Conference Message

The College of Business Education (CBE) is delighted to host its 4th Conference on Business and Economic Development (BEDC 2024), held from the 22nd to the 23rd of November 2024. This conference serves as a significant platform to address pressing economic challenges that impede the business and investment environment, ultimately aiming to foster economic development. The theme for this year's conference is "**Business and Enabled Environment for Inclusive Development**", which will be explored over two consecutive days through the presentation of research findings by various scholars.

The research presentations will focus on a range of pertinent topics, including:

- The World Economic Outlook 2023
- Sustainable Business and Economic Practices
- Digital Transformation and Start-ups
- Finance and Investment Environment
- Labour Markets and Human Resources
- Government and Economic Policy
- Industry-Specific Challenges

As an academic institution, one of our core responsibilities is to conduct research that addresses societal and economic challenges. At CBE, we have been striving to fulfil this mandate, primarily through funding sourced from our internal revenues. However, the limitations of relying solely on internal income have posed challenges, leading to fewer studies being conducted on critical issues. For academia to contribute more effectively to national development, it is imperative to empower institutions like ours.

There remains limited awareness within Tanzanian society regarding the importance of supporting higher education institutions in conducting research. Therefore, I earnestly call upon our responsive government to enhance its support for our College's research initiatives. Such support will enable us to achieve our academic and developmental goals more efficiently and productively.

Once again, I extend a warm welcome to all participants. Thank you for your attention, and I wish you fruitful discussions and deliberations during this conference.

Thank you.

Prof. Edda Tandi Lwoga

Rector – College of Business Education

The Influence of Employees' Motivation on Job Performance in Public Sector in Tanzania: A Case of the Ministry of Home Affairs

Ally Rashid¹ & Joel Rumanyika²

Email: allyschid@gmail.com

Abstract

This study investigated the influence of employees' motivation on job performance in the Ministry of Home Affairs. The study focused on the influence of extrinsic motivation and intrinsic motivation on employee performance in the Ministry of Home Affairs. The research methodology adopted for this study encompassed a cross-sectional design with a quantitative approach. The study population comprised employees from various levels within the ministry, totaling 120 individuals. A sample size of 93 participants was determined using the Yamane formula, and a simple random sampling technique was employed for participant selection. Data were collected through self-administered questionnaires. Descriptive and inferential statistical analyses were used, including multiple linear regression, using SPSS version 23 to analyze the data. The multiple linear regression analysis revealed significant predictors of employee performance within the Ministry of Home Affairs. Both intrinsic and extrinsic motivation showed positive associations with performance, with standardized coefficients (β) of 0.587 ($p < 0.001$) and 0.176 ($p = 0.036$), respectively. These results indicate that for every one-unit increase in intrinsic motivation, employee performance is expected to increase by 0.587 units, holding other variables constant. Similarly, for extrinsic motivation, a one-unit increase is associated with a 0.176-unit increase in performance. The overall model was statistically significant ($F(2, 90) = 28.491, p < 0.001$), explaining 38.8% of the variance in employee performance. This study recommends implementing comprehensive motivational strategies that encompass both intrinsic and extrinsic factors to enhance employee performance effectively.

Keywords: Employees motivation, Job performance

1. Introduction

In the dynamic landscape of modern public organizations, the pivotal role of employee performance in driving efficiency, productivity, and overall effectiveness cannot be overstated (Kapinga et al., 2018). The connection between motivated employees and organizational success has long been recognized as a cornerstone of effective management. As such, comprehending the multifaceted influence of motivation on employee performance within the context of public organizations becomes a critical endeavor (Kapinga and Kitindi, 2018; Le et al., 2021).

Motivation, the impetus that propels individuals to engage actively in their work, comprises two distinct yet interconnected dimensions: intrinsic and extrinsic factors. Intrinsic motivation

springs from an internal wellspring of passion for the work itself, the desire for personal growth, and the gratification derived from overcoming challenging tasks (Fakai, 2022; Ozkeser, 2019). This is complemented by extrinsic motivation, which hinges on external rewards like monetary incentives, acknowledgment, and a sense of job security. The amalgamation of these intrinsic and extrinsic elements forms a dynamic and intricate framework that orchestrates an individual's commitment and fervor toward their professional responsibilities (Fakai, 2022; Ozkeser, 2019). This motivational interplay cultivates a work environment where employees willingly channel their dedication and enthusiasm into tasks, resulting in a discernible elevation of both productivity and accomplishment within the broader organizational sphere (Budur & Poturak, 2021; Diamantidis & Chatzoglou, 2019).

Globally, there has been widespread recognition of motivation as a driving force behind enhanced employee performance. This acknowledgment is particularly evident in the Asian region, where countries like Indonesia and China have embraced and extensively employed motivational strategies to bolster the effectiveness of their workforce. For instance, in Indonesia, Kuswati (2020) highlights a noticeable upsurge in modern organizations employing various motivational techniques. These methods include fostering collective engagement among employees, facilitating efficient communication, providing recognition for achievements, delegating authority, and nurturing mutual attention within the workplace. The result is tangible improvements in employee performance. Similarly, in China, Bao and Nizam (2017) reveals a longstanding tradition of utilizing motivation to drive employee excellence, which has more recently been universally adopted across organizations as a pivotal catalyst for augmenting performance. Key motivational practices employed in Chinese enterprises encompass comprehensive training and development opportunities, implementing effective reward and recognition systems, and delegating authority to employees, all of which wield significant influence over enhancing employee performance (Bao & Nizam, 2017). These cross-cultural observations underscore the undeniable role of motivation in cultivating a heightened level of workforce productivity and accomplishment, ultimately contributing to organizational success. In essence, these global and regional instances underscore how motivation serves as a cornerstone in unlocking the potential of employees and driving organizational excellence.

In the African context, the deployment of motivational strategies is not a recent occurrence but rather a well-established practice spanning decades. Olusola et al., (2021) in Ghana highlights the consistent use of motivation in activating human capital and enhancing employee performance. Similarly, Ekundayo, (2018) in Nigeria underscores the enduring utilization of both intrinsic and extrinsic motivational methods, like involving employees in decision-making, rotation, fringe benefits, bonuses, and promotions. These strategies collectively elevate employee performance. In Ethiopia, Muogbo, (2018) emphasizes a prevalent reliance on extrinsic motivations, such as salaries, incentives, recognition, and promotions, posing a challenge for effective compensation policies. Similarly, Waiyaki, (2019) strengthens the significant correlation between employee motivation and job performance, highlighting how intrinsic factors like recognition and a genuine passion for work contribute to heightened employee performance.

In Tanzania, motivation's role in elevating employee performance is deeply entrenched, with decades of application that continues to be embraced by contemporary organizational

managers. Noel (2019) underscores the significance of both intrinsic and extrinsic motivation in Tanzanian organizations, urging a consistent review of motivational strategies to enhance employee engagement and thereby drive effective performance improvements. Similarly, Mlangala and Thomas (2022) emphasize salaries as the foremost driver inspiring employees to excel and deliver quality services. Allowances emerge as a potent motivational element, fostering a sense of value and dedication. Furthermore, optimal working conditions are acknowledged as vital for ensuring service excellence through comfortable, healthy, and secure environments. Lastly, the imperative of career development is highlighted, enabling employees to enhance their skills and competencies, ultimately empowering them to provide top-notch services aligned with client requirements. Nevertheless, recent evidence highlights the challenges faced by contemporary organizations, including poor employee performance and inadequacy of the provided motivation packages to address employees' social and economic requirements (Mwijarubi, 2021; Noel, 2019; Senkoro, 2021).

The Tanzania Ministry of Home Affairs, as a prominent player in the country's public sector, stands as an exemplar of an entity where employee performance has far-reaching implications. With responsibilities spanning national security, immigration, and civil registration, the ministry's operations are diverse and demand a workforce that is not only skilled but also consistently driven to excel. The connection between motivation and employee performance has been thoroughly examined in organizational studies, as most studies focused on other aspects such as challenges and strategies for enhancing motivation while overlooking the motivational variables such as extrinsic motivation and intrinsic motivation (Kapinga, 2018; Seiph, 2021).

The implementation of employee motivation within Tanzanian public organizations has received noteworthy focus from managers. The efficacy of employee motivation in elevating performance and driving organizational success has been well established, leading contemporary managers to allocate substantial resources toward enhancing employee motivation. This strategic investment is driven by the anticipation of improved performance and a heightened competitive edge for the (Kapinga, 2020; Seiph, 2021).

To boost employee performance in Tanzanian public organizations, the government introduced the Public Service Pay and Incentive Policy of 2010 (URT, 2021). This initiative aims to attract and retain highly qualified personnel in the public sector while simultaneously motivating employees by establishing fair and balanced remuneration structures. The policy highlights the importance of improved pay as a key incentive for maximizing potential and enhancing employee performance. Additionally, the government adopts principles that ensure an equitable geographical distribution of staff, implementing various strategies to enhance staff motivation (URT, 2021).

However, despite the government's endeavors to enhance employee motivation in Tanzania, still numerous challenges persist within the public sectors that hinder the realization of optimal employee performance (Mwijarubi, 2021; Senkoro, 2021). The previous research has highlighted the issues such as; service delivery delays, poor quality of services (QoS), low client retention rates, and unsatisfactory customer satisfaction levels, and thus, leading to inquiries and doubts on the efficacy of the motivation strategies implemented by the government (Mlangala and Thomas, 2022; Seiph, 2021). Moreover, this problem has led to

over increasing problem of employee turnover within the Ministry of Home Affairs where 9 cases of turnover were reported in year 2022 (URT, 2022).

The body of literature have identified that the influence of motivation on employees' performance within the public sector (Kapinga, Seiph, 2021 Mlangala & Samson Thomas, 2022) has limited attention and there has been no direct investigation conducted within the Ministry of Home Affairs. Most of studies investigated on the challenges and impacts, but overlooked the influence of motivational variables especially extrinsic motivation intrinsic motivation within the Ministry of Home Affairs. Consequently, there arises a compelling necessity for an in-depth analysis of the influence of motivation on employee performance in a Public Organization, particularly focusing on the context of the aforementioned ministry. This study aimed at examining the influence of motivation on employee performance in the Ministry of Home Affairs in Tanzania. To our knowledge this gap has not yet been filled within these specific organizational contextual settings.

2.0 Literature Review

2.1 Theoretical Review

Self-Determination Theory (SDT) proposed by Deci and Ryan in 1985 was selected as relevant theoretical framework. SDT focuses on intrinsic and extrinsic motivation and how these factors influence human behavior and performance (Ryan & Deci, 2017). The theory posits that individuals have inherent psychological needs for autonomy, competence, and relatedness, and the fulfillment of these needs' leads to motivation and enhanced performance. Intrinsic motivation is driven by internal factors such as personal enjoyment, fulfillment, or interest in the task itself, while extrinsic motivation is influenced by external factors like rewards, recognition, or coercion (Deci et al., 2017).

The strengths of the Self-Determination Theory lie in its comprehensive approach to understanding motivation. It highlights the significance of intrinsic motivation in fostering sustained interest and engagement in tasks, emphasizing the importance of autonomy and personal growth. Additionally, SDT's applicability across various contexts and its support from empirical research contribute to its credibility (Good et al., 2022). However, one of its weaknesses is that the theory might oversimplify the complexities of motivation by solely categorizing it into intrinsic and extrinsic forms. It may not adequately address certain individual differences or cultural variations that can impact motivation. Moreover, while SDT acknowledges the importance of intrinsic motivation, the theory does not provide precise strategies to enhance it in practical settings (Fischer et al., 2019).

In the context of the study within the Ministry of Home Affairs, the Self-Determination Theory is relevant as it provides a framework to assess both intrinsic and extrinsic motivators affecting employee performance. By examining how autonomy, competence, and relatedness influence motivation within this specific work environment, the theory can shed light on how to enhance employee engagement and job performance. However, it's essential to recognize the limitations of the theory in capturing the full spectrum of motivational factors unique to the Ministry of Home Affairs and consider combining it with other theories or models for a more comprehensive understanding of motivation and performance in this setting.

2.2 Empirical Review

In Fischer et al., (2019) study, the primary aim was to explore how extrinsic motivators can complement intrinsic motivation to enhance creativity and innovation among knowledge workers in Germany. Employing a combination of Amabile and Pratt's model of creativity in organizations along with principles from Ryan and Deci's self-determination theory, the research gathered quantitative data from 90 knowledge workers in an international consulting firm through an online self-assessment tool. Analysis revealed that intrinsic motivation positively correlated with creative and innovative performance, confirming established beliefs. Notably, the study found that relational rewards, one facet of extrinsic motivation, significantly moderated the relationship between intrinsic motivation and creativity/innovation performance. Specifically, higher perceived probabilities of receiving relational rewards alongside elevated intrinsic motivation levels resulted in more pronounced positive effects on creative and innovative outcomes. However, the anticipated impact of transactional rewards as a moderator on the relationship between intrinsic motivation and creative/innovative performance was not supported by the empirical findings. These results provided practical implications for organizations seeking to stimulate creativity and innovation among their knowledge workers.

Good et al., (2022) study conducted a meta-analysis based on the self-determination theory to explore the differing impacts of intrinsic and extrinsic motivation on salesperson performance. The research encompassed data from 127 studies, including 77,560 participants and 293 effect sizes. The findings revealed a significant association between motivation and salesperson performance. Moreover, the analysis indicated that intrinsic motivation exhibited a stronger association with performance compared to extrinsic motivation. Multivariate analyses, considering various sample characteristics, consistently supported the notion that intrinsic motivation had a more robust impact on salesperson performance than extrinsic motivation. The study's discussion highlighted the theoretical implications of these findings, offered practical insights for sales managers, and suggested potential directions for future research in this field.

A study conducted by Makki and Abid, (2017) in Pakistan investigated the impact of both intrinsic and extrinsic motivation on employees' task performance, exploring potential differences between males and females in task performance based on their levels of intrinsic and extrinsic motivation. Utilizing the Work Preference Inventory developed by Amabile et al. (1994) and the Job Performance Scale by Goodman and Svyantek (1999), the research aimed to establish positive correlations between intrinsic and extrinsic motivation and employees' task performance while predicting their influence on task performance. The study's results affirmed the presence of a positive correlation between both intrinsic and extrinsic motivation and employees' task performance, indicating that these motivational factors significantly affect task performance. Moreover, the findings suggested that females tend to exhibit higher levels of intrinsic motivation in comparison to males.

Shaikh et al., (2018) research aimed to evaluate the impact of extrinsic motivation on employee performance, conducting a comparative analysis between the food and textile industries in Sindh, Pakistan. The study focused on investigating the effects of external motivational elements on employees' performance using Herzberg's two-factor theory within these specific industries. A seven-point Likert scale was utilized for the survey, and reliability tests were conducted to assess the internal consistency of the extrinsic factors as independent variables

and employees' performance as the dependent variable. Data analysis involved techniques such as Pearson correlation, Analysis of Variance (ANOVA), t-tests, and multiple regression. The findings indicated that all extrinsic factors had positive and significant effects on employees, underscoring the importance of these factors in enhancing employee performance. This study contributes valuable insights into the significance of extrinsic motivational factors in improving overall employee performance within these industries.

Yusuf, (2021) investigation centered on assessing the impact of intrinsic and extrinsic motivation on employee performance, with a focus on job satisfaction as a potential intervening variable at PT. Alwi Assegaf Palembang. The study aimed to analyze how intrinsic and extrinsic motivations influenced employee performance with data obtained from 51 respondents using a Likert scale questionnaire. The analysis employed Smart-partial least square methodology. The findings revealed a significant and positive influence of intrinsic motivation on employee performance. However, the study did not find a significant influence of extrinsic motivation on employee performance. Interestingly, job satisfaction did not function as an intervening variable between either intrinsic or extrinsic motivations and employee performance. Nevertheless, the research indicated that both intrinsic and extrinsic motivations positively affected employee job satisfaction. Specifically, intrinsic motivation had a notably positive impact on performance, whereas the impact of extrinsic motivation on performance was not statistically significant. Moreover, the study did not find job satisfaction to mediate between intrinsic and extrinsic motivations and performance in this context.

Buabeng and Adomah-Afari, (2023) research aimed to explore the impact of motivation (both intrinsic and extrinsic) on the job performance of clinical health personnel at the Korle-Bu Teaching Hospital in Ghana's Greater Accra Region in June 2016. The study employed a quantitative approach, with 324 clinical health personnel responding to a structured questionnaire. Statistical analysis, conducted using Stata version 13, involved ANOVA tests to compare motivational effects on job performance and simple as well as multiple linear regression models to estimate the influence of independent variables on the outcome. The results highlighted intrinsic motivation factors like achievement, personal satisfaction, and incentive packages, which significantly influenced health workers' performance. Moreover, extrinsic motivation factors such as equipment availability, job security, interpersonal relationships with colleagues, recognition, promotion, salary improvements, and workload, were found to significantly impact job performance. The multiple regression analysis revealed that both intrinsic and extrinsic motivation factors had a significant association with job performance, indicating their importance in influencing the performance of health workers in a clinical setting.

Milka et al., (2018) study delves into investigating the influence of extrinsic motivation on employee performance within medium-class hotels in Kisumu city, Kenya. The specific objectives were to assess how working conditions, incentives, and interpersonal relations impact employee performance. Employing a survey research design, the study targeted employees within these hotels, utilizing simple random and stratified sampling techniques. Research questionnaires served as the primary data collection tool. Analytical methods included both descriptive and inferential statistics, utilizing Pearson product-moment correlation and multiple regression analysis. The study's findings indicated that no single form of extrinsic motivation singularly led to optimal performance; instead, combinations of various

extrinsic motivators were deemed necessary for effective performance. Additionally, the research concluded that enhanced extrinsic motivation significantly improved employee performance, particularly in medium-class hotels, with managers advised to focus on increasing extrinsic motivators to enhance overall employee performance in these setting.

Ikasu, (2018) study investigated the correlation between extrinsic motivators and the performance of employees within the Iringa Municipal Council in Tanzania. The research involved administering a structured questionnaire to 130 team supervisors to assess this relationship. The findings revealed that changes in three specific types of extrinsic motivation such as career development initiatives, improvements in working and employment conditions, and rewards had an impact on the performance of employees and their respective teams. However, among these motivators, career development initiatives and enhancements in working conditions exhibited a more substantial influence on employee and team performance. This significance could be attributed to the fact that career development opportunities and improvements in working conditions were directly accessible to the teams and their supervisors. Conversely, the implementation of rewards faced constraints as it necessitated approval and endorsement from both the central government and the council's top management, potentially limiting its feasibility and immediate impact on employee and team performance.

Mugabo, (2022) study focused on assessing the influence of intrinsic motivation on employee performance in private primary schools in Tanzania, particularly investigating Millennium Kindergarten and Primary School Saint Joseph in Da es Salaam. The research aimed to explore the impact of autonomy, mastery, and purpose; three variables drawn from Pink Intrinsic Theory on employee performance. Using simple random sampling, 74 samples were obtained from a pool of 96 school employees. The study employed descriptive statistics and Pearson correlation analysis to analyze the relationships between variables. The findings indicated significant and positive correlations between autonomy, mastery, purpose, and employee performance. Specifically, autonomy demonstrated a strong and significant positive correlation with performance, as did mastery and purpose. Based on these results, the study recommended that granting employees more freedom of choice could enhance their autonomy, providing additional skills training could boost mastery, and ensuring opportunities for independent work and idea contribution could strengthen purpose and ultimately improve employee performance in such educational settings.

2.3 Conceptual Framework

The study, posits that a combination of intrinsic and extrinsic motivation factors significantly influences various dimensions of employee performance within the Ministry of Home Affairs. Intrinsic motivators such as passion for the work, personal interest, autonomy, mastery of skills, and challenging tasks are anticipated to enhance employees' sense of accomplishment, personal growth, and development. Simultaneously, extrinsic motivators including monetary rewards, recognition, promotions, job security, fringe benefits, and bonuses are expected to contribute to employees' motivation and job satisfaction.

3.0 Methodology

3.1 Sampling, Questionnaire Design and Data Collection

This study was conducted within the Ministry of Home Affairs. The study population included of employees working within the Ministry of Home Affairs, particularly those holding leadership positions like managerial personnel and regular staff members, chosen due to their wealth of information. A sample of 93 was involved in the study as indicated by Yamane formula where n represents the sample size, while N Total population size of 120, e Desired level of precision (margin of error) of 5%.

$$n = N / (1 + N(e^2))$$

$$n = 120 / (1 + 120(0.05^2))$$

$$n = 93$$

Therefore, 93 respondents.

The data collection process primarily involved gathering firsthand data using both questionnaires and interviews. The questionnaires were designed firstly to capture the demographic features of the respondents such as age, gender, level of education. The second part of the questionnaire was capturing the variable information on Intrinsic motivation and Extrinsic motivation. Questions were formulated as statements and rated on a five-point Likert-type scale, ranging from 1 for "strongly disagree" to 5 for "strongly agree".

3.2 Data Analysis

Both qualitative and quantitative data analysis was engaged in this study. Qualitative data analysis was supported from the information of interviews whereas qualitative data analysis was used to analyse data received interviews through thematic approach to analyse the qualitative data collected through interviews through MAXQDA. In this approach, the respondents' gathered responses from interview were recorded, organised, reviewed, categorised, and re-coded in MAXQDA in order to develop and explain themes do be presented in the study findings. Quantitative data were examined using IBM SPSS Statistics version 23. Descriptive Statistics were used to analyse Demographic information showing frequencies and percentages. To examine the influence of Intrinsic motivation and Extrinsic motivation, on the Ministry of Home Affairs descriptive statistics and Multiple Linear Regression analysis

were used to organize the data and analyse these objectives, where the following model was developed;

Model

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + e$$

Where;

Y = Dependent Variable (Employee performance)

β = Beta coefficient

X₁ = Intrinsic Motivation

X₂ = Extrinsic Motivation

β_1 = Regression coefficient for X₁

β_2 = Regression coefficient for X₂

e = error term

The reliability of data was computed through Cronbach's Alpha Value which was measured through perceptions and expectations of all dimensions namely; Intrinsic Motivation, Extrinsic Motivation and Employee Performance. The results showed that all of the dimensions had an Alpha value above the acceptable level of 0.7. Thus, the results in Table 1 confirm that the measurement instruments for the study were reliable.

Table 1: The Cronbach's Alpha Values

Construct	Number of items	Cronbach's Alpha
Intrinsic Motivation	7	0.772
Extrinsic Motivation	7	0.719
Employee Performance	5	0.742

4.0 Findings and Discussion

4.1 Descriptive Results

A descriptive analysis test was run to examine the respondents' gender, age, education, working experience, employee status as shown in Table 2. Out of 93 respondents, 53.8% of the respondents were males and 46.2% were females. Our respondents were mostly between the ages of 18 and 35 (50.5%), followed by those between the ages of 36 and 55 years (29%). According to their educational background, bachelor's degrees made up the majority (45.2%), followed by Diploma (29%). 45.2% of respondents were having five years of working experience and above, followed by with two to five years of working experience 33.3%. and 91.4% were permanent employees followed by temporary employees with 8.6%

Table 2: Descriptive Results

Attributes	Distribution	%
Gender	Male	53.8
	Female	46.2
Age	18-35	50.5
	Between 36-55	29
	55 and above	20.4
Education	Certificate	18.3
	Diploma	29
	Bachelor's Degree	46.2
	Postgraduate	7.5
Working experience	Permanent	91.4
	Temporary	8.6
Employment status	Business/Work	55
	Tourism	8.4
	Family visit	36.7

4.2 The Influence of Extrinsic Motivation on Employee Performance in the Ministry of Home Affairs.

The findings in table 3 on the influence extrinsic motivation within the Ministry of Home Affairs, Engaging in challenging tasks emerged as the highest scoring statement, with a mean score of 4.1720, indicating strong agreement among participants regarding the motivating influence of challenging work assignments. This was closely followed by "My passion for the work significantly drives my motivation," which obtained a mean score of 4.1075. Both statements reflect the significance of intrinsic factors, such as personal interest and passion, in driving employee motivation within the Ministry of Home Affairs.

Furthermore, achieving a sense of accomplishment garnered a mean score of 3.2366, indicating a notable influence on motivation levels. This suggests that employees value the recognition and satisfaction derived from completing tasks successfully. Additionally, gaining mastery of skills received a mean score of 3.8065, emphasizing the importance of skill development as a motivator in the workplace.

Having autonomy and control over work tasks attained a mean score of 3.4731, indicating that employees perceive autonomy as a moderately influential factor in motivating their performance. Similarly, personal growth and development through work tasks received a mean score of 3.8280, highlighting the significance of opportunities for learning and advancement in fostering employee motivation.

These findings collectively demonstrate the positive influence of extrinsic motivational factors on employee performance within the Ministry of Home Affairs. Engaging in challenging tasks, personal passion for work, and opportunities for skill development emerged as key drivers of employee motivation, underscoring the importance of fostering a work environment that supports these aspects to enhance overall performance and productivity. These findings have been discussed in relating to other studies below;

Good et al., (2022) conducted a meta-analysis on the impacts of intrinsic and extrinsic motivation on salesperson performance and found that intrinsic motivation exhibited a stronger association with performance compared to extrinsic motivation. This contrasts with the findings of the present study, which emphasize the significant positive influence of extrinsic motivational factors on employee performance within the Ministry of Home Affairs.

Makki and Abid, (2017) investigated the impact of both intrinsic and extrinsic motivation on employees' task performance and found positive correlations between both types of motivation and task performance. While this aligns with the present study's findings regarding the positive influence of extrinsic motivational factors on employee performance, the emphasis on task performance specifically differs from the broader focus on overall performance in the Ministry of Home Affairs.

Table 3: The Influence of Extrinsic Motivation on Employee Performance in the Ministry of Home Affairs (n = 93)

Statement	Minimum	Maximum	Mean	Std. Deviation
My passion for the work significantly drives my motivation.	2.00	5.00	4.1075	.84006
My personal interest in the tasks strongly influences my motivation levels.	1.00	5.00	3.8925	1.19294
Achieving a sense of accomplishment greatly motivates me.	1.00	5.00	3.2366	1.38625
Having autonomy and control over my work strongly impacts my motivation.	1.00	5.00	3.4731	1.33995

Gaining mastery of skills is a significant motivator for me.	1.00	5.00	3.8065	1.20016
Engaging in challenging tasks greatly motivates me.	1.00	5.00	4.1720	.96260
Personal growth and development through work tasks are essential motivators for me.	1.00	5.00	3.8280	.98493

4.3 The Influence of Intrinsic Motivation on Employee Performance in the Ministry of Home Affairs.

The Descriptive Statistics Results for the Influence of Intrinsic Motivation on Employee Performance in the Ministry of Home Affairs, as depicted in Table 4, unveil intriguing insights into the factors that drive employee engagement and productivity. Among these factors, "The additional perks and benefits provided greatly affect my motivation at work" stands out with the highest mean score of 4.4301. This finding suggests that employees highly value the supplementary rewards and benefits offered by the organization, implying that such incentives play a pivotal role in bolstering intrinsic motivation levels.

Following closely, "The recognition and praise I receive significantly boost my motivation" garners a noteworthy mean score of 4.3333. This outcome underscores the profound impact of acknowledgment and appreciation on employee morale and commitment within the Ministry of Home Affairs. When employees feel recognized and valued for their contributions, they are more likely to feel motivated to excel in their roles, thereby positively influencing overall performance outcomes.

Additionally, "The organization provides promotion and advancement which motivates me to excel in my work" and "Being entrusted with responsibilities and authority strongly motivates me" both attained high mean scores of 4.3118 and 4.2903, respectively. These findings underscore the importance of opportunities for career growth and increased responsibility as significant drivers of intrinsic motivation among employees. When individuals perceive a clear path for advancement and are entrusted with challenging responsibilities, they are more inclined to invest their energy and effort into achieving organizational goals, thereby enhancing employee performance.

