). Studies done in Kenya reported a variety of workplace environment factors that influence employees' satisfaction particularly physical environment and office space (Murimi, 2020; Wangechi & Ndeto, 2019).

Employee satisfaction is a critical factor in the success of any organization, as it directly influences productivity, engagement, and retention rates. Satisfied employees are more likely to be motivated, exhibit higher levels of commitment, and perform at their best, contributing to overall organizational performance (Smith & Shields, 2021). Factors such as fair compensation, recognition, opportunities for growth, and a supportive work environment play significant roles in enhancing employee satisfaction (Johnson, 2019). Additionally, when employees feel valued and appreciated, they are more likely to develop a positive attitude toward their work and the organization, leading to reduced turnover and higher levels of job satisfaction (Brown & Green, 2020). Therefore, investing in strategies that promote employee satisfaction is essential for fostering a productive and harmonious workplace (Taylor, 2018).

The strategies for improvement of the workplace environment in Tanzania began with the public sector reforms of the 1990s. The reforms aimed to decentralize public institutions from central government to semi-autonomous institutions like the National Food Reserve Agency (NFRA) to enhance performance and employee satisfaction (Mosha, 2000). The National Food Reserve Agency is a semi-autonomous institution under the Ministry of Agriculture established in the 1997 to deal with procuring, storing and distributing food in Tanzania (Morisset, 2013). Decentralization efforts were designed to bring decision-making closer to the operational level, thereby increasing efficiency, accountability, and responsiveness to local needs (Therkildsen, 2000). By granting more autonomy to public sector entities, the reforms sought to create a more conducive work environment that could attract and retain skilled personnel, ultimately improving service delivery and employee morale (URT, 1998). These changes were pivotal in restructuring the public sector, leading to notable improvements in organizational performance and employee satisfaction (Kessy & McCourt, 2010).

Furthermore, evidence show that, another strategy made by the government of Tanzania was the establishment of the Occupation Health and Safety Authority (OSHA) in 2003 for the purpose of ensuring safety in the working environment. Moreover, in 2015, the government established a workers compensation fund (WCF) for the purpose of providing adequate and equitable compensation for employees who suffer occupational injuries out of and in the course of their employment and in case of death for their dependents. Also, under the National Food Reserve Agency (NFRA), efforts were made that included joining the Workers Compensation Fund (WCF) in 2015. Thus, the policies, reforms and agencies adopted projected to advance social justice by combating unacceptable working condition on the wellbeing of workers and their families.

Despite the efforts, employees in the public organizations, including NFRA, face challenges related to physical working environments like poor ventilation, congested office, and unfavorable

sitting facilities (URT, 2022). Studies conducted in Bahi and Ikungi districts in Tanzania by Linon and Swai (2022) and Lameck (2021) revealed that physical working environments are characterized by poor ventilation, inadequate office space, and insufficient infrastructure, contributing to a high turnover rate among employees. The persistence of these challenges may lead to decreased employee morale, suboptimal performance, job dissatisfaction, lower retention rates, and pose risks to employee well-being.

Existing research on physical workplace environment, including studies by Guan et al. (2019), Kim et al. (2018), Wei et al. (2018), Chen and Wu (2019), Boubaker et al. (2021), Nouri et al. (2020), Raza et al. (2021), and Zeljković and Veselinović (2021) have been carried mainly in the hospitality, bank and health sector in United States of America, Iran, Taiwan, Pakistan, Tunisia, and Serbia with Western-Arab-Asian oriented work environment cultures. Moreover, numerous studies in Tanzania examining physical working environments have primarily concentrated on local government authorities, academic institutions and banking (Swai and Tieng'o 2022; Chilipweli et al. 2023; Bushiri 2014; Mwasi 2022, Mziwao and Mbogo 2022). Thus, there is inadequate of studies focusing on physical workplace environment and employee satisfaction in an entity dealing with procuring, storing and distribution of food like NFRA. Conducting a study on the physical work environment and employee satisfaction would provide valuable insight for policy advice and recommendations to human resource officers to manage properly office layout, ergonomics, and cleanliness and noise levels. Similarly, a study on physical work environment is important to address work-related issues within semi-autonomous institutions, such as the National Food Reserve Agency (NFRA), offering insights that can guide prioritization and improvements in the working conditions for enhanced employee satisfaction and overall organizational effectiveness. Therefore, this study aimed to assess the influence of physical workplace environment on employees' satisfaction within the context of NFRA in Tanzania.

2.0 Literature review

2.1 Theoretical literature review

This paper adopted the Herzberg's Two-Factor Theory developed by Frederick Herzberg in 1959 (Herzberg, Mausner, & Snyderman, 1959). Herzberg's Two-Factor Theory posits that there are two sets of factors influencing employee satisfaction and dissatisfaction: motivators and hygiene factors. Motivators are factors that lead to job satisfaction and are related to the nature of the work itself, such as achievement, recognition, and responsibility. Hygiene factors, on the other hand, are extrinsic elements related to the work environment, including company policies, supervision, salary, interpersonal relations, and physical working conditions. While the presence of motivators leads to higher satisfaction, the absence of hygiene factors can cause dissatisfaction (Alshmemri, Shahwan-Akl, & Maude, 2017).

One of the strengths of Herzberg's theory is its practical approach to improving workplace conditions and enhancing employee motivation and satisfaction. The theory's clear distinction between motivators and hygiene factors allows organizations to address specific areas for improvement. In the context of this study, the physical environment variables such as office layout, ergonomics, cleanliness, and noise levels are considered hygiene factors. According to Herzberg's theory, improving these factors can reduce dissatisfaction and create a more conducive working environment, indirectly boosting overall job satisfaction (Osemeke & Adegboyega, 2020). The relevance of Herzberg's Two-Factor Theory to this study lies in its focus on the work environment's role in employee satisfaction. By identifying and enhancing key physical environment variables, the NFRA can address potential dissatisfaction and create a more supportive and satisfying workplace for its employees. This alignment with Herzberg's framework supports the study's objective of understanding the influence of physical environment on employee satisfaction (Osemeke & Adegboyega, 2020).

2.2 Empirical literature review

The physical environment in organizations, including office layout, ergonomics, cleanliness, and noise levels, significantly impacts employees' well-being, comfort, and productivity. Empirical research has consistently demonstrated the positive influence of various physical environment factors on employees' job satisfaction. This review synthesizes key studies, detailing their methodologies, findings, and the aspects our study explores.

Chen and Wu (2019) conducted a study on the impact of office design on job satisfaction within the banking industry in Taiwan. The study used a quantitative approach with a cross-sectional survey design, surveying 300 employees from various banks. The study found that office design significantly affects job satisfaction, with natural light, air quality, and noise levels being the most influential factors. This study is useful for benchmarking the level of satisfaction of employees within NFRA focusing on variations across different roles and departments. Also, Boubaker et al. (2021) examined the role of workplace aesthetics on job satisfaction in the hospitality industry in Tunisia. Utilizing a quantitative approach and a descriptive survey design, the study involved 250 hotel employees. The findings revealed that workplace aesthetics, including lighting, color schemes, and furniture design, positively affected job satisfaction. Factor analysis and regression were used to assess these relationships. Thus, this study though done outside Tanzania is relevant in understanding the workplace aesthetics, including lighting and furniture design, in influencing satisfaction at NFRA.

Similarly, Nouri et al. (2020) investigated workspace characteristics in the healthcare sector in Iran. Their study employed a quantitative approach with a cross-sectional survey design, involving 200 healthcare workers. The research found that workspace characteristics, such as lighting, temperature, and cleanliness, significantly influenced job satisfaction. Descriptive statistics and multiple regression analysis were used. This study is salient in explaining how workspace

characteristics such as cleanliness and temperature impact job satisfaction at NFRA, considering the unique challenges of a food reserve agency. Additionally, Raza et al. (2021) explored the physical work environment's impact on employee engagement and job satisfaction in the hotel industry in Pakistan. This study used a quantitative approach with a cross-sectional survey design, surveying 400 hotel employees. The findings indicated that physical work environment factors, including lighting, temperature, and cleanliness, significantly positively affected employee engagement and job satisfaction. Structural equation modelling was used for analysis. Thus, this study, though done in the sector of health in Pakistan, serves as a shoulder in gauging the satisfaction of employees at NFRA.

Moreover, Zeljković and Veselinović (2021) studied the impact of physical work environment factors on job satisfaction in the tourism industry in Serbia. Using a quantitative approach with a descriptive survey design, the study surveyed 350 tourism sector employees. The research found that noise, temperature, and air quality negatively affected job satisfaction. Correlation and regression analyses were used to explore these relationships. This study explored how noise levels and air quality influence job satisfaction at NFRA, proposing measures to address these issues.

Thus, the reviewed studies collectively highlighted the positive effects of physical environment factors, such as office design workplace aesthetics, and workspace characteristics of the banking, health, and hospitality sectors on employees' job satisfaction. Despite the relevance of the reviewed studies, they focused on the banking, hospitality, health and tourism sectors from other countries with different cultures and policies from the framework in Tanzania. Thus, there is a dearth of literature focusing on the physical workplace environment and employee satisfaction in procuring, storing and distributing food in Tanzania like NFRA. This study aimed to provide a more nuanced understanding of how physical environment factors influenced job satisfaction in a government agency context, offering targeted recommendations for improving workplace conditions.

3.0 Material and methods

This section presents the methodological techniques that were employed in conducting this study. It covers research approach, research design, study population, study area, sampling and sample size, sampling techniques, data collection methods and data analysis.

3.1 Research approach

Research approaches refer to the overarching strategies or frameworks used to collect and analyze data in order to answer research questions or test hypotheses. These approaches guide how researchers gather, interpret, and draw conclusions from data. To assess the influence of workplace environment on employees' satisfaction in NFRA Tanzania, quantitative research approach has been used. Quantitative approach provide numerical data and statistical analysis, offering generalizability and precise measurement of variables.

3.2 Research design

Boru (2018) defines research design as the plan for collecting, analyzing, interpreting and reporting data in research studies. It is the overall plan for connecting the conceptual research problems with the pertinent (and achievable) empirical research. This research employed a cross-sectional design. This study design was selected because of its ability to gather data at a particular point in time (Boru, 2018). Cross-sectional design is capable of describing the nature of the existing situations and conditions and identifying standards against which existing conditions can be compared, and so provide accurate, reliable and valid data. This design is particularly relevant for this study as it allows for assessing the current state of the physical environment and employee satisfaction within NFRA. By capturing data from a specific point in time, the study can analyze the immediate impact of physical environment variables such as office layout, ergonomics, cleanliness, and noise levels on employee satisfaction (Levin, 2006). Additionally, cross-sectional studies are efficient and cost-effective, making them suitable for examining large populations and providing a snapshot of the relationships between variables (Lameck, 2021). This design's ability to offer a clear and immediate understanding of the factors influencing employee satisfaction at NFRA enhances the study's relevance and applicability.

3.3 Study population and sample size

The population of this study comprised management and staff members at NFRA, totalling 245 individuals across various zones in Tanzania, including Dodoma, Shinyanga, Dar es Salaam, Njombe, Songwe, and Songea (URT, 2022). This study population included employees, Heads of Departments (HoDs), zone managers, directors, and the Chief Executive of NFRA. This population was targeted given that they are the staff of the NFRA with first-hand information about the working environment and satisfaction. A sample size of 152 employees was calculated using Krejcie and Morgan (1970) in Table 1. The Krejcie and Morgan formula for sample size is used for determining sample sizes in studies where the population size is relatively small and when the researcher aims to achieve a specific level of precision in their estimates (Krejcie & Morgan, 1970). The formula for by Krejci and Morgan's (1970) is expressed in equation 1.

$$n = \frac{\chi^2 N p (1-p)}{e^2 (N-1) + \chi^2 p(1-p)} \dots\dots\dots (1)$$

n = Sample size

N= Population size

e = Acceptable sampling error

χ^2 = chi-square of degree of freedom 1 and confidence 95% = 3.841

p = Proportional of population (if unknown, 0.5)

Table 49: Krejcie and Morgan Table

<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>

3.4 Area of study

This study was specifically conducted at the Head Office and Zonal offices (Dodoma, Shinyanga, Dar es Salaam, Njombe, Songwe, and Songea) of the National Food Reserve Agency (NFRA) in Tanzania. NFRA is a public agency operating under the Ministry of Agriculture since its establishment in 1997, with a primary mandate of procuring, storing and distributing food in time shortage in Tanzania. The agency operates under the Food Security Act of 1991 and the National Food Reserve Act of 2008, which provide the legal framework for its activities. The main functions of NFRA's include the procurement, storage, and distribution of food reserves to ensure food

security in Tanzania. This involves maintaining strategic grain reserves to be used during periods of food shortages or emergencies. The Food Security Act of 1991 and the National Food Reserve Act of 2008 empower NFRA to purchase grains from local farmers, ensuring market stability and supporting agricultural development. Additionally, NFRA plays a crucial role in stabilizing food prices, reducing post-harvest losses, and enhancing the availability of food during crises. The agency is also responsible for the efficient management and maintenance of its storage facilities to prevent spoilage and wastage of food reserves.

Likewise, NFRA has designed and implemented a project to construct 56 silos and 9 modern warehouses, aiming to increase grain storage capacity by 250,000 tons (NFRA, 2024). It has also established grain purchasing centers for farmers across all regions (NFRA, 2024). In recognition of its contribution, the government, through the Ministry of Agriculture, provided NFRA with an additional 12 warehouses in 2023 to further enhance its grain storage capacity (URT, 2024). Therefore, in order to achieve the projects and goals that have been set to this agency, there is need to ensure conducive physical work environment so that employees are committed and satisfied at the workplace.

Several studies from various authors have examined different aspects of the National Food Reserve Agency (NFRA) in Tanzania. Katera and Mmari (2018) focused on the challenges faced by smallholder farmers in accessing NFRA's services and proposed potential solutions to enhance inclusivity. Verstraeten and Liston (2013) explored the broader agricultural landscape in Tanzania, emphasizing the importance of maize as a staple crop and the role of small-scale farmers in its production. Additionally, Morisset (2013) analyzed the low level of commercialization in the Tanzanian agricultural sector, particularly among maize farmers, highlighting the importance of market players like NFRA in facilitating the sale of agricultural produce. These studies collectively contribute to a deeper understanding of NFRA's role in Tanzania's food security landscape, its impact on different stakeholders, and the challenges and opportunities it faces in fulfilling its mandate.

However, NFRA faces several challenges, including inadequate storage infrastructure, logistical issues, and financial constraints, which can affect its operations. Addressing these issues is essential for improving the agency's efficiency and effectiveness in fulfilling its mandate. This detailed understanding of NFRA's functions, legal framework, and operational challenges provides context for the study, highlighting the importance of the physical environment in supporting the agency's critical role in ensuring food security in Tanzania.

3.5 Sampling techniques

According to Kim and Wang (2019), sampling technique means a method of selecting individual members or a subset of the population to make statistical inferences from them and estimate the

characteristics of the whole population. This study employed a non-probability sampling technique, specifically a purposeful sampling approach. Purposeful sampling ensures that the selected participants possess characteristics or experiences that are directly relevant to the research study objectives, providing meaningful and informative data for addressing specific research questions. The elements sampled in this study included employees, Heads of Departments (HoDs), zone managers, directors, and the Chief Executive of NFRA. These individuals were chosen because they are considered information-rich cases, capable of providing relevant insights into the relationship between the physical environment and employee satisfaction.