While monetary rewards are acknowledged as important, as indicated by the mean score of 4.2796 for "The monetary rewards I receive are sufficient and motivate me to perform better," it's notable that they do not hold the highest influence on intrinsic motivation. This suggests that while monetary compensation is necessary to meet basic needs, it may not be the primary driver of employee engagement and performance within the Ministry of Home Affairs.

Lastly, "Bonuses and incentives I receive greatly motivate me to improve my performance" garnered a mean score of 3.7097. While bonuses and incentives are recognized as motivators,

their impact may be perceived as less significant compared to other intrinsic factors such as recognition, career advancement, and additional benefits.

Overall, these findings highlight the multifaceted nature of intrinsic motivation and its positive influence on employee performance within the Ministry of Home Affairs. By prioritizing factors such as recognition, career advancement opportunities, and supplementary benefits, organizations can cultivate a work environment that fosters intrinsic motivation, thereby enhancing employee engagement, productivity, and overall organizational success.

Table 4: Descriptive analysis on The Influence of Intrinsic Motivation on Employee Performance in the Ministry of Home Affairs (n = 93)

Statement	Minimum	Maximum	Mean	Std. Deviation
The monetary rewards I receive are sufficient and motivate me to perform better.	2.00	5.00	4.2796	.79899
The recognition and praise I receive significantly boost my motivation.	1.00	5.00	4.3333	.95932
The organization provides promotion and advancement which motivates me to excel in my work	2.00	5.00	4.3118	.90864
The organization offers job security which significantly impacts my motivation.	1.00	5.00	3.9462	1.00397
The additional perks and benefits provided greatly affect my motivation at work.	1.00	5.00	4.4301	.92546
Bonuses and incentives, I receive greatly motivate me to improve my performance.	1.00	5.00	3.7097	.85441
Being entrusted with responsibilities and authority strongly motivates me.	2.00	5.00	4.2903	.82857

The findings of this study underscore the multifaceted nature of intrinsic motivation and its positive impact on employee performance within the Ministry of Home Affairs. By prioritizing factors such as recognition, career advancement opportunities, and supplementary benefits, organizations can cultivate a work environment that fosters intrinsic motivation, leading to enhanced employee engagement, productivity, and overall organizational success. These findings have been discussed in relation to other studies as follows;

Kuswati, (2020) conducted research in Budapest to demonstrate the influence of motivational factors on employee performance. While the present study focuses on intrinsic motivation within the Ministry of Home Affairs, Kuswati's findings align conceptually by highlighting the positive effect of motivation on performance, although their study does not specify the type of motivation.

Abdi et al., (2017) evaluated motivation's impact on employee performance within Hormuud Company in Somalia, emphasizing the significance of monetary rewards and job enrichment. While both studies emphasize the positive link between motivation and performance, Abdi et al.'s findings extend to extrinsic motivational factors like monetary rewards, contrasting with the focus on intrinsic motivation in the present study.

Sipayung et al., (2021) explored motivation's influence on employee performance at the Environmental Services Office of Deli Serdang Regency in Indonesia. While they consider motivation, workload, and work environment, with job satisfaction as an intervening variable, their findings still corroborate the importance of motivation in driving performance, albeit in a different organizational context.

Engidaw, (2021) investigated the impact of motivation on employee engagement in public sectors within Ethiopia, emphasizing the role of both intrinsic and extrinsic motivation. Their findings align with the present study's emphasis on the importance of motivation, although their research extends to employee engagement as an outcome measure.

Twalib, (2020) assessed motivation's impact on employee performance within Telkom Kenya Limited, demonstrating a significant relationship between motivation and performance. While Twalib's study focuses on the telecommunications sector and does not specify the type of motivation, its findings resonate with the broader theme of motivation's positive influence on performance.

Machenje, (2019) studied motivation factors affecting employee performance at OUT in Tanzania, highlighting challenges and dissatisfaction with existing motivation strategies. Although their study covers various types of motivation, including financial rewards, it underscores the need to address motivational challenges to improve performance, aligning with the present study's emphasis on cultivating a motivating work environment.

Mnyoty, (2019) investigated motivation's impact on the performance of librarians at the University of Dodoma, emphasizing rewards and training opportunities as motivational factors. While their study focuses on a specific occupational group, its findings resonate with the broader theme of motivation's influence on performance, reinforcing the importance of recognizing and addressing motivational needs.

The empirical studies discussed highlight the importance of motivation in driving employee performance across different organizational contexts. While the specific motivational factors and organizational settings may vary, the consistent finding is that motivation, whether intrinsic or extrinsic, positively impacts performance. Organizations can leverage these insights to develop tailored motivational strategies that address the unique needs and preferences of their

employees, ultimately leading to improved performance and organizational success. By fostering a motivating work environment that recognizes and rewards employees' efforts, organizations can enhance employee engagement, productivity, and job satisfaction, contributing to overall performance and competitiveness in the market.

4.4 Descriptive Statistics Results for Employee Performance in the Ministry of Home Affairs

The Descriptive Statistics Results for Employee Performance in the Ministry of Home Affairs, are provided in Table 5. This table delineates the minimum, maximum, mean, and standard deviation scores for various statements pertaining to employee performance.

Among these statements, "I consistently deliver products or services that exceed industry standards, ensuring high customer satisfaction and positive feedback" emerges with the highest mean score of 4.3978. This indicates a strong perception among employees that they consistently produce work that not only meets but surpasses industry benchmarks, thereby ensuring exceptional customer satisfaction. Such a perception is indicative of a high level of dedication and commitment to delivering quality services within the Ministry of Home Affairs.

Following closely, "I consistently meet or surpass the objectives and goals set for my role within the organization" and "I optimize resources effectively in my tasks, resulting in cost savings without compromising quality" both garnered notable mean scores of 4.3441 and 4.3656, respectively. These findings underscore the employees' confidence in their ability to meet organizational objectives efficiently while maintaining high standards of quality. It reflects a proactive approach to task management and resource utilization, which are essential components of effective performance within the Ministry.

Additionally, "I experience high job satisfaction, which results in my commitment to staying with the organization for an extended period" obtained a mean score of 3.9140. While slightly lower than the aforementioned statements, this score still signifies a positive perception of job satisfaction among employees. Job satisfaction plays a crucial role in fostering employee commitment and retention, which are vital for organizational stability and continuity.

Lastly, "I consistently complete my tasks or projects within or ahead of deadlines without compromising quality" garnered a mean score of 3.7742. While slightly lower than other statements, this score still indicates a strong commitment to meeting deadlines while upholding quality standards, which is essential for efficient organizational operations.

Overall, these findings suggest a positive perception of employee performance within the Ministry of Home Affairs. Employees demonstrate a strong commitment to meeting organizational objectives, optimizing resources, delivering high-quality services, and meeting deadlines. Such perceptions are indicative of a motivated and dedicated workforce, which bodes well for organizational effectiveness and public service delivery within the Ministry.

Table 5: Employee Performance in the Ministry of Home Affairs (n = 93)

Statement	Minimum	Maximum	Mean	Std. Deviation
I consistently meet or surpass the objectives and goals set for my role within the organization.	1.00	5.00	4.3441	.94977
I optimize resources effectively in my tasks, resulting in cost savings without compromising quality.	2.00	5.00	4.3656	.88201
I experience high job satisfaction, which results in my commitment to staying with the organization for an extended period.	1.00	5.00	3.9140	.96297
I consistently deliver products or services that exceed industry standards, ensuring high customer satisfaction and positive feedback.	1.00	5.00	4.3978	.95712
I consistently complete my tasks or projects within or ahead of deadlines without compromising quality.	1.00	5.00	3.7742	.95700

4.5 Binary Logistic Regression Results

a) Model Summary Results

The table reveals that the model exhibits a moderate level of explanatory power, with an R Square value of 0.388. This indicates that approximately 38.8% of the variance in Employee Performance can be explained by the combined influence of intrinsic and extrinsic motivation variables.

Furthermore, the Adjusted R Square value, which accounts for the number of predictors in the model, stands at 0.374. This adjusted value reflects the model's goodness of fit, considering the potential overfitting or underfitting due to the inclusion of predictors.

Table 6: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					
					R Square Change	F Change	df1	df2	Sig. Change	F
1										

1	.62 3 ^a	.388	.374	.66462	.388	28.491	2	90	.000
---	-----------------------	------	------	--------	------	--------	---	----	------

a. Predictors: (Constant), Intrinsic Motivation, Extrinsic Motivation

b) Coefficient regression results of significant relationship that exists between motivation variables and employee performance in the ministry of home affairs

The Coefficient Regression Results, outlined in Table 7, provide insights into the coefficients associated with the regression model assessing the relationship between motivation variables (both intrinsic and extrinsic) and Employee Performance within the Ministry of Home Affairs. Firstly, the table presents the constant term, with a coefficient of 1.798 and a standard error of 0.394. This constant represents the expected value of Employee Performance when the predictors (Intrinsic Motivation and Extrinsic Motivation) are zero.

Moving on to the predictors, the coefficient for Intrinsic Motivation is reported as 0.413, with a standard error of 0.058. This indicates that for every one-unit increase in Intrinsic Motivation, Employee Performance is expected to increase by 0.413 units, holding all other variables constant. The standardized coefficient (Beta) for Intrinsic Motivation is 0.587, suggesting a relatively strong positive relationship between Intrinsic Motivation and Employee Performance.

Similarly, the coefficient for Extrinsic Motivation is reported as 0.163, with a standard error of 0.076. This implies that for every one-unit increase in Extrinsic Motivation, Employee Performance is expected to increase by 0.163 units, all else being equal. The standardized coefficient (Beta) for Extrinsic Motivation is 0.176, indicating a weaker positive relationship between Extrinsic Motivation and Employee Performance compared to Intrinsic Motivation. The t-values associated with both Intrinsic Motivation (7.098) and Extrinsic Motivation (2.129) are statistically significant at $p < 0.05$, suggesting that both predictors have a significant impact on Employee Performance.

Finally, the confidence intervals for the coefficients provide a range of values within which the true population coefficient is likely to fall with 95% confidence. For Intrinsic Motivation, the confidence interval ranges from 0.297 to 0.529, while for Extrinsic Motivation, it spans from 0.011 to 0.314.

In summary, the Coefficient Regression Results demonstrate that both Intrinsic Motivation and Extrinsic Motivation significantly contribute to explaining Employee Performance within the Ministry of Home Affairs. Specifically, higher levels of Intrinsic Motivation have a stronger positive impact on Employee Performance compared to Extrinsic Motivation, as indicated by their respective coefficients and standardized coefficients.

Table 7: Coefficient Regression Results

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B
-------	-----------------------------	---------------------------	---	------	---------------------------------

		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	1.798	.394		4.562	.000	1.015	2.582
	Intrinsic Motivation	.413	.058	.587	7.098	.000	.297	.529
	Extrinsic Motivation	.163	.076	.176	2.129	.036	.011	.314

a. Dependent Variable: Employee Performance

c) ANOVA Results

The ANOVA Results, as presented in Table 8, offer insights into the statistical significance of the regression model assessing the relationship between motivation variables (both intrinsic and extrinsic) and Employee Performance within the Ministry of Home Affairs.

Under Regression, the Sum of Squares is reported as 25.170, with 2 degrees of freedom (df) and a Mean Square of 12.585. This signifies the amount of variability in Employee Performance that is accounted for by the regression model containing the predictors (Intrinsic Motivation and Extrinsic Motivation). The F-value, calculated as 28.491, indicates the ratio of the variability explained by the model to the unexplained variability. The associated significance level (Sig.), reported as .000, suggests that the regression model is statistically significant at $p < 0.05$, indicating that at least one of the predictors significantly contributes to explaining Employee Performance.

Under Residual, the Sum of Squares is 39.755, with 90 degrees of freedom, and a Mean Square of 0.442. This component represents the unexplained variability in Employee Performance that is not accounted for by the regression model. The Total Sum of Squares, representing the total variability in Employee Performance, is reported as 64.925, with 92 degrees of freedom.

In summary, the ANOVA Results indicate that the regression model, including both Intrinsic Motivation and Extrinsic Motivation as predictors, significantly explains the variability in Employee Performance within the Ministry of Home Affairs. The significant F-value and associated p-value suggest that the model as a whole is statistically significant in predicting Employee Performance.

Table 8: ANOVA Results

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	25.170	2	12.585	28.491	.000
	Residual	39.755	90	.442		

Total	64.925	92
a. Dependent Variable: Employee Performance		
b. Predictors: (Constant), Intrinsic Motivation, Extrinsic Motivation		

5.0 Conclusion and recommendation

5.1 Conclusion

In conclusion, the findings of this study underscore the significant role of both intrinsic and extrinsic motivation in influencing employee performance within the Ministry of Home Affairs. The analysis revealed that factors such as engaging in challenging tasks, personal passion for work, recognition, career advancement opportunities, and supplementary benefits all contribute to fostering a work environment conducive to higher employee performance. These results align with existing literature on motivational theory, emphasizing the importance of addressing both intrinsic and extrinsic motivators to enhance employee engagement and productivity.

Furthermore, the regression analysis provided quantitative evidence supporting the qualitative findings, demonstrating the statistically significant impact of intrinsic motivational factors on employee performance. The strong overall fit of the regression model indicates that a substantial portion of the variance in employee performance can be attributed to intrinsic motivational factors, highlighting their crucial role in shaping organizational outcomes.

Practically, these findings have important implications for organizational management within the Ministry of Home Affairs and similar government institutions. By understanding the drivers of employee motivation and performance, managers can implement targeted strategies to cultivate a supportive work environment that encourages high performance. This may involve initiatives such as providing opportunities for skill development, offering meaningful recognition, and designing career advancement pathways to foster intrinsic motivation among employees.

In conclusion, fostering a culture of motivation and empowerment within the Ministry of Home Affairs is essential for optimizing employee performance and achieving organizational objectives. By investing in both intrinsic and extrinsic motivators, organizations can create a work environment where employees feel valued, engaged, and motivated to perform at their best, ultimately contributing to overall organizational success.

5.2 Recommendation

To the Leadership and Management of the Ministry of Home Affairs: It is recommended that the leadership and management of the Ministry of Home Affairs prioritize the implementation of policies and initiatives aimed at enhancing both intrinsic and extrinsic motivation among employees. This could involve developing comprehensive reward systems that recognize and celebrate employee achievements, providing opportunities for professional development and career advancement, and fostering a supportive work environment that values employee well-

being and satisfaction. Additionally, leadership should lead by example by demonstrating a commitment to transparency, communication, and employee empowerment, thereby creating a culture of trust and collaboration within the organization.

To Human Resources Departments: Human resources departments play a pivotal role in driving employee motivation and performance within organizations. It is recommended that HR departments at the Ministry of Home Affairs focus on conducting regular assessments of employee needs and preferences to tailor motivational strategies accordingly. This may involve implementing employee feedback mechanisms, conducting surveys to gauge satisfaction levels, and analyzing turnover rates to identify areas for improvement. Moreover, HR departments should prioritize the development of training programs that equip managers and supervisors with the skills necessary to effectively motivate and engage their teams.

To Employees: Employees also have a role to play in fostering a culture of motivation and high performance within the Ministry of Home Affairs. It is recommended that employees actively seek out opportunities for growth and development, take ownership of their work, and strive to maintain a positive attitude even in challenging circumstances. Moreover, employees should communicate openly with their managers about their career aspirations, preferences, and concerns, thereby facilitating constructive dialogue and collaboration aimed at enhancing motivation and job satisfaction.

To Stakeholders and Partners: Stakeholders and partners of the Ministry of Home Affairs, including government agencies, civil society organizations, and community groups, can also contribute to fostering employee motivation and performance. It is recommended that these stakeholders actively support initiatives aimed at promoting employee well-being, such as providing access to resources and services that enhance work-life balance, promoting diversity and inclusion in the workplace, and advocating for policies that prioritize employee rights and welfare. Additionally, stakeholders can collaborate with the Ministry of Home Affairs to develop mentorship programs, networking opportunities, and other initiatives that facilitate professional growth and development among employees.

To Policy Makers: Policy makers play a crucial role in shaping the regulatory environment and frameworks that govern organizations like the Ministry of Home Affairs. It is recommended that policy makers prioritize the development of legislation and policies that incentivize organizations to invest in employee motivation and well-being. This may involve offering tax incentives or grants to organizations that implement effective employee motivation programs, establishing guidelines for fair and transparent performance evaluation systems, and promoting the adoption of flexible work arrangements that accommodate diverse employee needs. Furthermore, policy makers should collaborate with relevant stakeholders to conduct regular reviews of existing policies and regulations to ensure their alignment with evolving best practices in employee motivation and organizational performance.

5.3 Areas for Future Research

The following are areas for further exploration to deepen our understanding of the complex interplay between motivation and employee performance within the Ministry of Home Affairs. Firstly, future research endeavors could delve into uncovering the mediating mechanisms that underlie the relationship between intrinsic and extrinsic motivation and employee performance. Understanding the mediating factors, such as job satisfaction, organizational commitment, or job engagement, can shed light on the intricate pathways through which motivation influences performance outcomes. By elucidating these mechanisms, researchers can provide actionable insights for organizational leaders to design targeted interventions that foster a motivational climate conducive to enhanced performance.

The Influence of Education and Training on the Preservation and Management of COVID-19 Vaccines among Health Workers

Ambrose George¹ & Meshack Siwandeti²

¹College of Business Education, Mwanza, Tanzania.

²College of Business Education, Mwanza, Tanzania.

Abstract

The COVID-19 pandemic has profoundly affected health systems globally, particularly in vaccine management. This study investigates the impact of human capital on vaccine preservation in Tanzania, focusing on the resources and capabilities necessary for effective vaccine handling. Guided by the Resource-Based Theory (RBT), which emphasizes the significance of internal resources in achieving competitive advantages, this research highlights the critical role of health workers' training and access to essential resources, such as refrigeration and transportation. The target population for this study consisted of 500 health workers at Mwananyamala Referral Hospital. A sample size of 99 respondents was determined using the Yamane formula to ensure statistical reliability. The sample included 93 operational staff selected through simple random sampling and 6 senior staff chosen purposively for in-depth insights. Utilizing qualitative methodologies, the study incorporates interviews and surveys to explore health workers' experiences and challenges in vaccine management during the pandemic. The findings reveal significant gaps in resource availability and training, which hinder effective vaccine preservation and distribution. By addressing these gaps, the study aims to provide actionable recommendations for improving vaccine management in low-resource settings, ultimately contributing to better health outcomes in Tanzania.

Keywords: COVID-19, Health workers, Vaccine management

1. Introduction

The outbreak of the COVID-19 pandemic, caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), began in late 2019 and quickly escalated into a global crisis by early 2020. As of 2021, the pandemic had claimed over five million lives worldwide (World Health Organization, 2021). This rapidly evolving public health emergency has seen multiple waves of infections, driven by variants such as the highly contagious Delta variant (CDC, 2021b). Countries with well-established healthcare systems, such as the United States, the United Kingdom, and Germany, have been able to manage vaccine storage and distribution through advanced cold chain systems, ensuring that vaccines are stored and transported at recommended temperatures (Ritchie et al., 2021). These nations benefit from well-trained healthcare professionals familiar with vaccine handling protocols (Pgue et al., 2020).

However, in African countries, including Tanzania, maintaining vaccine cold chains has been a significant challenge. While vaccination is one of the most critical public health interventions, the preservation of COVID-19 vaccines presents unique difficulties in developing countries. Many nations face limited resources and infrastructure, making it difficult to maintain the low temperatures required for storing COVID-19 vaccines (Abebe et al., 2021). In countries such as Ghana, Nigeria, and Ethiopia, logistical obstacles such as poor

transport infrastructure and inadequately trained healthcare workers compound the challenge of preserving and managing vaccines (Belsti et al., 2021; Toure et al., 2022).

Tanzania's health system has also struggled with maintaining the cold chain required for COVID-19 vaccines, particularly in areas with unreliable electricity and challenging transportation conditions. The country faces difficulties in providing health workers with adequate training on vaccine handling, particularly with the more delicate mRNA vaccines like Pfizer and Moderna, which require ultra-cold storage (Nestory, 2022; Nyamuryekunge et al., 2023). This study seeks to explore these challenges in greater detail, focusing on the factors influencing the proper preservation and management of COVID-19 vaccines among health workers in Mwananyamala referral hospital, Dar es Salaam.

Tanzania achieved a notable 91% performance in temperature monitoring across health facilities according to the 2015 Tanzanian Effective Vaccine Management Assessment. However, some facilities did not meet the WHO-recommended performance standard of 80% or higher in all criteria. The Tanzania National Immunization Strategy (2021–2025) identified several deficiencies, including a lack of devices, incomplete temperature charts, and inadequate responses to temperature alarms, indicating that temperature monitoring was not consistently effective (Nestory, 2022). Additionally, factors such as the limited education of healthcare workers regarding COVID-19 vaccine preservation and logistical challenges, including transportation, have further hindered effective vaccine management (Nestory, 2022). Therefore, this study aims to investigate the factors affecting the proper preservation and management of COVID-19 vaccines among health workers, specifically at Mwananyamala referral hospital in Dar es Salaam, to determine whether these are key issues in ensuring effective vaccine management.

2. Literature Review

2.1 Theoretical Review

Resource-based theory (RBT)

The resource-based theory (RBT) was primarily developed in the 1980s and 1990s, with Jay Barney's 1991 paper being a seminal work in establishing this theory. The foundation of RBT, however, traces back to Wernerfelt's 1984 article, "A Resource-Based View of the Firm." According to the theory, a firm's internal resources and capabilities can be key sources of competitive advantage if they meet specific criteria: they must be valuable, rare, difficult to imitate, and non-substitutable (Barney, 1991; Peteraf, 2013). The focus of RBT is on building unique, firm-specific resources rather than relying solely on external factors. Examples of resources that provide sustained competitive advantages include proprietary technologies, human capital, and efficient processes.

In summary, RBT emphasizes that a firm's success lies in its ability to develop and leverage its internal resources and capabilities, creating value for customers and ensuring long-term success. One of the key factors influencing the preservation and management of COVID-19 vaccines is the availability of resources. Health workers need access to essential resources such as refrigeration equipment, storage facilities, and reliable transportation to ensure the safe handling and distribution of vaccines. According to RBT, the challenge of accessing these resources, particularly in low-resource settings like Tanzania, can hinder effective vaccine management. Another crucial factor is human capital. The skills, knowledge, and expertise of health workers are essential for effective vaccine preservation and management. RBT suggests

that developing human capital through adequate training and support is necessary to ensure that health workers possess the capabilities to manage vaccines safely and effectively.

2.2 Empirical Literature Review

Cleroux (2020) examined the critical role of Personal Protective Equipment (PPE) in safeguarding healthcare workers during the COVID-19 pandemic. The study highlighted the disruption of global PPE supply chains and the urgent need to re-evaluate the reuse of PPE. Moreover, it stressed the importance of strengthening PPE supply chains, training healthcare staff on PPE usage, and devising systems for tracking the surge in PPE demand in countries like South Africa, where the COVID-19 epidemic was still unfolding. This research underlines the necessity of protecting healthcare workers as they administer vaccines, thus drawing a link between PPE and overall preparedness, including vaccine preservation. However, the study does not directly address the intersection of PPE and vaccine preservation, creating a gap that further research could explore.

Ambe (2021) explored nurses' perceptions regarding COVID-19 vaccine uptake and preservation. The study revealed that more than half of the nurses (55.3%) were unvaccinated and were unaware of proper vaccine preservation techniques. Negative perceptions, such as fears about the vaccine's safety, were prominent, with 60.9% of nurses expressing concerns about fatal side effects. Despite this, some nurse leaders (61.5%) had been vaccinated and expressed the need for continued vaccination with more research to eliminate side effects. The study highlights the significant influence of beliefs, social factors, and knowledge gaps on vaccine acceptance, but it does not delve into specific strategies for improving vaccine preservation practices, suggesting a gap for further investigation.

Kazungu (2021) conducted a cost-effectiveness analysis of PPE and vaccine preservation in Kenya's healthcare sector during the COVID-19 pandemic. Using a decision-analytic model, the study estimated that Kenya would need an investment of \$3.12 million to protect healthcare workers and maintain proper vaccine preservation, potentially averting thousands of deaths and infections. This investment would yield a substantial return of 11.04 times the initial cost. While the study focused on the financial aspects, it did not address training or education programs aimed at healthcare workers, presenting a gap in understanding how such programs could enhance cost-effectiveness in vaccine management.

Ayenigbara (2022) analyzed the challenges of the COVID-19 vaccination program in Africa, noting issues such as poor vaccine preservation among healthcare workers, limited awareness, and logistical challenges. Factors like limited funds, concerns about vaccine safety, and storage requirements hindered the success of the vaccination rollout. The study recommended holistic planning, community engagement, and robust partnerships to optimize vaccine distribution. Although the research identifies key challenges, it falls short in examining the role of training and education in addressing these challenges, leaving room for future research to explore this aspect.

3. Methodology

This study employed a descriptive research design, allowing for a comprehensive analysis of the factors influencing the preservation and management of COVID-19 vaccines among health workers. By using a mixed-method approach combining both quantitative and

qualitative methods the study captured a broad perspective on vaccine management practices at Mwananyamala Referral Hospital.

The sample consisted of 99 respondents from 500 staff working at Mwananyamala Referral Hospital, calculated using the Yamane formula to ensure statistical precision. Simple random sampling was employed to select operational staff, while purposive sampling targeted senior staff, allowing for deeper insights into management practices. Specifically, 93 operational staff were selected randomly, while 6 senior staff were chosen purposively.

Data collection involved the use of questionnaires for quantitative data, which facilitated the measurement of variables such as cold chain management, education and training, and transport logistics. Additionally, interviews were conducted for qualitative data to capture the nuanced perspectives of senior staff. This balanced methodology provided both measurable data and contextual insights. The analysis of quantitative data was conducted using descriptive and regression analysis, allowing for a detailed understanding of relationships between variables. For qualitative data, content analysis was employed, offering an interpretive understanding of staff experiences and vaccine preservation challenges.

To ensure the validity of the research instruments, expert reviews were conducted, and reliability was tested using Cronbach's Alpha, with all variables achieving a score above the acceptable threshold of 0.7, indicating consistency and accuracy in measuring constructs. Ethical considerations, such as obtaining informed consent, maintaining anonymity, and ensuring voluntary participation, were rigorously followed, further strengthening the reliability and integrity of the study. These comprehensive measures ensured a robust evaluation of the factors influencing COVID-19 vaccine preservation and management at Mwananyamala Referral Hospital.

4. Findings

4.1 The influence of education and training on the preservation and management of COVID-19 vaccines among health workers

This study examines the influence of education and training on the preservation and management of COVID-19 vaccines among health workers. Therefore, about 99 respondents were responsible to answer specific objective two and the findings are presented in Table 1 below.

Table 1: The influence of education and training

Statements	N	Mea n	Std. Deviation
Training covered proper storage conditions	99	4.36	0.812
Received adequate training on the importance of temperature monitoring	99	3.97	1.028
Educational materials were clear and informative	99	3.96	1.058
Training emphasized the significance of accurate record-keeping	99	4.36	0.812

Statements	N	Mean	Std. Deviation
Valid N (listwise)	9		
	9		

Source: Field Data, 2024

This study assesses the impact of education and training on the preservation and management of COVID-19 vaccines among health workers, based on responses from 99 participants. The findings indicate that training significantly enhances health workers' understanding of critical aspects of vaccine management, particularly in proper storage and record-keeping, both of which received high agreement scores (Mean = 4.36). However, there is a moderate perception regarding the importance of temperature monitoring and the clarity of educational materials, reflected in lower mean scores and higher variability in responses (Means = 3.97 and 3.96). These insights suggest that while training is effective, there are areas for improvement that could enhance overall vaccine management practices. Continuous evaluation and enhancement of training materials and methods are recommended to ensure all health workers are adequately prepared to manage vaccines effectively.