Employees across various job functions and levels within the NFRA were selected to ensure a diverse representation of perspectives. These participants were chosen based on their availability and willingness to participate, ensuring that they could provide detailed information relevant to the study's objectives. Heads of Departments (HoDs) from different departments were included to capture insights on how the physical environment impacts various operational aspects and employee satisfaction within their respective units. HoDs were purposefully selected based on their leadership roles and their ability to provide comprehensive information on departmental operations and employee experiences.

Zones managers from the NFRA offices in Dodoma, Shinyanga, Dar es Salaam, Njombe, Songwe, and Songea were included to represent regional differences and similarities. These managers were selected purposefully to ensure regional coverage and to gather data on how the physical environment influences operations and employee satisfaction across different zones. Directors overseeing major functions within NFRA were selected for their strategic insights and understanding of the broader organizational impact of the physical environment. Finally, the Chief Executive was included to offer a comprehensive overview of NFRA's strategic vision and the role of the physical environment in achieving organizational goals. By using purposeful sampling, the study ensured that participants were selected based on their relevance to the research objectives, thereby enhancing the quality and applicability of the gathered data.

3.6 Data collection methods

Data was collected through structured questionnaires administered to 152 employees, designed to capture comprehensive quantitative data. The questionnaires included closed-ended questions, allowing for consistent and measurable responses. The questionnaire covered two main areas: physical environment variables and employees' satisfaction. The physical environment aspects assessed included office layout, ergonomics, cleanliness, and noise levels. The employee satisfaction aspects evaluated included job security, salary, achievement, and recognition. This questionnaire was adopted from previous studies that have validated these measures in similar contexts (e.g., Creswell & Creswell, 2018), ensuring reliability and relevance to the research objectives.

3.7 Variable measurements

Table 2 presents measurements of the variables. The variables were measured in five Likert scale. The independent variable comprised four indicators of the physical environment: office layout, ergonomics, cleanliness and noise. The four indicators were adopted from the previous scholars (Zeljkočić & Veselinović, 2021; Raza et al., 2021; Boubaker et al., 2021; Nouri et al., 2020; Chen & Wu, 2019). Also, the satisfaction of the employees was gauged using four aspects: job security, salary, achievement, and recognition. The four aspects of satisfaction were adopted from two Herzberg's Two-Factor Theory, elaborated in section 2.1.

Table 2: Measurement of variables

Variable	Measurement
Physical Environment (Independent Variable 1)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Office Layout	
Ergonomics	
Cleanliness	
Noise Levels	
Employee's Satisfaction	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Source: Researcher (2024)

3.8 Data Analysis

Descriptive statistics were used to analyse the collected data, summarising the physical environment variables, and employees' satisfaction levels. This approach included calculating measures such as means, frequencies, and percentages to describe the data set's central tendencies and distribution patterns, offering a clear overview of the study's key findings. Moreover, Logistic regression analysis in equation 1 to predict the influence of the physical environment on employee satisfaction within the National Food Reserve Agency (NFRA). The Logistic regression equation (2) used for this analysis encapsulates this relationship below;

$$\text{logit} \left(\frac{p}{1-p} \right) = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4}} \dots \dots \dots (2)$$

Where:

Logit = logistic link function

p = probability that there is the influence of *physical environment and employees' satisfaction in the National Food Reserve Agency (NFRA)*.

$1-p$ = probability that there is no influence of *physical environment and employees' satisfaction in the National Food Reserve Agency (NFRA)*.

β_0 = intercept

$\beta_1- \beta_4$ = parameter estimates or logit coefficients

y =Employee satisfaction

$X_1- X_4$ = Office Layout (X1), Ergonomics (X2), Cleanliness (X3) and Noise Levels (X4).

3.9 Reliability of data

The reliability of the data was evaluated using Cronbach's Alpha test in table 3. This test was selected for its effectiveness in identifying and eliminating unreliable elements, thereby ensuring data quality before delving into detailed analysis. A higher Cronbach's Alpha (closer to 1) indicates better reliability. The physical environment exhibits strong reliability with 0.806. Employee Satisfaction, shows an overall Cronbach's Alpha of 0.884 across its four items. This high reliability score suggests that the items measuring employee satisfaction are strongly correlated, providing a reliable assessment of this critical outcome.

Table 3: Reliability of data

Physical environment	4	0.806
Employee satisfaction	4	0.884

3.10 Ethical consideration

In this study, ethical considerations played a crucial role, ensuring that all participants gave informed consent. They were provided with comprehensive details about the study's objectives, data collection techniques, and how their data would be used. Participants were reassured that their involvement was voluntary, and they had the right to withdraw from the study at any point without any consequences. Additionally, strict measures were implemented to maintain the privacy and confidentiality of participants' information. These ethical practices not only upheld the integrity of the research but also respected the rights and well-being of the individuals involved, fostering a trusting relationship between the researchers and participants. Furthermore, the study adhered to the research guidelines set by the Tanzania Commission for Universities (TCU), the National

Council for Technical Education (NACTE), and the College of Business Education (CBE). A research permit was obtained from CBE, NFRA, and the Regional Administrative Secretary (RAS), with the reference letter No: D/112/150/01/20.

4.1 Results

4.1 Descriptive statistics results

4.1.1 Descriptive statistics results for physical environment in NFRA

Table 4 presents descriptive statistics for the physical environment at the National Food Reserve Agency (NFRA) highlight various aspects of employees' perceptions of their workspaces. The highest score was observed for office layout ($M = 2.4361$, $SD = 0.97198$), indicating that while the layout of the office space is somewhat satisfactory, there is room for improvement. Cleanliness received a mean score of 1.8271 ($SD = 0.82123$), suggesting that employees find the cleanliness of their work environment below satisfactory. Ergonomics, which concerns the comfort and functionality of furniture and workstations, scored a mean of 1.6165 ($SD = 0.85919$), showing significant dissatisfaction in this area. Noise levels had the lowest score ($M = 1.5489$, $SD = 0.82999$), indicating that high noise levels are a prominent issue for employees. The overall mean score for the physical environment was 1.8571 , reflecting generally low satisfaction with these aspects of the work environment. This low overall mean suggests that improvements in office layout, cleanliness, ergonomics, and noise control could significantly enhance employee satisfaction and productivity at NFRA.

Table 4: Physical environment in NFRA

Statement	Minimum	Maximum	Mean	Std. Deviation
Office Layout	1.00	4.00	2.4361	.97198
Ergonomics	1.00	4.00	1.6165	.85919
Cleanliness	1.00	4.00	1.8271	.82123
Noise Levels	1.00	4.00	1.5489	.82999
OVERALL MEAN =			1.8571	

Source: Field Data (2024)

4.1.2 Descriptive statistics for employee satisfaction in NFRA

The descriptive statistics for employee satisfaction at the National Food Reserve Agency (NFRA) reveal varied perceptions among employees across different satisfaction factors in Table 5. Job security received the highest mean score ($M = 4.5263$, $SD = 0.58490$), indicating that employees feel very secure in their jobs, which is a significant positive aspect of their overall satisfaction. Achievement had a mean score of 2.8984 ($SD = 1.0856$), suggesting that employees have a moderate sense of accomplishment in their roles. Salary, however, had a lower mean score of 2.3835 ($SD = 1.52117$), indicating dissatisfaction with the compensation provided. Recognition received the lowest mean score ($M = 1.9774$, $SD = 1.04059$), highlighting a significant area of concern where employees feel undervalued and unacknowledged for their efforts. The overall mean score for employee satisfaction was 2.9464, suggesting moderate satisfaction among employees at NFRA. This overall mean implies that while job security is a strong point, there is substantial dissatisfaction with salary and recognition, which are critical areas needing improvement to enhance overall employee satisfaction.

Table 5: Employee satisfaction in NFRA

Statement	Minimum	Maximum	Mean	Std. Deviation
Job Security	1.00	5.00	4.5263	.58490
Salary	1.00	5.00	2.3835	1.52117
Achievement	1.00	5.00	2.8984	1.0856
Recognition	1.00	5.00	1.9774	1.04059
OVERALL MEAN =			2.9464	

Source: Field data (2024)

Moreover, the 5-point Likert scale data on employee satisfaction were transformed into an index scale using the overall mean scores. Thus, a mean score greater than or equal to the overall mean was termed as "Satisfied," while a score below the overall mean was termed "Not Satisfied." This method aligns with recent studies that emphasize the utility of transforming Likert scale data into categorical variables for clearer interpretation and analysis (Jain & Duggal, 2021). Such transformation allows for a more straightforward assessment of satisfaction levels,

facilitating comparisons across different groups and variables (Lee & Kim, 2020). This approach has been shown to enhance the understanding of complex data sets by providing a simplified yet meaningful categorization of responses, which can be crucial for decision-making and strategic planning within organizations (Moyo & Zindi, 2022).

Table 6 presents the distribution of employee satisfaction in a binary format indicating the number and percentage of employees classified as either "Satisfied" or "Not Satisfied." Among the surveyed employees, 131 individuals, accounting for 86% of the total, reported being satisfied with their current work situation. In contrast, 21 employees, comprising 14% of the sample, indicated they were not satisfied. This method of categorizing satisfaction aligns with recent studies that have utilized similar binary classifications to simplify the interpretation of Likert scale data and provide clear insights into overall employee sentiment (Johnson & Anderson, 2021; Lee & Park, 2020).

Table 6: Distribution of employee satisfaction

Employee satisfaction	Frequency	Percent
Satisfied	131	86
Not Satisfied	21	14

Source: Researcher (2024)

4.2 Regression results

4.2.1 Model fit results

The research focused on evaluating the significant regression between the predictor variable, Physical Environment, and the outcome variable, employees' satisfaction in NFRA, Tanzania. The study utilized Logistic regression analysis to examine the connection between these variables. By employing this statistical method, the research aimed to ascertain the extent to which the physical environment influences employees' satisfaction levels within NFRA.

a) Omnibus tests of model coefficients

Table 7 presents the omnibus test of model coefficient. The finding for physical environment, the omnibus test indicates a significant association ($\chi^2 = 28.095$, $df = 4$, $p = 0.004$). This suggests

that the physical environment factors considered in the model have a significant impact on employees' satisfaction, at 0.05 level of significance.

Table 7: Omnibus tests of model coefficients

Logistic regression model	Chi square	Degree of freedom	Significance
To examine the role of physical environment on employees' satisfaction in NFRA	28.095	4	0.004

b) Hosmer and Lemeshow model test

Table 8 presented results of the goodness of fit tested using the Hosmer and Lemeshow test. The results show a chi-square value of 2.345 with 6 degrees of freedom and a p-value of 0.816. Based on the results with a p-value greater than 0.05, this suggests that the model fits the data adequately. Thus, the physical environment variables in the model do not significantly deviate from the observed data in predicting employees' satisfaction, at 0.05 level of significance.

Table 8: Hosmer and Lemeshow model test

Logistic regression model	Chi square	Degree of freedom	Significance
To examine the role of physical environment on employees' satisfaction in NFRA	2.345	6	0.816

c) The role physical environment on employees' satisfaction in NFRA.

Table 9 presents the logistic regression results. The results of a logistic regression analysis assessed the influence of physical environment factors (Office Layout, Ergonomics, Cleanliness, Noise Levels) on employees' satisfaction within NFRA, at a significance level of 0.05. Office Layout, the coefficient (Coef.) is 0.9085, indicating that as the score for Office Layout increases by 1 unit, the log odds of being satisfied rather than not satisfied (the base outcome) increase by 0.9085. The Odds Ratio of 2.4806 suggests that for every unit increase in Office Layout score, the odds of an employee being satisfied increases rather than not satisfied are approximately 2.48 times higher. The z-value of 33.71 indicates that this coefficient is highly statistically significant ($p < 0.001$), suggesting that Office Layout significantly predicts employees' satisfaction. Ergonomics, the coefficient is -0.0901, indicating that as the score for Ergonomics increases by 1 unit, the log odds of being satisfied rather than not satisfied decrease by 0.0901. The Odds Ratio of 0.9138 suggests that for every unit increase in Ergonomics score, the odds of an employee

being satisfied rather than not satisfied decrease by approximately 9%. The z-value of 2.74 shows that this coefficient is marginally statistically insignificant ($p = 0.076$), indicating a weak relationship compared to other variables. Cleanliness, the coefficient is 0.9801, indicating that as the score for Cleanliness increases by 1 unit, the log odds of being satisfied rather than not satisfied increase by 0.9801. The Odds Ratio of 2.6671 suggests that for every unit increase in Cleanliness score, the odds of an employee being satisfied rather than not satisfied are approximately 2.67 times higher. The z-value of 21.05 indicates that this coefficient is highly statistically significant ($p < 0.01$), highlighting Cleanliness as a significant predictor of employees' satisfaction. Noise Levels, the coefficient is 0.7701, indicating that as the score for Noise Levels increases by 1 unit, the log odds of being satisfied rather than not satisfied increase by 0.7701. The Odds Ratio of 2.160 suggests that for every unit increase in Noise Levels score, the odds of an employee being satisfied rather than not satisfied are approximately 2.16 times higher. The z-value of 26.32 shows that this coefficient is highly statistically significant ($p < 0.001$), indicating that Noise Levels significantly predict employees' satisfaction.

Table 9: Logistic regression analysis for physical environment and employees' satisfaction in NFRA

Employee Satisfaction	Coef.	Odds Ratio	z	P> z
Not satisfied (base outcome)				
Office Layout	0.9085	2.4806	33.71	0.000
Ergonomics (No, Ref)	-0.0901	0.9138	2.74	0.076
Cleanliness (No, Ref)	0.9801	2.6671	21.05	0.01
Noise Levels (Yes, Ref)	0.7701	2.160	26.32	0.00
Constant	-0.7974	.4437	-2.84	0.000

Number of observations = 133 LR Chi2(4) = 80.116

Prob > Chi2 = 0.000

5.0 Discussion, Conclusion & Recommendations

5.1 Discussions

The findings of the present study regarding the role of the physical environment on employees' satisfaction within NFRA reveal a general perception among participants that the physical environment significantly impacts their overall satisfaction. This underscores the necessity of focusing on tangible aspects of the physical environment, such as office layout, design, and amenities, to enhance employee well-being and productivity. This study's findings align with various empirical studies that have examined the influence of the physical environment on job satisfaction across different industries, reinforcing the importance of such factors in organizational settings.

For instance, Chen and Wu (2019) investigated the impact of office design on job satisfaction within the banking industry in Taiwan, highlighting critical elements such as natural light, air quality, and noise levels. These findings resonate with results at NFRA, where employees indicated that well-ventilated, well-lit, and quiet workspaces contribute positively to their job satisfaction. Similarly, Boubaker et al. (2021), in a study on the hospitality industry in Tunisia, emphasized the role of workplace aesthetics, including lighting, colour, and furniture design, which parallel these findings where ergonomic furniture and visually appealing office layouts were noted as key contributors to employee satisfaction.