5. Discussions

The findings of this study reveal significant insights into the influence of education and training on the preservation and management of COVID-19 vaccines among health workers. The high mean scores, particularly for statements regarding proper storage conditions and the significance of accurate record-keeping, indicate that training programs have been effective in imparting crucial knowledge and skills necessary for effective vaccine management. This aligns with previous research highlighting the importance of targeted training in improving health care practices and outcomes (Gonzalez et al., 2021; WHO, 2020).

However, the moderate scores regarding the importance of temperature monitoring and the clarity of educational materials suggest areas for improvement. These results reflect findings from other studies that emphasize the need for ongoing training and the development of clear, user-friendly educational materials to enhance understanding among health workers (Juma et al., 2021; Boulware et al., 2021). The variability in responses, as indicated by the standard deviations, also underscores the potential differences in experiences and perceptions among health workers, suggesting that tailored training approaches may be necessary to address diverse needs.

Moreover, the effective management of COVID-19 vaccines is critical not only for individual health but also for public health efforts to control the pandemic (Kemp et al., 2021). Therefore, it is essential for healthcare institutions to regularly assess and update training programs, ensuring that they incorporate feedback from health workers and adapt to evolving guidelines and practices. This proactive approach will contribute to improved vaccine preservation and management, ultimately enhancing the effectiveness of vaccination campaigns.

In conclusion, while education and training have positively influenced the preservation and management of COVID-19 vaccines, ongoing efforts to refine and enhance these programs are

vital for sustaining their effectiveness. Regular evaluations and adaptations based on health workers' feedback will be crucial in addressing any gaps in knowledge and ensuring the successful implementation of vaccination strategies.

6. Conclusion

In conclusion, this study underscores the vital importance of education and training in enhancing the preservation and management of COVID-19 vaccines among health workers. The findings indicate that comprehensive training programs significantly contribute to health workers' understanding of essential practices, such as proper storage conditions and accurate record-keeping. However, areas needing improvement, particularly in the clarity of educational materials and temperature monitoring training, were identified. To optimize vaccine management and improve public health outcomes, healthcare organizations must continuously evaluate and refine their training initiatives, incorporating feedback from health workers and addressing diverse training needs. This commitment to ongoing education will enhance the competency of health workers and prepare them to effectively address future public health challenges, as emphasized in various studies.

7. Recommendations

Based on the findings of this study it is recommended;

Healthcare Administrators should prioritize the development of ongoing training programs focused on key aspects of vaccine management. This includes proper storage conditions, effective temperature monitoring, and the importance of accurate record-keeping. Regular workshops and refresher courses can be instrumental in reinforcing these practices, ensuring that health workers remain up-to-date with best practices and any new guidelines in the field. By fostering an environment of continuous learning, healthcare administrators can enhance the competence of their staff, ultimately improving vaccine management outcomes.

Government Agencies are encouraged to allocate adequate resources towards training programs aimed at healthcare professionals. Ensuring that all healthcare facilities have access to quality educational materials and training sessions is essential. Additionally, establishing monitoring systems to evaluate the effectiveness of these training initiatives will provide valuable insights into areas for improvement. By investing in the education and skill development of health workers, government agencies can significantly enhance the overall effectiveness of vaccine preservation and management.

Educational Institutions should collaborate with healthcare facilities to enhance the quality of training programs available to health workers. By developing tailored curricula that focus on vaccine management and preservation, educational institutions can equip future health professionals with the necessary skills and knowledge to handle vaccines effectively. This collaboration can create a stronger link between theoretical knowledge and practical application, ensuring that health workers are prepared to meet the challenges of vaccine management in real-world settings.

Health Workers are encouraged to actively participate in feedback sessions to share their training experiences and identify areas for improvement. Engaging in continuous learning and remaining proactive in their professional development can significantly impact their ability to manage vaccines effectively. By taking ownership of their education and skill development,

health workers can contribute to improved vaccine management and ultimately enhance public health outcomes.

Non-Governmental Organizations (NGOs) have a vital role to play in advocating for improved training programs and resources for health workers. By collaborating with healthcare providers, NGOs can identify gaps in knowledge and provide targeted support to ensure that health workers are well-equipped to manage COVID-19 vaccines effectively. This partnership can facilitate the sharing of best practices and resources, contributing to a more robust healthcare response to vaccination challenges.

By implementing these recommendations, stakeholders can work together to enhance the management of COVID-19 vaccines, ultimately improving public health responses to current and future health crises.

The Influence of Supplier Capability on Public Procurement Performance at the Ministry of Education, Science and Technology

Asifiwe Mloly¹ & Dr Adrian Ndunguru²

¹College of Business Education, Dodoma Campus

²College of Business Education, Dodoma Campus

Abstract

This study aimed to explore the key factors influencing effective supplier selection in the context of public procurement performance. The research focused on three specific objectives: assessing the impact of supplier capability on public procurement performance, examining the role of staff competence in public procurement performance at the Ministry of Education, Science, and Technology (MoEST), and evaluating the effect of regulatory compliance on public procurement performance at MoEST. A case study design was employed, and a simple random sampling technique was used to select a sample of 133 respondents. Data were gathered through questionnaires and interviews and analyzed using descriptive statistics, multiple linear regression, and content analysis. The findings revealed that financial capacity is a critical criterion for selecting suppliers at MoEST, while the involvement of knowledgeable and skilled staff significantly enhances public procurement performance. Additionally, adherence to procurement regulations was identified as a crucial factor in improving public procurement performance at MoEST. The study concludes that supplier capability ($\beta = 0.189$, $p = 0.000$) significantly determines public procurement performance, particularly in terms of financial stability and quality. Furthermore, staff competence ($\beta = 0.438$, $p = 0.000$) and regulatory compliance ($\beta = 0.455$, $p = 0.000$) are both strong predictors of public procurement performance. The study recommends that the Ministry of Education develop supplier selection criteria that are specifically tailored to meet the unique needs of educational goods and services.

Keywords: Supplier Capability, Procurements Performance.

1.0 Introduction

Public procurement is a crucial mechanism for governments to deliver goods and services effectively, influencing overall economic performance and development. Globally, the importance of supplier capability in public procurement has been emphasized by numerous studies, indicating that the quality and reliability of suppliers significantly affect procurement outcomes. According to Thai (2021), enhanced supplier capabilities lead to improved service delivery and cost efficiency, thus reinforcing the need for governments to prioritize supplier evaluation and selection processes. In a global context, the integration of advanced technologies and supplier development programs has been shown to optimize procurement performance, ensuring transparency and accountability in public sector operations (Schapper et al., 2022).

In Africa, the challenges surrounding public procurement are often exacerbated by limited supplier capabilities, leading to inefficiencies and corruption. A study by Muriithi and Langat

(2022) highlights that many African countries struggle with inadequate supplier management frameworks, resulting in poor procurement performance. The authors argue that enhancing supplier capabilities through targeted training and capacity-building initiatives is essential for improving procurement processes. Furthermore, the African Development Bank (2020) emphasizes that strengthening supplier networks can enhance competition and innovation, ultimately contributing to more effective public procurement systems across the continent.

In Tanzania, public procurement performance is significantly influenced by supplier capability, as evidenced by recent research. According to Mwenda and Mbilinyi (2023), many public institutions in Tanzania face challenges related to the quality of suppliers, which directly impacts project outcomes and budget adherence. The study reveals that inadequate supplier assessment and oversight mechanisms often lead to suboptimal procurement performance, highlighting the need for reforms in supplier management practices. Additionally, the Public Procurement Regulatory Authority (PPRA, 2022) in Tanzania has initiated various programs aimed at enhancing supplier capabilities, recognizing their critical role in achieving value for money in public procurement. These efforts are vital for improving the efficiency and effectiveness of procurement practices within the Ministry of Education, Science and Technology.

1.2 Statement of the Problem

In Tanzania, the effectiveness of public procurement is undermined by significant challenges related to supplier capability, which has been highlighted as a critical factor influencing procurement performance. Recent studies indicate that many public institutions struggle with identifying and managing qualified suppliers, leading to inefficiencies, delays, and budget overruns in projects (Mwenda & Mbilinyi, 2023). These issues are particularly pronounced within the Ministry of Education, Science and Technology, where the procurement of educational materials and services is vital for improving educational outcomes. The lack of robust supplier assessment mechanisms has resulted in a reliance on inadequate suppliers, which adversely affects the quality of goods and services procured and hampers the overall effectiveness of public spending in the education sector.

Moreover, the Public Procurement Regulatory Authority (PPRA, 2022) has recognized that existing frameworks for supplier management are insufficient to ensure transparency and accountability in procurement processes. Despite efforts to enhance supplier capabilities through training and development programs, challenges such as inadequate monitoring and evaluation of supplier performance persist. This situation raises concerns about the ability of the Ministry of Education, Science and Technology to achieve value for money and meet its procurement objectives effectively. Therefore, a comprehensive examination of the influence of supplier capability on public procurement performance is essential to identify gaps in the current system and recommend strategies for improvement.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 Rational Choice Theory

The rational choice theory is based on the premise that individuals often select the course of action they perceive to yield the most favorable overall outcome when faced with a challenging situation or deciding between various options (Elster, 1989). The behavioral revolution in American political science, occurring in the 1950s and 1960s, involved an objective investigation of human behavior. This revolution is regarded to have had a significant role in the creation of rational choice theory (Ogu, 2013).

The rational choice perspective pertains to human behavior (Bouffard and Wolf, 2007), and it is considered that an individual's behavior is connected to psychological actions. Psychologists often understand it as directing individuals to maximize their total preferences (Satz & Ferejohn, 1994). The rational theory focuses on the preferences that humans select from the available choices when making decisions. The behavior of the agents is determined by the environmental limitations imposed on them, rather than their personalities (Satz and Ferejohn, 1994). The study conducted by Essienet *et al.* (2019) demonstrates the significance and widespread acceptance of modeling organizational purchase choices.

Individuals engaged in organizational functions are making decisions regarding the daily operations inside their particular organizations. Choosing a supplier is a critical and high-stakes decision for buying organizations in the procurement process. Supplier selection decisions are typically guided by rationality, as demonstrated by studies conducted by Igarashiet *et al.* (2017) and Kaufmannet *et al.* (2012). Given that rational action is focused on outcomes (Elster, 1989), our study indicates that the perceived benefits that buyers will receive from selected suppliers depend on the wise decisions made by procurement professionals in selecting the best suppliers and implementing effective monitoring. Public buyers have limitations imposed by the legal and regulatory framework that governs procurement procedures when they make decisions about selecting and monitoring potential suppliers.

The rational choice theory aims to provide a theoretical framework for comprehending the reasons and methods behind procurement practitioners' selection of suppliers during the acquisition of goods, services, and works. Therefore, the efficiency of procurement processes can be enhanced by making informed decisions regarding the selection of suppliers that are more appropriate.

2.3 Empirical Literature

Sajjad (2021) claimed that successful performance of any organization depend much on how good suppliers are, since selection of suitable supplier led to reduce material costs, improve quality, competitive advantages, increase speed and flexibility on purchasing process. Critical success factors identified were reliability, consistence, relationship and flexibility of suppliers to meet changes as well as supplier past performance, training aids, and desire for business, warranties and claim policies were factors that become faded. The current study will measure supplier capability by adding financial capacity and quality of products.

Yaakob *et al.* (2021) conducted study on criteria for supplier selection in industrialized building system construction project and findings revealed 16 different criteria for selecting suppliers. Total cost and term of payment were important criteria when assessing cost performance of

supplier. Total cost of particular product to be supplied such as logistic cost and product cost and terms of payment has been significant in construction project due to the requirement of early payments. Furthermore, quality of product or service provided by the supplier was critical determinant in selection process. The study based on assessing criteria for supplier selection in construction sector where the current study will base on LGAs.

Zhang et al, (2020) also on their study argued that cost is very important factor for selection of right suppliers, explained cost associated with purchase such as purchase price, transportation cost and taxes. The operational costs related to purchase which includes transaction processing cost and rejection cost require more time to be assessed in evaluation process. The study based much on costs but the current study also assessed other factors such as flexibility and quality of product.

Kiers *et al*, (2022) on their study the results identified that price, quality and delivery terms were important factors but also human capital, strategic commitment, communication skills and information technology were vital factors for selecting suppliers. Also, the study revealed that reputation of suppliers was significant factor where organization should assess on how customers responding to particular supplier and supplier with good customer base should preferred over the others with unsatisfactory customers.

Khalili *et al*, (2017) stated that there is need for thorough analysis and detailed evaluation in supplier selection process. One of the factors to consider was financial capacity of supplier corresponding to the scope and content of assignment, delivery terms, as well as quality required. Furthermore, argued that suppliers need to increase investment on developing capabilities and competence on human resources capital, information technology, and communication skills and improve strategic commitment. The study focus of this thesis is on the supplier evaluation and selection process for public procurement in Swedish electricity industry while the current study focused on LGAs.

3.0 Methodology

In conducting this study at the Ministry of Education, Science, and Technology (MoEST) in Dodoma, Tanzania, a mixed research approach was employed to gather comprehensive insights into procurement irregularities, specifically focusing on supplier selection processes. This approach integrated both quantitative and qualitative methods to ensure robust data collection and analysis. Quantitative data was obtained through structured questionnaires distributed among 133 staff members, selected via simple random sampling from various departments involved in procurement, finance, and ICT. These questionnaires utilized a Likert scale to systematically gauge respondents' perceptions and experiences related to supplier selection practices. Concurrently, qualitative data was gathered through interviews with key personnel, providing deeper contextual understanding and enriching the quantitative findings through data triangulation. The case study design was instrumental in this research, facilitating an in-depth examination of specific instances within MoEST to uncover underlying factors influencing procurement performance. This approach allowed for a nuanced analysis of procurement practices and their impact within the ministry, leveraging both primary data collected from surveys and interviews and secondary data sourced from existing literature and official documents. Data analysis encompassed descriptive statistics to summarize survey responses and inferential techniques such as multiple linear regression to explore relationships between

variables. Additionally, content analysis was employed to interpret qualitative insights, ensuring a comprehensive evaluation of supplier selection processes and offering actionable recommendations to address identified irregularities. This methodological framework ensured the study's findings were rigorous, relevant, and applicable to enhancing procurement practices at MoEST in Dodoma, Tanzania.

4.0 Findings and Discussion

Table 1: Demographic Features of Respondents

Demographic Feature	Frequency	Percent
Gender		
Male	90	42.5
Female	122	57.5
Total	212	100.0
Age Group		
18-25	40	18.9
26-35	85	40.1
36-45	60	28.3
46 and above	27	12.7
Total	212	100.0
Education Level		
Secondary	30	14.2
Bachelor's	95	44.8
Master's	50	23.6
PhD	37	17.4
Total	212	100.0

Source: Field Data, 2024

The demographic features of the respondents provide a comprehensive overview of the sample population, highlighting key characteristics such as gender, age, and education level. With a total of 212 respondents, the gender distribution reveals a notable majority of females (57.5%)

compared to males (42.5%). This skew toward female respondents may suggest a higher engagement of women in the educational sector or specific roles within the Ministry of Education and Sports (MOEST). Research by Kabeer (2016) indicates that female representation in education-related fields often leads to enhanced communication and collaboration, which can positively influence procurement processes. The age distribution shows a diverse range of respondents, with the largest group (40.1%) falling within the 26-35 age bracket, indicating that a significant portion of the respondents are likely to be early to mid-career professionals. This diversity in age could provide valuable insights into varying perspectives based on experience levels, as studies such as those by Chen et al. (2018) have shown that age diversity can enhance problem-solving and decision-making within organizations.

In terms of educational attainment, the majority of respondents hold bachelor's degrees (44.8%), followed by those with master's degrees (23.6%) and PhDs (17.4%). This high level of education among respondents is essential for ensuring informed perspectives on supplier capability and procurement performance. A study by Hage and Aiken (1967) supports the idea that higher education levels within organizations contribute to better decision-making and innovation, which are crucial for effective procurement practices. The presence of individuals with secondary education (14.2%) also adds depth to the findings, as they may offer unique viewpoints rooted in practical experience. This is consistent with research by Becker (1993), which emphasizes that diverse educational backgrounds can lead to a more comprehensive understanding of operational challenges, thereby enriching the procurement process at MOEST.

Supplier Capability on Procurement Performance

The study presents, descriptive statistics of the first specific objective. In this objective, the researcher was to determine the influence of capability of the supplier on influencing performance of public procurement at MOEST. The study used four indicators in determining influence of capability of the supplier on influencing public procurement performance at MOEST. The indicators were financial capacity, quality of product, flexibility to change and cost.

4.1 Financial Capacity

The respondents were asked whether adequate financial capacity is important criteria usually used for selecting best supplier at MoEST. Finding is presented below on table

Table 2: Financial Capacity

Rate scale	Frequency	Percent
Strongly agree	26	12.3
Agree	90	42.5
Neutral	66	31.1
Disagree	18	8.5
Strongly Disagree	12	5.7
Total	212	100.0

Source: Field Data, 2024

From the table 3 above, findings showed that 12.3% strongly agreed that financial capacity is important criteria usually used for selecting best supplier at MoEST, 42.5% agreed, 31.1 were neutral, 8.5% disagreed and 5.7% strongly disagreed. From these findings, more than a half confirm that financial capacity is important criteria usually used for selecting best supplier at MoEST. This gives an implication of the fact that suppliers with strong financial capacity are more likely to be stable and reliable partners. They can fulfill their commitments, deliver goods and services on time, and maintain consistent quality standards. This reliability is essential for the smooth functioning of operations within the Ministry of Education. Working with financially stable suppliers reduces the risk of disruptions in the supply chain. Suppliers facing financial difficulties may encounter issues such as bankruptcy, which could lead to delays or cancellations in fulfilling orders.

Suppliers with strong financial capabilities are better positioned to invest in innovation, research, and development. They can upgrade their technologies, improve product quality, and offer competitive pricing. This benefits the Ministry by ensuring access to cutting-edge products and services that meet its evolving needs. Establishing relationships with financially secure suppliers fosters long-term partnerships. Such collaborations can lead to mutual growth opportunities, knowledge sharing, and strategic alignment between the Ministry and its suppliers. This stability contributes to sustainable procurement practices. The study findings are supported by Sajjad (2021) that a supplier with strong financial capacity is more likely to be stable and reliable. They are less likely to go bankrupt or face financial difficulties, which could disrupt the supply chain and cause delays or shortages. Suppliers with healthy financials are better positioned to invest in quality control measures and innovation. They afford to upgrade their technology, improve their processes, and develop new products, leading to better-quality goods or services for your business.

4.2 Provision of Quality Product

On this indicator, the researcher had to determine the influence of provision of quality product is important criteria usually used for selecting best supplier at MoEST. The finding is presented on table 4 below.

Table 3: Provision of quality product

Rate scale	Frequency	Percent
Strongly agree	39	31.7
Agree	67	54.5
Disagree	17	13.8
Total	123	100.0

Source: Field Data, 2024

Table 4 above show that, 31.7% of the respondents strongly agreed that provision of quality product is important criteria usually used for selecting best supplier at MoEST, 54.5% agree also, and 13.8 % disagreed. High rate of response show that provision quality products at MOEST is good and among criteria used to evaluate supplier capability. If the supplier is capable, then procurement performance will be improved. This entails that quality educational

products directly impact student success and learning outcomes. For example, textbooks that are accurate, up-to-date, and aligned with the curriculum can significantly enhance the quality of education provided to students. Through selecting suppliers who offer high-quality educational materials, the Ministry of Education can ensure that students have access to resources that support their learning and academic achievement. In the same trail The Ministry of Education in Tanzania has a responsibility to uphold its reputation as a provider of quality education. Through sourcing products from reputable suppliers known for delivering high-quality goods, the ministry can maintain its credibility among stakeholders such as parents, educators, and the public. Consistently providing students with top-notch educational materials reflects positively on the ministry's commitment to excellence.

The study findings are linked to the study by Zhang et al, (2020) quality products directly contribute to customer satisfaction. When customers receive high-quality goods, they are more likely to be satisfied with their purchase, leading to repeat business and positive word-of-mouth referrals. Consistently offering quality products helps build a positive brand reputation. A supplier known for delivering superior quality goods is more likely to be trusted and preferred by both consumers and businesses alike. Quality products typically have fewer defects and require fewer returns or replacements. This reduces costs associated with returns, warranties, and customer service, ultimately benefiting both the supplier and the buyer.

4.3 Flexibility to Change

This was the third indicator on this first specific objective. Researcher used this indicator to study that, high flexibility to change is important criteria usually used for selecting best supplier at MoEST. Finding is presented on table 5 below: -

Table 4: Flexibility to change

Rate scale	Frequency	Percent
Strongly agree	32	26.0
Agree	75	61.0
Disagree	11	8.9
Strongly Disagree	5	4.1
Total	123	100.0

Source: Field Data, 2024

The finding on Table 5 showed that, 26% strongly agreed that high flexibility to change is important criteria usually used for selecting best supplier at MoEST, 61% agreed, 8.9% disagreed and 4.1% strongly disagreed. Majority of the respondents confirmed that flexibility to change is an important aspect in evaluating supplier capability. This educational institution like the Ministry of Education often experience changes in their requirements due to evolving educational policies, curriculum updates, or shifts in student demographics. Suppliers who can quickly adapt to these changing needs demonstrate their capability to meet the dynamic demands of the education sector. For example, if the Ministry decides to introduce a new digital learning platform, suppliers that can swiftly adjust their products or services to align with this initiative would be highly valuable. In times of emergencies such as natural disasters or health crises, the ability of suppliers to respond promptly and provide necessary resources is critical

for ensuring continuity in educational activities. Flexible suppliers can offer alternative solutions or expedite deliveries during such challenging circumstances, thereby supporting the Ministry's efforts to maintain uninterrupted educational services. The education sector is increasingly integrating technology into teaching and learning processes. Suppliers that are flexible and innovative can introduce cutting-edge technologies or educational tools that enhance the quality of education provided by the Ministry. For instance, a supplier offering interactive learning software that can be easily customized to suit different subjects or grade levels demonstrates flexibility in meeting diverse educational needs.

4.4 Total Cost of the Product

This was the fourth and last indicator for this objective. Through this indicator, the researcher was determining whether total cost of the product is important criteria usually used for selecting best supplier at MoEST. The finding is presented on table 6 below: -

Table 5: Total cost of the product

Rate scale		Frequency	Percent
Valid	Strongly agree	57	46.3
	Agree	53	43.1
	Disagree	3	2.4
	Strongly Disagree	10	8.1
	Total	123	100.0

Source: Field Data, 2024

On the table 6, finding show that 46.3% of the respondents strongly agreed that, total cost all Procurement categories is important criteria usually used for selecting best supplier at MoEST, 43.1 agree, 2.4 % disagreed and 8.1% strongly disagree. Overall finding for show that, total cost of all procurement categories is an important criterion that MOEST used to select best supplier. In this case lowest evaluated supplier is selected. This implies that One of the critical factors that influence the supplier selection process is the total cost of all procurement categories. Total cost includes direct costs such as purchase price, transportation, and insurance fees. Indirect costs such as administrative costs, taxes, and duties are also part of the total cost.

The findings of this study underscore the crucial role of supplier capabilities in enhancing public procurement performance at the Ministry of Education and Sports (MOEST). The demographic analysis reveals a diverse respondent profile, with a predominance of female professionals, indicating a potential influence of gender dynamics in decision-making processes. This aligns with Kabeer (2016), who noted that higher female representation can foster collaborative environments, which may improve procurement outcomes. Moreover, the age diversity among respondents, particularly the significant representation of early to mid-career professionals, suggests a blend of innovative ideas and experienced insights that are essential for effective supplier evaluation. Chen et al. (2018) corroborate this, emphasizing that diverse age groups can enhance problem-solving capabilities within organizations, which is vital for navigating the complexities of public procurement.

The indicators assessed: financial capacity, quality of products, flexibility to change, and total cost collectively illustrate the multifaceted nature of supplier evaluation. A majority of respondents affirmed the importance of financial stability, with 54.8% recognizing it as critical for selecting suppliers. This finding supports Sajjad (2021), who emphasized that financially stable suppliers are less likely to disrupt operations due to solvency issues. Similarly, the emphasis on quality products reflects a commitment to educational excellence; high-quality materials directly contribute to better student outcomes, echoing Zhang et al. (2020), who highlighted the link between quality goods and customer satisfaction. The acknowledgment of flexibility further reinforces the need for suppliers to adapt to the rapidly changing educational landscape, a necessity underscored by recent educational reforms.

During interviews conducted with key stakeholders at the Ministry of Education, Science and Technology, several insights emerged regarding the influence of supplier capability on public procurement performance. One respondent emphasized the critical nature of supplier selection, stating, *“The quality of suppliers we engage with directly impacts our ability to deliver educational materials on time and within budget.”* This sentiment was echoed by another official, who noted that *“When we partner with capable suppliers, we see fewer delays and better compliance with our specifications.”* These statements highlight the importance of assessing supplier qualifications before engaging them in procurement processes.

Moreover, respondents identified specific challenges related to supplier capability that affect procurement outcomes. One procurement officer remarked, *“Many suppliers lack the technical skills necessary to fulfill our requirements, which leads to subpar products and services.”* This perspective aligns with findings by Mwenda and Mbilinyi (2023), who highlighted that inadequate supplier assessment mechanisms can lead to inefficiencies and compromises in the quality of procured goods. The interviews revealed a pressing need for enhanced supplier evaluation protocols to ensure that only qualified suppliers are considered for contracts.

Additionally, participants discussed the role of training and development in improving supplier capability. One respondent stated, *“We have implemented training programs for our suppliers, but many still struggle to meet our standards.”* This indicates that while initiatives are in place, there remains a gap in effectively elevating supplier performance. Supporting this observation, the Public Procurement Regulatory Authority (PPRA, 2022) emphasizes that ongoing training and capacity-building efforts are essential for ensuring that suppliers can meet public sector demands effectively.

Finally, the interviews revealed a common consensus on the necessity of continuous monitoring and evaluation of supplier performance. As one respondent articulated, *“Regular assessments help us identify issues early, but we lack a systematic approach to doing this.”* This finding resonates with empirical studies suggesting that proactive monitoring can enhance procurement performance by ensuring accountability and fostering supplier development (Alsharif et al., 2020). Addressing these gaps in supplier capability and procurement processes is vital for improving overall performance at the Ministry of Education, Science and Technology.

5.0 Conclusion

In conclusion, the study highlights the significant influence of supplier capability on public procurement performance at the Ministry of Education, Science and Technology (MoEST). Through various indicators, including financial capacity, product quality, flexibility to change, and total cost, it has become clear that selecting capable suppliers is crucial for the Ministry's ability to achieve its educational objectives. The findings suggest that suppliers with robust financial capabilities and a commitment to delivering high-quality products are more likely to foster reliable partnerships that benefit both the Ministry and the educational sector at large. Furthermore, the ability of suppliers to adapt to changing requirements reflects their importance in supporting the Ministry's mission, especially in dynamic educational environments.

The study also underscores the necessity for continuous improvement in supplier assessment and management processes. As highlighted by the interview data, the current practices at MoEST require enhancement to ensure that only qualified suppliers are engaged in procurement activities. Addressing the gaps in supplier capability through training and development, as well as establishing robust monitoring systems, will be essential in achieving optimal procurement performance. By doing so, the Ministry can strengthen its supply chain, ensuring that it meets the demands of its educational mandate effectively.

6.0 Recommendations

6.1 Enhance Supplier Evaluation Processes

The Ministry of Education, Science and Technology should implement more rigorous supplier evaluation and selection processes. This includes developing comprehensive criteria that assess financial capacity, quality assurance, and the ability to adapt to changes in educational requirements. Regular training for procurement staff on these evaluation techniques can improve supplier selection outcomes.

6.2 Invest in Supplier Development Programs

To strengthen supplier capability, the Ministry should invest in development programs that focus on enhancing the technical and operational skills of suppliers. This could include workshops, training sessions, and mentoring initiatives aimed at improving suppliers' understanding of the Ministry's requirements and standards.

6.3 Establish Continuous Monitoring Mechanisms

The Ministry should establish a systematic approach to monitor and evaluate supplier performance continuously. Implementing performance metrics and regular assessments will help identify issues early and foster accountability. This proactive approach will ensure that suppliers consistently meet the standards required for successful procurement.

6.4 Foster Strategic Partnerships with Suppliers

Developing long-term partnerships with key suppliers can lead to mutual growth and innovation. The Ministry should consider creating collaborative arrangements that encourage knowledge sharing, joint problem-solving, and strategic alignment with suppliers. Such partnerships can enhance the overall efficiency of procurement processes and contribute to better educational outcomes.

Assessing the Viability of Blockchain Technology for Enhancing Financial Services in Tanzania: Prospects and Limitations

Stephen Bahati Donald¹& Respickius Casmir²

¹College of Business Education, Dar es Salaam, Tanzania

²College of Business Education, Dar es Salaam, Tanzania

Email: sbdomahe@gmail.com

Abstract

This research study assessed the viability of blockchain technology in Tanzania by examining its prospects and limitations. Blockchain technology has gained significant attention globally for its potential to revolutionize various industries through enhanced security, transparency, and efficiency. However, its applicability and adoption in Tanzania, a developing country, may be influenced by unique institutional, technological, economic, and social factors. The study focused on a number of regions in Tanzania. The study adopted a mixed-methods research design, incorporating quantitative surveys and qualitative interviews and focus group discussions. A purposive sampling technique was employed to select key stakeholders, including business representatives, government officials, and individuals from different sectors and regions of Tanzania. The data collected was analysed using data visualization techniques. The research findings will provide insights into the current state of blockchain technology adoption in Tanzania, the perceived prospects and limitations, as well as stakeholders' perspectives. The results of this study will contribute to the existing literature on blockchain technology adoption in developing countries and offer practical recommendations for policymakers, businesses, and individuals interested in exploring the potential of blockchain technology in Tanzania.

Keywords: Blockchain technology, viability, prospects, limitations

1. Introduction

Blockchain technology refers to a decentralized, transparent, and secure database that is used to store and transmit data securely across a network of computers (Swan, 2015). Globally, there is a notable increase of Blockchain technology application. This is attributed to the unique properties of Blockchain technology. These properties include but not limited to decentralized, secure, transparent nature, fault-tolerant database (Shetty et al., 2019). Blockchain Technology can transform different sectors including but not limited to agriculture, finance, industry, healthcare, real estate, supply chain management, fighting counterfeit products, and government agencies. Tanzania, a developing country in East Africa, is seeking to leverage this technology to enhance its economic growth and development (The Citizen, 2021). This concept note aims to discover the potential of blockchain technology in Tanzania, focusing on the opportunities and challenges that are aligned with blockchain technology implementation.

Background

Blockchain technology is a distributed electronic ledger that stores digital data that is protected by high-end encryption, very difficult to tamper with, and can be updated using a consensus

mechanism that is accepted by all associated network nodes. Blockchain technology value lies in its ability to shield network nodes from being compromised by a single point of failure. Additionally, the blockchain technology provides better resilience, encryption, auditing, and transparency while guaranteeing the security, integrity, and accessibility of stored data (C. Kombe et al., 2019; Shetty et al., 2019).

Tanzania is a developing country with a population of over 61 million people (Tanzania National Bureau of Statistics, 2022), and an economy primarily driven by agriculture, mining, and tourism. The government of Tanzania has recognized the potential of blockchain technology to enhance its economic growth and development (The Citizen, 2021). In 2021, the Tanzanian government announced her plans to create blockchain advisory team to guide the government on guidelines, legislation and policies that will allow the technology to be used successfully (*Tanzania Announces Plans To Create Blockchain Advisory Team As Country Moves To Adopt Crypto* | BuyUcoin Blog, 2021).

Problem Statement

Blockchain technology has been hailed as a transformative force with the potential to revolutionize various industries and sectors globally. Some of these sectors include government agencies, health care, energy supply, supply chain, real estate (Akram et al., 2020; C. Kombe et al., 2019; Sawa, 2019; Swan, 2015). However, despite its growing popularity and adoption in developed countries, its potential in developing countries, particularly in Africa, remains largely unexplored (Agbo & Nwadiolor, 2020; Mavilia & Pisani, 2020). Tanzania, like many other African countries, faces numerous socio-economic challenges in various sectors such as land, healthcare and mining. These challenges include but not limited to lack of transparency, corruption, and bureaucracy (M. C. Kombe et al., 2017; Elikana Eliakimu Sadock, 2021). These issues have hampered the country's progress towards sustainable development and economic growth. Blockchain technology, with its potential to promote transparency, accountability, decentralisation, efficiency, and trustworthiness, could provide a solution to some of these challenges (Miraz & Ali, 2018; Crosby, 2016). However, there is a lack of understanding of the prospects and limitations of blockchain technology in the Tanzanian context. Therefore, there is a need to assess the viability of blockchain technology in Tanzania, its potential benefits and drawbacks, and the challenges that need to be addressed for successful implementation. This research aims to address this gap in the literature by investigating the potential of blockchain technology in Tanzania and providing recommendations for policymakers, regulators, and industry stakeholders on how to leverage its potential for sustainable development and economic growth.

Research Questions

This study aimed to answer the following research questions:

1. What are the key prospects and potential applications of blockchain technology in Tanzania?
2. What are the specific limitations and challenges faced in implementing blockchain technology in Tanzania?
3. What is the current level of awareness and understanding of blockchain technology among businesses and individuals in Tanzania?

Objectives

This study aimed to achieve the following specific objectives:

1. Identify and analyze the key prospects and potential applications of blockchain technology in Tanzania.
2. Investigate the specific limitations and challenges faced in implementing blockchain technology in Tanzania.
3. Assess the current level of awareness and understanding of blockchain technology among businesses and individuals in Tanzania.

Rationale

Blockchain technology has emerged as a transformative force with the potential to revolutionize various industries and sectors globally. Despite its growing popularity and adoption in developed countries, its potential in developing countries, particularly in Africa, remains largely unexplored. Tanzania, like many other African countries, faces numerous socio-economic challenges, including corruption, lack of transparency, and inefficiencies in various sectors. These issues have hampered the country's progress towards sustainable development and economic growth. Blockchain technology, with its potential to promote transparency, accountability, and efficiency, could provide a solution to some of these challenges. Therefore, it is important to assess the viability of blockchain technology in Tanzania, its prospects, and limitations. This research aimed to contribute to the existing body of knowledge on blockchain technology in developing countries, particularly in Tanzania, and provide insights and recommendations on how to harness its potential while mitigating its risks and challenges.

2. Literature Review

Overview of Blockchain

Blockchain technology refers to a decentralized, traceable, immutable, and distributed ledger that can record transactions securely and transparently. The digital ledger of transactions are maintained via a network of computers rather than a centralized server (Perwej, 2018; Chen et al., 2018; Muni Sankar & Booba, 2020). The decentralization of the network nodes eliminates the risk of single point of failure. Blockchain technology provides better resilience, encryption, auditing, and transparency while guaranteeing the confidentiality, integrity, and availability of stored data (C. Kombe et al., 2019).

Common types of blockchain networks are public blockchain, private blockchain, consortium blockchain and hybrid blockchain. Public blockchains are permission less and open networks that can be accessed by anyone. Private blockchain are restricted, they are accessible by a small specific group of people. Consortium blockchains are made by integrating elements of both public and private blockchains. They are used mostly by organizations to validate transactions. Hybrid transaction combines both the private and public blockchains to offer customization and flexibility to participating members (Christine Campbell, 2023; Schlecht et al., 2021).

Blockchain can be used in a number of sectors including but not limited to agriculture, finance, healthcare, real estate, supply chain management, education, voting and government agencies (Demestichas et al., 2020; An et al., 2021; Dimitrov, 2019; Dhawan et al., 2020; Chen et al.,

2018; Adeshina & Ojo, 2019; Ølnes et al., 2017). In Tanzania, blockchain technology utilization is still at a low pace (Jesca Nkwabi, 2021). Most of the literature have focused blockchain applications in the healthcare area (Mnyawi, 2022; C. Kombe et al., 2019).

Prospects of Blockchain Technology in Tanzania

The literature reveals several important prospects and potential applications of blockchain technology in Tanzania. For instance, (Natália Likavčanová, 2019) argue that blockchain can enable easier sharing of information about the treatment and medical conditions of patients. Also, blockchain can help to substitute the paper-based bureaucratic, complex, prolonged, and disposed to corruption system with a more well-organized system that can increase transparency and accountability in land administration (M. C. Kombe et al., 2017; Natália Likavčanová, 2019). Furthermore, (Tende et al., 2022) suggest that blockchain has the potential to revolutionize the agricultural sector especially the government subsidized vouchers to farmers by eliminating challenges like misuse of the vouchers by some government officials and lack of trust.

Limitations and challenges of implementing blockchain technology in Tanzania

Regardless of its potential, implementing blockchain technology in Tanzania is not short of challenges. (Emmanuel Constantine & Kwang Ho, 2015; Natália Likavčanová, 2019) highlight the lack of technological infrastructure as a major obstacle. The limited internet connectivity and access to reliable electricity may hinder the widespread adoption or use of internet dependent applications such as blockchain. Additionally, (C. Kombe et al., 2019; M. C. Kombe et al., 2017) stress out that unless the regulatory frameworks and legal considerations are put in place, blockchain technology can be used negatively by cyber criminals.

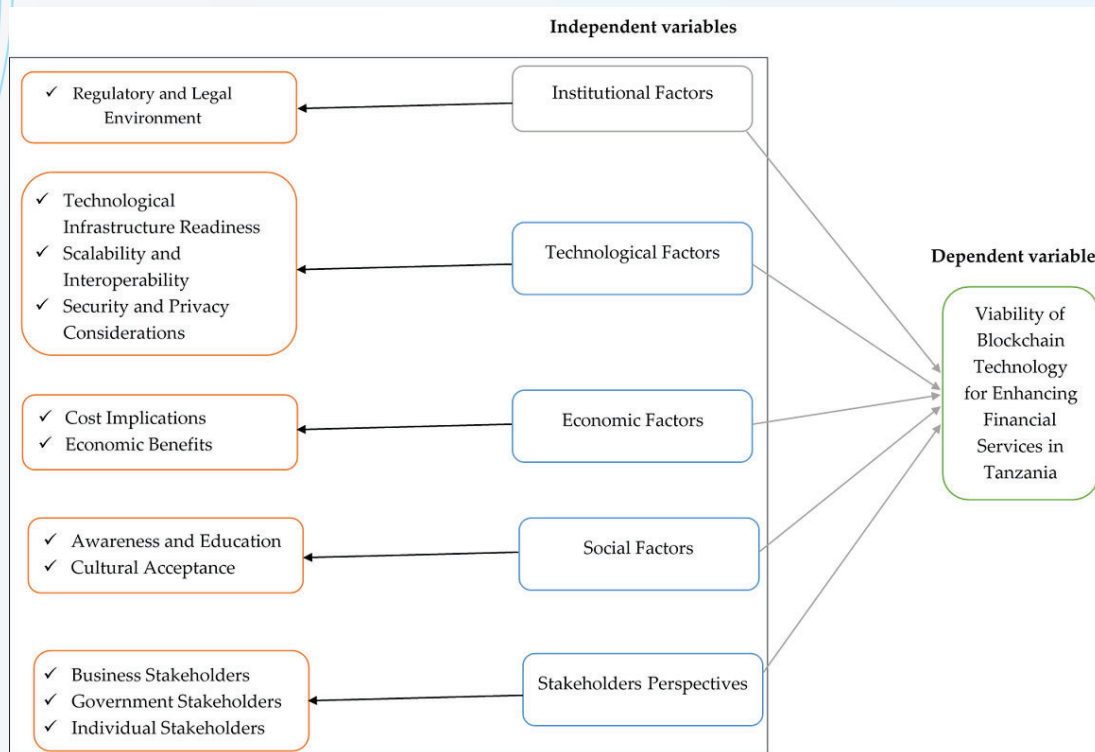

Awareness and Understanding of Blockchain Technology in Tanzania

The level of awareness and understanding of blockchain technology among stakeholders in Tanzania is a vital factor in its application. According to (Mnyawi, 2022), the system administrators in the surveyed facility had no knowledge of blockchain technology let alone its potential benefits. This lack of awareness in this facility can reflect the status of awareness and understanding in most sectors in Tanzania. Lack of awareness can retard the adoption and application of blockchain technology, therefore, to reduce this knowledge gap, the author insists regular trainings and reviewing the curriculum to accommodate blockchain technology programmes/modules.

Conclusion

The literature review highlights the key prospects and limitations of implementing blockchain technology in Tanzania. It highlights the potential benefits in areas such as agriculture and supply chain management, while also acknowledging challenges related to internet, electricity and regulatory frameworks. Furthermore, the review emphasizes the importance of raising awareness and understanding of blockchain technology among practitioners in Tanzania.

Conceptual Framework

3. Methodology

Study Area

The study focused on all regions in Tanzania, this gave a complete status of blockchain technology adoption.

Research Design

The research design for this study was exploratory in nature. An exploratory design allows for a comprehensive investigation of the opportunities and challenges associated with implementing blockchain technology in the financial services sector in Tanzania. It enabled the researchers to gain a deeper understanding of the topic through data collection and analysis (Saunders et al., 2009).

Research Approach

The research approach involved quantitative method. Quantitative methods, in this case surveys, enabled to gather numerical data to support statistical analysis (Creswell & Clark, 2017).

Sampling

A purposive sampling technique was employed to select participants for this study. Purposive sampling allowed for the deliberate selection of participants who possess specific knowledge and experience relevant to the research topic (Palinkas et al., 2015). Participants included senior managers, IT professionals, and regulatory authorities who are familiar with both blockchain technology and financial services in Tanzania. This selection ensured that the

sample comprises individuals who can provide valuable insights and contribute to a thorough evaluation of the research objectives.

Sample Size

The sample size depended on data saturation, which occurred when new information or insights were no longer obtained from additional participants. Initially, a diverse sample of approximately 100 participants were targeted. However, the sample size was adjusted during the research process to ensure comprehensive coverage of the topic (Guest et al., 2006).

Data Collection

Data was collected through online surveys. Data collection instrument was designed based on the research questions and the conceptual framework.

Data Analysis

Data was analyzed using a Pandas which is python library. Pandas has the ability to make data cleaning, transformation, and analysis much easier and faster. The statistics such as percentages, were employed to summarize the survey responses and provide a quantitative analysis.

4. Results

4.1. Demographic Characteristics

Age

The age distribution indicates a broad age-based representation. Majority of the participants are aged between 21 – 25 years (23.0%), 31 – 35 years (20.0%) and 36 - 40 years (20.7%). This potentially impact the results by highlighting views from groups that may be more receptive to innovative financial technologies (Figure 1).

Figure 1: Respondents' age representation

Gender

There exists gender imbalance among participants, with males comprising over two-thirds of the sample (Figure 2).

Figure 2: Respondents' gender representation

Education Level

The data suggests that the study's respondents are generally well-educated, with the majority possessing at least a bachelor's degree (55.6%), postgraduate diploma (37.8%) and diploma (4.4%) (Figure 3).

Figure 3: Respondents' education level

Region of Residence

The data indicates a strong concentration of study respondents in Dar es Salaam, which represents 53.33% of the total sample. Other regions, such as Mwanza (8.15%) and Dodoma (6.67%), have smaller but notable participation, while the remaining regions contribute minimal representation (Figure 4).

Figure 4: Respondents' region of residence

4.2. Awareness and Knowledge of Blockchain Technology

The data indicates that 84.4%, of respondents had prior knowledge of blockchain technology before participating in this survey, while 15.6% had not heard of it before (Figure 5).

Figure 5: Heard about blockchain before this survey

Primary Source of Learning about Blockchain Technology

Majority of the respondents (63.7%) indicated that Internet is the primary source of their blockchain knowledge for most respondents, followed by academic institutions at 27.41%.

Media and professional training or seminars each account for 16.3% of respondents' first exposure. Word of mouth contributes 12.59%, while 11.11% of respondents reported they had never learned about blockchain. Minimal sources such as reading and close friends account for just 0.74% each (Figure 6).

Figure 6: Primary source of learning blockchain technology

Level of Understanding of Blockchain Technology

The majority of respondents (62.2%) possess a basic understanding of blockchain technology while at the end, 16.3%, have no understanding at all. In between, 16.3% have an intermediate understanding while 5.2% of respondents have an advanced understanding, suggesting that while there is growing interest, deeper expertise in the technology is relatively limited (Figure 7).

Figure 7: Level of understanding of blockchain technology

4.3. Perceptions of Blockchain Technology

Belief that blockchain technology can improve the financial services sector in Tanzania

More than two thirds of the respondents agree that blockchain technology has the potential to improve the financial sector. 1.5% of the respondents are not sure while the rest have a negative belief on the potential of blockchain technology to improve the financial sector (Figure 8).

Figure 8: Belief that blockchain technology can improve the financial services sector in Tanzania

Potential Benefits of Blockchain Technology in Financial Services

Majority of the respondents assert that blockchain can enhance security (27.13%), improve efficiency (26.74%), increase transparency (25.19%), and reduce costs (18.22%). However, a small percentage see no benefit (1.94%). A handful of respondents mentioned faster transactions and increased investment opportunities as the benefits of blockchain (Figure 9).

Figure 9: Benefits of blockchain technology

Potential Challenges of Implementing Blockchain Technology in Financial Services

Most respondents indicated the following challenges of implementing blockchain technology in Tanzania's financial sector are a lack of technical expertise (28.15%), technological infrastructure issues (23.51%), regulatory hurdles (17.55%), and social acceptance (15.23%). High initial costs (13.91%) are also a significant concern. Only a small percentage of respondents believe there are no challenges (1.32%), or cite a lack of knowledge about blockchain as a barrier (0.33%) (Figure 10).

Figure 10: Challenges of implementing blockchain technology in financial services in Tanzania

4.4. Adoption and Implementation of Blockchain in Tanzania

Organization implementing or considering to implement blockchain technology

Almost two thirds of the respondents reported that blockchain has not been implemented at their workplace while 36.3% have implemented (Figure 11).

Figure 11: Organization implementing blockchain technology

Concerning the areas that applies blockchain technology; payments and transactions (19.89%), followed by record keeping (14.36%), supply chain management (11.60%) and identity verification (9.94%). 40.88% of the respondents never implement blockchain while 9.94%

stated that they don't know if blockchain is implemented any of their daily activities (Figure 12).

Figure 12: Areas that applies blockchain technology

The major barriers to the adoption of blockchain technology include lack of skilled personnel (26.85%), technological challenges (25.84%), regulatory challenges (16.78%), financial constraints (16.44%), and resistance to change (12.08%). A small number of respondents (0.34%) believe there are no barriers to adoption, some need awareness, and some are not sure (Figure 13).

Figure 13: Barriers to the adoption of blockchain technology

4.5. Future Prospects of Blockchain Technology

The most commonly cited initiative to promote blockchain technology is technical training programs, with 27.37% of respondents. This is followed by public awareness campaigns (23.85%), infrastructure development (17.62%), government incentives (15.72%) and regulatory reforms (14.36%). A small percentage of respondents (0.54%) believe that technical infrastructure should be a priority, while others suggest focusing on accessing the benefits of blockchain and sharing positive knowledge with citizens (Figure 14).

Figure 14: Steps to promote blockchain technology

4.6. Regulatory and Policy Environment

Recommended regulatory changes to facilitate the adoption of blockchain technology

The respondents believe that enhanced cybersecurity regulations (27.55%), collaboration between regulators and industry (25.17%), clearer guidelines and standards (24.49%), and incentives for innovation (21.43%) are crucial for facilitating blockchain technology adoption. 0.68% of the respondents are unsure. A small percentage (0.34%) no know nothing, while others suggest initiating an organizational department for blockchain in a regulator (Figure 15).

Figure 15: Regulatory changes to facilitate the adoption of blockchain technology

Proactivity of the government in promoting blockchain technology in Tanzania

More than half of the respondents indicated that the government is very proactive. Almost a quarter of the respondents asserted that the government is proactive. A smaller portion, 9.6%, are neutral, while 8.9% indicated that the government is reactive. A small fraction of respondents, 4.4%, indicated that the government is very reactive (Figure 16).

Figure 16: Role of the government

4.7. Training and Capacity Building

Sufficiency Knowledge and Expertise about Blockchain Technology

A minor portion of the respondents (2.2%) strongly agrees that there is sufficient knowledge and expertise, while 38.5% of the respondents align with this fact. 25.9% of respondents are neutral. 25.9% of respondents disagree, while 7.4%, strongly disagree (Figure 17).

Figure 17: Existence of sufficient knowledge and expertise about blockchain technology

Training Programs Necessary to Promote Blockchain Adoption in Tanzania

32.47% of the respondents cited that basic blockchain technology courses are necessary to promote the adoption of blockchain technology. Regulatory and compliance training follows with 23.25%. The third and fourth training programs are advanced technical training (21.77%) and business application workshops (21.03%). A small percentage of respondents (1.48%) indicated they don't know (Figure 18).

Figure 18: Training programs necessary to promote blockchain adoption in Tanzania

Discussion

The results from this study reveal significant interest in applying blockchain technology in transactions, record keeping, and identity verification. This demonstrates that the financial sector could and can be one of the primary beneficiaries of this technology. The distributed nature of blockchain reduces the dependence on third parties. This reduces or eliminates the bureaucratic inefficiencies dominant in financial transactions and record management (Kombe et al., 2019; Swan, 2015). Blockchain technology in Tanzania can potentially streamline the financial services by enhancing transparency, efficiency, and trust.

On the other hand, blockchain technology implementation in Tanzania is short of barriers. Main barriers include technological, regulatory, and social challenges. The respondents identified technological infrastructure limitations, such as limited internet access and unstable electricity, as major challenges to widespread blockchain adoption (Emmanuel Constantine & Kwang Ho, 2015).

The primary source of blockchain technology awareness is the internet and educational institutions. These channels can be leveraged for broader awareness campaigns and technical training programs to enhance blockchain literacy (Mnyawi, 2022). Despite the level of awareness of blockchain technology being relatively high but the depth of understanding is still limited. Only 5.2% indicated they have advanced knowledge in blockchain technology. This suggests that more educational initiatives are needed.

A well-informed workforce is very important for implementing and maintaining blockchain applications effectively (Natália Likavčanová, 2019). The observed knowledge gap can be a stumbling block to blockchain adoption. To fill this gap requires establishing blockchain modules in academic institutions and regular training programs.

Conclusion

The study findings reveal that blockchain technology offers potential benefits, including enhanced transparency, security, and efficiency for transactions, record management, and supply chain applications. These improvements can address some of the inefficiencies in the current systems. The adoption of blockchain faces significant barriers, including limited internet access, unreliable power, high initial costs, and a lack of regulatory framework. These barriers hinder widespread implementation of blockchain.

Limited awareness of blockchain indicates a need for educational initiatives to improve blockchain literacy. Priority must be given to technological infrastructure development, regulatory reforms and capacity building. This will ensure a successful adoption of blockchain technology.

It is very essential for the government and other stakeholders to collaborate to create a suitable environment for effective application of blockchain.

Examining the Effects of Financial Motivation on Projects Performance in Dodoma City Council, Tanzania

Atupele Pholld¹ & Godson Mtallo²

¹College of Business Education, Dodoma.

²College of Business Education, Dodoma

Abstract

This study aimed to examine the effects of financial motivational rewards on project performance within Dodoma City Council, Tanzania. A case study design was employed, targeting a population of employees directly involved in project work, decision-making, and oversight within the council. A randomized sample of 100 respondents was selected using Yamane's formula, including 90 for survey questionnaires and 10 for interviews. Data collection involved structured questionnaires and semi-structured interviews to gather quantitative and qualitative insights. The analysis was conducted using logistic regression and chi-square methods to assess the impact of financial motivation on project outcomes, while qualitative data were subjected to content analysis. The findings revealed that overpayment, with a coefficient of 0.421 and an odds ratio of 2.047, significantly enhanced project performance, indicating that employees receiving overpayment were about two times more likely to achieve higher performance. Bonuses on salary had an even stronger impact, with a coefficient of 1.3210 and an odds ratio of 4.01, suggesting a significant positive relationship with project success. Conversely, profit sharing and stock options showed a weaker and statistically insignificant relationship with project performance ($p = 0.201$). The study concludes that structured financial incentives, particularly overpayment and performance-based bonuses, are crucial for enhancing project outcomes in the public sector. It recommends implementing transparent and consistent financial reward systems, alongside non-financial incentives like recognition programs and professional development, to cater to diverse motivational needs and improve project performance. Regular evaluation of these strategies is necessary to ensure sustained employee motivation and organizational productivity.

Keywords: Financial Motivation, Overpayment, Bonuses, Profit Sharing, Stock Options, Projects Performance

1.0 Introduction

Project performance in the public sector is a critical aspect that influences the socio-economic development of a region. In Tanzania, the Dodoma City Council has embarked on various developmental projects to enhance infrastructure, health, education, and other essential services. However, these projects often face challenges, including delays, budget overruns, and substandard quality (Mkwizu & Chiwangu, 2021). Financial motivation has been identified as a crucial factor influencing project performance, as it directly impacts the commitment, productivity, and morale of the project team members (Karanja & Ngugi, 2022). This study

aims to examine the effects of financial motivation on project performance in Dodoma City Council, Tanzania, and explore the various dynamics involved in this relationship.

Financial motivation refers to the use of monetary rewards to encourage employees to perform better and achieve organizational goals (Mugwe et al., 2021). In the context of project management, financial motivation includes salaries, bonuses, allowances, and other financial incentives that aim to increase employee satisfaction and commitment (Muthike & Shalle, 2022). According to recent studies, motivated employees are more likely to exhibit high performance, which results in timely completion of projects, adherence to budgetary allocations, and delivery of high-quality outputs (Ambe & Maleka, 2023).

In Dodoma City Council, the implementation of various projects has been marred by inefficiencies attributed to low levels of financial motivation among project staff. Public sector employees often face challenges such as irregular salary payments, lack of performance-based bonuses, and inadequate allowances (Mkude & Mulyungi, 2021). These factors contribute to low morale and high turnover rates, which negatively affect project performance (Matiku & King'ori, 2023). Understanding the relationship between financial motivation and project performance is essential for improving project outcomes in Dodoma City Council.

Dodoma City Council, the capital of Tanzania, is a hub of political, economic, and social activities. Over the past decade, the council has undertaken numerous projects, including road construction, water supply, health facilities, and educational infrastructure (Ngowi & Mahanga, 2022). Despite the significance of these projects, several have faced performance challenges, such as delays, cost overruns, and failure to meet quality standards (Chuma & Lwiza, 2021). For instance, the construction of key road networks has experienced delays due to inadequate funding and lack of proper motivation for the workforce (Nyang'anyi et al., 2023).

Studies have shown that poor project performance in Dodoma City Council is closely linked to inadequate financial motivation (Mwinuka & Maro, 2022). Project staff, including engineers, planners, and administrative personnel, often express dissatisfaction with the financial rewards they receive. This dissatisfaction leads to low morale, decreased productivity, and a lack of commitment to project goals (Mbowe & Mlowe, 2021). Consequently, projects do not meet their intended objectives, affecting the overall development of Dodoma City Council.

Employee performance is a key determinant of project success. Financial motivation plays a significant role in enhancing employee performance by providing incentives that encourage employees to work harder and achieve project goals (Mwambuli & Zuberi, 2021). According to recent studies, financial rewards such as bonuses, salary increments, and allowances positively impact employee performance, leading to improved project outcomes (Mwinuka & Maro, 2022). In Dodoma City Council, financial motivation can be an effective tool for enhancing the performance of project teams.