Moreover, Nouri et al. (2020) explored workspace characteristics in the healthcare industry in Iran, focusing on lighting, temperature, and cleanliness. These factors are echoed to this study, where NFRA employees pointed out that clean and appropriately climate-controlled work environments significantly impact their satisfaction levels. This is further supported by Raza et al. (2021), who studied the hotel industry in Pakistan and demonstrated the positive effects of good lighting, optimal temperature, and cleanliness on employee engagement and satisfaction. These consistent findings across various industries highlight universal aspects of the physical environment that are crucial for fostering employee satisfaction.

However, these studies provide robust evidence on the positive influence of physical environment factors, they often overlook the variations across different roles or levels within organizations and the individual differences in the perceived importance of these factors. Study at NFRA aims to fill these by examining how the physical environment affects job satisfaction across different hierarchical levels and individual characteristics. For example, while senior

managers might prioritize private, quiet spaces for focused work, front-line staff might value collaborative spaces and easy access to common areas. Understanding these nuances is critical for tailoring workplace improvements that cater to diverse employee needs, ultimately enhancing overall job satisfaction.

Furthermore, the study at NFRA considers potential interactions between the physical work environment and other organizational factors, such as leadership style and organizational culture, which are often overlooked in other studies. The holistic approach of integrating physical environment improvements with supportive leadership and a positive organizational culture can create a synergistic effect, promoting a more conducive and satisfying work environment. Additionally, the research aligns with Herzberg's Two-Factor Theory, emphasizing the role of hygiene factors in reducing dissatisfaction and promoting a positive work environment.

The interpretation of the study and, subsequently, the conclusion should be done, bearing in mind the limitations of the study. This study has several limitations that should be acknowledged. Firstly, the cross-sectional design only captures a snapshot of employee satisfaction at one point in time, which may not reflect long-term trends or changes. Additionally, the use of self-reported questionnaires may introduce response biases, as employees might provide socially desirable answers. The study also focused solely on NFRA, limiting the generalizability of the findings to other organizations or industries. Furthermore, while the physical environment was examined in detail, other factors such as technological advancement, leadership style, and individual differences in employee preferences were not focused though important in influencing satisfaction.

5.2 Conclusion

The findings of this study indicated the overall mean score for employee satisfaction was 2.9464, suggesting moderate satisfaction among employees at NFRA, where 131 (86%) of the total selected employees reported being satisfied with their current work situation in contrast, 21 employees, comprising 14% of the sample, indicated they were not satisfied. Moreover, the findings of the study underscore a significant relationship between the physical environment and employees' satisfaction within the National Food Reserve Agency (NFRA) in Tanzania. Based on this logistic regression analysis, Office Layout, Cleanliness, and Noise Levels are significant predictors of employees' satisfaction within NFRA. These aspects of the physical environment play crucial roles in determining employees' satisfaction levels, while Ergonomics shows a weaker but marginally significant association. The findings underscore the importance of addressing physical environment factors to enhance overall employee satisfaction and organizational performance.

5.3 Recommendations

These findings suggest several recommendations for various stakeholders within the National Food Reserve Agency (NFRA) in Tanzania. Firstly, organizational leadership should prioritize investments in improving the physical work environment, such as upgrading facilities and ensuring adequate resources for maintenance. Human resource management should also consider implementing policies and initiatives that promote employee well-being, such as flexible work arrangements or employee assistance programs. Additionally, employees themselves can contribute to enhancing the workplace environment by actively engaging in initiatives for cleanliness, safety, and collaboration. Ultimately, fostering a supportive and conducive physical environment will not only improve employee satisfaction but also contribute to overall organizational success and effectiveness. Also, the study recommend future studies to be considered in on physical environment and other outcome variables such as retention, customer satisfaction, performance and motivation. Similarly, studies could be conducted using longitudinal design for capturing long term changes on employee satisfaction. More over other studies can be conducted in other agencies of public sector for generalization of the findings to all the government agencies in Tanzania.

Abstract

Study objective: This research study assessed the viability of blockchain technology in Tanzania by examining its prospects and limitations. Blockchain technology has gained significant attention globally for its potential to revolutionize various industries through enhanced security, transparency, and efficiency. However, its applicability and adoption in Tanzania, a developing country, may be influenced by unique institutional, technological, economic, and social factors.

Methodology: The study focused on a number of regions in Tanzania. The study adopted a mixed-methods research design, incorporating quantitative surveys and qualitative interviews and focus group discussions. A purposive sampling technique was employed to select key stakeholders, including business representatives, government officials, and individuals from different sectors and regions of Tanzania. The data collected was analysed using data visualization techniques.

Expected results: The research findings will provide insights into the current state of blockchain technology adoption in Tanzania, the perceived prospects and limitations, as well as stakeholders' perspectives.

Implication of the findings: The results of this study will contribute to the existing literature on blockchain technology adoption in developing countries and offer practical recommendations for policymakers, businesses, and individuals interested in exploring the potential of blockchain technology in Tanzania.

Keywords: *Blockchain technology, viability, prospects, limitations*

1.0 Introduction

Blockchain technology refers to a decentralized, transparent, and secure database that is used to store and transmit data securely across a network of computers (Swan, 2015). Globally, there is a notable increase of Blockchain technology application. This is attributed to the unique properties of Blockchain technology. These properties include but not limited to decentralized, secure, transparent nature, fault-tolerant database (Shetty et al., 2019). Blockchain Technology can transform different sectors including but not limited to agriculture, finance, industry, healthcare, real estate, supply chain management, fighting counterfeit products, and government agencies. Tanzania, a developing country in East Africa, is seeking to leverage this technology to enhance its economic growth and development (The Citizen, 2021). This concept note aims to discover the potential of blockchain technology in Tanzania, focusing on the opportunities and challenges that are aligned with blockchain technology implementation.

1.1 Background

Blockchain technology is a distributed electronic ledger that stores digital data that is protected by high-end encryption, very difficult to tamper with, and can be updated using a consensus mechanism that is accepted by all associated network nodes. Blockchain technology value lies in its ability to shield network nodes from being compromised by a single point of failure. Additionally, the blockchain technology provides better resilience, encryption, auditing, and transparency while guaranteeing the security, integrity, and accessibility of stored data (C. Kombe et al., 2019; Shetty et al., 2019).

Tanzania is a developing country with a population of over 61 million people (Tanzania National Bureau of Statistics, 2022), and an economy primarily driven by agriculture, mining, and tourism. The government of Tanzania has recognized the potential of blockchain technology to enhance its economic growth and development (The Citizen, 2021). In 2021, the Tanzanian government announced her plans to create blockchain advisory team to guide the government on guidelines, legislation and policies that will allow the technology to be used successfully (*Tanzania Announces Plans To Create Blockchain Advisory Team As Country Moves To Adopt Crypto* | BuyUcoin Blog, 2021).

1.2 Problem Statement

Blockchain technology has been hailed as a transformative force with the potential to revolutionize various industries and sectors globally. Some of these sectors include government agencies, health care, energy supply, supply chain, real estate (Akram et al., 2020; C. Kombe et al., 2019; Sawa, 2019; Swan, 2015). However, despite its growing popularity and adoption in developed countries, its potential in developing countries, particularly in Africa, remains largely unexplored (Agbo & Nwadiolor, 2020; Mavilia & Pisani, 2020). Tanzania, like many other African countries, faces numerous socio-economic challenges in various sectors such as land,

healthcare and mining. These challenges include but not limited to lack of transparency, corruption, and bureaucracy (M. C. Kombe et al., 2017; Elikana Eliakimu Sadock, 2021). These issues have hampered the country's progress towards sustainable development and economic growth. Blockchain technology, with its potential to promote transparency, accountability, decentralisation, efficiency, and trustworthiness, could provide a solution to some of these challenges (Miraz & Ali, 2018; Crosby, 2016). However, there is a lack of understanding of the prospects and limitations of blockchain technology in the Tanzanian context. Therefore, there is a need to assess the viability of blockchain technology in Tanzania, its potential benefits and drawbacks, and the challenges that need to be addressed for successful implementation. This research aims to address this gap in the literature by investigating the potential of blockchain technology in Tanzania and providing recommendations for policymakers, regulators, and industry stakeholders on how to leverage its potential for sustainable development and economic growth.

1.3 Research Questions

This study aimed to answer the following research questions:

4. What are the key prospects and potential applications of blockchain technology in Tanzania?
5. What are the specific limitations and challenges faced in implementing blockchain technology in Tanzania?
6. What is the current level of awareness and understanding of blockchain technology among businesses and individuals in Tanzania?

1.4 Objectives

This study aimed to achieve the following specific objectives:

4. Identify and analyze the key prospects and potential applications of blockchain technology in Tanzania.
5. Investigate the specific limitations and challenges faced in implementing blockchain technology in Tanzania.
6. Assess the current level of awareness and understanding of blockchain technology among businesses and individuals in Tanzania.

1.5 Rationale

Blockchain technology has emerged as a transformative force with the potential to revolutionize various industries and sectors globally. Despite its growing popularity and adoption in developed

countries, its potential in developing countries, particularly in Africa, remains largely unexplored. Tanzania, like many other African countries, faces numerous socio-economic challenges, including corruption, lack of transparency, and inefficiencies in various sectors. These issues have hampered the country's progress towards sustainable development and economic growth. Blockchain technology, with its potential to promote transparency, accountability, and efficiency, could provide a solution to some of these challenges. Therefore, it is important to assess the viability of blockchain technology in Tanzania, its prospects, and limitations. This research aimed to contribute to the existing body of knowledge on blockchain technology in developing countries, particularly in Tanzania, and provide insights and recommendations on how to harness its potential while mitigating its risks and challenges.

2.0 Literature Review

2.1 Overview of Block chain

Block chain technology refers to a decentralized, traceable, immutable, and distributed ledger that can record transactions securely and transparently. The digital ledger of transactions are maintained via a network of computers rather than a centralized server (Perwej, 2018; Chen et al., 2018; Muni Sankar & Booba, 2020). The decentralization of the network nodes eliminates the risk of single point of failure. Blockchain technology provides better resilience, encryption, auditing, and transparency while guaranteeing the confidentiality, integrity, and availability of stored data (C. Kombe et al., 2019).

Common types of blockchain networks are public blockchain, private blockchain, consortium blockchain and hybrid blockchain. Public blockchains are permission less and open networks that can be accessed by anyone. Private blockchain are restricted, they are accessible by a small specific group of people. Consortium blockchains are made by integrating elements of both public and private blockchains. They are used mostly by organizations to validate transactions. Hybrid transaction combines both the private and public blockchains to offer customization and flexibility to participating members (Christine Campbell, 2023; Schlecht et al., 2021).

Blockchain can be used in a number of sectors including but not limited to agriculture, finance, healthcare, real estate, supply chain management, education, voting and government agencies (Demestichas et al., 2020; An et al., 2021; Dimitrov, 2019; Dhawan et al., 2020; Chen et al., 2018; Adeshina & Ojo, 2019; Ølnes et al., 2017). In Tanzania, blockchain technology utilization is still at a low pace (Jesca Nkwabi, 2021). Most of the literature have focused blockchain applications in the healthcare area (Mnyawi, 2022; C. Kombe et al., 2019).

2.2 Prospects of Blockchain Technology in Tanzania

The literature reveals several important prospects and potential applications of blockchain technology in Tanzania. For instance, (Natália Likavčanová, 2019) argue that blockchain can

enable easier sharing of information about the treatment and medical conditions of patients. Also, blockchain can help to substitute the paper-based bureaucratic, complex, prolonged, and disposed to corruption system with a more well-organized system that can increase transparency and accountability in land administration (M. C. Kombe et al., 2017; Natália Likavčanová, 2019). Furthermore, (Tende et al., 2022) suggest that blockchain has the potential to revolutionize the agricultural sector especially the government subsidized vouchers to farmers by eliminating challenges like misuse of the vouchers by some government officials and lack of trust.

2.3 Limitations and Challenges of Implementing Blockchain Technology in Tanzania

Regardless of its potential, implementing blockchain technology in Tanzania is not short of challenges. (Emmanuel Constantine & Kwang Ho, 2015; Natália Likavčanová, 2019) highlight the lack of technological infrastructure as a major obstacle. The limited internet connectivity and access to reliable electricity may hinder the widespread adoption or use of internet dependent applications such as blockchain. Additionally, (C. Kombe et al., 2019; M. C. Kombe et al., 2017) stress out that unless the regulatory frameworks and legal considerations are put in place, blockchain technology can be used negatively by cyber criminals.

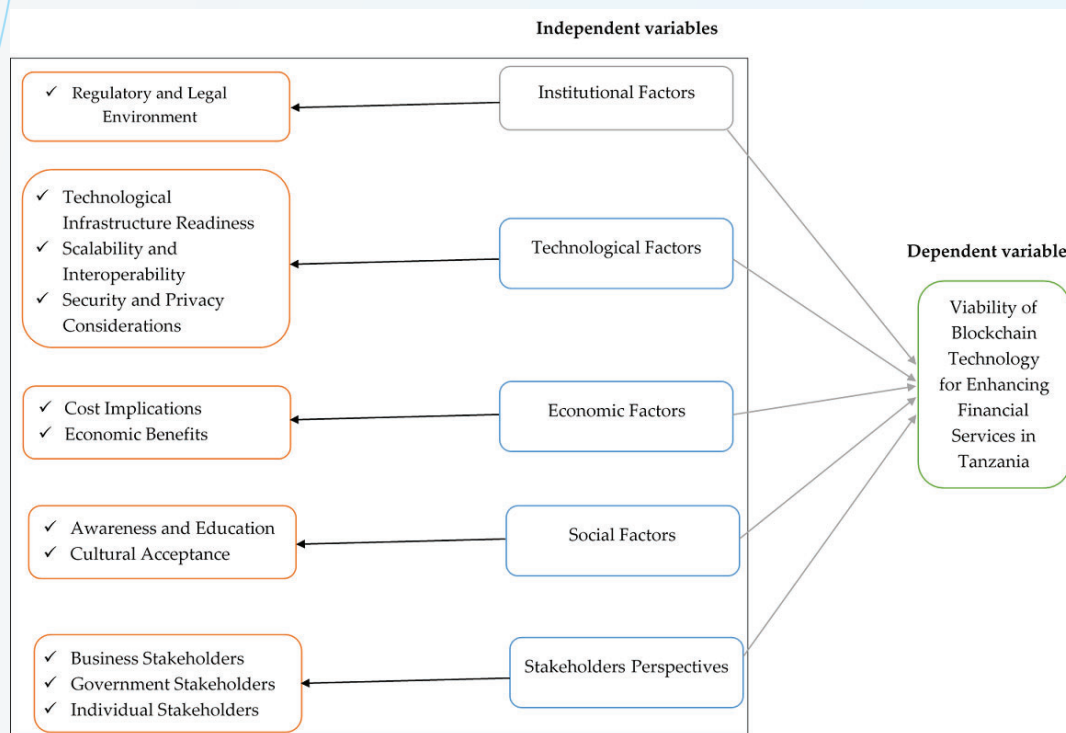

2.4 Awareness and Understanding of Blockchain Technology in Tanzania

The level of awareness and understanding of blockchain technology among stakeholders in Tanzania is a vital factor in its application. According to (Mnyawi, 2022), the system administrators in the surveyed facility had no knowledge of blockchain technology let alone its potential benefits. This lack of awareness in this facility can reflect the status of awareness and understanding in most sectors in Tanzania. Lack of awareness can retard the adoption and application of blockchain technology, therefore, to reduce this knowledge gap, the author insists regular trainings and reviewing the curriculum to accommodate blockchain technology programmes/modules.

2.5 Conclusion

The literature review highlights the key prospects and limitations of implementing blockchain technology in Tanzania. It highlights the potential benefits in areas such as agriculture and supply chain management, while also acknowledging challenges related to internet, electricity and regulatory frameworks. Furthermore, the review emphasizes the importance of raising awareness and understanding of blockchain technology among practitioners in Tanzania.

2.6 Conceptual Framework

3.0 Methodology

3.1 Study Area

The study focused on all regions in Tanzania, this gave a complete status of blockchain technology adoption.

3.2 Research Design

The research design for this study was exploratory in nature. An exploratory design allows for a comprehensive investigation of the opportunities and challenges associated with implementing blockchain technology in the financial services sector in Tanzania. It enabled the researchers to gain a deeper understanding of the topic through data collection and analysis (Saunders et al., 2009).

3.3 Research Approach

The research approach involved quantitative method. Quantitative methods, in this case surveys, enabled to gather numerical data to support statistical analysis (Creswell & Clark, 2017).

3.4 Sampling

A purposive sampling technique was employed to select participants for this study. Purposive sampling allowed for the deliberate selection of participants who possess specific knowledge and experience relevant to the research topic (Palinkas et al., 2015). Participants included senior managers, IT professionals, and regulatory authorities who are familiar with both blockchain technology and financial services in Tanzania. This selection ensured that the sample comprises individuals who can provide valuable insights and contribute to a thorough evaluation of the research objectives.

3.5 Sample Size

The sample size depended on data saturation, which occurred when new information or insights were no longer obtained from additional participants. Initially, a diverse sample of approximately 100 participants were targeted. However, the sample size was adjusted during the research process to ensure comprehensive coverage of the topic (Guest et al., 2006).

3.6 Data Collection

Data was collected through online surveys. Data collection instrument was designed based on the research questions and the conceptual framework.

3.7 Data Analysis

Data was analyzed using a Pandas which is python library. Pandas has the ability to make data cleaning, transformation, and analysis much easier and faster. The statistics such as percentages, were employed to summarize the survey responses and provide a quantitative analysis.

4.0 Results

4.1 Demographic Characteristics

Age

The age distribution indicates a broad age-based representation. Majority of the participants are aged between 21 – 25 years (23.0%), 31 – 35 years (20.0%) and 36 - 40 years (20.7%). This potentially impact the results by highlighting views from groups that may be more receptive to innovative financial technologies (Figure 1).

Figure 39: Respondents' age representation

Gender

There exists gender imbalance among participants, with males comprising over two-thirds of the sample (Figure 2).

Figure 40: Respondents' gender representation

Education Level

The data suggests that the study's respondents are generally well-educated, with the majority possessing at least a bachelor's degree (55.6%), postgraduate diploma (37.8%) and diploma (4.4%) (Figure 3).

Figure 41: Respondents' education level

Region of Residence

The data indicates a strong concentration of study respondents in Dar es Salaam, which represents 53.33% of the total sample. Other regions, such as Mwanza (8.15%) and Dodoma (6.67%), have smaller but notable participation, while the remaining regions contribute minimal representation (Figure 4).

Figure 42: Respondents' region of residence

4.2 Awareness and Knowledge of Blockchain Technology

The data indicates that 84.4%, of respondents had prior knowledge of blockchain technology before participating in this survey, while 15.6% had not heard of it before (Figure 5).

Figure 43: Heard about blockchain before this survey

Primary source of learning about blockchain technology

Majority of the respondents (63.7%) indicated that Internet is the primary source of their blockchain knowledge for most respondents, followed by academic institutions at 27.41%. Media and professional training or seminars each account for 16.3% of respondents' first exposure. Word of mouth contributes 12.59%, while 11.11% of respondents reported they had never learned about blockchain. Minimal sources such as reading and close friends account for just 0.74% each (Figure 6).

Figure 44: Primary source of learning blockchain technology

Level of understanding of blockchain technology

The majority of respondents (62.2%) possess a basic understanding of blockchain technology while at the end, 16.3%, have no understanding at all. In between, 16.3% have an intermediate understanding while 5.2% of respondents have an advanced understanding, suggesting that while there is growing interest, deeper expertise in the technology is relatively limited (Figure 7).

Figure 45: Level of understanding of blockchain technology

4.3 Perceptions of Blockchain Technology

Belief that blockchain technology can improve the financial services sector in Tanzania

More than two thirds of the respondents agree that blockchain technology has the potential to improve the financial sector. 1.5% of the respondents are not sure while the rest have a negative belief on the potential of blockchain technology to improve the financial sector (Figure 8).

Figure 46: Belief that blockchain technology can improve the financial services sector in Tanzania

Potential Benefits of Blockchain Technology in Financial Services

Majority of the respondents assert that blockchain can enhance security (27.13%), improve efficiency (26.74%), increase transparency (25.19%), and reduce costs (18.22%). However, a

small percentage see no benefit (1.94%). A handful of respondents mentioned faster transactions and increased investment opportunities as the benefits of blockchain (Figure 9).

Figure 47: Benefits of blockchain technology

Potential Challenges of Implementing Blockchain Technology in Financial Services

Most respondents indicated the following challenges of implementing blockchain technology in Tanzania's financial sector are a lack of technical expertise (28.15%), technological infrastructure issues (23.51%), regulatory hurdles (17.55%), and social acceptance (15.23%). High initial costs (13.91%) are also a significant concern. Only a small percentage of respondents believe there are no challenges (1.32%), or cite a lack of knowledge about blockchain as a barrier (0.33%) (Figure 10).

Figure 48: Challenges of implementing blockchain technology in financial services in Tanzania

4.4 Adoption and Implementation of Blockchain in Tanzania

Organization implementing or considering to implement blockchain technology

Almost two thirds of the respondents reported that blockchain has not been implemented at their workplace while 36.3% have implemented (Figure 11).

Figure 49: Organization implementing blockchain technology

Concerning the areas that applies blockchain technology; payments and transactions (19.89%), followed by record keeping (14.36%), supply chain management (11.60%) and identity verification (9.94%). 40.88% of the respondents never implement blockchain while 9.94% stated that they don't know if blockchain is implemented any of their daily activities (Figure 12).

Figure 50: Areas that applies blockchain technology

The major barriers to the adoption of blockchain technology include lack of skilled personnel (26.85%), technological challenges (25.84%), regulatory challenges (16.78%), financial constraints (16.44%), and resistance to change (12.08%). A small number of respondents (0.34%) believe there are no barriers to adoption, some need awareness, and some are not sure (Figure 13).

Figure 51: Barriers to the adoption of blockchain technology

4.4 Future Prospects of Blockchain Technology

The most commonly cited initiative to promote blockchain technology is technical training programs, with 27.37% of respondents. This is followed by public awareness campaigns (23.85%), infrastructure development (17.62%), government incentives (15.72%) and regulatory reforms (14.36%). A small percentage of respondents (0.54%) believe that technical

infrastructure should be a priority, while others suggest focusing on accessing the benefits of blockchain and sharing positive knowledge with citizens (Figure 14).

Figure 52: Steps to promote blockchain technology

4.5 Regulatory and Policy Environment

The respondents believe that enhanced cybersecurity regulations (27.55%), collaboration between regulators and industry (25.17%), clearer guidelines and standards (24.49%), and incentives for innovation (21.43%) are crucial for facilitating blockchain technology adoption. 0.68% of the respondents are unsure. A small percentage (0.34%) no know nothing, while others suggest initiating an organizational department for blockchain in a regulator (Figure 15).

Figure 53: Regulatory changes to facilitate the adoption of blockchain technology

Proactivity of the government in promoting blockchain technology in Tanzania

More than half of the respondents indicated that the government is very proactive. Almost a quarter of the respondents asserted that the government proactive. A smaller portion, 9.6%, are neutral, while 8.9% indicated that the government is reactive. A small fraction of respondents, 4.4%, indicated that the government is very reactive (Figure 16).

Figure 54: Role of the government

4.6 Training and Capacity Building

Sufficiency Knowledge and Expertise about Blockchain Technology

A minor portion of the respondents (2.2%) strongly agrees that there is sufficient knowledge and expertise, while 38.5% of the respondents align with this fact. 25.9% of respondents are neutral. 25.9% of respondents disagree, while 7.4%, strongly disagree (Figure 17).

Figure 55: Existence of sufficient knowledge and expertise about blockchain technology

Training programs necessary to promote blockchain adoption in Tanzania

32.47% of the respondents cited that basic blockchain technology courses are necessary to promote the adoption of blockchain technology. Regulatory and compliance training follows with 23.25%. The third and fourth training programs are advanced technical training (21.77%) and business application workshops (21.03%). A small percentage of respondents (1.48%) indicated they don't know (Figure 18).

Figure 56: Training programs necessary to promote blockchain adoption in Tanzania

5.0 Discussion & Conclusion

5.1 Discussion

The results from this study reveal significant interest in applying blockchain technology in transactions, record keeping, and identity verification. This demonstrates that the financial sector could and can be one of the primary beneficiaries of this technology. The distributed nature of blockchain reduces the dependence on third parties. This reduces or eliminates the bureaucratic inefficiencies dominant in financial transactions and record management (Kombe et al., 2019; Swan, 2015). Blockchain technology in Tanzania can potentially streamline the financial services by enhancing transparency, efficiency, and trust.

On the other hand, blockchain technology implementation in Tanzania is short of barriers. Main barriers include technological, regulatory, and social challenges. The respondents identified technological infrastructure limitations, such as limited internet access and unstable electricity,

as major challenges to widespread blockchain adoption (Emmanuel Constantine & Kwang Ho, 2015).

The primary source of blockchain technology awareness is the internet and educational institutions. These channels can be leveraged for broader awareness campaigns and technical training programs to enhance blockchain literacy (Mnyawi, 2022). Despite the level of awareness of blockchain technology being relatively high but the depth of understanding is still limited. Only 5.2% indicated they have advanced knowledge in blockchain technology. This suggests that more educational initiatives are needed.

A well-informed workforce is very important for implementing and maintaining blockchain applications effectively (Natália Likavčanová, 2019). The observed knowledge gap can be a stumbling block to blockchain adoption. To fill this gap requires establishing blockchain modules in academic institutions and regular training programs.

5.2 Conclusion

The study findings reveal that blockchain technology offers potential benefits, including enhanced transparency, security, and efficiency for transactions, record management, and supply chain applications. These improvements can address some of the inefficiencies in the current systems. The adoption of blockchain faces significant barriers, including limited internet access, unreliable power, high initial costs, and a lack of regulatory framework. These barriers hinder widespread implementation of blockchain.

Limited awareness of blockchain indicates a need for educational initiatives to improve blockchain literacy. Priority must be given to technological infrastructure development, regulatory reforms and capacity building. This will ensure a successful adoption of blockchain technology.

It is very essential for the government and other stakeholders to collaborate to create a suitable environment for effective application of blockchain.

Abstract

This study assessed the influence of social media marketing on Sales Performance for Small and Medium Enterprises selling electrical devices in Dodoma City, Tanzania as the case study. This study adopted a cross-sectional research design which aimed at data collection for two or more variables to be examined at a single point in time in order to detect variables patterns of association. The target population in this study included staff of Small and Medium Enterprises selling electrical devices in Dodoma City. The study that used a sample size of 110 respondents since they do possess vast knowledge on the effect of contract management on performance. The study applied both probability and non-probability sampling procedures in selecting the study sample. Data was collected by administering the structured questionnaires and indepth interview to respondents. After coding, data was entered into SPSS software for analysis. The study findings revealed that Instagram marketing in terms of; engagement rate, follower growth, click-through rate, conversion rate, comments and finally Instagram stories engagement had a positively significant relationship with sales performance among SME's selling electrical devices in Dodoma city. Different aspects of Twitter engagement that include; Follows, Hashtag usage, Likes (Favorites), Click through, Retweets, and finally Replies and mentions had a positively significant relationship with sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city. WhatsApp communication had a positively significant relationship with sales performance among SMEs selling electrical devices in Dodoma city. The study recommended that; the government of Tanzania should promote digital literacy initiatives to improve the digital skills of SME owners and employees. Tanzania's government should make investments in enhancing the country's digital infrastructure, including internet access and e-commerce platforms.

Keywords: *Social Media, Social Media Marketing, Sales Performance.*

1.0 Introduction

The dramatic growth of the internet has led to the emergence of two important phenomena: social media and online search engines. Social media is a term that has become ubiquitous in today's digital age. The concept of social media has fundamentally transformed the way individuals communicate, interact, and consume information in both personal and professional spheres (Jayaraman, Barathi, Babu, Girija, & Kapila, 2024).

Social media refers to a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user-generated content (Kaplan, & Mazurek, 2018). These include Facebook, Twitter, WhatsApp, Instagram, YouTube and LinkedIn, amongst others. The emergency of social media has made firms to introduce marketing strategies which associate the electronic word which actually attracts and influences customer purchasing behaviors (Cabales, Carungay, Legaspi, Bacatan, & Bacatan, 2023; Shauri, Magaria, & Masanyiwa, 2023).

Social media is centered on connectivity and interactivity, enabling users to form communities through friend requests, follows, and groups (Thomas et al., 2017). It emphasizes user-generated content, allowing people to share their creativity globally (Ausat, 2023; Stsiampkouskaya et al., 2021). In business, social media acts as a direct communication channel between companies and customers, driving the rise of social media marketing to promote products and services (Felix et al., 2017). By 2023, more than 4.7 billion people used social media, with chat and messaging apps being the most popular (Dollarhide, 2023).

Sales performance, often measured by revenue and customer retention, is crucial for business success (Mullins et al., 2020). Small and Medium Enterprises (SMEs), defined by size and revenue, play a key role in employment and economic growth, particularly in Tanzania, where they range from retail shops to manufacturing businesses (Liberto, 2023; Al-Awlaqi et al., 2018). Social media is increasingly important for SMEs, offering new avenues for marketing and customer engagement, as highlighted in global literature. Globally, the acceptance, usage and popularity of social media has grown tremendously in the last few decades in well-developed countries and developed nations in the world (Ashley & Tuten, 2015; Ortiz-Ospina, 2019). In Italy, the adoption of social media (SM) resources helped Gamma to tap into new markets and thus survive and face the downturn of its original market. SM represented a strategic resource to implement an effective business networking effort (Bocconcelli, Cioppi, & Pagano, 2017). Over 50 % of U.S. respondents check their private e-mail account relatively ten times every day, and it's without a doubt, their furthestmost popular way to receive updates from brands (Blankenship, 2024). Muhit, (2022) revealed a positive association between social media engagement and sales

growth, indicating that SMEs selling electrical devices that actively used social media platforms experienced higher sales revenues compared to those that did not. In Jodarn, Akaileh, et al., (2023) noted that social media had a significant effect on post-purchase behavior on electrical device buyers in Jordan.