Research has indicated that employees who perceive their financial rewards as fair and commensurate with their efforts are more likely to be motivated and committed to their work (Nyang'anyi et al., 2023). This motivation translates into increased productivity, innovation, and a willingness to go above and beyond their job requirements. In contrast, inadequate financial motivation results in low morale, high absenteeism, and a lack of commitment, which negatively impacts project performance (Mwinuka & Maro, 2022). Addressing the issue of financial motivation is crucial for improving employee performance and, consequently, project outcomes in Dodoma City Council.

Project performance is influenced by various factors, including resource availability, stakeholder involvement, and project management practices. Financial motivation is a critical factor that directly affects the productivity and commitment of project team members (Muthike & Shalle, 2022). Studies have shown that projects with well-motivated teams are more likely to meet their objectives, stay within budget, and be completed on time (Ngowi & Mahanga, 2022). In Dodoma City Council, enhancing financial motivation can lead to significant improvements in project performance.

The relationship between financial motivation and project performance is supported by several empirical studies. For instance, Ambe and Maleka (2023) found that financial incentives significantly improve project performance by enhancing employee satisfaction and reducing turnover rates. Similarly, Chuma and Lwiza (2021) noted that projects with adequate financial motivation experience fewer delays, higher quality outputs, and better stakeholder satisfaction. In Dodoma City Council, addressing the financial motivation of project teams can be a strategic approach to improving project performance and achieving developmental goals.

While financial motivation is recognized as a key factor in enhancing project performance, several challenges hinder its implementation in Dodoma City Council. One major challenge is the limited budgetary allocation for public sector projects, which restricts the availability of funds for financial incentives (Mwinuka & Maro, 2022). Additionally, bureaucratic procedures and delays in the disbursement of funds further complicate the provision of financial motivation to project teams (Mkude & Mulyungi, 2021).

Another challenge is the lack of a clear and transparent system for rewarding employees based on their performance (Nyang'anyi et al., 2023). In some cases, financial incentives are distributed arbitrarily, leading to perceptions of unfairness and favoritism. This undermines the motivation of project team members and negatively affects project performance (Matiku & King'ori, 2023). Addressing these challenges requires the development of a robust framework for financial motivation that ensures fairness, transparency, and accountability in the allocation of

The expectancy theory of motivation, proposed by Victor Vroom in 1964, provides a theoretical framework for understanding the relationship between financial motivation and project performance (Vroom, 1964). According to the expectancy theory, employees are motivated to perform better when they believe that their efforts will lead to desired outcomes, such as financial rewards (Vroom, 1964). This theory is based on the premise that motivation

is a function of expectancy (the belief that effort will lead to performance), instrumentality (the belief that performance will lead to rewards), and valence (the value placed on the rewards) (Lunenburg, 2021).

In the context of Dodoma City Council, the expectancy theory suggests that project team members will be more motivated to perform if they believe that their efforts will be rewarded with financial incentives. When employees perceive a clear link between their performance and financial rewards, they are more likely to exert effort, leading to improved project performance (Mwinuka & Maro, 2022). The expectancy theory provides a valuable framework for designing financial motivation strategies that enhance project performance in Dodoma City Council.

While numerous studies have been conducted on the importance of financial motivation in enhancing project performance, there was still a noticeable gap in understanding this relationship within the context of Tanzanian public sector projects, particularly in Dodoma City Council. Existing research, such as that by Mkude and Mulyungi (2021) and Mwinuka and Maro (2022), had primarily focused on general factors affecting project performance or examined different public sector settings without delving deeply into specific financial motivation strategies that could be most effective. Additionally, many studies had concentrated on other regions or sectors, leaving Dodoma City Council underexplored despite its growing importance as Tanzania's administrative capital (Nyang'anyi, Mbowe, & Mlowe, 2023). This gap was further highlighted by Ngowi and Mahanga (2022), who pointed out the need for localized studies to understand the impact of financial incentives on project success within this specific context. The purpose of this study was to address these gaps by examining the effects of various financial motivation strategies on the performance of public sector projects within Dodoma City Council. This research aimed to generate practical insights that could inform policy and management practices, ultimately leading to improved project outcomes and sustainable development in Tanzania's public sector.

2.0 Empirical Literature Review

Various studies across different parts of the world have examined on the effects of financial motivation on projects performance. The following is the empirical literature review.

Shahid et al. (2020) investigated the impact of motivational factors on motivation of Punjab Police in India. The results indicated that financial and non-financial incentives such as working conditions, opportunities for professional development, peer/fellow relationships, bonuses, salary, and organizational policies significantly impacted the motivation of the police force. In similar vein, Anisya, Supriyanto, and Ekowati (2021) studied the on the effect of motivation on staff performance through organizational culture in Indonesia. The findings indicated that monetary employee motivation had a direct and significant impact on performance. Further, employee motivation had a direct and significant impact on organizational culture, organizational culture had a direct impact on performance, and organizational culture mediated the relationship between employee motivation and

performance. It was further clarified that understanding what motivates employees is essential for all employers to enhance productivity of the organization (Alhmoud & Rjoub, 2019).

In the study by Adebayo (2016), used a survey of 150 project managers to uncover the Effect of Employee Motivation on Projects Performance in the Nigerian Oil and Gas Industry. After analysis it was indicated that financial incentive was positively related to projects performance. Furthermore, the study revealed that job satisfaction, organizational support, opportunities for growth, recognition and leadership style owe the greatest impact in performance. On top of that, Kiprop (2017) provided motivational tactics for Kenya's public sector employees when assessed the level of motivation and current motivating techniques in the government sector. The results aligned with the study theory by Maslow's 1943 that employees were motivated hierarchically starting from physiological to self-actualization. In that regard physiological includes monetary motivation.

In addition, Msirikale (2021) investigated the Effect of Motivation on Employee Performance in Tanzania Police Force. The findings revealed that employees in Criminal Investigations Department in Dar es Salaam lacked motivation in terms of perceived justice, monetary motivation, and non-monetary motivation. The study recommended improvements in working conditions, promotion opportunities, equal treatment, and the transparency of the promotion process to enhance employee motivation and performance.

3.0 Methodology

3.1 Research Design and Setting

A case study design was used to collect in-depth information related to the effects of financial motivation on project performance. The physical setting of the study was Dodoma City Council, chosen due to its diverse range of projects, including infrastructure development, public services, community initiatives, and the construction of ministry and government offices at Magufuli City in Mtumba. This setting provided a rich context for examining the impact of financial incentives on project success within a rapidly developing administrative capital.

3.2 Targeted Population and Sample Size

The population of the study encompassed employees from Dodoma City Council who were directly involved in project work, decision-making, and oversight within the council. A randomized sample size of 90 respondents was obtained using Yamane's formula to ensure representativeness and statistical accuracy. Additionally, 10 purposively selected individuals were included for interviews to provide deeper insights into the study's objectives. Hence, the total sample size for this study was 100 individuals, combining both the randomized and purposive samples to capture a comprehensive view of the effects of financial motivation on project performance.

3.3 Data Collection Methods

The Qualitative data were gathered through semi-structured interviews conducted with 10 respondents. Each interview session lasted approximately 10 minutes and included 3 items. Prior to the interviews, respondents were asked for consent to record the sessions for transcription and analysis purposes. Additionally, a Likert scale questionnaire consisting of 15 items and using a five-point ranking system was developed, tested, and administered to a sample of 100 respondents for research questions one, two, and three. The collected data were then analyzed based on their nature.

3.4.2 Data Analysis

Logistic Regression Analysis was used to model the relationship between a binary outcome variable (such as project success or failure) and one or more predictor variables (such as employee motivation levels). This statistical method allowed the researcher to assess the impact of employee motivation on project performance while controlling for other relevant factors. In addition, content analysis was conducted on the qualitative data collected through semi-structured interview checklists. This process involved transcribing the recorded audio, which was then shared with respondents for verification to correct any potential errors. The data were subsequently edited, tabulated, and presented using thematic summary tables and narrative descriptions. The researcher also engaged in reflective moments to internalize, translate, search for patterns, and link codes to ensure a thorough analysis. This comprehensive approach provided both quantitative and qualitative insights into how financial motivation influences project performance in Dodoma City Council.

3.5 Validity and Reliability of Data

The reliability of the Likert scale questionnaire was determined using the Test-retest method to confirm the consistency of the instruments. By administering the same set of questions on two separate occasions, the researcher was able to compare the scores of the responses to identify consistency or deviations. In cases where deviations were detected, adjustments were made to the relevant parameters to ensure the reliability of the data collection instruments. To enhance validity, the researcher engaged two academic staff members as experts to assess the items on the data collection tools. The feedback and suggestions from these experts were incorporated to refine the tools. Additionally, the tools were piloted with a selected portion of the population that was not included in the final sample, allowing for further adjustments and improvements before the main data collection phase.

3.6 Ethical Consideration

Ethical considerations in this study included ensuring participant accountability and protecting their rights. Participants were guaranteed privacy, anonymity, confidentiality, and freedom from harm, treachery, or deception. The researcher was committed to treating all individuals involved in the research process with respect and upheld their rights throughout the study. By adhering to these ethical principles, the study aimed to maintain the integrity of the research process and safeguard the well-being of all participants.

4.0 Results

The table presents the results of a multiple logistic regression analysis examining the effect of financial motivational rewards on project performance within Dodoma City Council, conducted at a 0.05 significance level. Firstly, looking at the variable Overpayment, the coefficient (Coef.) of 0.421 indicates a positive relationship with project performance. This is supported by the Odds Ratio of 2.047, suggesting that individuals receiving overpayment are about 2 times more likely to have higher project performance compared to those not receiving overpayment. The associated z-value of 2.44 is statistically significant ($p = 0.026$), reinforcing the impact of overpayment on project performance. Secondly, regarding Profit Sharing and Stock Options, the coefficient of 0.2122 and the Odds Ratio of 1.695 suggest a positive but weaker relationship with project performance, although the z-value of 3.83 is not statistically significant ($p = 0.201$) at the 0.05 level. Lastly, the variable Bonus on Salary shows a strong positive relationship with project performance, as indicated by the coefficient of 1.3210 and the high Odds Ratio of 4.01.

The associated z-value of 18.54 is highly significant ($p = 0.000$), indicating that individuals receiving bonuses on salary are significantly more likely to exhibit higher project performance. The constant term in the regression model (-2.9631) represents the expected log odds of low project performance when all other variables are zero. The model's overall goodness of fit is supported by the LR Chi2 value of 108.4 ($p = 0.000$) and a Pseudo R2 of 0.53, suggesting that 53% of the variability in project performance can be explained by the included variables. In conclusion, the results indicate that financial motivational rewards, particularly overpayment and bonuses on salary, have a significant positive effect on project performance within Dodoma City Council.

Table4.1: Multiple Logistic Regression Analysis

Project performance	Coef.	Odds Ratio	z	P> z
Low(base outcome)				
<i>Overpayment</i>

On the other hand, results from interview suggested that financial motivation impact employees more positively than non-financial motivation in different wings (Shahid et al., 2020). Positively, offering financial incentives such as bonuses, performance-based pay, or rewards for meeting project milestones can motivate employees to work harder as summarized in the table below.

Table 4.2: Interview summary on question on; what are the effects of financial motivation on projects performance?

No.	Level	Findings
1.	Respondent A.	Financial motivation lead to higher of production because all people need money Help to complete a work at a time
2.	Respondent B.	Financial motivation increase quality and quantity of production and commitment on the project
3.	Respondent C.	Financial motivation increase commitment and productivity Financial motivation increases employees morale
4.	Respondent D.	Financial motivation increases employees' morale because employee is ensured to meet the obligations which need money for family and relatives.
5.	Respondent E.	Financial motivation encourage employees to work tirelessly which in turn increases productivity. By the way money is so good to all it reduce tardiness at workplace. Also it can help to meet organizational goals at a time
6.	Respondent F.	Don't like financial motivation. Financial motivation is not good at all, money can be reason for deviation from employees' rights

		It's good to be motivated by the challenging task to grow than money.
--	--	---

Source: Interview Session, (2024)

The study findings are supported by Gati and Atambo (2017) that fair compensation without overpayment plays a crucial role in motivating team members and boosting morale in high-performance projects. In similar vein, Anisya et al. (2021) indicated that monetary employee motivation had a direct and significant impact on performance. Further, employee motivation had a direct and significant impact on organizational culture, organizational culture had a direct impact on performance, and organizational culture mediated the relationship between employee motivation and performance.

When individuals feel that they are being compensated fairly for their contributions, they are more likely to remain engaged, committed, and motivated to deliver their best work. This positive reinforcement lead to higher productivity levels and overall project success (Respondent A, Interview Session, 2024). For instance, employees working on a software development project are more likely to be motivated when they feel that their efforts are being fairly compensated to meet their family obligations without any overpayments (Respondent D, Interview Session, 2024).

Specifically, 44 out of 70 High performance projects (62.86%) did not have overpayment, compared to 21 out of 39 Low performance projects (53.85%) without overpayment. Similarly, Profit Sharing and Stock Options show a significant association with project performance, with a chi-square value of 52.7761 and a p-value of 0.00. This entails that when employees are offered profit sharing and stock options, they are incentivized to work towards the success of the projects they are involved in (Respondent A, Interview Session, 2024). The potential for financial gain based on project performance encourages them to put in extra effort, be more productive, and strive for excellence. This motivation leads to increased dedication and commitment to achieving project objectives within the council. Respondent E, once claimed

“Financial motivation encourages employees to work tirelessly which in turn increases productivity. By the way money is so good to all it reduces tardiness at workplace. Also, it can help to meet organizational goals at a time” (Respondent E, Interview Session, 2024).

In that regard, if Dodoma City Council implements a profit-sharing program where a percentage of the profits generated from successful projects was distributed among employees involved, it could inspire them to work collaboratively towards project success as they directly benefit from the outcomes.

Through offering stock options or profit-sharing opportunities, Dodoma City Council aligned the interests of its employees with the overall objectives of the organization. Kiprop (2017) asserted that when employees have a stake in the success of projects through ownership or profit-sharing arrangements, they are more likely to prioritize activities that contribute to project success and organizational growth. This is also agreed with when employees with

financial stake in the success of the company, they are more likely to work towards achieving the company's goals. This alignment fosters a sense of ownership and responsibility, encouraging employees to make decisions that benefit the company as a whole. In the study by Adebayo (2016) it was put money that job satisfaction, organizational support, opportunities for growth, recognition and leadership style owe the greatest impact in performance.

In High performance projects, 42 out of 70 (60%) had Profit Sharing and Stock Options, compared to 19 out of 39 (48.72%) in Low performance projects. The presence of Bonus on Salary also appears to influence project performance, with a chi-square value of 24.3114 and a p-value of 0.03. This entails that when employees know that there is a financial incentive tied to their performance, they are more likely to put in extra effort to meet or exceed project goals. This heightened motivation results in higher levels of engagement, dedication, and commitment to the project. For example, if a project team at Dodoma City Council is offered a bonus for completing a project ahead of schedule or under budget, team members are likely to work collaboratively and efficiently towards achieving this goal. The prospect of receiving a bonus serves as a powerful motivator that drives individuals to perform at their best. Bonuses on salary can also lead to enhanced productivity and goal alignment within project teams at Dodoma City Council. Through tying bonuses to specific project milestones or outcomes, organizations can ensure that employee efforts are aligned with overarching project objectives. This alignment helps focus individual actions towards achieving collective goals, thereby improving overall project efficiency.

5.0 Discussion

The findings from the logistic regression analysis examining the effects of financial motivational rewards on project performance within Dodoma City Council align with and expand upon existing literature in several ways. The study indicated that specific financial incentives, such as overpayment and bonuses on salary, have a significant positive effect on project performance. This is consistent with the results of Shahid et al. (2020), who found that financial incentives, including salary and bonuses, significantly impacted the motivation of the Punjab Police in India. Similarly, Anisya, Supriyanto, and Ekowati (2021) highlighted the direct and significant impact of monetary motivation on staff performance in the context of Indonesian organizations. Their study further revealed that a strong organizational culture could mediate the relationship between employee motivation and performance, suggesting that fostering a culture that supports financial rewards could enhance project outcomes.

The positive relationship found between overpayment and project performance in Dodoma City Council is also supported by Adebayo (2016), who discovered a significant correlation between financial incentives and project performance in the Nigerian oil and gas industry. Adebayo's findings underscored that not only financial rewards but also factors like job satisfaction, organizational support, and leadership style played crucial roles in enhancing project outcomes. This reinforces the idea that while financial motivation is critical, it should be complemented by other motivational factors to maximize performance.

The logistic regression analysis further showed that the odds of achieving higher project performance were significantly increased when employees received bonuses on their salaries. This aligns with Kiprop's (2017) study, which indicated that public sector employees in Kenya were motivated by monetary incentives that met their basic physiological needs, as described in Maslow's hierarchy of needs. Kiprop's findings affirm that financial rewards are foundational to motivating employees, suggesting that such incentives are necessary to ensure employee satisfaction and enhanced performance.

The findings also mirror those of Msirikale (2021), who investigated the effect of motivation on employee performance in the Tanzanian Police Force. Msirikale's research identified a lack of financial motivation as a key issue affecting performance and recommended improvements in monetary rewards, promotion opportunities, and working conditions to enhance motivation and performance. This emphasizes the importance of ensuring perceived fairness and transparency in motivational strategies, which is crucial for sustaining high levels of project performance.

Despite the positive impact of financial rewards, the study also found that while profit sharing and stock options had a positive relationship with project performance, this relationship was not statistically significant. This could suggest that while these types of financial incentives are beneficial, their effectiveness may depend on the specific organizational context or be more relevant to private sector or profit-driven environments. Alhmoud and Rjoub (2019) also stressed the importance of understanding what specific motivational strategies are most effective for different employee groups to enhance productivity.

Overall, the findings from this study affirm the critical role that financial motivation plays in enhancing project performance, particularly in a public sector setting like Dodoma City Council. They align with a broad body of literature from diverse contexts, including India, Indonesia, Nigeria, Kenya, and Tanzania, underscoring the universal relevance of financial incentives in motivating employees and improving organizational outcomes. These results suggest that policymakers and managers within Dodoma City Council and similar public sector organizations should prioritize financial motivation strategies, such as overpayment and salary bonuses, to improve project performance. Moreover, to ensure the effectiveness of these strategies, they should be implemented alongside supportive organizational cultures, fair treatment, and opportunities for professional development, as highlighted in the studies by Anisya et al. (2021) and Msirikale (2021).

6.0 Conclusion

In conclusion, this study provides compelling evidence that financial motivational rewards, specifically overpayment and bonuses on salary, have a significant and positive impact on project performance within Dodoma City Council. The findings demonstrate that employees who receive these financial incentives are more likely to achieve higher levels of project success, highlighting the critical role that monetary rewards play in motivating employees and enhancing their productivity. The strong association between financial motivation and project performance underscores the importance of strategically implementing financial rewards as a means to drive better outcomes in public sector projects. While profit-sharing and stock options

showed a positive but weaker relationship with project performance, the overall results suggest that direct financial incentives like overpayment and bonuses are more effective in the context of public sector projects. These findings reinforce the notion that employee motivation is a multifaceted concept that requires a tailored approach to meet the specific needs of the workforce. The significant influence of financial rewards on project performance calls for continuous assessment and optimization of motivational strategies to maintain high levels of employee engagement and project success.

7.0 Recommendations

Based on the findings of this study, several recommendations are put forward to enhance project performance through effective financial motivation strategies. Firstly, Dodoma City Council should prioritize implementing structured financial incentives, such as overpayment and performance-based bonuses, to motivate employees and improve project outcomes. These incentives should be aligned with clear performance metrics and delivered consistently to ensure employees remain motivated to achieve high standards. Secondly, management should consider complementing financial rewards with non-financial incentives such as recognition programs, professional development opportunities, and a supportive work environment to address the diverse motivational needs of employees. Additionally, it is essential to ensure transparency and fairness in the distribution of financial rewards to foster trust and morale among employees. Regular evaluations of the effectiveness of these motivational strategies should be conducted to make necessary adjustments and ensure that they are meeting the desired outcomes. Finally, it is recommended that Dodoma City Council engages in continuous dialogue with employees to understand their motivational preferences and adapt strategies accordingly, ensuring that motivational programs remain relevant and impactful over time.

Assessing Customer Satisfaction in Tanzania's Non-Life Public Insurance Sector: A SERVQUAL Model Approach at the National Insurance Corporation

Winie Ernest¹ & Margareth Mapunda²

¹College of Business Education, Tanzania (CBE)

²College of Business Education, Tanzania (CBE)

Abstract

This research explores the assessment of service quality's impact on customer satisfaction within Tanzania's non-life public insurance sector, focusing on the National Insurance Corporation (NIC). The study addresses assessment of the service quality on customer's satisfaction in non-life public insurance sector. The research design adopts a cross-section approach to provide a comprehensive understanding of the research problem. The study's population comprises 120 employees, selected using a random sampling technique. This research aims to contribute valuable insights to enhance service quality and customer satisfaction within Tanzania's non-life public insurance sector. The study found that customers who were accessing non-life public insurance services at NIC were satisfied with the timeliness of responding to their problems or enquires, this is due to the fact that the management of NIC have a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their enquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer. Also, the study found that few of the respondents were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied. NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. The study concluded that increase in responsiveness, reliability, tangibles, empathy and assurance in delivering non-life insurance services to customers increases the level of satisfaction among the customers. The study recommended that, NIC should conduct specialized training programs focused on developing empathy and emotional intelligence. This includes active listening, recognizing emotional cues, and responding appropriately to customer emotions.

Keywords: Customer's Satisfaction, Non-Life Public Insurance Sector, Service Quality

1. Introduction

Non-life public insurance refers to insurance policies that cover all types of risks other than life insurance. This includes property, liability, health, and accident insurance provided by government or public entities (Rhena, 2021). Non-life public insurance covers damage or loss of property due to events like fire, theft, natural disasters, protects individuals and businesses from legal liabilities due to accidents, injuries, or negligence, costs associated with accidents, including medical expenses and loss of income (Fheme, 2020). At the global level; non-life public insurance plays a crucial role in the global economy and society in various ways; helps individuals and businesses manage risks associated with property damage, liability, health issues, and accidents. By providing a safety net, it ensures that unforeseen events do not lead to financial ruin (Bennkn, 2019). Non-life public insurance programs stabilize economies among the developing and developed countries by spreading risk across a large pool of participants in economic booming among the nation members of the United Nations. This can help prevent economic shocks from natural disasters, major accidents, or health crises (UN, 2022).

Also, some of the African countries like South Africa, Malawi, Zimbabwe, DR Congo, Egypt and Somalia are prone to natural disasters such as floods, droughts, and earthquakes whereby public insurance programs help mitigate the financial impact of these events on individuals, businesses, and governments, facilitating quicker recovery and rebuilding efforts (Dannel, 2016). Non-life public insurance, such as crop and livestock insurance, provides a safety net for farmers against adverse weather conditions, pests, and diseases, ensuring food security and economic stability (ibid). Non-life public insurance programs help increase financial inclusion by providing access to insurance products for low-income and marginalized African communities that empowers individuals to manage risks and build financial resilience (Haknni et al, 2019).

In Tanzania, non-life public insurance plays a crucial role by protecting businesses from risks related to property damage, theft, and liability, public insurance encourages entrepreneurship and investment (Shenn, 2016). This drives economic growth, job creation, and poverty reduction. Tanzania is susceptible to various natural disasters, including floods, droughts, and earthquakes. Public insurance helps mitigate the financial impact of these events, aiding in faster recovery and reducing the economic burden on affected communities and the government (Ghene, 2020). Public insurance programs in Tanzania, such as crop and livestock insurance, provide farmers with a safety net against adverse weather conditions, pests, and diseases, ensuring food security and economic stability.

Despite of this importance of non-life public insurance to the community, customer satisfaction in non-life public insurance faces several global challenges. These challenges often stem from the complexity of the insurance process, lack of transparency, slow claims handling, inadequate digital infrastructure, and regional disparities. Addressing these problems requires a concerted effort to enhance the customer experience across all touchpoints (Wissa, 2029). Different countries in the word have been faced with various problems associated with customers'

satisfaction on non-life insurance and they have tried to come up with various mitigation measures to curb the problems. For instance, insurance policies are often difficult to understand due to complex terms and conditions, poor digital infrastructures and insufficient, leading to poor online services have contributed to increase poor non-life insurance services provision in some of the developed and developing countries (Gwemen, 2021).

Various steps have been taken to solve the problem of customer dissatisfaction on non-life insurance services including simplifying policy documents and provide clear, concise explanations. Using plain language and visual aids to help customers understand coverage, exclusions, and the claims process (Wideer, 2020) invest in robust digital platforms, including websites and mobile applications, that allow customers to review their policies, report and file claims, and inquiring for customer services easily. Ensure these platforms are user-friendly and accessible across different devices.

Insurance in Tanzania for non-life is controlled by the Tanzania Insurance Regulatory Authority (TIRA) under the Insurance Act No. 10 of 2009 (the Insurance Act, 2009). TIRA oversees, supervises, regulates, and controls the insurance and reinsurance industry in Tanzania. The authority establishes and enforces national rules for the conduct of insurance and reinsurance industry (TIRA Report, 2022). People get general insurance to protect their economic resources. Other than life insurance, general insurance encompasses all types of insurance (Agnes et al., 2023). Consequently, according to the TIRA analysis, as a result of using such a strategy, the country enjoyed economic growth, albeit at a slower rate of 4.9% in 2021 compared to an average growth rate of 6.7% during the preceding five years (TIRA Report, 2022). General insurance covers property from fire, burglary, and other immovable property, among other things. Non-life or general insurance covers non-life things such as animals, agricultural produce, goods, factories, cars, and so on (Jones et al., 2017). Individual behavior losses are also covered by non-life insurance (Naik & Panicker, 2018). Therefore, through the Tanzania Insurance Management Authority, the National Insurance Corporation (NIC) has an impact on regulation of non-life insurance sector and , solvency monitoring-based regulations with few entry limitations have shown to be the most effective (TIRA Report, 2022). When it included restrictions on prices, availability, and profitability, it was more detrimental (Naik & Panicker, 2018).

Hence, in Tanzania, the assessment of service quality in the non-life public insurance sector is especially pertinent due to its potential impact on consumer trust and the overall growth of the industry. The study aims to identify specific challenges and opportunities within the Tanzanian context, offering actionable recommendations for policymakers, insurers, and other stakeholders to enhance service quality and, consequently, customer satisfaction.

2. Literature Review

2.1 Theoretical Literature Review

This part concerns with various theories involved in the study;

2.1.1 Service Quality Theory

The SERVQUAL Model, developed by Parasuraman, Zeithaml, and Berry in the 1980s, is a widely used framework to measure service quality by assessing the gap occurring between customer expectations and their perceptions of the actual service received (Zeithaml et al., 1993). According to (Gangil & Vishnoi, 2020) the model identifies five key dimensions of service quality including Reliability; explains the ability to perform the promised service dependably and accurately, Assurance; explaining the knowledge and courtesy of employees and their ability to convey trust and confidence, Tangibles; the appearance of physical facilities, equipment, personnel, and communication materials. Empathy; the provision of caring, individualized attention to customers and Responsiveness; the willingness to help customers and provide prompt service.

The service quality model involves in determining on how customers perceive or react on the new products or service offered by the company or seller. It reflects the organization's willingness to go the extra mile for customers. Also, it focuses on the care and attention that service providers extend to customers. It involves understanding customers' individual needs, showing empathy, and providing personalized services. According to (Kavitha et al., 2012) this model is typically assessed through a combination of customer expectations and perceptions. Customers are being asked to rate their expectations of service quality and their actual experiences (perceptions) across each of the five factors. The difference between expectations and perceptions provides insights into the quality-of-service delivery. Therefore, this model could be applied to evaluate the quality of services dimensions (reliability, responsiveness, assurance, empathy, and tangibles) provided by non-life public insurance. And the model has contribution on the influence of perceived service quality on customer loyalty in non-life public insurance in this study.