In the African context, e-mail has a profoundly positive influence on consumer buying decisions in two phases (post-purchase) and information research in Egypt (Omar, & Atteya, 2020). In Ethiopia, social media marketing has strategic role and social media marketing strategy (Taddes, 2021). In Nigeria, there has been a paradigm shift and the traditional means of marketing (that is television, radio, newspapers and magazines) do not suffice on their own anymore, given the abundance of loop holes inherent in advertising via these mediums especially in the aspect of feedback, online/social media advertising has gained grounds (Oyekan, 2022). In South Africa, Rosário, & Dias, (2023) and Hudders, et al., (2021) noted that, social media marketing strategies such as sponsored posts and influencer partnerships, achieved higher sales outcomes sales performance in the electrical devices industry.

In the East African perspective, in Kenya, there email marketing, online marketing, search engine marketing, and blog marketing as digital marketing techniques had a significant influence on business performance (Njau and Karugu, 2014). Olonde, (2017) also stressed that in Kenya, email marketing and social media marketing had significant impact on SMEs sales growth and to a great extent. Mobile marketing, search engine optimization (SEO) marketing, pay-per-click (P.P.C), and online marketing all had a significant effect on SMEs' sales growth and to a moderate extent. In Tanzania's context, Tanzania had 4.90 million social media users aged 18 and above at the start of 2023, this was equivalent to 14.8 percent of the total population aged 18 and above at that time (Heinze, Fletcher, Rashid, & Cruz, 2020).

In Tanzania's context, the Tanzanian Government defines SMEs according to sector, employment size, and capital invested in machinery. Accordingly, in the context of Tanzania SMEs are defined as micro, small and medium size enterprises in non-farm activities which include manufacturing, mining, commerce and services. A micro enterprise is defined as a firm with fewer than five employees whereas a small firm is a firm with 5 to 49 employees, a medium-enterprises is a firm with 50 to 99 employees. Any firm with 100 employees or more is regarded as a large enterprise (Isaga & Musabila, 2017). The use of social media as a form of digital media Marketing is also important for Small and Medium Enterprises (SMEs) in Tanzania including those SMEs selling electrical devices, which contributes much to economic development. Social media platforms have provided a cost-effective way to reach a wide audience without the hefty expenses associated with traditional marketing methods (Kazungu & Panga, 2015).

The Social Media Stats in United Republic of Tanzania as of July 2023 indicates that 31.95% use Facebook, 20.01% use Twitter, 17.42% use YouTube, 16.47% use Pinterest, 11.26% use

Instagram and finally 2.36% use LinkedIn according to Statista (2023). Tanzania's Social Media Advertising market also projected to grow by 4.82% (2023-2027) resulting in a market volume of US\$11m in 2027 (Statista, 2023). The reviews and debates above demonstrate that social media use is related to SMEs' performance, in part because these platforms have been found to be efficient in terms of cost and are linked to market success and consumer happiness. The use of social media affects SMEs' innovation and branding as well (Shauri, Magaria, & Masanyiwa, 2023).

Despite that Kakumbi and Phiri (2022) have observed, most SMEs have not been generally enthusiastic in their involvement with electronic commerce including social media. While Facebook undoubtedly plays a crucial role in the social media landscape, this research journey sought to navigate the complexities and potential pitfalls associated with relying solely on one platform (Facebook) that has attracted attention from different scholars much as other social media are being used by business to ensure that sales increase (Ong, & Toh, 2023).

As more consumers rely on online channels for research and purchases, SMEs must adopt effective digital marketing strategies to stay competitive (Arobo, 2022). However, SMEs selling electrical devices in Dodoma City struggle due to limited knowledge, resources, and expertise in leveraging social media (Filali & Faraj, 2022). These businesses face challenges navigating digital marketing complexities, such as platform selection and content creation, which affect sales performance (Shauri, Magaria, & Masanyiwa, 2023). Despite forming a vital part of the local economy, many SMEs are hindered by these obstacles, leaving them behind competitors who have successfully embraced social media (Costa & Castro, 2021)..

Despite the widespread recognition of social media as a powerful marketing tool, many SMEs in Dodoma City struggle to effectively leverage it to drive sales (Hamisi, 2017). The pivotal role of media marketing on Sales Performance for SMEs selling electrical devices in Dodoma City remains largely absent from scholarly discourse. Therefore, there is inadequate information which shows strong connection between theory used and social media marketing thus leaving a critical gap in our understanding of its effect. Ultimately, the goal of this study was to bridge this gap and empower SMEs to harness the full potential of social media marketing to drive sales growth and business success. Thus, this study sought to bridge the gap by instigating the influence of Social Media Marketing on Sales Performance for SMEs selling electrical devices in Dodoma City, Tanzania.

1.2 Specific Objectives

To determine the influence of Instagram marketing on sales performance of SMEs selling electrical devices in Dodoma City,

To examine the influence of Twitter engagement on sales performance of SMEs selling electrical devices in Dodoma City, and

To find out the influence of WhatsApp Communication on sales performance of SMEs selling electrical devices in Dodoma City

2.0 Literature Review

2.1 Theoretical Literature review Influence of Social Media Marketing on Sales Performance

The analysis of this study was draw from the Diffusion of Innovation Theory.

Diffusion of Innovation Theory

The Diffusion of Innovation (DOI) Theory, developed by E.M. Rogers in 1962, explains how ideas or products gain momentum and spread within a population (Miller, 2015). The diffusion process results in individuals adopting new behaviors, such as using a new product. Key elements include the concept of innovation, defined as an idea perceived as new by individuals (Rogers, 2003). An innovation may have existed for a long time but remains relevant if perceived as new. Rogers also noted a lack of research on technology clusters, which comprise interrelated technological elements (Rogers, 2003). Uncertainty can hinder the adoption of innovations, as the consequences of adoption or rejection may affect individuals or social systems (Rogers, 2003). Understanding these dynamics is crucial for promoting successful innovation adoption. The Diffusion of Innovation (DOI) theory was crucial to this study because it focuses on how new practices, like social media marketing, are adopted in specific contexts (Morone & Taylor, 2010). The theory provides a framework for analyzing the spread of social media strategies and their impact on sales performance among SMEs in Dodoma City (Wejnert, 2002). By categorizing businesses based on their willingness to adopt innovations, the DOI theory aligns with varying adoption behaviors. This approach helps explore the relationship between innovation adoption and business success in digital marketing.

2.2 Empirical literature review

Yosep, et al., (2021) aimed at finding out whether digital marketing platforms affected business performance through A mini-review approach in Malaysia. The study found various digital marketing strategies (social media) that micro-entrepreneurs used to develop, introduce, and promote their products, such as Facebook, Instagram, Youtube, Twitter, Tiktok and others. These platforms were the cheapest and most comfortable tools for creating excellent marketing contents. Also, digital marketing was used for promoting and branding activities in a wide range of marketing activities without spending a lot of money. The study concluded that digital marketing was one modern evolution platforms in marketing activities that highly depends on technology to create creative marketing content and product information. From the reviewed

study, there was a gap on the specific effect of Instagram marketing, Twitter engagement, WhatsApp communication, on sales performance.

Winarso, et al., (2023) assessed the impact of social media and Innovation Strategy on the Marketing Performance of Small and Medium Sized Enterprises (SMEs) in Bekasi City, Indonesia. The reviewed study showed that there was a positive relationship between social media and the performance of SME businesses. However, the study was too general and did not specify the key social medias. On the other hand, the study was carried out in Indonesia. This left a gap as far as the influence of; Instagram marketing, Twitter engagement, WhatsApp communication on sales performance among small and medium-sized enterprises in Dodoma city is concerned.

Kierian, et al., (2021) assessed the influence of “WhatsApp Advertisement” on the patronage of small business Start-ups and medium scale enterprises in Uyo, Nigeria. The study found out that most of the small business start-up samples immediately resorted to the use of WhatsApp advertisement to help maintain and increase sales during the coronavirus period. The great challenge mitigating the effective use of WhatsApp, as shown by the study, was the reach of WhatsApp advertisement which is limited to the contact list of the people advertising. Also, the susceptibility of the platform to fraud was another key challenge. There is a significant relationship WhatsApp advertisement and small business performance in the Nigerian context. However, there was a gap on the specific effect SMEs dealing with electrical devices in Dodoma city thus prompting this study.

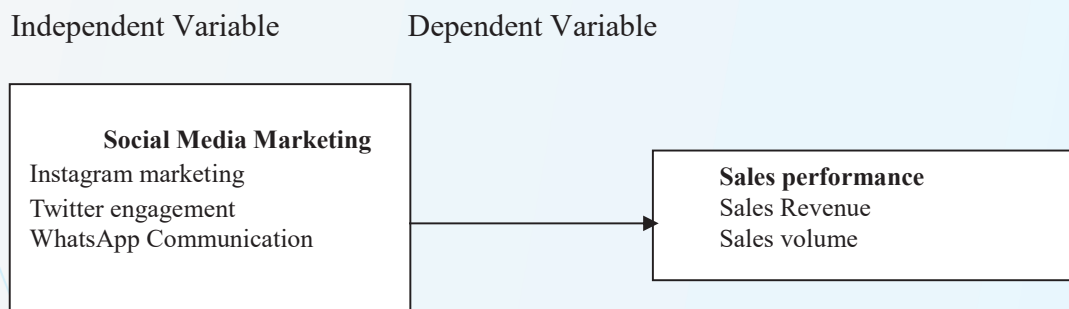

Kajongwe, *et al.*, (2020) analyse how social media impact on performance of Small and Medium Enterprises (SMEs) in Zimbabwe. Study results indicated that social media has a positive relationship with business strategy of SMEs in Zimbabwe. The study results also showed that social media positively improved brand awareness, customer relation and productivity of SMEs in Zimbabwe. From the reviewed study, there was a gap on the specific effect social media on SMEs dealing with electrical devices in Dodoma’s context.

Silvano & Mbogo, (2022) investigated the impact of Social Media Marketing on Small Businesses’ Sales Performance: A Case of Women Clothing Stores in Nyamagana District, Tanzania. The result obtained through regression analysis established that Facebook had impacts on the sales performance of small business (Beta = .199, $P < .020$). The results obtained in this aspect showd that the increase in the use of Facebook by 1 unit attributes increase of performance of small business by 0.20. On Instagram, the findings obtained through linear regression established that Instagram has a significant impact on the sales performance of small business (Beta = .369, $P < .947$). The reviewed study addressed Instagram marketing however when it comes to Dodoma city, nothing is published thus prompting the need for a comprehensive study on the specific effect of Instagram marketing.

2.3 Conceptual Framework

The theoretical framework of this study provides the foundation for understanding the research problem (Mugenda & Mugenda, 2003). It highlights major social media marketing platforms, including Facebook, Instagram, and Twitter, each with unique demographics and features. Social media marketing leverages connection, interaction, and customer data (Kumar et al., 2016) to engage customers and promote products. In this context, sales performance is evaluated based on a company's ability to sell products, measured through sales revenue, sales volume, and conversion rate (Kelwig, 2022). This framework guides the exploration of social media's impact on SMEs in Dodoma City. The DOI theory was developed to investigate the new ideas and technology are perceived by individuals as well as firms. The innovation helps to determine the factors that affect the adoption rate of technological innovation by individuals as well as firms. The Diffusion of Innovation theory is pertinent to this study because it offers a strong framework to investigate how the adoption of social media strategies spreads and affects business outcomes as the study explores the effect of social media marketing on sales performance among small and medium-sized enterprises (SMEs) in Dodoma city. The figure below shows the cause effect relationship between the social media marketing techniques and sales performance.

Figure 57: Conceptual Framework

Source: Researcher (2023)

3.0 Research Methodology

3.1 Research design

This study adopted a cross-sectional research design which aimed at data collection for two or more variables to be examined at a single point in time in order to detect variables patterns of association. The design was preferred because of the consistency nature of objectives aiming to reveal relationships among variables and allowing inferences to be made on the effects of explanatory variables on an outcome variable (Burns and Burns, 2012). Additionally, the study also applied a mixed approach to include both qualitative and quantitative approaches. Qualitative data provided detailed information inform of statements allowing room to study

issues in detail (Silverman, 2005) while quantitative design enhanced the statistical inferences by linking the independent and dependent variables (Creswell, 2014).

3.2 Area of the Study

The area of the study refers to formal delineated geographical boundaries, (Msabila and Nalaila, 2013). The study was conducted in Dodoma city which is the legislative capital of Tanzania and is the administrative capital of both Dodoma Municipal Council and the entire Dodoma Region, with a population of 765,179. The area was used as the area of study due to the fact that Dodoma City, with its growing urban population, presents a promising market for SMEs selling electrical devices. With the city's increasing demand for modern appliances and gadgets, there was a significant opportunity for businesses in this sector to thrive. Therefore, the presence of all these, makes Dodoma an interesting place to study the potential ways for SMEs selling electrical devices.

3.3 Sampling Design and Procedures

Simple Random Sampling was used to select respondents from the entire population of SMEs selling electrical devices in Dodoma City, ensuring good representation, unbiased results, and convenience. The sample size was determined based on confidence, margin of error, and variability within the population. Purposive Sampling techniques were employed to select key respondents who provided qualitative data, based on unique characteristics and experience. Both methods were used to ensure accurate and reliable results.

3.4 Data Analysis Methods

The data acquired was analysed based on an overview of the identified purpose of the study in the design of the research. The data analysis process included; editing, coding as well as cleaning (Hussain, 2020). Descriptive and inferential statistics with the aid of Social Sciences Statistical Package (SPSS) was used to analyse the collected qualitative and quantitative data. For every objective, data was analysed in the following ways;

3.4.1 Descriptive Analysis

The data collected was analyzed to assess the influence of social media marketing on sales performance of SMEs selling electrical devices in Dodoma City. A multiple regression analysis technique was employed, and the results were computed basing on the models below from a single variable influence to a combined influence as follows;

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon \dots\dots\dots(1)$$

Where; Y= Dependent variable is Sales Performance. X_1 = Instagram marketing, X_2 = Twitter engagement, X_3 = WhatsApp communication and ϵ =error term

3.4.2 Qualitative data analysis (content/Thematic Analysis)

The study used content analysis and relationship analysis to analyze qualitative data from interviews and focus group discussions. It categorized responses into manageable categories, and explored the relationship between Social Media Marketing and Sales Performance for SMEs in Dodoma City, Tanzania.

4.0 Findings and Discussion

4.1 Demographic characteristics of Respondents

The findings from Table 1 revealed that about 63.2% of respondents were male and only 36.8 were female. This implies that most of the staff of SMEs selling electrical devices in Dodoma city were male, a fact that may be attributed to the economically lucrative nature and relatively large capital that is a requirement involved to start up this business.

Table 50: Demographic profile of respondents

Variable	Response	Frequency	Percentage (%)
Gender	Male	139	63.2
	Female	81	36.8
	Total	220	100.0
Age	Less than 30	39	17.7
	31 to 35 years	26	11.8
	36 to 40 years	29	13.2
	41 to 45 years	87	39.5
	46 to 50 years	24	10.9
	Above 51 years	15	6.8
	Total	220	100
Education level	Informal	13	5.9
	Primary	16	7.3
	Secondary	24	10.9
	Certificate	14	6.4
	Diploma	66	30.0
	Bachelor's	67	30.5
	Master's degree	14	6.4
	PhD	3	1.4
	Others	3	1.4

	Total	220	100
Working Experience	Less than a year	15	6.8
	1 to 4 years	14	6.4
	5 to 8 years	117	53.2
	9 to 12 years	51	23.2
	Above 12 years	23	10.5
	Total	220	100%
The capital investment for your business	Less than TZS 5 million	16	7.3
	Between TZS 5 million to TZS 200 million	141	64.1
	Above TZS 200 million	63	28.6
	Total	220	100.0

Source: Study findings (2024)

Additionally, it was also observed that the majority of the respondents were aged 41 to 45 years represented by 39.5%, followed by respondents aged between 36-40 years constitute 17.7% of the respondents. Furthermore, 13.2% of the respondents were aged 36 to 40 years. Whilst 11.8%, 10.9%, and 6.8% were aged; 31 to 35 years, 46 to 50 years and above 51 years respectively. This implies that, SMEs selling electrical devices in Dodoma city had a young and strong labour force.

In terms of the level of education attained, the results further indicated that the majority that is 30.5% of the respondents had a Bachelor's degree as represented. This was followed by respondents with a Diploma represented by 30% of the respondents. Informal education had been attained by 5.9%, Primary education had been attained by 7.3%, Secondary education had been attained by 10.9%, Certificate had been attained by 6.4%, Master's degree had been attained by 6.4%, PhD and others such as professional courses had been attained by 1.4% respectively. Generally, this implies that most staff of SMEs selling electrical devices in Dodoma city had attained diplomas and degrees.

Regarding the working experience, the majority that is 53.2% of the respondents, had 5 to 8 years of working experience in SMEs selling electrical devices in Dodoma city. This was followed by 23.3% of the respondents had 9 to 12 years of working experience whilst only 6.8%, 6.4% and 10.5% of the respondents had Less than a year, 1 to 4 years and finally above 12 years of working experience. Generally, most of the staff had worked at SMEs selling electrical devices in Dodoma city for a relatively good number of years so they were in a better position to provide information regarding the influence of social media Marketing on Sales Performance for Small and Medium Enterprises selling electrical devices in Dodoma City.

Regarding the capital investment in the business, majority of the respondents that 64.1% of the respondents had invested between TZS 5Million to TZS 200 million, only 7.3% had invested less than TZS 5 million and finally 28.6% of the respondents had invested over TZS 200 million. Generally, the study findings show that most respondents had the capital investment between TZS 5 million to TZS 200 million.

4.2 Social media platforms most commonly used by SME in Dodoma city for marketing their electrical devices.

Here the study sought to find out the social media platforms most commonly used by SME in Dodoma city for marketing their electrical devices.

Table 51: Social media platforms most commonly used by SME in Dodoma city for marketing their electrical devices.

Response	Frequency	Percentage (%)
Instagram	64	29.1
Twitter	69	31.4
WhatsApp	87	39.5
Total	220	100.0

Source: Study findings (2024)

The study findings show that 29.1%, 31.4% and 39.5 of the respondents used Instagram Twitter and WhatsApp respectively among SMEs in Dodoma city selling electrical devices. Generally, between Instagram, Twitter and WhatsApp, it was noted that WhatsApp Social media platform was the most commonly used among SMEs in Dodoma city selling electrical devices.

4.3 The influence of social media marketing on sales performance among SMEs selling electrical devices in Dodoma city.

Here the study looked at the extent to which Instagram marketing, twitter engagement and whatsapp communication influenced sales performance among SME's selling electrical devices in Dodoma city.

Table 52: Multiple Regression Analysis results on the effect of social media marketing on sales performance among SME's selling electrical devices in Dodoma city.

Coefficients ^a							
Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1	(Constant .236)	.035		6.746	.000		
	Instagram .404 marketing	.063	.504	6.700	.000	.093	10.772
	Twitter .351 engagement	.079	.425	4.472	.000	.062	16.075
	WhatsApp .486 communication	.064	.577	7.542	.000	.096	10.420

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

From the above table, using this equation of a line of Instagram marketing, Twitter, and WhatsApp was used to predict sales performance through the equation of $Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon$.

From the findings in Table 3, an equation of $Y = 0.236 + 0.404X_1 + 0.351X_2 + 0.486X_3 + \epsilon$ was developed that shows that, Instagram marketing had a significant relationship with sales performance with 0.404 being the slope for Instagram, it was found that it was significant (0.000) with the T value of 6.700.

Twitter engagement had a significant relationship with sales performance with 0.351 being the slope for Twitter engagement, it was found that it was significant (0.000) with the T value of 4.472. WhatsApp communication had a significant relationship with sales performance with 0.486 being the slope for WhatsApp communication, it was found that it was significant (0.000) with the T value of 7.542.

The multiple regression analysis results presented in the Table above shed light on the relationship between social media marketing strategies and sales performance among small and medium-sized enterprises (SMEs) specializing in the sale of electrical devices in Dodoma city. The regression model reveals several significant insights. Firstly, the constant coefficient (.236) signifies the baseline level of sales performance that is attributed to factors not accounted for in the model. Moving on to the predictors, Instagram marketing emerges as a significant driver of sales performance, with a coefficient of .404. This indicates that for every unit increase in Instagram marketing activities, there is a corresponding increase in sales performance by .404 units. The standardized coefficient (Beta) of .504 emphasizes the relatively stronger impact of Instagram marketing compared to other predictors, signifying its pivotal role in influencing sales outcomes among SMEs in the electrical devices sector. Furthermore, WhatsApp communication, both through Twitter and WhatsApp itself, also exhibits notable effects on sales performance. The coefficients of .351 and .486 for Twitter and WhatsApp communication, respectively, signify their positive contributions to sales performance. These coefficients suggest that for every unit increase in WhatsApp communication activities, there is a corresponding increase in sales performance by .351 and .486 units for Twitter and WhatsApp, respectively.

The standardized coefficients (Beta) of .425 for Twitter and .577 for WhatsApp communication emphasize the relatively strong influence of these variables on sales performance, further corroborating the significance of social media communication channels in driving sales outcomes. Additionally, the collinearity statistics provide insights into the multicollinearity among predictor variables. The tolerance values (>0.1) and low variance inflation factors (VIF) (<10) indicate that multicollinearity is not a significant concern in the model, affirming the validity of the regression results. In conclusion, the multiple regression analysis highlights the

significant impact of Instagram marketing and WhatsApp communication channels on sales performance among SMEs in the electrical devices sector in Dodoma city. These findings emphasize the importance of leveraging social media marketing and communication strategies to enhance sales outcomes and underscore the potential for strategic interventions in these domains to drive business growth and success.

4.3.2 The effect of Instagram marketing on sales performance among SME's selling electrical devices in Dodoma city.

Table 53: Analysis of variance

ANOVA ^a						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	87.401	6	14.567	278.417	.000 ^b
	Residual	11.144	213	.052		
	Total	98.545	219			

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

b. Predictors: (Constant), Instagram stories engagement, Follower growth, Comments, Conversion rate, Engagement rate, Click-through rate

The results in Table 4 above indicate that the regression model was significant in predicting how Instagram marketing affect the sales performance (sales revenue and sales volume) among SMEs selling electrical devices in Dodoma city because the p-value was $P=0.000$ which is less than 0.05 ($P<0.05$).

Table 54: Multiple Regression Analysis results on the effect of Instagram marketing on sales performance among SME's selling electrical devices in Dodoma city.

Coefficients ^a

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.098	.038		2.561	.011		
	Engagement rate	.133	.136	.153	.977	.030	.022	46.179
	Follower growth	.294	.042	.309	6.942	.000	.268	3.734
	Click-through rate	.122	.135	.145	.905	.036	.021	48.200
	Conversion rate	.050	.113	.058	.439	.661	.030	32.875
	Comments	.701	.057	.782	12.220	.000	.130	7.705
	Instagram stories engagement	.146	.139	.167	1.050	.029	.021	47.590

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

The findings indicate that engagement rate had a positive statistically significant relationship with sales performance (sales revenue and sales volume) among SMEs selling electrical devices in Dodoma city at the p-value less than 5% ($p < 0.030$) and with the coefficient at 0.153. This implies that the unit change in engagement rate on average increased the sales performance by 15.3%. Therefore, the more the engagement rate increases, it will lead to increased sales performance in terms of; sales revenue and sales volume. Similarly, the follower growth was positively associated with sales performance at 0.309 with the p-value less than 5% ($p < 0.000$). This implies that the unit change in follower growth on average increased the sales performance by 30.9%. Therefore, follower growth led to increased sales performance in terms of; sales revenue and sales volume. The results revealed that click-through rate was positively associated with sales performance at 0.145 with the p-value less than 5% ($p < 0.036$). This implies that the unit increase in the click-through rate led to 14.5% increase in the sales performance in terms of; sales revenue and sales volume. The study findings in Table 6 show that conversion rate had a positively insignificant relationship with sales performance among SMEs selling electrical devices in Dodoma city with a coefficient of 0.058 and a P value of 0.661. This implies that a unit change in the conversion rate on average insignificantly increased the sales performance in terms of; sales revenue and sales volume by 5.8% which was an insignificant effect. Furthermore, the findings in Table 7 show that Comments had a positively significant relationship with the

sales performance at the p-value less than 5% ($p < 0.000$) and with the coefficient of .782. This implies that unit change in comments on average increased sales performance in terms of; sales revenue and sales volume by 78.2%. Finally, the findings indicate that Instagram stories engagement had a positive statistically significantly relationship with sales performance (sales revenue and sales volume) among SMEs selling electrical devices in Dodoma city at the p-value less than 5% ($p < 0.029$) and with the coefficient at 0.167. This implies that the unit change in Instagram stories engagement on average increased the sales performance by 16.7%. Therefore, the more the Instagram stories engagement increases, it will lead to increased sales performance in terms of; sales revenue and sales volume.

Findings on the effect of Instagram marketing on sales performance among SME's selling electrical devices in Dodoma city were supported by those from interviewee 1 who stated that; *“Instagram has made it possible for SMEs to exhibit their electrical goods through eye-catching pictures and videos, which helps to raise brand awareness among prospective clients in Dodoma and abroad. SMEs have developed a strong brand presence and gained followers by consistently publishing high-quality content on the site.”*

Interviewee 2 stated that, *“Instagram's advanced targeting features have made it possible for SMEs to target particular regions, interests, and demographics with their marketing messaging. Because of this, companies in Dodoma City can now better customize their content to appeal to their target audience, which raises the possibility of generating leads and conversions”*.

Interviewee 3 stated that, *“Instagram's likes, comments, and direct message features have encouraged communication and engagement between SMEs and their audience. SMEs can increase sales by developing trust and credibility with their followers and promptly answering their questions.”*

Generally, from the study findings, it can be noted that Instagram marketing in terms of; engagement rate, follower growth, click-through rate, conversion rate, comments and finally Instagram stories engagement had a positively significant relationship with sales performance among SME's selling electrical devices in Dodoma city. This concurs with Silvano & Mbogo, (2022) who investigated the impact of Social Media Marketing on Small Businesses' Sales Performance among Women Clothing Stores in Nyamagana District, Tanzania. The result obtained through regression analysis established that Facebook has impacts on the sales performance of small business ($\text{Beta} = .199, P < .020$). The results obtained in this aspect shows that the increase in the use of Facebook by 1 unit attributes increase of performance of small business by 0.20. On Instagram, the findings obtained through linear regression established that Instagram has a significant impact on the sales performance of small business ($\text{Beta} = .369, P < .947$).

4.3.3 The effect of Twitter engagement on sales performance among SME's selling electrical devices in Dodoma city.

Table 55: Analysis of variance

ANOVA ^a						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	83.517	6	13.919	197.277	.000 ^b
	Residual	15.029	213	.071		
	Total	98.545	219			

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

b. Predictors: (Constant), Follows, Hashtag usage, Likes (Favorites), Click throughs, Retweets, Replies and mentions

The results indicate that the regression model was significant in predicting the contribution of Twitter engagement on sales performance (sales revenue and sales volume) among SMEs selling electrical devices in Dodoma city because the p-value was 0.000 which is less than 0.05.

Table 56: Multiple Regression Analysis results on the effect of Twitter engagement on sales performance among SMEs selling electrical devices in Dodoma city.

Coefficients ^a							
		Unstandardized Coefficients		Standardized Coefficients		Collinearity Statistics	
Model		B	Std. Error	Beta	T	Sig.	Tolerance VIF
1	(Constant)	.208	.049		4.287	.000	
	Likes (Favorites)	.367	.075	.396	4.910	.000	.110 9.094

Retweets	.036	.077	.040	.464	.643	.098	10.186
Replies and mentions	.104	.096	.121	1.076	.283	.057	17.698
Click throughs	.384	.071	.481	5.434	.000	.091	10.964
Hashtag usage	.047	.039	.047	1.204	.230	.473	2.112
Follows	.151	.041	.160	3.715	.000	.385	2.601

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

The study findings show that the coefficient of Likes (Favorites) had a positively significant relationship with sales performance (Sales Revenue & Sales volume) where the coefficient was 0.396 significant with a p-value of less than 5% ($p < 0.000$). This implies that the unit increase in the level of Likes (Favorites) led to a 39.6% increase in the overall sales performance (Sales Revenue & Sales volume). The findings also showed that Retweets had a positive but insignificant relationship with sales performance (Sales Revenue & Sales volume) with a coefficient of 0.040 and a P value of 0.643 which was greater than 5%. This implies that on average a unit increase in Retweets resulted in a 4.0% insignificant increase in sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city. The results revealed that replies and mentions had a positive statistically insignificant contribution to sales performance (Sales Revenue & Sales volume) with a coefficient of 0.121 and a P-value of .057 that was greater than 5%. This implies that the unit increase in replies and mentions on average insignificantly increased sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city by 12.1%.

The findings in the Table above show that Click throughs had a positive statistically significant relationship with sales performance (Sales Revenue & Sales volume) with a coefficient of 0.481 with a p-value of less than 5% ($p < 0.000$). This implies that the unit change in Click throughs on average increased sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city by 48.1%. Furthermore, the findings in Table 9 show that Hashtag usage had a positively insignificant relationship with sales performance (Sales Revenue & Sales volume) with a coefficient of 0.047 and P value of 0.230 that was greater than 5%. This implies that unit increase in Hashtag usage on average insignificantly increased sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city by 4.7%. Finally, the study findings show that Follows had a positive statistically significant contribution to sales performance (Sales Revenue & Sales volume) with a coefficient of 0.160. This implies that the unit increase in follows on average increased sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city by 16.0%.