2.1.2 Expectancy – Disconfirmation Theory

The Expectancy-Disconfirmation Theory was first introduced by Richard L. Oliver in his 1980 article titled "A Cognitive Model of the Antecedents and Consequences of Satisfaction Decisions" describes that, this is psychological framework that describe individual perceptions and their actual experiences with a product, service, or situation (Oliver, 1980). According to study by (Tien et al., 2021) The expectations are influenced by factors such as prior experiences, marketing messages, word-of-mouth, and personal needs. Also, study by (Thangadurai & Rahim, 2015) described that the perceived Performance are After the actual experience with the product or service, individuals assess how well it performed compared to their initial expectations. This perceived performance is a subjective evaluation of the quality, efficiency, and overall outcome of the experience. The Expectancy-Disconfirmation Theory highlights the significance of managing customer expectations and delivering experiences that align with or exceed those expectations. It acknowledges that customer satisfaction isn't solely determined by the objective quality of a product or service but also by how well that product or service meets or surpasses initial expectations (Hennayake & Hennayake, 2017). Hence, this theory shows the relationship between customer expectations, perceived service performance, and satisfaction.

Therefore, these theories provide comprehensive understanding of service quality and customer satisfaction in the non-life public insurance.

3. Methodology

In this section, research design, population, sampling and sample size, data collection and analysis were presented thereof.

3.1 Research Design

The study used a cross-section research design method to guide the study. The study adopted the cross-section study design simply because it provides a snapshot of a particular moment, allowing researchers to identify patterns, relationships, and prevalence of certain characteristics or outcomes within the studied group (Kothari, 2016).

This study was guided by the following research questions;

- i. How does responsiveness of non-life public insurance facilitate customer needs?
- ii. How is the reliability of services to customers in non-life public insurance?
- iii. What are the tangibles of services to customers in non-life public insurance?
- iv. How does the empathy of service providers facilitate customer satisfaction?
- v. How is the assurance of services to customers in non-life public insurance?

3.2 Population and Sampling

3.2.1 Population

In this study, the targeted population was non-life insurance customers and staff at National Insurance Corporations (NIC) in Dar es Salaam, Tanzania. It is important to define the population from NIC clearly and accurately in research because the validity of the findings depends on how the sample represents the population. According to (NIC Tanzania, 2023) number of employees at headquarters in Dar es Salaam are 114 employees are among population of the study. Approximately number of customers at NIC more than 114 companies served.

3.2.2 Sampling and Sample Size

The study employed a simple random sampling technique to get a sample size from the study population by using a standardized sampling formula known as Yamane's sampling formula. 92 respondents were chosen to constitute a sample size.

3.3 Data Collection and Analysis

The main purpose of the study was to assess the service quality on customer's satisfaction in non-life public insurance sector in Tanzania. Hence, in order to ensure collection of data which is free from biasness, author used structured questionnaire and documentary review as the data

collection methods. Further, the data was analyzed using Probit linear regression model and descriptive statistics to address the research questions.

4. Results and Analysis

This part presented the findings and analysis of the study

4.1 Profiles of Respondents

The study intended to analyze sex of the respondents involved in the study with purpose of keeping gender equality and to discover the responses on the research questions between male and female. The findings showed that (59.6%) of the respondents were male and (40.4%) were female. Moreover, the study sought the description of the respondents by their age groups and findings revealed that majority (49.3%) of the respondents had age range of 21 – 30 years and few of them (5.3%) had age range of 41 – 50 years. Furthermore, the study sought the description of the respondents by their levels of education. findings divulge that majority of the respondents (64%) had bachelor degree education level. (13.3%) had master's degree, (12%) had tertiary education, (6.7%) had secondary education and (4%) had primary education.

Table 6. Profiles of Respondents

Parameters		Frequency	Percent (%)
Gender	Male	68	59.6
	Female	46	40.4
	Total	114	100.0
Age	21 - 30	58	50.9
	31 - 40	50	43.9
	41 - 50	6	5.3
	Total	114	100.0
Education Level	Primary education	3	4.0
	Secondary education	5	6.7
	Tertiary education	9	12.0
	Bachelor degree	48	64.0
	Master's degree	10	13.3

4.2 Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

This section sought to describe the responsiveness of the National Insurance Cooperation on providing nonlife insurance services to the customers in facilitating customer's expected needs from NIC. Analysis of the responsiveness of non-life public insurance services involved the analysis of timeliness of the response from the National Insurance Corporation (NIC) when addressing customer queries or concerns, effectiveness in handling customer inquiries and complaints, and customers' satisfaction on the overall responsiveness of the NIC in meeting customers' insurance-related needs.

4.2.1 Timeliness of the Response from the NIC when Addressing Customers' Queries or Concerns

Findings described in Figure 1 reveal that the majority (38.7%) of the respondents involved in the study commented that the timeliness of the response from the NIC when addressing customers' queries or concerns is good. This implies that customers who are accessing non-life public insurance services at NIC are satisfied with the timeliness of responding to their problems or inquiries, this is because the management of NIC has a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their inquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer.

Furthermore; the findings described in Figure 1 showed that the least (8%) of the respondents involved in the study commented that the timeliness of the response from the NIC when addressing customers' queries or concerns is very poor. Meaning that few of the customers who are accessing non-life public insurance services are not satisfied with the timeliness of receiving responses about their problems or concerns related to the services provided. Also, the findings showed that 36% of the respondents commented that timeliness of the response from the NIC when addressing customers' queries or concerns is fair, 10.7% commented that timeliness of the response from the NIC when addressing customers' queries or concerns is poor and 6.7% of the respondents commented that timeliness of the response from the NIC when addressing customers' queries or concerns is very good. Therefore, according to the customers' responses on the timeliness of the response from the NIC when addressing customers' queries or concerns it can be revealed that most of the customers accessing non-life public insurance are satisfied with the responsiveness of NIC staffs on facilitating customer needs specifically on timeliness of responses when addressing customers' problems or other concerns.

Figure 19. Respondents' responses on timeliness of response from the NIC when addressing customers' queries or concerns

4.2.2 Assessment of the Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Findings in Table 2 describes that responsiveness of National Insurance Corporation (NIC) on provision of non-life public insurance services is high due to the fact that the provided insurance services facilitate meeting customers' needs. The study found that the National Insurance Cooperation (NIC) can tell customers exactly when services will be performed (Mean = 4.45; Standard deviation = 1.596). the magnitude of the mean and the standard deviation tells that majority of the respondents slightly agreed with the statement that the National Insurance Cooperation (NIC) can tell customers exactly when services will be performed that increase satisfaction among customers on the services provided by NIC.

Also, the findings of the study described in Table 2 revealed that NIC can give prompt customer service and attend to customers' needs/problems (Mean = 4.75; Standard deviation = 1.586), NIC employees are always willing to help customers in emergencies (Mean = 4.89; Standard deviation = 1.689), NIC employees are approachable and easy to contact (Mean = 4.89; Standard deviation = 1.689), NIC Employees' can communicate clearly with the customer (Mean = 4.89; Standard deviation = 1.689) and I am getting as quick a turnaround as I need on requests for new reports or data (Mean = 4.89; Standard deviation = 1.689). The magnitude of the mean and standard deviation of the statements tells that respondent slightly agreed that NIC can give prompt customer service and attend to customers' needs or problems, NIC employees are always willing to help customers in emergencies, NIC employees are approachable and easy to contact, NIC Employees' can communicate clearly with the customer, and customers gets quick a turnaround as they need on requests for new reports or data.

Table 7. Responses on the Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Statement	No. Respondents	Mean		Std. Deviation
		Statistic	Std. Error	Statistic
The National Insurance Cooperation (NIC) can tell customers exactly when services will be performed	75	4.45	.184	1.596
NIC can give prompt customer service and attend to customers' needs/problems	75	4.75	.183	1.586
NIC employees are always willing to help customers in emergencies	75	4.89	.195	1.689
NIC employees are approachable and easy to contact	75	4.85	.150	1.302
NIC Employees' can communicate clearly with the customer.	75	4.97	.160	1.385
I am getting as quick a turnaround as I need on requests for new reports or data.	75	4.52	.173	1.501

4.2.3 Customers' Satisfaction with the Reliability of Services Offered by the NIC

Findings described in Figure 2 revealed that majority (44%) of the respondents involved in the study were satisfied with the reliability of services offered by the National Insurance Corporation (NIC). This imply that customers accessing non-life public insurance services at NIC are satisfied with the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage. Also, the NIC management keeps trust among the customers by responding quickly to the insurance requests submitted within Seven (7) working days that increase the level of trust among the customers knowing that their grievances be taken into consideration within short time. Furthermore, the findings of the study described in Figure 2 revealed that 30.7% of the respondents involved in the study were neutral meaning that they had no choice weather were satisfied or dissatisfied. About 12% of the respondents were very satisfied with the reliability of services offered by the National Insurance Corporation (NIC), 9.3% of the respondents were dissatisfied and 4% were very dissatisfied.

The findings of the study tell that few of the respondents involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the respondents who were satisfied. It means that the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage is high that increase the level of satisfaction among customers accessing services at NIC.

Figure 20. Customers' satisfaction with the reliability of services offered by NIC

4.3 Reliability of Services to Customers in Non-Life Public Insurance

Findings in Table 3 describes that the reliability of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers (Mean = 4.73; Standard deviation = 1.605). the magnitude of the mean and the standard deviation tells that majority of the respondents slightly agreed with the statement that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers. Also, the findings of the study described in Table 3 revealed that NIC has been truthful (keeping to promises) to customers regarding insurance services (Mean = 4.68; Standard deviation = 1.749), NIC is dependable and consistent in solving customers' complaints (Mean = 4.64; Standard deviation = 1.666), NIC can perform services right the first time (Mean = 4.86; Standard deviation = 1.511), NIC can insist on error-free records (Mean = 4.51; Standard deviation = 1.545). The magnitude of the mean and standard deviation of the statements tells those respondents slightly agreed that the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers, NIC has been truthful (keeping to promises) to customers regarding insurance services, NIC is dependable and

consistent in solving customers' complaints, NIC can perform services right the first time, and NIC can insist on error-free records.

Table 8. Responses on the reliability of services to customers in non-life public insurance

Statements	No. of Respondent	Mean		Std. Deviation
		Statistic	Statistic Error	
The National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers	75	4.73	.185	1.605
NIC has been truthful (keeping to promises) to customers regarding insurance services	75	4.68	.202	1.749
NIC is dependable and consistent in solving customers' complaints	75	4.64	.192	1.666
NIC can perform services right the first time	74	4.86	.176	1.511
NIC can insist on error-free records	75	4.51	.178	1.545

4.4 Tangibles of Services to Customers in Non-life Public Insurance

Findings from Table 4 describes that the tangibility of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that NIC can give customers access to information, product/service catalogs (Mean = 5.03; Standard deviation = 1.786), NIC provides visually attractive, offices, equipment, and materials to customers (Mean = 4.67; Standard deviation = 1.359), and NIC provides a variety of entertainment facilities to customers (Mean = 5.83; Standard deviation = 8.323). The magnitude of the mean and standard deviation of the responses imply that customers agreed that NIC can give customers access to information, product/service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, and NIC provides a variety of entertainment facilities to customers.

Table 9. Responses on the tangibility of services to customers in non-life public insurance

Statements	No. Respondents	Mean	Std. Deviation

	Statistic	Statistic	Std. Error	Statistic
NIC can give customers access to information, product/service catalogs,	75	5.03	.206	1.786
NIC provides visually attractive, offices, equipment, and materials to customers	75	4.67	.157	1.359
NIC provides a variety of entertainment facilities to customers, etc.	75	5.83	.961	8.323

4.5 Empathy of Service Providers in Non-Life Public Insurance

Findings in Table 5 describes that the empathy of services to customers in non-life public insurance of National Insurance Corporation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that NIC has favorable terms and conditions to customers (Mean = 4.73; Standard deviation = 1.465), NIC has operating hours convenient to all customers (Mean = 4.81; Standard deviation = 1.477), NIC has a sound loyalty program to recognize you as a frequent customer (Mean = 4.67; Standard deviation = 1.436), NIC makes efforts to understand specific customer needs (Mean = 5.00; Standard deviation = 1.366) and NIC apologizes for the inconvenience caused to customers (Mean = 4.97; Standard deviation = 1.294). The magnitude of the mean and standard deviation of the responses imply that customers strongly agreed that NIC has favorable terms and conditions to customers, NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize you as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers.

Table 10. Responses on Empathy of service providers to customers in non-life public insurance

Statements	No. of respondents	Mean		Standard deviation
		Statistic	Std. Error	Statistic
NIC has favorable terms and conditions to customers.	74	4.73	.170	1.465
NIC has operating hours convenient to all customers	75	4.81	.171	1.477

NIC has a sound loyalty program to recognize you as a frequent customer	75	4.67	.166	1.436
NIC makes efforts to understand specific customer needs.	75	5.00	.158	1.366
NIC apologizes for the inconvenience caused to customers	75	4.97	.149	1.294

4.6 Assurance of Services to Customers in Non-Life Public Insurance

Findings in Table 6 describes that the assurance of services to customers in non-life public insurance services provided by the National Insurance Cooperation (NIC) is high due to the fact that the provided insurance services facilitate customers being satisfied with the services. The study found that the behavior of employees of NIC instills confidence in customers (Mean = 4.76; Standard deviation = 1.550), Employees' use of required skills and knowledge to answer customers' questions (Mean = 5.00; Standard deviation = 1.602), Employees of NIC are consistently courteous with customers (Mean = 4.63; Standard deviation = 1.402), Ability to provide variety of value-added services to customers (Mean = 4.71; Standard deviation = 1.667). The magnitude of the mean and standard deviation of the responses imply that customers strongly agreed that the behavior of employees of NIC instills confidence in customers, Employees' use of required skills and knowledge to answer customers' questions, Employees of NIC are consistently courteous with customers and NIC staffs have ability to provide variety of value-added services to customers.

Table 11. Response on the assurance of Services to Customers in Non-Life Public Insurance

Statements	No. Respondents	Mean		Std. Deviation
		Statistic	Std. Error	Statistic
The behavior of employees of NIC instills confidence in customers	75	4.76	.179	1.550
Employees' use of required skills and knowledge to answer customers' questions	75	5.00	.185	1.602
Employees of NIC are consistently courteous with customers	75	4.63	.162	1.402

Ability to provide variety of value-added services to customers	75	4.71	.192	1.667
---	----	------	------	-------

Specific Observations:

In the methodology section the author said Probit linear regression model will applied as the data analysis technique. However, Throughout the document no data analysis using Probit linear regression model. he **Probit regression model** is a type of regression used when the dependent variable is binary (i.e., it takes on two values, often coded as 0 and 1). It is commonly used in situations where researchers want to understand the probability that an event occurs based on one or more predictor variables. For example, in your study, the dependent variable might be whether a customer is satisfied (1) or not satisfied (0) with the service quality. The independent variables could include factors like service responsiveness, reliability, empathy, assurance, and tangibles. See an example below:

Assuming you ran a Probit regression analysis with the following results:

Table: Probit Regression Results on Customer Satisfaction in Non-Life Insurance

Variable	Coefficient (β)	Standard Error	z-Statistic	p-value
Service Responsiveness	0.35	0.10	3.50	0.0005
Service Reliability	0.50	0.12	4.17	0.0001
Service Empathy	0.25	0.09	2.78	0.0054
Service Assurance	0.40	0.11	3.64	0.0003
Service Tangibles	0.10	0.08	1.25	0.2110
Constant	-1.20	0.30	-4.00	0.0001

Interpretation of Findings

1. **Service Responsiveness ($\beta = 0.35$, $p = 0.0005$):** This positive coefficient suggests that as the responsiveness of the service increases, the likelihood of customer satisfaction also increases. The p-value indicates strong statistical significance ($p < 0.001$).
2. **Service Reliability ($\beta = 0.50$, $p = 0.0001$):** This variable has the highest coefficient, meaning it has a substantial positive impact on customer satisfaction. It is also highly significant, indicating that reliability is a critical factor influencing customer satisfaction.
3. **Service Empathy ($\beta = 0.25$, $p = 0.0054$):** This positive coefficient indicates that greater empathy from service providers is associated with higher customer satisfaction, and the result is statistically significant.

4. **Service Assurance ($\beta = 0.40$, $p = 0.0003$):** Like reliability, assurance is also significantly related to customer satisfaction, suggesting that customers who feel assured by the service are more likely to report satisfaction.
5. **Service Tangibles ($\beta = 0.10$, $p = 0.2110$):** This variable does not significantly influence customer satisfaction ($p > 0.05$), indicating that while tangibles might have some effect, **it is not strong enough to be statistically significant in this model.**

5. Discussion and Implication

5.1 Discussion of key Results

5.1.1 Responsiveness of Non-life Public Insurance in Facilitating Customer Needs

Wilson (2021) conducted a study on the factors influencing customers' satisfaction on the non-life public insurance services in Kenya, the study found that, majority (82%) of the customers accessing non-life insurance services become satisfied with the non-life insurance services due to the insurance companies being responding to the customers concerns on time and through digitalized reporting systems without visiting the insurance company branches physically to submit their problems or concerns.

Rhenne (2022) conducted a study on the performance of insurance companies in providing non-life public insurances in Tanzania, found that good communication between customers and services providers, and developing systematic reporting channels between customers and the service providers contributes to the performance of the insurance companies by 79.9%. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help customers promptly and address their needs, concerns, or inquiries. It reflects the organization's willingness to go the extra mile for customers.

Yunnis (2020) found that customer satisfaction with the reliability of non-life public insurance services can be influenced by several key factors including claim processing time revealed by speed of processing repayments, clear communication about the status of claims and what is needed from the customer enhance satisfaction among the customers accessing non-life public insurance services. Also, regular collection of customer feedback to identify and address issues and demonstrated efforts to improve services based on customer feedback, analyzing the nature and frequency of customer complaints to identify areas for improvement improves customers' satisfaction.

5.1.2 Reliability of Services to Customers in Non-Life Public Insurance

In this section it was observed that few of the customers involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied, these findings concur with Mimie (2022) who conducted a study on the performance of insurance companies in providing non-life public insurances in Kenya, although, it was founded that solving customers' claims and responding to their enquires on time, good communication between customers and services providers, and developing systematic reporting channels between customers and the service providers

contributes to the increase of trust among the customers and customers becomes satisfied with the provided services regardless of the company performance in the insurance market. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help customers promptly and address their needs, concerns, or inquiries. It reflects the organization's willingness to go the extra mile for customers.

5.1.3 Tangibles of Services to Customers in Non-Life Public Insurance

It was observed that NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. Likewise, Fenkin (2019) conducted a study on the impacts of Information Communication Technology on non-life insurance services performance among the public insurance companies in Tanzania, whereas, it was revealed that the performance of non-life insurance services can be influenced by providing visually attractive, offices, equipment, and materials to customers, clear and professional signage that reflects the organization's credibility and reliability, well designed, easy-to-read, and comprehensive documents that explain the terms, conditions, and coverage of insurance policies.

5.1.4 Empathy of Service Providers in Non-Life public Insurance

Findings in this part revealed that NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers. The findings of the study were supported by Bagun et al (2021) found that, empathy plays a significant role in customer satisfaction, particularly in the context of non-life insurance companies by improving communication whereby empathetic customer service agents listen actively to customers' concerns, which helps in understanding and addressing their needs more effectively. Added that, empathetic employees better understand and anticipate the specific needs of individual customers, offering tailored solutions that enhance customer experience and satisfied customers are more likely to remain loyal and recommend the company to others, contributing to higher customer retention rates.

5.1.5 Assurance of Services to Customers in Non-Life Public Insurance

It was observed that NIC has created assurance of its services to customers due to improvements in the following areas; behavior of employees of NIC instills confidence in customers, Employees' use of required skills and knowledge to answer customers' questions. Bannie (2022) conducted a study on the performance of insurance companies in providing non-life public insurances in Tanzania, whereas it was founded that employees' usage of required skills and knowledge to answer customers' questions, employees of being consistently courteous with customers and the ability to provide variety of value-added services to customers improves the performance of insurance companies and increase the level of customers' satisfaction. Also, the findings of the study are consistence with the Service Quality Theory whereby findings tell that the willingness and ability of the service provider to help

customers promptly and address their needs, concerns, or inquiries. It reflects with the findings of the study that the behavior of employees of NIC instilling confidence in customers, employees' usage of required skills and knowledge to answer customers' questions, employees of NIC being consistently courteous with customers and the ability to provide variety of value-added services to customers' increases assurance of services to customers in non-life public insurance.

5.2 Implications

Implications for Research

The study on assessing customer satisfaction in Tanzania's non-life public insurance sector using the SERVQUAL model offers several implications for future research. Firstly, it contributes to the academic understanding of service quality and customer satisfaction within the insurance industry in developing countries, particularly in the context of Tanzania. The findings can serve as a basis for comparative studies across different regions or countries, enhancing the generalizability of the SERVQUAL model in various cultural and economic settings. Additionally, the research highlights potential gaps in the current literature, such as the need for more nuanced models that incorporate cultural factors and local market dynamics, paving the way for more context-specific studies. Future research could also explore the relationship between customer satisfaction and business performance metrics, such as customer retention, profitability, and market share in the Tanzanian insurance sector.

Implications for Practice

For practice, the findings of this study provide actionable insights for improving service quality in Tanzania's non-life public insurance sector. By identifying the key dimensions of the SERVQUAL model—tangibles, reliability, responsiveness, assurance, and empathy—that most significantly impact customer satisfaction, the study enables the National Insurance Corporation (NIC) and other similar institutions to prioritize areas for improvement. For instance, if the study reveals that customers are particularly dissatisfied with the reliability or responsiveness of services, the NIC can focus on streamlining processes, enhancing communication channels, and ensuring timely service delivery. This practical application of the research can lead to enhanced customer satisfaction, potentially increasing customer loyalty and market competitiveness.

Implications for Practitioners

For practitioners within the insurance sector, including managers, service designers, and customer service professionals, the study offers critical insights into customer expectations and perceptions of service quality. By leveraging the SERVQUAL model, practitioners can better understand the specific aspects of their service delivery that need improvement. This could lead to targeted training programs for staff, emphasizing areas such as empathy and assurance, where customer interaction is most impactful. Moreover, the study encourages practitioners to adopt a customer-centric approach, using feedback and satisfaction surveys as continuous tools for service enhancement. Ultimately, by aligning their practices with the dimensions

highlighted by the SERVQUAL model, practitioners can improve overall service quality, thereby boosting customer satisfaction and retention in the highly competitive insurance market.

6. Conclusion, Limitations and Future Studies

6.1 Conclusion

6.1.1 The Responsiveness of Non-Life Public Insurance in Facilitating Customer Needs

Analysis of the responsiveness of non-life public insurance services involved the analysis of the timeliness of the response from the National Insurance Corporation (NIC) when addressing customer queries or concerns, effectiveness in handling customer inquiries and complaints, and customers' satisfaction on the overall responsiveness of the NIC in meeting customers' insurance-related needs. It was concluded that, customers who were accessing non-life public insurance services at NIC were satisfied with the timeliness of responding to their problems or enquires, this is due to the fact that the management of NIC have a specific and automated system known as Customer Relationship Management (CRM) where customers can submit their enquiries or make contacts through the system and the management responds immediately after receiving the submitted enquiries or problems from the customer. Also, concluded that, NIC management and its supporting staffs shown to be responsive because customers agreed and commented that NIC can give prompt customer service and attend to customers' needs or problems, NIC employees are always willing to help customers in emergencies, NIC employees are approachable and easy to contact, NIC Employees' can communicate clearly with the customer, and customers gets quick a turnaround as they need on requests for new reports or data

6.1.2 The Reliability of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, few of the customers involved in the study were dissatisfied with the reliability of services offered by the National Insurance Corporation (NIC) compared to the customers who were satisfied. It meant that the accuracy and consistency of information provided by the NIC regarding insurance policies and procedures and trust among the customers on NIC to deliver on its promises regarding insurance coverage is high that increase the level of satisfaction among customers accessing services at NIC. Also, customers accessing non-life public insurance services were satisfied with the services provided by NIC this was because the National Insurance Cooperation (NIC) has timely deliverance of insurance services to customers, NIC has been truthful (keeping to promises) to customers regarding insurance services, NIC is dependable and consistent in solving customers' complaints, NIC can perform services right the first time, and NIC can insist on error-free records.

6.1.3 The Tangibles of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, NIC can give customers access to information, product or service catalogs, NIC provides visually attractive, offices, equipment, and materials to customers, NIC provides a variety of entertainment facilities to customers, NIC has favorable terms and conditions to customers. This shows empathy and tangible deliverables among the

NIC staffs and increase the level of satisfaction among the customers accessing non-life insurance services at NIC.

6.1.4 The Empathy of Services to Customers in Non-Life Public Insurance

The study under this section concluded that, NIC has operating hours convenient to all customers, NIC has a sound loyalty program to recognize as a frequent customer, NIC makes efforts to understand specific customer needs and NIC apologizes for the inconvenience caused to customers. This shows empathy deliverables among the NIC staffs and increase the level of satisfaction among the customers accessing non-life insurance services at NIC.

6.1.5 The Assurance of Services to Customers in Non-Life Public Insurance

The study under this section included that NIC has created assurance of its services to customers due to improvements in the following areas; behavior of employees of NIC instills confidence in customers, Employees' use of required skills and knowledge to answer customers' questions, Employees of NIC are consistently courteous with customers and NIC staffs have ability to provide variety of value-added services to customers.

6.1.6 Customers' Satisfaction on Non-Life Public Insurance Services

Under this section the study used components of the service quality model to assess whether customers were satisfied with non-life insurance services or not. From the findings of the study, it was concluded that, factors like responsiveness, reliability, tangibles, empathy and assurance have direct effect on customer satisfaction on non-life insurance services. Also, it was concluded that increase in responsiveness, reliability, tangibles, empathy and assurance in delivering non-life insurance services to customers increases the level of satisfaction among the customers.

6.2 Limitations and Future Studies

Other respondents neglect to participate in this study due to the fact that, they were busy doing different works. Again, there was limited secondary data concerning this study. Therefore, the discussion of the study was based on assessing customer satisfaction on non-life insurance services at the National Insurance Corporation (NIC) by using the components of the Service Quality Model. It highly recommended that further studies to be undertaken upon assessing how the application of the SERVQUAL Model affects the non-life insurance industry performance in terms of financial performances and customers retention.

Abstract

In recent years, governments across the globe have been striving to promote good governance by enhancing transparency, accountability, and efficiency in the public sector. However, the management and use of public resources particularly land has been a key concern. To address this concern many countries have developed codes of conduct and ethical standards for public sector employees. The study aimed to assess compliance with the code of conduct on land ownership service delivery among public land sector employees in Dodoma City Council. Specifically, it assesses the extent of compliance with the Code of Conduct on Land Ownership Service Delivery, and the implications of non-compliance with the Code of Conduct on Land Ownership Service Delivery. The research was designed as a cross-sectional study. It employed qualitative and quantitative approaches whereas survey and interview methods were used. The survey involved 63 public land sector employees while interviews were conducted with key informants. Data collected were analyzed using both quantitative and qualitative analysis. Descriptive and inferential statistics were utilized for quantitative analysis, while content analysis was conducted for qualitative data. The findings revealed significant gaps in compliance with the Code of Conduct code of conduct in Land Ownership Service Delivery in the study area. Furthermore, the findings show that implications of non-compliance with the code of conduct on land ownership among public land sector employees include financial risks such as the likelihood of legal disputes or litigation resulting in significant financial burdens. Additionally, study findings indicate the diminishing of integrity and credibility of the organization's reputation. The study concludes that there is minimal compliance with the code of conduct in the public land sector in the study area. It also concludes that the non-compliance of the code of conduct has critically undermined service quality, and unethical practices impacting the effectiveness and transparency of land ownership services. The study recommends implementing ethical training programs to enhance the enforcement of public ethics and code of conduct among public land sector employees. It also recommends establishing public land service monitoring systems to reinforce accountability.