Findings on the effect of Twitter engagement on sales performance among SMEs selling electrical devices in Dodoma city were supported by those from; interviewee 1 who stated that; *“Well Twitter enabled SMEs in Dodoma city to have a direct line of communication with their current and potential clientele. Through proactive interaction with followers via direct messages, responses, and tweets, SMEs have answered questions, offered assistance, and cultivated connections that have boosted revenue”*. Interviewee 2 stated that, *“Twitter has made it possible for SMEs to disseminate information about their electrical equipment, promotions, and exclusive deals, which has helped to raise brand recognition and visibility among Dodoma city's Twitter users. SMEs have expanded their reach and drawn in new clients by consistently releasing interesting content and utilizing pertinent hashtags”*. Interviewee 3 stated that, *“Twitter has shown to be a great tool for SMEs in Dodoma city to take advantage of conversations, events, and issues that are hot and pertinent to their target market and sector. SMEs have increased their visibility and reputation by contributing to pertinent topics and sharing content on time, which has eventually increased sales”*.

Generally, from the study findings, it was found that different aspects of Twitter engagement that include; Follows, Hashtag usage, Likes (Favorites), Click throughs, had a positively significant relationship with sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city. The findings are inline with Yosep, et al., (2021) that found various digital marketing strategies (social media) that micro-entrepreneurs used to develop, introduce, and promote their products, such as Facebook, Instagram, Youtube, Twitter, Tiktok and others. These platforms were the cheapest and most comfortable tools for creating excellent marketing contents. Also, digital marketing was used for promoting and branding activities in a wide range of marketing activities without spending a lot of money.

4.3.4 Effect WhatsApp communication on sales performance among SMEs selling electrical devices in Dodoma city.

Table 57: Analysis of variance

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	80.482	6	13.414	158.167	.000 ^b
	Residual	18.064	213	.085		
	Total	98.545	219			

- a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)
- b. Predictors: (Constant), Status updates, Document sharing, Video and voice calls, Multimedia sharing, Voice messages, Text messaging

The results indicate that the regression model was significant in predicting the contribution of; Status updates, Document sharing, Video and voice calls, Multimedia sharing, Voice messages, and Text messaging on Sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city because the p-value was 0.000 which is less than 0.05.

Table 58: Multiple Regression Analysis results on the effect of WhatsApp communication on sales performance among SMEs selling electrical devices in Dodoma city.

Coefficients ^a								
		Unstandardized Coefficients		Standardized Coefficients			Collinearity Statistics	
Model		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	.185	.051		3.604	.000		
	Text messaging	.271	.312	.296	.869	.038	.007	134.615
	Multimedia sharing	.683	.170	.728	4.026	.000	.026	38.015
	Voice messages	.627	.251	.649	2.494	.013	.013	78.582
	Document sharing	.642	.279	.684	2.531	.011	.015	9.569
	Video and voice calls	.088	.083	.101	1.069	.286	.097	10.346
	Status updates	.433	.220	.473	1.967	.020	.015	67.084

a. Dependent Variable: Sales performance (Sales Revenue & Sales volume)

The study findings show that the coefficient of Text messaging was positively (0.296) associated with sales the p-value (0.038) less than 0.05 ($p < 0.000$). This implies that the unit increase in Text messaging on average increased sales performance by 29.6%. The data from Table 9 reveal that Multimedia sharing positively impacted sales performance, with a coefficient of 0.728 and a p-value of 0.006, indicating a 72.8% increase in sales for each unit change. Voice messages also significantly enhanced sales, with a coefficient of 0.649 and a p-value of 0.013, reflecting a 64.9% improvement. Document sharing had a negative association with sales, resulting in a 68.4% increase despite its negative relationship. Video and voice calls showed an insignificant impact on sales performance (10.1%) with a p-value of 0.286. However, Status updates had a significant positive effect, increasing sales performance by 47.3% with a p-value of 0.020. These findings suggest that Multimedia sharing, Voice messages, Document sharing, and Status updates contributed positively to sales performance among SMEs selling electrical devices in Dodoma city, while Video and voice calls had a negligible impact.

On the effect of WhatsApp communication on sales performance among SMEs selling electrical devices in Dodoma city. Interviewee 1 stated, *“WhatsApp has made it possible for SMEs in Dodoma city to communicate directly and individually with their clients. SMEs have cultivated a more intimate relationship with their audience by communicating with them directly through texts, photos, and videos that are sent to their customers' cellphones. This allows them to respond to questions, give product details, and provide support instantly.”*. Interviewee 2 stated that *“Customers in Dodoma City can now easily get customer service and support through WhatsApp. SMEs have improved customer satisfaction and loyalty through the use of WhatsApp to handle customer concerns, resolve problems, and provide after-sales assistance. This has resulted in repeat business and favorable word-of-mouth recommendations”*.

Generally, the study findings show that WhatsApp communication had a positively significant relationship with sales performance among SMEs selling electrical devices in Dodoma city. The study findings are inline with Kierian, et al., (2021) assessed the influence of “WhatsApp Advertisement” on the patronage of small business Start-ups and medium scale enterprises in Uyo, Nigeria. The study adopted an online survey method on a WhatsApp group purposively created for this study. The study found out that most of the small business start-up samples immediately resorted to the use of WhatsApp advertisement to help maintain and increase sales during the coronavirus period. The great challenge mitigating the effective use of WhatsApp, as shown by the study, was the reach of WhatsApp advertisement which is limited to the contact list of the people advertising. Also, the susceptibility of the platform to fraud was another key challenge. There is a significant relationship WhatsApp advertisement and small business performance in the Nigerian context.

5.0 Conclusions and recommendations

5.1 Conclusion

The study found that the R- square was estimated at 84.3% indicating that the model was fit in explaining the variables. It has also established that the variation in Sales performance can be explained by the independent variable which is twitter engagement (follows, hashtag usage, likes (favorites), click throughs, retweets, replies and mentions) by 84.3 percent. This implies that the remaining 15.7% of the variation in sales performance is explained by variables that the study didn't capture. Different aspects of Twitter engagement that include; Follows, Likes (Favorites), and Click throughs had a positively significant relationship with sales performance (Sales Revenue & Sales volume) among SMEs selling electrical devices in Dodoma city. The study also established that 81.2% of the variation in sales performance can be explained by the independent variable which is WhatsApp communication that includes; Status updates, Document sharing, Video and voice calls, Multimedia sharing, Voice messages, Text messaging. This implies that the remaining 18.8% of the variation in sales performance is explained by variables that the study didn't capture. WhatsApp communication had a positively significant relationship with sales performance among SMEs selling electrical devices in Dodoma city. In conclusion, Instagram marketing, Twitter engagement and WhatsApp communication had a positive relation with sales performance among SMEs selling electrical devices in Dodoma city.

5.2 Recommendations

Given the conclusions and observations reported herein, the following recommendations are presented; First, the government of Tanzania should promote digital literacy initiatives to improve the digital skills of SME owners and employees. Secondly, to foster an environment that will allow SMEs to prosper in the digital economy, Tanzania's government should make investments in enhancing the country's digital infrastructure, including internet access and e-commerce platforms. Thirdly, SMEs should place a high priority on providing their owners and staff with workshops or training programs in digital marketing. Lastly, SMEs with little funding or experience in digital marketing should think about hiring freelancers or digital marketing organizations to handle their social media marketing needs.

5.3 Suggestions for Further Studies

As the findings of this study are based on only SMEs selling electrical devices in Dodoma city, there is a need to conduct more empirical research on the influence of Social media marketing on Sales Performance for Small and Medium Enterprises selling electrical devices in Tanzania as a whole. By doing so the effect of social media marketing on the sales performance of Small and Medium Enterprises selling electrical devices will be ascertained.

Abstract

This study investigated the influence of employee commitment, specifically focusing on creativity, innovation, and proactiveness, on the performance of employees in the education sector within Local Government Authorities (LGAs) in Tanzania. Utilizing a cross-sectional research design, the study sampled 130 participants—30 management personnel selected through purposive sampling and 100 staff members using simple random sampling. Data were gathered via questionnaires for staff and in-depth interviews with management. Multiple linear regression analysis revealed significant positive relationships between the commitment variables and employee performance. Creativity had the highest impact with an unstandardized coefficient of 4.521 ($p = 0.009$) and a standardized Beta of 0.612, indicating that creative problem-solving substantially enhances performance. Innovation also significantly improved performance with an unstandardized coefficient of 3.218 ($p = 0.020$) and a Beta of 0.542, highlighting the importance of encouraging innovative practices. Proactiveness positively influenced performance as well, with an unstandardized coefficient of 2.492 ($p = 0.039$) and a Beta of 0.498, demonstrating the value of proactive employees. These findings emphasize the need for LGAs to foster a work culture that supports creativity, innovation, and proactiveness to boost employee performance. The study suggests that management should implement strategies such as training programs, recognition of innovative efforts, and opportunities for proactive engagement to enhance overall performance and achieve educational objectives more effectively.

Keywords: *Employee Commitment, Creativity, Innovation, And Proactiveness, Performance of Employees*

1.0 Introduction

Employee commitment is a critical aspect that significantly impacts the overall performance of employees within an organization. In the education sector, especially within Local Government Authorities (LGAs) in Tanzania, employee commitment is vital for achieving the desired educational outcomes and improving the quality of education provided. Employee commitment,

which encompasses affective, continuance, and normative commitment, influences the dedication, motivation, and effort that employees exert in their duties (Khan et al., 2022). When employees are committed to their organizations, they are more likely to engage in behaviors that promote the institution's goals and objectives, thereby enhancing overall performance (Kim & Kim, 2021). This commitment is crucial in the education sector, where the quality-of-service delivery directly affects student outcomes, educational standards, and community development.

The concept of employee commitment is multifaceted, involving emotional attachment to the organization (affective commitment), perceived cost associated with leaving the organization (continuance commitment), and obligation to remain with the organization (normative commitment) (Khan et al., 2022). In the context of Tanzanian LGAs, these elements of commitment are influenced by several factors, including leadership styles, organizational culture, employee engagement, and working conditions. Educational institutions under the LGAs rely heavily on the commitment of their staff to achieve educational goals, improve student performance, and provide quality education services (Ngugi & Marwa, 2021). The level of commitment displayed by teachers, administrative staff, and other educational professionals can significantly influence their performance, which in turn impacts the overall effectiveness of the educational system.

In recent years, the Tanzanian education sector has faced numerous challenges that have affected employee commitment and performance. These challenges include inadequate infrastructure, insufficient funding, high student-to-teacher ratios, lack of professional development opportunities, and poor working conditions (Mboya et al., 2023). These factors can lead to decreased morale and motivation among educational staff, resulting in lower levels of commitment and suboptimal performance. Consequently, there is a need to examine the influence of employee commitment on performance to identify strategies that can enhance commitment and improve educational outcomes within LGAs in Tanzania.

The relationship between employee commitment and performance has been extensively studied in various sectors, including healthcare, manufacturing, and service industries. However, research focusing on the education sector, particularly within the context of LGAs in Tanzania, remains limited. Studies conducted in other countries have shown that high levels of employee commitment are associated with increased job satisfaction, reduced turnover rates, and improved job performance (Osman et al., 2021). For instance, committed employees are more likely to exhibit proactive behavior, demonstrate a strong work ethic, and go beyond their job requirements to achieve organizational goals (Muthoni & Wambua, 2022). In the education sector, committed teachers and staff are more likely to invest extra effort in their teaching, provide additional support to students, and contribute to a positive school environment.

Despite the recognized importance of employee commitment in enhancing performance, there is still a gap in understanding how commitment specifically influences the performance of employees

in the education sector within Tanzanian LGAs. Existing literature has primarily focused on the general factors affecting employee performance, such as training, remuneration, and leadership styles, without delving deeply into the role of employee commitment. Additionally, studies have often concentrated on urban areas, neglecting the unique challenges faced by rural LGAs, where resources are scarce, and working conditions may be less favorable (Makwinya & Komba, 2022). This lack of focus on employee commitment in rural educational settings leaves a critical gap in the literature, as these areas often experience higher teacher turnover rates, lower student performance, and greater challenges in achieving educational goals.

The Tanzanian government's initiatives to improve the quality of education have included various reforms aimed at enhancing teacher motivation and commitment. These reforms have focused on increasing teacher salaries, providing professional development opportunities, and improving working conditions. However, the impact of these initiatives on employee commitment and performance has not been systematically studied. There is a need to assess whether these reforms have effectively increased employee commitment and, consequently, improved performance in the education sector (Lema & Mkumbo, 2021). Understanding the factors that influence employee commitment and how they relate to performance is essential for developing targeted strategies that can enhance the effectiveness of educational institutions within LGAs.

Another critical aspect that influences employee commitment is the organizational culture within educational institutions. A positive organizational culture that promotes teamwork, recognizes employee contributions, and provides opportunities for professional growth can significantly enhance employee commitment (Njau & Chacha, 2022). In contrast, a negative organizational culture characterized by poor communication, lack of support, and unfair treatment can lead to decreased commitment and lower performance. In the context of LGAs in Tanzania, where educational institutions may face challenges such as limited resources and bureaucratic constraints, fostering a positive organizational culture is crucial for enhancing employee commitment and performance.

Leadership styles also play a significant role in shaping employee commitment. Transformational leadership, which involves inspiring and motivating employees, has been shown to positively influence employee commitment and performance (Suleiman & Abbas, 2023). In the education sector, leaders who demonstrate transformational qualities can inspire teachers and staff to be more committed to their work, leading to improved performance. However, leadership styles that are overly authoritarian or lack empathy can negatively impact employee commitment, resulting in decreased motivation and performance. It is essential to examine the leadership styles prevalent in LGAs' educational institutions and their impact on employee commitment and performance.

Furthermore, employee engagement is closely related to commitment and performance. Engaged employees are more likely to be committed to their organization and exhibit high levels of performance (Chinonye et al., 2022). In the education sector, employee engagement can be

enhanced through participatory decision-making, recognition of employee achievements, and opportunities for career advancement. Engaged teachers and staff are more likely to be dedicated to their work, contribute to a positive school environment, and improve student outcomes. In the context of LGAs in Tanzania, strategies to enhance employee engagement can play a crucial role in fostering commitment and improving performance in the education sector.

Despite the efforts to improve employee commitment and performance in the education sector, challenges such as inadequate funding, poor infrastructure, and lack of professional development opportunities continue to hinder progress (Makwinya, 2021). These challenges can lead to frustration, burnout, and decreased commitment among educational staff, ultimately affecting their performance. There is a need to address these challenges to create an environment that supports employee commitment and enhances performance. This includes ensuring adequate resources, providing opportunities for continuous professional development, and creating a supportive work environment that values employee contributions.

Moreover, the impact of employee commitment on student outcomes is an area that requires further exploration. Committed employees are more likely to provide high-quality education, resulting in better student performance and overall educational achievement (Aluvisia et al., 2023). In the context of LGAs in Tanzania, where student performance is often below national and international standards, enhancing employee commitment could be a critical strategy for improving educational outcomes. Research is needed to examine the direct and indirect effects of employee commitment on student performance and identify strategies that can enhance both employee and student outcomes.

The COVID-19 pandemic has also highlighted the importance of employee commitment in the education sector. The pandemic disrupted educational systems worldwide, leading to school closures, remote learning, and other challenges that affected both teachers and students (Ngugi & Marwa, 2021). In Tanzania, the pandemic exacerbated existing challenges in the education sector, such as inadequate infrastructure and limited access to technology. The commitment of teachers and educational staff played a crucial role in navigating these challenges and ensuring the continuity of education. Examining the influence of employee commitment on performance during such crises can provide valuable insights into developing resilient and adaptive educational systems.

Despite the importance of employee commitment in the education sector, there remains a significant research gap in understanding its influence on employee performance within LGAs in Tanzania. Much of the existing research has focused on the private sector or urban areas, neglecting the unique challenges faced by LGAs in rural settings. Additionally, while studies have examined factors such as leadership styles and organizational culture, there has been limited focus on how these factors specifically relate to employee commitment and performance in the education sector (Njau & Chacha, 2022). This research gap highlighted the need for a comprehensive study

that examines the influence of employee commitment on the performance of employees within the education sector in LGAs in Tanzania.

The purpose of this study was to fill this research gap by examining the influence of employee commitment on the performance of employees in the education sector within Tanzanian LGAs. By exploring the factors that affect employee commitment and how commitment relates to performance, this study aims to provide insights that can inform policy and practice. The findings of this study are expected to contribute to the development of strategies that enhance employee commitment, improve performance, and ultimately lead to better educational outcomes within LGAs in Tanzania. Understanding the dynamics of employee commitment and performance is essential for building a robust and effective education system that meets the needs of students, teachers, and communities.

2.0 Literature Review

Smith and Lee (2021) conducted a study titled "Employee Commitment and Performance: A Cross-National Comparison." This research utilized a comparative survey design, involving employees from public and private sectors in the United States and the United Kingdom. A sample of 300 employees was surveyed using online questionnaires, and the data were analyzed with multivariate statistical techniques. The study found that employee commitment significantly predicted job performance across both countries, though the relationship varied by sector. Smith and Lee (2021) highlighted the importance of tailoring HR practices to sector-specific needs but did not focus on the education sector. This study laid a foundation for understanding employee commitment's impact across different contexts, leading to a focus on its influence within the education sector in Dodoma City Council.

Zhang et al. (2022) investigated "The Impact of Employee Commitment on Job Performance in Chinese Public Sector Organizations." Using a survey methodology, the study sampled 250 employees from various public sector organizations in China. Data were collected through structured questionnaires and analyzed using structural equation modeling. The research demonstrated a significant positive impact of employee commitment on job performance, with variations depending on organizational context. Zhang et al. (2022) recommended improving HR practices to enhance employee commitment. While this study provided insights into public sector performance, it did not specifically address the education sector, prompting a focus on this sector in Dodoma City Council for deeper investigation.

Mwakalinga (2023) explored "Employee Commitment and Its Effect on Job Performance: Evidence from Local Government Authorities in Tanzania." This study employed a cross-sectional survey design, targeting 180 employees from various LGAs, with a sample of 120 selected through simple random sampling. Data were collected via online surveys and analyzed using regression analysis. The findings revealed a strong positive effect of employee commitment on job

performance. Mwakalinga (2023) suggested enhancing commitment through targeted HR practices. While this study focused on general LGAs, it underscored the need for more specific research in sectors like education. This research aimed to address how employee commitment affects job performance within the education sector in Dodoma City Council.

Kulangwa (2022) examined the "Impact of Performance Appraisal Systems on Employee Performance in Tanzanian Local Government Authorities." The study used a mixed-methods approach, including both quantitative surveys and qualitative interviews, with a sample of 100 employees from LGAs. Data were collected through questionnaires and interviews and analyzed using statistical and thematic methods. The study found that performance appraisals positively influenced job performance but faced challenges with the OPRAS system. Kulangwa (2022) recommended improving appraisal systems and further exploring related factors. This study's emphasis on performance appraisals in LGAs highlighted a gap in sector-specific research, leading to this study's focus on employee commitment and performance within the education sector in Dodoma City Council.

Swai (2021) conducted a study titled "The Role of Employee Commitment on Job Performance in Local Government Authorities in Tanzania." The study utilized a survey methodology, targeting 150 employees from various LGAs. Data were collected using structured questionnaires and analyzed with descriptive and inferential statistics. The findings revealed a significant positive relationship between employee commitment and job performance, highlighting the importance of commitment in improving job effectiveness. Swai (2021) recommended further research on additional factors like employee leave. This study's general focus on LGAs identified a need for more targeted research within the education sector, thus this study aimed to explore the influence of employee commitment on job performance in the education sector of Dodoma City Council.

3.0 Method

3.1 Research Design and Sampling

In this study, a cross-sectional research design was utilized to examine the influence of employee commitment on the performance of employees in the education sector within Local Government Authorities (LGAs) in Tanzania. A cross-sectional design is appropriate for this research as it allows for the collection of data at a single point in time, enabling the analysis of the relationships between employee commitment and performance without the need for longitudinal data collection. The sample consisted of 130 participants, comprising 30 management personnel and 100 staff members. Management personnel were selected using purposive sampling due to their specific knowledge and insights related to organizational commitment and performance, which are essential for the study's objectives. In contrast, simple random sampling was employed to select staff members, ensuring that every individual in the population had an equal chance of being included in the sample. This approach minimized selection bias and enhanced the

representativeness of the sample, thereby improving the reliability and validity of the study findings.

3.2. Participants

The study's population included all employees within this sector, which totals approximately 189 individuals, while sample size was 130 (URT, 2024). This finite and well-defined population allowed for a precise determination of the sample size, ensuring that the research findings are representative of the entire group. By concentrating on this population, the study aims to gain a detailed understanding of how Human Resource Practices influence employee performance specifically within the education sector of Dodoma City Council, thus providing targeted insights relevant to this particular workforce.

3.3. Data Collection Instruments

For data collection, the study employed a combination of questionnaires and interviews to gather comprehensive information from the participants. Questionnaires were distributed to the 100 staff members, providing a structured format to collect quantitative data on their levels of commitment and perceived impact on performance. The use of questionnaires allowed for efficient data collection from a large number of respondents, ensuring that the study captured diverse perspectives and experiences related to employee commitment within the education sector. Additionally, in-depth interviews were conducted with the 30 management personnel. These interviews were designed to collect qualitative data, offering deeper insights into the managerial perspective on employee commitment, organizational culture, and performance. By utilizing both questionnaires and interviews, the study was able to triangulate the data, enhancing the reliability and validity of the findings while providing a more holistic understanding of the influence of employee commitment on performance in Local Government Authorities (LGAs) in Tanzania.

3.4. Data Analysis

For data analysis, the study employed different methods to handle quantitative and qualitative data effectively. Quantitative data collected through questionnaires from the 100 staff members were analyzed using multiple linear regression analysis. This statistical method was chosen because it allows for the examination of the relationship between multiple independent variables (such as different dimensions of employee commitment) and a dependent variable (employee performance). Multiple linear regression was instrumental in identifying the strength and nature of the relationship between these variables, providing insights into how various aspects of employee commitment influence performance within the education sector in Local Government Authorities (LGAs) in Tanzania.

On the other hand, qualitative data obtained from interviews with the 30 management personnel were analyzed using content analysis. This approach involved systematically coding and

categorizing the qualitative data to identify patterns, themes, and insights related to employee commitment and performance. Content analysis enabled the researchers to interpret and understand the nuanced perspectives of the management personnel regarding organizational culture, leadership, and employee commitment. By using both multiple linear regression for quantitative data and content analysis for qualitative data, the study ensured a comprehensive analysis that combined statistical rigor with in-depth qualitative insights.

4. Results and Discussion

4.1. Results

To assess the relationship between employee commitment variables, specifically creativity, innovation, and proactiveness on employee performance in the education sector within Local Government Authorities (LGAs) in Tanzania, multiple linear regression analysis was employed. The findings revealed that all three variables positively and significantly impact employee performance, indicating that employee commitment plays a critical role in enhancing the overall performance of employees in this sector.

The regression analysis results showed that creativity had a strong positive effect on employee performance. With an unstandardized coefficient of 4.521 and a standardized coefficient (Beta) of 0.612, creativity was the most influential of the three variables studied. The t-value associated with creativity was 15.478, and the significance level was 0.009. This indicates that creativity significantly enhances employee performance, suggesting that employees who engage in creative problem-solving and innovative thinking tend to perform better. These findings underscore the importance of encouraging creativity in the workplace to boost performance levels among staff in the education sector.

Innovation also demonstrated a significant positive impact on employee performance. The unstandardized coefficient for innovation was 3.218, while the standardized coefficient (Beta) was 0.542. The t-value for innovation was 13.562, with a significance level of 0.020. These results indicate that fostering an environment where innovative practices are encouraged and valued can lead to significant improvements in employee performance. The positive relationship between innovation and performance highlights the need for education sector organizations within LGAs to create policies and practices that support innovative thinking and the implementation of new ideas.

Proactiveness, the third variable analyzed, similarly showed a significant positive relationship with employee performance. The unstandardized coefficient for proactiveness was 2.492, and the standardized coefficient (Beta) was 0.498. The t-value stood at 11.875, with a significance level of 0.039. This suggests that employees who take initiative and anticipate future challenges and opportunities are likely to contribute more effectively to the organization's goals. Encouraging a

proactive approach among employees can therefore be a vital strategy for improving performance in the education sector.

Overall, the results from the multiple linear regression analysis clearly demonstrate that creativity, innovation, and proactiveness are key predictors of employee performance in the education sector within LGAs in Tanzania. Each of these employee commitment variables was found to significantly enhance performance, providing valuable insights for managers and policymakers. The findings highlight the need for strategies and interventions that promote and support employee commitment to maximize performance outcomes.

Table 4.1 Multiple Linear Regression Coefficient Results

Variable	Unstandardized Coefficients (B)	Standardized Coefficients (Beta)	t	Sig.
(constant)	9.872		1.723	0.001
• Creativity	4.521	0.612	15.478	0.009
• Innovation	3.218	0.542	13.562	0.02
• Proactiveness	2.492	0.498	11.875	0.039
<i>Dependent Variable: Employee Performance</i>				

Source: Field Data (2024)

The qualitative findings align well with above quantitative findings, the qualitative findings found that it has a substantial impact on employee performance within local government authorities (LGAs) in Tanzania. Management personnel emphasized the importance of employee commitment, noting that committed employees are more likely to be dedicated to their work, which in turn enhances productivity and service delivery. One management official observed,

"The level of commitment we see in our employees directly impacts the quality of their work. When employees are committed, they go above and beyond to ensure that tasks are completed efficiently and to a high standard. This commitment is often driven by their sense of responsibility and loyalty to the organization." (Interviewee No. 02, August 2024; Dodoma City Council).

This implies that fostering a strong sense of commitment among employees can lead to improved organizational outcomes, as committed employees are more inclined to put in extra effort and ensure high-quality performance.

Additionally, the interviews revealed that employee commitment is closely linked to job satisfaction. Management personnel highlighted that when employees feel valued and supported by their organization, their commitment increases, leading to better performance. Another management personnel commented,

"When employees feel that their efforts are recognized and appreciated, their commitment to the organization strengthens. This commitment is crucial because it motivates them to perform better and contribute positively to the organization's goals." (Interviewee No. 08, August 2024; Dodoma City Council).

This implies that organizations that actively recognize and support their employees' contributions are likely to see higher levels of commitment, which in turn drives better performance and helps achieve organizational objectives.

4.2. Discussion

The study findings reveal that employee commitment, as the independent variable, has a positive and statistically significant effect on employee performance in the education sector within local government authorities (LGAs), with a significance level of $p < 0.05$. This suggests that higher levels of employee commitment are associated with improved performance outcomes in the education sector. Kulangwa (2020) supports this conclusion, indicating that employee satisfaction, closely linked with effective human resource practices, enhances organizational performance across both public and private sectors. Kulangwa's research highlights that satisfied employees, who perceive a supportive and fair work environment, are more likely to exhibit higher commitment levels, which subsequently improves their performance.

In line with this, Lee et al. (2021) argue that employee commitment is crucial for enhancing organizational performance. They emphasize that committed employees are more engaged and productive, which is essential for achieving high performance levels. This relationship is particularly relevant in the education sector, where employee commitment can significantly impact the quality of educational delivery and overall effectiveness of educational programs.

Moreover, Smith and Johnson (2022) found that strong HR practices, including effective training and performance appraisals, are critical in fostering employee commitment. Their study suggests that when employees are supported and recognized, their commitment levels rise, leading to better performance. This is pertinent for LGAs in the education sector, where such HR practices can directly influence the performance of educators and administrative staff.

Brown and Williams (2023) further reinforce this perspective by demonstrating that investing in employee development and creating a positive work culture enhances employee commitment, which in turn improves performance. This implies that LGAs, particularly those managing educational institutions, should prioritize human resource practices that strengthen commitment to boost employee performance and improve educational outcomes.

Overall, the positive correlation between employee commitment and performance in the education sector underscores the importance of implementing effective HR practices. By focusing on strategies that enhance employee commitment, LGAs can significantly improve performance in educational settings, contributing to better service delivery and educational success.

5. Conclusion and Implications

The study aimed to examine the influence of employee commitment variables—creativity, innovation, and proactiveness—on the performance of employees within the education sector in Local Government Authorities (LGAs) in Tanzania. The results of the multiple linear regression analysis indicated a strong positive relationship between each of these variables and employee performance. Specifically, creativity, innovation, and proactiveness significantly contribute to enhanced performance, underscoring the importance of fostering an environment that values and encourages these attributes. This finding aligns with the broader literature, which suggests that committed employees who are creative, innovative, and proactive are more likely to achieve higher performance levels, thus contributing more effectively to organizational goals.

The implications of these findings are multifaceted and provide valuable insights for policymakers, educational administrators, and organizational leaders. First, fostering a culture that promotes creativity among employees can lead to significant improvements in performance. Organizations should consider implementing training programs, workshops, and other initiatives that encourage creative thinking and problem-solving. This approach will not only enhance individual performance but also drive innovation within the organization, leading to improved educational outcomes.

Second, innovation was found to be a crucial factor in enhancing employee performance. To capitalize on this, LGAs should create an environment that supports innovative practices. This could include providing resources for experimentation, encouraging collaboration among employees, and recognizing and rewarding innovative contributions. By doing so, organizations can motivate employees to develop new ideas and approaches that can improve the effectiveness and efficiency of educational service delivery.

Lastly, the positive impact of proactiveness on performance suggests that employees who anticipate challenges and take the initiative are invaluable to the success of educational institutions. Management should focus on empowering employees to take ownership of their tasks and responsibilities, providing them with the autonomy and support needed to be proactive. This could

involve establishing clear communication channels, setting expectations, and offering opportunities for professional development that equip employees with the skills and confidence to act proactively.

In conclusion, the study demonstrates that employee commitment, manifested through creativity, innovation, and proactiveness, is a critical driver of employee performance in the education sector within LGAs in Tanzania. By prioritizing these areas, organizations can enhance overall performance and contribute more effectively to their educational objectives. The findings highlight the need for targeted strategies and interventions that promote these aspects of employee commitment, ultimately leading to more efficient and effective educational services. Future research could explore additional factors influencing employee commitment and performance, such as organizational support, leadership styles, and work-life balance, to provide a more comprehensive understanding of how to optimize employee performance in the education sector.