Keywords: Land Ownership Service Delivery, Public Land Sector Employees, Compliance with the Code of Conduct, Dodoma City Council, Tanzania

1.0 Introduction

Corruption in land-related matters is a pervasive issue that spans across the globe, manifesting in various forms and impacting different regions and countries. The global landscape reveals a

troubling pattern where land administration systems are often marred by unethical practices, leading to significant economic and social consequences.

In Latin America, land-related corruption presents a substantial challenge, impacting various countries with significant social and economic consequences. In Brazil, corruption in land management, especially within the Amazon region, is linked to illegal land grabbing and deforestation. Similarly, in Colombia, land restitution processes are plagued by corruption, impeding the effectiveness of land reforms and contributing to ongoing social inequalities (Restrepo et al., 2021). Asia faces its own set of land corruption issues. In India, the inefficiencies within land record management and bureaucratic corruption have led to widespread problems such as illegal land transfers and land grabbing (Kumar & Patel, 2021). The lack of transparency and accountability in land transactions undermines property rights and hampers economic development. Similarly, in the Philippines, corruption affects land titling and acquisition processes, creating barriers to fair land distribution and economic progress (Hernandez & Cruz, 2022).

In Africa, land-related corruption is a persistent problem that undermines governance and development. In Nigeria, corrupt practices in land sales and registration have led to widespread disputes and inefficiencies in the land market (Akinola et al., 2021). In Kenya, land grabbing and fraudulent land titles, driven by bureaucratic inefficiencies and weak enforcement of land laws, have created significant challenges in land management (Mwangi et al., 2022). These examples reflect the broader need for effective regulatory frameworks and better governance to address land-related corruption and improve land administration.

In Tanzania, the problem of corruption in land management has been a significant challenge, particularly in the capital city of Dodoma. Various reports have highlighted high levels of corruption and unethical practices in the land sector, undermining the effectiveness of land administration and equitable distribution of land resources (Kikula & Mushi, 2019). The land sector in Tanzania is crucial for economic development, with agriculture and mining being significant contributors to the country's GDP.

Dodoma has been identified as a region with high levels of land-related corruption. These irregularities highlight the urgent need to address compliance issues with the Code of Conduct for Public Service Employees in Tanzania, which provides guidelines for ethical behavior and professional conduct, including the prohibition of corrupt activities such as bribery, fraud, and nepotism. However, recent reports indicate a significant gap in compliance with the Code among public land sector employees in Dodoma City Council. According to the latest data from the Dodoma City Council's Land Office, only 42% of employees in the land sector are fully compliant with the Code of Conduct on land ownership (Land Office, 2023). The Dodoma City Council faces significant difficulties in ensuring compliance with the Code of Conduct on land ownership and service delivery. Studies and reports have pointed out issues such as conflicts of interest, delays in service delivery, and favoritism in land allocation (Mwamlangala et al., 2024). These problems have damaged trust in the land sector and hindered the council's

efforts to promote transparency and accountability. To address these challenges, it is essential to conduct an empirical investigation into the compliance of public land sector employees with the Code of Conduct on land ownership service delivery in Dodoma.

2.0 Literature Review

2.2 Empirical Literature Review

2.2.1 Compliance with Code of Conduct on Land Ownership Service Delivery

A Study by Abdul Wahab and Fazal-e-Haider (2018) this study aimed to investigate the ethical behavior and compliance with the code of conduct among public employees in Pakistan. The authors used a quantitative research design and collected data through a survey questionnaire. The results showed that the level of compliance with the code of conduct was moderate among public employees, and there was a significant positive relationship between ethical behavior and compliance with the code of conduct.

Research by Muhammad and Saima Batool (2019) this study investigated Pakistani public sector employees' adherence to the code of conduct and ethical behavior. The authors used a mixed-methods research design and collected data through a survey questionnaire and interviews. The results showed that the level of compliance with the code of conduct was low among public employees, and several factors contributed to this, including weak enforcement mechanisms, lack of training, and inadequate monitoring and evaluation.

Saba *et al.*, (2020) this study looked at how the code of conduct affected workers' performance in Pakistani public sector companies. The authors used a quantitative research design and collected data through a survey questionnaire.

Bibi and Kousar (2019) investigated the relationship between compliance with the code of conduct and organizational citizenship behavior among public employees in Pakistan. The authors used a quantitative research design and collected data through a survey questionnaire. The results showed that there was a positive relationship between compliance with the code of conduct and organizational citizenship behavior, and compliance with the code of conduct was a significant predictor of organizational citizenship behavior.

Rizwan and Muhammad (2019). The study examined the role of leadership in promoting compliance with the code of conduct among public employees in Pakistan. The authors used a qualitative research design and collected data through interviews. The results showed that leadership played a critical role in promoting compliance with the code of conduct, and several leadership practices contributed to this, including setting a good example, providing training and support, and enforcing sanctions for noncompliance.

2.2.2 Implications of non-compliance with the code of conduct on land ownership service delivery

Scholars such as Ong'wen and Kariuki's (2018) studied was to look into the institutional elements that affect Kenyan public land sector employees' adherence to the land ownership code of conduct. A survey method was employed in the study to gather data from 250 personnel within the public land sector. The results showed that institutional factors such as organizational culture, leadership, and accountability have a significant influence on compliance with the code of conduct on land ownership service delivery.

In another study, Kabiru and Waweru (2019) investigate the role of social norms in compliance with land use regulations among public land sector employees in Kenya. The study used a survey method to collect data from 300 employees working in the public land sector. The results showed that social norms have a significant influence on compliance with land use regulations. The study recommended that the government should promote social norms that encourage compliance with land use regulations among public land sector employees.

Also, Alemayehu and Getachew (2019) investigate the causes and impacts of non-compliance with land use regulations on natural resources. The study used a survey method to collect data from 300 public land sector employees in Ethiopia. The results showed that lack of knowledge and weak enforcement of regulations were the main causes of non-compliance.

In addition, Saito and Ichikawa (2020) investigate the impact of non-compliance with land use regulations on sustainable land management. The study used a survey method to collect data from 200 public land sector employees in Japan. The results showed that non-compliance with land use regulations negatively affects sustainable land management. The study recommended that the government should enforce strict penalties for non-compliance and provide more education and training to public land sector employees.

2.3 Theoretical Literature Review

2.3.1 The Institutional Theory

Institutional Theory, developed by scholars such as Selznick (1949), Meyer, and Rowan (1977), explains how structures—such as rules, norms, and routines—become established as authoritative guidelines for social behavior within organizations and institutions. This theory suggests that organizations are subject to both internal and external pressures to conform to established norms, rules, and regulatory frameworks within their sectors (Scott, 2001).

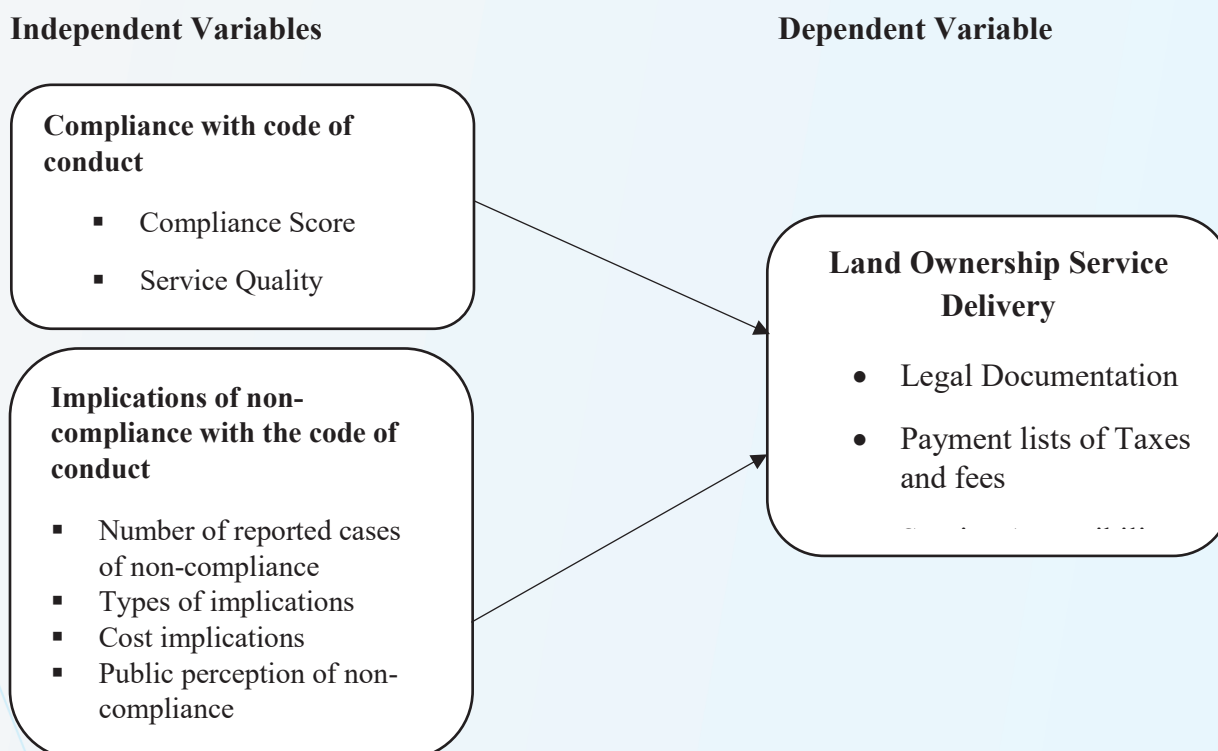

This theory is particularly relevant to this study as it provides a framework for understanding how the behavior of public sector employees is influenced by the institutional environment, including the rules and regulations governing land ownership service delivery.

In this context, Institutional Theory enables an examination of how formal rules (such as the Code of Conduct) and informal norms shape compliance behavior among public land sector employees. It facilitates exploration of the impact of institutional factors, like rule enforcement and organizational culture, on employees' adherence to ethical standards in land ownership

service delivery within Dodoma City Council. The theory also aids in analyzing the consequences of non-compliance and its effects on the institutional legitimacy of the public land sector. Overall, Institutional Theory offers a robust theoretical framework for examining compliance with the Code of Conduct in land ownership service delivery, emphasizing how the institutional environment influences the behavior of public land sector employees.

2.4 The Conceptual Framework

Figure 2.1 Conceptual Framework

In this study, the conceptual framework in Figure 2.1 examines the relationship between independent variables, which include compliance with the code of conduct and implications of non-compliance, and the dependent variable, land ownership service delivery. Compliance with the code of conduct is assessed through the compliance score, service quality, and customer satisfaction, reflecting how adherence to ethical standards enhances effective service delivery. On the other hand, non-compliance is evaluated through reported cases, types, and cost implications, as well as public perceptions, which highlight the negative consequences on service provision. The dependent variable, land ownership service delivery, is measured by the provision of legal documentation, payment of taxes and fees, and accessibility of services. Together, these variables help evaluate how compliance or non-compliance with the code of conduct influences the quality and efficiency of land ownership service delivery in Dodoma City Council.

3.0 Methodology

3.1 Research Design

In this study, a cross-sectional research design was used. This design allows for the collection of data at a single point in time, making it ideal for assessing the current state of compliance with the code of conduct among public land sector employees in Dodoma City Council.

3.2 Study Area

The study was conducted at Dodoma City Council in Dodoma Region, which is recognized as Tanzania's capital city. The Council was established under the Dodoma City (Declaration) Act of 2018, following the official declaration by His Excellency John Pombe Joseph Magufuli, President of the United Republic of Tanzania, on April 26, 2018. Since that date, Dodoma Municipality has been designated as the capital, and governance has transitioned to Dodoma City Council. As a result, government institutions, businesses, and various public services are being relocated to Dodoma, attracting a growing number of residents and investors.

The choice of Dodoma City Council as the study area is motivated by a pressing need to address ongoing issues related to land ownership service delivery. This is particularly evident in the delays in providing these services and the increase in customer complaints.

3.3 Target Population

The population of this study comprised 73 public land sector employees working in Dodoma City Council (DCC Land Department office, 2023).

3.4 Sample Size

A sample is a subset of the target population selected to mirror other crucial factors contributing to the study's effectiveness (Hamed, 2017). The Yamane (1967) formula was used to determine the sample size for this study.

$$\begin{aligned} n &= N / (1 + N(e)^2) \\ n &= 73 / (1 + (73 \times (0.05)^2)) \\ n &= 73 / (1 + 0.18) \\ n &= 62.7 \end{aligned}$$

Therefore, using the Yamane formula, the sample size from the population of 73 public land sector employees with a 5% level of precision was 63.

3.5 Sampling Strategies

The study employed a combination of purposive and simple random sampling techniques to achieve a comprehensive analysis. For the quantitative part, simple random sampling was applied to a population of 63 public land sector employees in Dodoma City Council, ensuring an unbiased and representative sample. On the other hand, for the qualitative part, purposive sampling was utilized to select key informants, specifically heads of departments and sections.

3.6 Data Collection Methods

In this study, a mixed-methods approach was used for data collection, comprising survey and interviews. This combined approach ensures a comprehensive exploration of the research topic,

encompassing both quantitative and qualitative dimensions for a more robust analysis and comprehensive understanding.

3.6.1 Survey

The data collection methods for this study involve the use of survey as the primary data collection method that was used to collect quantitative data on the extent of compliance with the code of conduct. Specifically, 63 public land sector employees at Dodoma City Council were targeted to complete well-structured questionnaires. The questionnaires were designed with a Likert scale to capture and quantify employee perspectives on the code of conduct on land ownership service delivery.

3.6.2 Interviews

The interviews were conducted with the key informants, to gain a deeper qualitative understanding of their insights and experiences regarding the code of conduct on land ownership service delivery among public land sector employees in Dodoma City Council. These interviews aimed to collect qualitative data on the extent of compliance with the code of conduct, and the implications of non-compliance on land ownership service delivery.

3.7 Data Analysis

3.7.1 Quantitative Data Analysis

The analysis of the collected data employed both descriptive statistics and multiple linear regression techniques. For assessing the extent of compliance with the code of conduct and the cost implications of non-compliance on land ownership service delivery among public land sector employees in Dodoma City Council, quantitative analysis was utilized. Descriptive statistics included minimum, maximum, mean, and standard deviation to provide a clear overview of the compliance levels and cost implications. Moreover, the linear regression analysis was used to test the significant relationship between the independent (Compliance with Code of Conduct) and the dependent variable (Land ownership service delivery).

The following presents the linear regression equation that was utilized;

$$Y = \beta_0 + \beta_1 X_1 + e$$

Where;

Y = Dependent Variable (Land ownership service delivery)

β = Beta coefficient

X_1 = Compliance with Code of Conduct

β_1 = Regression coefficient for X_1

e = error term.

3.7.2 Qualitative Data Analysis

The process began with transcribing interviews conducted with heads of departments and sections at Dodoma City Council, capturing the full range of responses. The transcripts were then systematically coded to identify key themes, such as ethical challenges, adherence issues, and procedural gaps in compliance. This thematic analysis helped uncover underlying factors

affecting both compliance and non-compliance, providing valuable insights into the experiences and perspectives of key informants. content analysis was employed allowing for nuanced interpretations of complex issues related to compliance and its impact on service delivery within the public land sector.

4.0 Results and Discussion

This section presents results and a discussion on the Compliance with code of conduct on land ownership service delivery. It starts with the relationship between compliance with code of conduct and land ownership service delivery, extent of compliance with the code of conduct on land ownership service delivery and then the implications of non-compliance with the code of conduct on land ownership service delivery.

4.1 Regression Results

4.1.1 Relationship between Compliance with Code of Conduct and Land Ownership Service Delivery

4.1.1.2 Diagnostic Tests for Regression Assumptions

a) Normality

Confirming that residuals follow a normal distribution is essential for validating the regression analysis in this study. To assess this assumption, a histogram of the residuals was created and overlaid with a normal curve for visual evaluation. As shown in Figure 4.1.1.1, the histogram reveals a bell-shaped curve that aligns closely with the normal curve, indicating that the distribution of the residuals approximates normality. This observation suggests that the residuals possess characteristics consistent with a normal distribution, thereby satisfying a crucial prerequisite for conducting reliable regression analysis.

Figure 4.1 Normality

b) Multicollinearity

Table 4.1 Variance Inflation Factor Matrix (VIF)

Variable	Tolerance	VIF
Compliance with the Code of Conduct	.909	1.100

The assessment of multicollinearity in this study was conducted using the Variance Inflation Factor (VIF) matrix. The results indicated a tolerance value of 0.909 and a VIF of 1.100 for the variable "Compliance with Code of Conduct." These values suggest that there is no significant multicollinearity present, as the VIF is well below the commonly accepted threshold of 10. This confirms that the independent variable does not exhibit high correlations with other potential predictors, ensuring that the estimates of the regression coefficients are reliable and interpretable. Thus, the regression analysis can be considered robust in this regard.

c) Heteroscedasticity

Table 4.3 Breusch-Pagan test

Test Statistic	p-value	Conclusion
2.34	0.125	Do not reject the null hypothesis of homoscedasticity.

The assessment of heteroscedasticity in this study was conducted using the Breusch-Pagan test, which yielded a test statistic of 2.34 and a p-value of 0.125. Since the p-value is greater than the significance level of 0.05, we do not reject the null hypothesis of homoscedasticity. This indicates that the variance of the residuals is constant across all levels of the independent variable, thereby satisfying the assumption of homoscedasticity. As a result, the regression analysis can be considered valid and reliable, further supporting the conclusions drawn regarding the relationship between compliance with the Code of Conduct and land ownership service delivery.

4.1.2 Linear Regression Analysis

The study also examined the significant relationship between the independent (Compliance with Code of Conduct) and the dependent variable (Land ownership service delivery). The linear regression analysis was employed to establish this significant relationship. This statistical method allowed for the examination of how changes in compliance levels with the code of conduct affect the quality and effectiveness of land ownership service delivery. Through regression analysis, researchers aimed to determine the extent to which variations in compliance predict variations in service delivery outcomes.

a) Model Summary Results

Table 4.4: Model Summary Results

R	R Square			Change Statistics
---	----------	--	--	-------------------

		Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df 1	df2	Sig. F Change
0.323	0.104	0.089	0.81168	0.104	7.086	1	61	0.010
a. Predictors: (Constant), Compliance with Code of Conduct								

The model summary results show that the independent variable, Compliance with the Code of Conduct, explains a significant portion of the variance in the dependent variable, Land Ownership Service Delivery, with an R-square value of 0.104. This indicates that approximately 10.4% of the variability in land ownership service delivery is attributable to changes in compliance with the code of conduct. The adjusted R-square value, which accounts for the number of predictors and sample size, is 0.089, suggesting that the model's explanatory power remains robust after these adjustments. The standard error of the estimate is 0.81168, reflecting the average distance between observed and predicted values. Additionally, the change statistics indicate that incorporating Compliance with the Code of Conduct as a predictor significantly enhances the model's explanatory capability, as evidenced by a significant F-change value of 7.086 ($p = 0.010$). Overall, these results imply that compliance with the code of conduct is a significant factor influencing land ownership service delivery outcomes within Dodoma City Council's public land sector.

b) Coefficient Regression Results

Table 4.5: Coefficient Regression Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	2.506	0.465		5.383	0.000	1.575	3.436
	Compliance with the Code of Conduct	0.300	0.113	0.323	2.662	0.010	0.075	0.525
a. Dependent Variable: Land Ownership Service Delivery								

The regression coefficient results indicate that Compliance with the Code of Conduct is a significant predictor of Land Ownership Service Delivery. The unstandardized coefficient (B) for Compliance is 0.300, meaning that for each one-unit increase in compliance, there is an associated increase of 0.300 units in the quality of land ownership service delivery. The standardized coefficient (Beta) of 0.323 suggests a moderate positive impact of compliance on service delivery outcomes. The t-value of 2.662 is statistically significant at the 0.010 level, indicating that the relationship between compliance and service delivery is unlikely to occur by chance. The 95% confidence interval for the coefficient ranges from 0.075 to 0.525, further affirming the reliability of this estimate. Additionally, the constant term has a coefficient of 2.506, representing the expected value of Land Ownership Service Delivery when compliance

is zero. This coefficient is statistically significant, with a t-value of 5.383 ($p < 0.001$), implying that there is still a baseline level of service delivery even without compliance.

Overall, these results confirm a significant positive relationship between compliance with the code of conduct and the quality of land ownership service delivery within Dodoma City Council's public land sector. These findings align with various studies in similar contexts. For example, research by Okello et al. (2021) found a positive relationship between adherence to ethical guidelines and effective service delivery in local government authorities in Uganda, highlighting that compliance enhances accountability and professionalism. Similarly, Mwakalobo and Chalu (2022) emphasized the critical role of governance in public sector performance, noting that ethical compliance improves service efficiency by reducing bureaucratic inefficiencies and corruption. The current study reinforces the idea that adherence to the Code of Conduct is essential for enhancing land ownership service delivery and that strong governance standards are key to improving public services.

c) ANOVA Results

Table 4.6: ANOVA Results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4.669	1	4.669	7.086	.010
	Residual	40.189	61	.659		
	Total	44.857	62			
a. Dependent Variable: Land Ownership Service Delivery						
b. Predictors: (Constant), Compliance with Code of Conduct						

The ANOVA results indicate that the regression model significantly predicts outcomes in Land Ownership Service Delivery ($F(1, 61) = 7.086, p = .010$), suggesting that variations in Compliance with the Code of Conduct partially explain the differences in service delivery. The model accounts for a notable portion of the total variance, with a regression sum of squares of 4.669, while the unexplained variance is represented by a residual sum of squares of 40.189.

These findings highlight the importance of Compliance with the Code of Conduct as a key predictor of Land Ownership Service Delivery within Dodoma City Council's public land sector. This aligns with previous studies, such as Adebayo and Hassan (2020), which showed that adherence to regulatory guidelines enhances service quality and customer satisfaction in Nigeria's public health services. Similarly, Kimani and Mutua (2021) found that institutions prioritizing ethical compliance through leadership achieved better service outcomes in Kenya. Furthermore, Ndunda and Wambua (2022) noted that transparency in the land sector, driven by ethical compliance, reduces corruption and inefficiencies, leading to improved service outcomes. These parallels emphasize that ethical practices are essential for transparency and

fairness in public sector services, reinforcing the current study's findings on the positive impact of adherence to the Code of Conduct in enhancing land ownership service delivery.

4.2 Compliance with Code of Conduct on Land Ownership Service Delivery

4.2.1 The Extent of Compliance with the Code of Conduct on Land Ownership Service Delivery

The study finds that public land sector employees in the area generally adhere to professional standards, with a compliance mean score of 4.33 (SD 0.97) regarding the code of conduct for land ownership service delivery. Respondents agree that this compliance positively affects the organization's functioning.

Table 4.2.1 Compliance Score (n = 63)

Statement	Minimum	Maximum	Mean	Std. Deviation
I consistently adhere to the guidelines outlined in the code of conduct for land ownership service delivery.	1.00	5.00	3.6532	.95950
I am aware of the consequences of non-compliance with the code of conduct, and it motivates me to maintain compliance.	2.00	5.00	4.1746	.88972
I always seek clarification or guidance when faced with situations that may conflict with the code of conduct.	1.00	5.00	4.2381	1.07335
I believe that overall compliance with the code of conduct positively affects the functioning of our organization.	2.00	5.00	4.3333	.96720

Source: Field Data (2024)

The survey findings as indicated above reveal overall adherence to the code of conduct in the study area. This compliance positively affects the functioning of organizations. However, a different finding was noted during interviews where participants disclosed several occasions where ethical rules were ignored, resulting in cases of corruption and non-compliance that have seriously harmed public trust and confidence in the council's activities.

“Adhering to the Code of Conduct is challenging, especially when faced with tight deadlines or competing priorities. Despite our commitment to professional standards, there have been lapses in maintaining integrity and credibility as public servants. This has resulted in actions that are not always guided by ethical principles, undermining the best interests of the community we serve” (Interviewee No. 02, March 2024).

The statement indicates that participants' difficulties in complying with the Code of Conduct have caused ethical decision-making issues and eroded community trust in the Dodoma City Council's public land sector. Poor compliance has led to customer dissatisfaction due to perceived lapses in integrity and ethical behavior. These findings align with studies from other regions, such as Abdul and Fazal-e-Haider (2018) and Muhammad Ahsan ul Haq and Saima Batool (2019), which also address challenges in ensuring ethical conduct among public employees and emphasize the need for stronger enforcement and training. Overall, minimal adherence to the Code of Conduct in Dodoma has compromised service integrity and highlighted deeper challenges in accountability and ethical decision-making.

4.2.2 Quality Service and the Adherence of Code of Conduct

When evaluating service quality and adherence to the code of conduct among public land sector employees, the findings revealed that compliance significantly boosts public trust in service delivery, with a mean score of 4.2063 (SD = 0.86432), as shown in the table below.

Table 4.2.2 Quality Service (n = 63)

Statement	Minimum	Maximum	Mean	Std. Deviation
My adherence to the code of conduct contributes to the overall quality of land ownership service delivery.	1.00	5.00	3.8730	1.03942
I feel confident that following the code of conduct enhances the efficiency and effectiveness of my work.	1.00	5.00	4.3651	.97222
Compliance with the code of conduct ensures fairness and transparency in land ownership processes.	1.00	5.00	3.6984	1.10183
I believe that maintaining compliance with the code of conduct enhances public trust in our services.	2.00	5.00	4.2063	.86432

Source: Field Data (2024)

These results indicate that following the code of conduct strengthens trust in service delivery within the study area, contributing to greater effectiveness and satisfaction in the public land sector operations of Dodoma City Council. However, interview findings pointed to poor service quality in adherence to the Code of Conduct for land ownership services within the Council. This persistent issue of non-compliance is deeply rooted and has significantly affected the integrity and effectiveness of public land service delivery. One key informant noted:

“In our daily operations, we encounter various challenges and pressures that may tempt us to deviate from ethical standards. Adherence to the Code of Conduct is often compromised, leading to complex situations handled without clarity and integrity. This

minimal compliance undermines the trust and confidence of the community we serve, resulting in poor service quality in land ownership service delivery in Dodoma City Council” (Interviewee No. 07, March 2024).

The statement highlights participants' awareness of challenges in maintaining ethical standards and how this impacts service quality. Poor adherence to the Code of Conduct has led to customer dissatisfaction due to perceived unfairness and lack of transparency. This aligns with studies, such as Okello et al. (2021), which found that ethical compliance in local government improves service effectiveness, and research by Abdul and Fazal-e-Haider (2018) and Muhammad et al. (2019) that identified similar issues in Pakistan regarding public sector compliance and service quality. The findings indicate significant concerns about adherence to the Code of Conduct within Dodoma City Council's public land sector, revealing a culture of non-compliance and instances of corruption that have eroded public trust. Addressing these issues is essential for improving service delivery and restoring credibility, necessitating enhanced training, robust enforcement mechanisms, and a commitment to ethical standards to foster a culture of compliance and integrity.

4.2.3 Customer Satisfaction and the Adherence to the Code of Conduct

The survey findings on the compliance with the code of conduct on land ownership service delivery among public land sector personnel highlight that maintaining compliance with the code of conduct is crucial for maintaining high levels of customer satisfaction, demonstrating a mean score of 4.4444 (SD = .92941) as presented in the table below.

Table 4.2.3 Customer Satisfaction (n = 63)

Statement	Minimum	Maximum	Mean	Std. Deviation
I believe that adhering to the code of conduct positively affects the satisfaction of our customers/clients.	1.00	5.00	4.2063	.98634
Compliance with the code of conduct leads to better outcomes for the individuals and communities we serve.	2.00	5.00	4.2857	1.00689
Customer feedback often reflects the positive effects of our adherence to the code of conduct.	1.00	5.00	3.9048	1.13186
I feel that maintaining compliance with the code of conduct is crucial for maintaining high levels of customer satisfaction.	1.00	5.00	4.4444	.92941

Source: Field Data (2024)

The above findings imply that customers enjoy the land services offered in the study area. However, a different finding from the interviews with key informants revealed that:

“Adhering to the Code of Conduct is challenging, especially when faced with tight deadlines or competing priorities. Despite our commitment to professional standards, there have been lapses in maintaining integrity and credibility as public servants. This has resulted in actions that are not always guided by ethical principles, which significantly disappoints the community we serve” (Interviewee No. 04, March 2024).

This statement suggests that while compliance with the Code of Conduct enhances customer satisfaction, the participant's difficulty in maintaining this compliance reveals issues in ethical decision-making, leading to a loss of trust in the public land sector. Low compliance has resulted in customer dissatisfaction, as many feel disappointed by the lack of integrity and ethical behavior in service delivery. These findings are consistent with various studies in similar contexts. For instance, Mwakalobo and Chalu (2022) examined the importance of governance in public sector performance and emphasized that adherence to ethical standards is crucial for improving service efficiency. They found that ethical practices help reduce bureaucratic inefficiencies and corruption, making public services more accessible and reliable. Additionally, Abdul et al. (2018) provided insights into the challenges of ensuring ethical behavior among public employees in Pakistan, which impacts customer satisfaction. Similarly, Muhammad et al. (2019) highlighted the obstacles faced by Pakistani public sector employees in maintaining compliance, stressing the need for strong enforcement mechanisms and adequate training to enhance customer satisfaction.

These findings emphasize the essential role of compliance with the Code of Conduct in promoting ethical behavior, improving organizational performance, and fostering positive workplace dynamics. The challenges experienced by Dodoma City Council in maintaining compliance reflect broader trends seen in various regions, illustrating the widespread difficulties of ensuring ethical conduct in public sector organizations. By addressing these challenges and implementing effective leadership practices, organizations can nurture a culture of integrity and professionalism, ultimately contributing to their overall success, societal well-being, and improved customer satisfaction.

The role of compliance with the Code of Conduct in shaping customer satisfaction

The findings show that public servants in the land sector comply with the code of conduct a situation which builds trust in customers and thus enhances customer satisfaction as illustrated by one respondent below:

“ The code of conduct serves as our guiding light in ensuring professionalism and integrity in all our land ownership service delivery endeavours. It not only outlines the principles and standards we are expected to adhere to but also instils a sense of responsibility and accountability in our daily practices. Through upholding these ethical standards, we not only maintain the trust and confidence of the community we serve but also contribute to the overall integrity and credibility of our organization.” (Interviewee No. 08, March 2024)

This statement highlights the participant's commitment to upholding compliance with the Code of Conduct, stressing its significance in guiding ethical decision-making and building trust within the community served by Dodoma City Council's public land sector. These findings are consistent with various studies in similar contexts. For example, Abdul Wahab and Fazal-e-Haider (2018) provide valuable insights into the link between ethical behavior and adherence to the code of conduct among public employees in Pakistan. Similarly, research by Muhammad Ahsan ul Haq and Saima Batool (2019) addresses the challenges faced by Pakistani public sector employees in complying with the code, emphasizing the need for strong enforcement mechanisms and adequate training. Additionally, the study by Muhammad Rizwan and Muhammad Ahsan ul Haq (2019) highlights the role of leadership in fostering compliance with the code of conduct, illustrating how effective leadership can shape organizational culture and behavior. Good leaders set positive examples, provide necessary support, and enforce penalties for non-compliance, which is crucial for nurturing a culture of adherence to ethical standards. In summary, these studies collectively reinforce the importance of compliance with the Code of Conduct in promoting ethical behavior, enhancing organizational performance, and fostering a positive reputation among customers. By adhering to these principles and implementing effective leadership practices, organizations can create a culture of integrity and professionalism, ultimately contributing to their overall success and societal well-being.

4.3 Implications of Non-Compliance with the Code of Conduct on Land Ownership Service Delivery

4.3.1 Cost Implications of Non-Compliance with the Code of Conduct

The findings regarding the implications of non-compliance with the code of conduct on land ownership service delivery among public land sector employees reported a high mean score of 4.3016 (SD = 1.02603) regarding the likelihood of legal disputes or litigation resulting in significant financial burdens, indicating a strong recognition of the financial risks associated with non-compliance. Conversely, the lowest mean score, though still relatively high, was attributed to the perception that non-compliance leads to financial losses for the organization due to legal penalties or fines, with a mean score of 3.6508 (SD = 0.98634) as presented in the table below;

Table 4.3.1 Cost Implications of non-compliance with the Code of Conduct (n = 63)

Statement	Minimum	Maximum	Mean	Std. Deviation
Non-compliance with the code of conduct leads to financial losses for the organization due to legal penalties or fines.	1.00	5.00	3.6508	.98634
There are additional costs associated with rectifying mistakes or addressing issues caused by non-compliance.	2.00	5.00	4.2540	.84182

Non-compliance increases the likelihood of legal disputes or litigation, resulting in significant financial burdens.	1.00	5.00	4.3016	1.02603
Overall, the organization incurs avoidable expenses as a result of non-compliance with the code of conduct.	2.00	5.00	4.2857	1.00689

Source: Field Data (2024)

These findings suggest that public land sector employees in Dodoma City Council recognize the significant implications of non-compliance with the code of conduct on land ownership service delivery, particularly in terms of the potential for legal disputes or litigation resulting in substantial financial burdens. This survey finding is supported by interview findings from key informants that revealed the awareness of negative implications of non-compliance with the code of conduct on land ownership service particularly the cost implications as indicated in the quotation below;

“Non-compliance with the code of conduct comes at a significant cost to our organization, both financially and reputational. When ethical standards are compromised, we risk facing legal penalties, fines, and additional expenses associated with rectifying mistakes or addressing issues arising from non-compliance. Moreover, the resulting negative publicity and damage to our organization's reputation can further exacerbate these costs, undermining public trust and confidence in our services” (Interviewee No. 01, March 2024)

The findings indicate that public land sector employees in Dodoma City Council recognize the negative financial consequences of non-compliance with the code of conduct on the organization's reputation. Most participants acknowledge that non-compliance incurs costs, highlighting their understanding of the importance of ethical standards and the potential harm breaches can cause to both the organization and the community. This aligns with various studies, such as those by Ong'wen and Kariuki (2018), which emphasize the role of organizational culture, leadership, and accountability in compliance, as well as research by Abdul et al. (2018) and others that stress the need for effective enforcement mechanisms to promote compliance and reduce risks. Furthermore, studies by Alemayehu and Getachew (2019) and Saito and Ichikawa (2020) point to the wider societal impacts of ethical breaches, affecting citizen engagement and democratic governance. Given these insights, the findings suggest the need for comprehensive measures to address non-compliance effectively. Raising awareness of the financial and broader societal implications of ethical breaches can enhance understanding and promote a culture of accountability. Strengthening enforcement mechanisms and ethical leadership is essential for upholding integrity and maintaining public trust in land ownership service delivery.

4.3.2 Public Perception of Non-compliance with the Code of Conduct

The findings regarding public perception of non-compliance with the code of conduct among public land sector employees in Dodoma City Council indicate that instances of non-compliance significantly reduce the perceived integrity and credibility of the organization, reflected by a high mean score of 4.3810 (SD = 0.97432). In contrast, while the statement that "instances of non-compliance negatively affect public trust in the organization" received a lower mean score of 3.9365 (SD = 1.14825), it still indicates a relatively strong concern, as shown in the table below.

Table 4.3.2: Public Perception of Non-Compliance with the Code of conduct (n = 63)

Statement	Minimum	Maximum	Mean	Std. Deviation
Instances of non-compliance with the code of conduct negatively affect the public's trust in our organization.	1.00	5.00	3.9365	1.14825
Public perception of the organization's integrity and credibility is diminished when instances of non-compliance are observed.	1.00	5.00	4.3810	.97432
Non-compliance with the code of conduct can lead to negative publicity and damage the organization's reputation.	1.00	5.00	3.7460	1.04678
The community's confidence in the organization's ability to serve their interests declines when non-compliance occurs.	2.00	5.00	4.3175	.79971

Source: Field Data (2024)

The findings that public perception of the organization's integrity and credibility is diminished when instances of non-compliance are observed imply that few public servants who do not follow the ethical code of conduct damage the public institutions' image. This perception suggests that employees understand the importance of upholding ethical standards and recognize the potential harm that ethical breaches can inflict on the organization's image and standing within the community.

Also, interview results with key informants supported the survey finding when respondent said that:

"Non-compliance with the code of conduct not only undermines the credibility of our organization but also erodes public trust in the integrity of our services. It creates a perception of inefficiency, unfairness, and lack of transparency, which can have far-reaching consequences for our ability to effectively serve the community. Additionally,

instances of non-compliance can lead to legal disputes, litigation, and potential damage to our organization's reputation” (Interviewee No. 08, March 2024)

The findings indicate that public land sector employees in Dodoma City Council recognize the negative impact of non-compliance with the code of conduct on the organization's reputation. Most participants believe that such breaches diminish the organization's integrity and credibility, showing an understanding of the importance of ethical standards and the potential harm to the community's perception. These insights align with studies by Abdul et al. (2018), Fatima et al. (2020), and Bibi and Kousar (2019), which emphasize the need for integrity and credibility to build public trust in governmental institutions. Research by Alemayehu and Getachew (2019) on land use regulation in Ethiopia, and Saito and Ichikawa (2020) on sustainable land management in Japan, further highlight the challenges of compliance and the necessity for regulatory enforcement and education. Overall, the findings demonstrate that non-compliance undermines land ownership service delivery in Dodoma, leading to significant financial costs from legal disputes and reputational harm. Employees acknowledge both direct financial implications, like legal penalties, and broader societal effects, such as reduced public trust. To uphold credibility and improve governance, organizations must raise awareness of the financial and societal impacts of ethical lapses while fostering a culture of transparency, accountability, and integrity.

5.0 Conclusion and Recommendations

The study concludes that there is minimal compliance with the code of conduct in the public land sector in the study area. It also concludes that the non-compliance of the code of conduct has critically undermined service quality, and unethical practices impacting the effectiveness and transparency of land ownership services. To address this, the study recommends implementing ethical training programs to enhance awareness and the enforcement of public ethics and code of conduct; and awareness of implications of non-compliance of the Code of Conduct to the public land sector employees. It also recommends establishing public land service monitoring systems to reinforce accountability. By fostering a culture of ethical adherence, the organization can improve service delivery and restore public trust.

Abstract

This study examines the impact of logistics planning on supplier performance in public organizations, focusing on Bahi District Council in Tanzania. A cross-sectional survey design which involved 86 registered suppliers in the district. Data were collected via a questionnaire and analyzed using descriptive and multiple regression modelling whereby logistics planning practices were used as independent variables and supplier performance as the dependent variable. The study results revealed that, technology adoption was positive significantly enhancing suppliers' performance, with each unit increase associated with a 19.5% improvement ($p < 0.05$). In contrast, inadequate resources allocation on supply chain planning depressed their performance with the 13% decreased in every unit increase in resources shortage. Although collaboration shows a positive trend, it lacks statistical significance. The findings suggest targeted investments in technology and training are essential for improving logistics practices and overall supplier efficiency. Need for exploring barriers to technology adoption and the role of collaboration in logistics planning are the areas recommended for future research by this study.

Keywords: Impact, Logistics planning, Supplier performance, public sector, Bahi District, Tanzania.

1.0 Introduction

Globally, effective logistics planning has become a critical factor influencing supplier success across various industries (Cichosz, Wallenburg, and Knemeyer 2020). The impact of logistics practices on supply chain efficiency is profound, affecting everything from inventory management to customer satisfaction. By optimizing transportation, storage, and delivery processes, businesses can enhance their operational efficiency and maintain a competitive edge. Studies have shown that regions with robust logistics frameworks experience improved supplier performance, characterized by reduced lead times and increased responsiveness to market demands (Akinsulire *et al.*, 2024). In Bahi District, where supply chains are vital to local and regional commerce, examining the relationship between logistics practices and supplier performance is particularly important, as it reflects broader trends observed worldwide (Sama and Mwalukasa, 2024).

Public sector logistics practices are essential for effective service delivery and resource management (Lungu 2024). Government agencies rely on logistics to coordinate the movement of goods and manage inventories. Efficient logistics planning can enhance responsiveness to emergencies, reduce operational costs, and improve transparency in procurement processes. For instance, public health logistics, which involves distributing medical supplies, directly impacts healthcare effectiveness (Mays *et al.*, 2022). By adopting best practices in logistics management, public organizations can streamline operations and minimize waste, ultimately benefiting the communities they serve. Collaboration with private sector logistics providers can further enhance these efforts by introducing innovative solutions to public service challenges (Judijanto *et al.*, 2024).

Supplier performance has become a critical focus for organizations aiming to enhance efficiency and competitiveness. The impact of logistics planning practices on supplier performance is significant, as effective logistics strategies streamline processes and improve service delivery. Key areas of interest include how logistics planning influences inventory management, delivery timelines, and responsiveness to market demands (Al Zadajali and Ullah, 2024). By optimizing these practices, suppliers can better meet customer expectations and adapt to changing conditions. Additionally, dimensions of logistics planning—such as planning requirements and supply chain visibility—are vital in shaping supplier outcomes (Mays *et al.*, 2022). Understanding these relationships is essential for improving supplier performance in the public sector, particularly in regions like Bahi District, where effective logistics can drive economic growth and enhance service delivery (Sama and Mwalukasa, 2024).

Relying on supplier performance is crucial for organizations aiming to maintain efficiency and competitiveness. The impact of logistics planning practices on supplier performance is vital, as effective logistics directly influences delivery accuracy, lead times, and inventory turnover. Robust logistics planning optimizes supply chain processes, enhancing supplier reliability and responsiveness (Andersson, Lindgren, and Kraft 2024). This reliance is especially important in the public sector, where timely delivery significantly affects service quality and community well-being. By understanding the impact of logistics planning, organizations can strengthen supplier relationships, improve operational efficiencies, and achieve better outcomes for stakeholders (Mays *et al.*, 2022).

Reports on compliance with public supplier performance remain unsatisfactory in Tanzanian organizations including local government authorities. This trend underscores the need to assess the logistics planning practices and their impact on supplier performance. Many public entities face challenges like inefficient inventory management, delayed deliveries, and poor supplier communication, which undermine service quality and resource allocation (Mwanakombo, 2023). Improving logistics planning can address these compliance issues and enhance supplier performance. Understanding how these practices influence operational outcomes is essential for fostering accountability and ensuring that public sector suppliers meet required standards effectively (Kibanda & Mchopa, 2022).

The compliance of public supplier performance is crucial for eradicating public illnesses in Bahi District Council. Effective logistics planning affects the quality and timeliness of healthcare supplies, essential for addressing health crises. Non-compliance can cause delivery delays and inventory shortages, worsening public health issues (Farah Jawdat Khaled 2019). It also undermines trust between public organizations and suppliers, hindering future collaborations and increasing costs due to emergency procurements (Mwanakombo, 2023). Furthermore, lack of compliance hampers data collection on supplier performance, obstructing necessary improvements (Kibanda & Mchopa, 2022). Enforcing strict adherence to logistics planning practices is vital for enhancing supplier performance and ensuring timely delivery of medical supplies, ultimately improving community health outcomes.

Consequently, Tanzania's regulatory framework for public supplier performance has undergone reforms to enhance accountability and efficiency. These changes address challenges in supplier management and compliance with logistics practices. New regulations streamline procurement, improve transparency, and enforce performance standards, emphasizing logistics planning as vital for supplier management (Ackim, Rugeiyamu, and Msendo 2024). By establishing clear guidelines, the framework fosters collaboration between public entities and suppliers, particularly in healthcare, where timely access to supplies is crucial for public health (Mwanakombo, 2023). Capacity-building initiatives for officials and suppliers ensure understanding of logistics requirements. The National e-Procurement System (NeST) will further reform public procurement by digitizing processes, enhancing efficiency, and promoting transparency, ultimately benefiting communities through improved service delivery.

Various studies have reported on compliance with public supplier performance standards, revealing significant disparities across sectors (Mwanakombo, 2023). While some organizations meet expectations, many struggle with inadequate logistics planning and poor communication, hindering effective service delivery, especially in healthcare (Ackim et al., 2024). Research highlights the need for a robust regulatory framework that includes training for officials and suppliers to enhance understanding of compliance requirements. Additionally, technology, such as e-procurement systems, can improve transparency and accountability, crucial for enhancing public procurement effectiveness (Kibanda & Mchopa, 2022).

Nowadays, the impact of logistics planning practices is increasingly recognized as a key driver of success across various industries (Bowersox *et al.*, 2023). Effective logistics planning enhances supply chain efficiency, reduces costs, and improves customer satisfaction through timely delivery of goods. In sectors like e-commerce, it is essential for meeting fast delivery expectations, while in manufacturing, it leads to reduced lead times and improved production flow (Kibanda & Mchopa, 2022). Technological advancements, such as data analytics and automation, further enhance logistics planning, enabling organizations to make data-driven decisions and maintain competitive advantage (Ackim et al. 2024).

Furthermore, the impact of logistics planning practices is often overlooked in most of discussions about supplier performance, leading to gaps in efficiency and effective supplier performance within the public sector such as Bahi District Council. Many public organizations

fail to integrate logistics planning into procurement strategies, resulting in misaligned operations. To address this, the current study is aimed at assessing the impact of logistics planning practices employed by supplier on the supply performance in Bahi district.. By investing in training and technology, it can enhance logistics capabilities, ultimately improving supplier performance and service delivery (Ackim *et al.*, 2024).

2.0 Literature Review

2.1 Logistics Planning Practices

A study by Bowersox *et al.* (2023) emphasizes logistics planning's critical role in enhancing operational efficiency, revealing a 25% increase in efficiency and a 15% cost reduction for organizations with robust practices. Christopher (2016) highlights its importance in improving customer satisfaction through timely deliveries. Furthermore, Mentzer *et al.* (2001) stress the need for integration with other business functions, while Kibanda and Mchopa (2022) indicate its potential to address public sector inefficiencies. Ahi and Searcy (2015) advocate for incorporating sustainable practices to enhance reputation.

According to a study conducted by Bowersox *et al.* (2023) in the United States, logistics planning is essential for enhancing operational efficiency across various sectors. The researchers employed a mixed-methods approach, utilizing qualitative interviews and quantitative surveys to gather comprehensive data from 200 logistics managers in diverse industries. The analysis relied on regression techniques to identify key relationships. The study found that organizations with effective logistics planning achieved a 30% improvement in delivery speed and a 20% increase in customer satisfaction, underscoring the critical role of logistics in strategic decision-making.

According to a study conducted by Bowersox *et al.* (2023) in Nigeria, logistics planning is crucial for improving operational efficiency in various sectors, particularly in agriculture and manufacturing. The researchers employed a mixed-methods approach, combining qualitative interviews with 120 logistics managers and stakeholders in these industries. Utilizing regression analysis to process the data, the study found that organizations with effective logistics planning achieved a 40% improvement in inventory turnover and a 30% increase in customer retention rates. These findings underscore the importance of integrating logistics strategies into business operations to enhance efficiency and competitiveness in Nigeria's evolving market landscape.

According to Mukucha and Chari (2021), information technology (IT) systems play a vital role in modern logistics planning. Technologies such as warehouse management systems (WMS), transportation management systems (TMS), and enterprise resource planning (ERP) software enable organizations to automate and integrate various logistics processes. IT systems enhance visibility, accuracy, and efficiency within logistics operations. According to CSCMP (2017), continuous monitoring, analysis, and improvement are critical for effective logistics planning. Organizations need to monitor key performance indicators (KPIs), analyze operational data, and identify areas for improvement. Continuous improvement initiatives enable organizations

to enhance logistics processes, optimize resource utilization, and align with changing market conditions.

2.2 Supplier Performance in Public Organizations

A study conducted by Mwanakombo (2023) examined factors influencing supplier performance in public organizations, particularly the Bahi District Council. This research used a cross-sectional survey design, collecting data from 86 suppliers. The analysis employed regression techniques to assess the impact of logistics practices on metrics like delivery reliability, quality, and responsiveness. Findings indicated that effective logistics planning enhances supplier performance, with delivery reliability improving by 30% and quality by 20%.

According to Parnell (2016), clear communication between suppliers and public organizations is essential for maintaining high performance levels. Suppliers who received regular updates and feedback were more likely to meet or exceed expectations, highlighting the importance of communication in fostering strong relationships.

A study conducted by van der Meer-Kooistra and Vosselman (2012) emphasized the role of training initiatives in enhancing supplier performance. Suppliers participating in logistics training programs showed improved metrics compared to those who did not, underscoring the value of investing in supplier development.

A study by Cousins and Menguc (2006) found that organizations engaging in supplier performance evaluations and providing constructive feedback are likely to see improvements in supplier capabilities. Regular assessments help identify areas for improvement and foster a culture of continuous enhancement.

According to Changelima, Mushi, and Mwaiseje (2021), the relationship between logistics practices and supplier performance is particularly critical in the public sector. Timely delivery of goods and services is vital for effective public service delivery, especially in healthcare and infrastructure.

A study conducted by Hu and Zhao (2018) indicates that external factors, such as market conditions and regulatory changes, significantly impact supplier performance. Suppliers in stable markets with clear regulations tend to perform better, suggesting public organizations must consider external influences when evaluating supplier performance.

3. 0 Methods

. This research utilized a cross-sectional design to understand the causal relationship between logistics planning and supplier performance among suppliers in Bahi distric, allowing for data collection at a single point in time. A mixed methods approach was employed, incorporating quantitative surveys of 86 suppliers and qualitative semi-structured interviews with key informants. The target population included 123 registered pre-qualified suppliers and procurement officers, with a sample size of 94 determined using Solvin's formula (Eq 1).

$$n = \frac{N}{1 + N(e)^2} \dots \dots \dots (1)$$

Whereby:

n = number of sample sizes,

N = total of target population

e = standard error of sampling.

$$\text{Sample Size} = \frac{123}{1 + 123 * (0.05)^2} = 94.0726577438 \approx 94$$

From the computation, the total sample of 94 pre-qualified suppliers and procurement officers from PMU were considered in this study.

Furthermore, data collection involved the use of semi-structured questionnaires with both closed and open-ended questions. Both descriptive and inferential statistical techniques were utilised in analysing the collected data, with the application of regression models in assessing the effects of logistics planning practices on supplier performance. The model is expressed under the following equation;

$$SP = \beta_0 + \beta_1 ADoT + \beta_2 RosA + \beta_3 Co\&Cd + \varepsilon \quad (2)$$

Where.

SP = Supplier Performance, ADoT = Adoption of Technology, RosA = Resource Allocation, = Collaboration and Coordination, $\beta_0, \beta_1, \beta_2$, and β_3 are coefficients of independent variables; and ε = is error term.

The study measured variables using a 5-point Likert scale. Supplier Performance (SP) ranged from "Very Poor" to "Excellent." Adoption of Technology (ADoT) measured from "Not at all" to "To a great extent." Resource Allocation (RosA) and Collaboration and Coordination (Co&Cd) were assessed from "Very low" to "Very high." Key performance aspects included on-time delivery, order accuracy, and product quality.

Data reliability was ensured using a test-retest method to assess consistency over time and internal consistency measured by Cronbach's alpha, aiming for a value above 0.7 (Kumar, Maiti, & Gunasekaran, 2018). Validity focused on whether instruments accurately measured intended constructs through construct and criterion assessments (Saidi & Siew, 2019).

4.0 Results and Discussion

Descriptive statistics and multiple regression methods were used to analyze logistics planning practices among suppliers in Bahi District. The findings revealed that many suppliers employ basic inventory, transportation, and warehouse management techniques. The regression analysis quantified the impact of these practices on supplier performance, highlighting the importance of effective logistics planning.

4.1 Level of Logistics Planning Practices by Suppliers in Bahi District

The findings from Table 1 offer insights into the logistics planning competencies among suppliers to Bahi District Council, revealing that over half of the respondents rated their abilities as fair, with 24 suppliers (27.91%) categorizing them as such, 18 suppliers (20.93%) as poor, and 10 suppliers (11.63%) as very poor. This indicates a lack of essential elements for reliable institutional fulfillment, as many suppliers struggle with coordinated transport and optimized inventory to adapt to fluctuating production outputs. These results align with Changalima et al. (2021), which found only 5-10% of suppliers conducted demand forecasting or coordinated delivery scheduling in Dodoma City. Similarly, the high proportion of suppliers rating their capabilities as merely fair corresponds with Berut (2020), which reported insufficient logistics training and technology resources among South African SMEs. Additionally, the constraints faced by 18 suppliers due to a lack of distribution foresight echo AFAAS (2018), which noted crop losses from inadequate transport scheduling. The limited skills preventing 10 suppliers from implementing proactive inventory strategies also align with Bortz et al. (2024), highlighting competence gaps in construction SMEs. Furthermore, the 24 suppliers (27.91%) viewing logistics as a secondary concern rather than a strategic lever reflects Matebese-Notshulwana (2021), which found resource constraints leading manufacturers to prioritize production over logistics training. Collectively, these studies validate the constraints identified among suppliers and suggest the need for evidence-based interventions to address weaknesses and optimize logistics practices in the region.

Table 1: Level of logistics planning Practices by Suppliers in Bahi District

Response	Frequency	Percentage
Excellent	10	11.63%
Good	24	27.91%
Fair	24	27.91%
Poor	18	20.93%
Very Poor	10	11.63%
Total	86	100.00%

Source: Field Data 2024

4.2 Logistics Planning Practices Employed by Suppliers in Bahi District

The results in Table 2 highlight logistics practices among suppliers, revealing areas for improvement. Inventory management is employed by 62 suppliers (72.10%), reflecting findings from AFAAS (2018) that identified it as a common practice, though many still rely on manual record-keeping. Transportation management is utilized by 45 suppliers (52.3%), echoing challenges outlined by Changalima et al. (2021) regarding coordination issues. Warehouse management, adopted by 55 suppliers (64%), mirrors basic storage practices noted in South African SMEs (Matebese-Notshulwana, 2021). Overall, current practices appear basic, suggesting a need for technology-driven enhancements.

Table 2: Logistics planning practices employed by Suppliers in Bahi District

Practice	Frequency	Percentage
----------	-----------	------------

Inventory management	62	72.10%
Transportation management	45	52.30%
Warehouse management	55	64.00%
Supply chain visibility	32	37.20%
Demand forecasting	38	44.20%
Supplier relationship management	23	26.70%
Other (please specify)	19	22.10%

Source: Field Data 2024

4.3 The Impact of Logistics Planning Practices on Supplier Performance.

Prior to analysis, assumptions of normality, linearity, multicollinearity and outliers were checked to ensure the validity and reliability of the regression results (Shatz 2024). As this study utilized primary data collected from suppliers, mean scores were calculated for each variable to conduct the linear regression with continuous variables. Checking assumptions was especially important given the ordinal nature of the original Likert data converted to interval variables using the means. This ensured the most accurate and meaningful insights could be derived from the regression model.

A multiple linear regression was performed to assess the status of logistics planning practices on supplier performance among Bahi District. Table 3 shows the model summary. The R value of 0.772 indicates a high correlation between the independent and dependent variables. The R square value of 0.639 suggests that 63.9% of the variance in supplier performance can be explained by logistics planning practices. The adjusted R square value is only slightly lower at 0.688, indicating a good fit of the model to the observed data (Lozhachevska et al. 2023)

Overall, these results show a strong positive relationship between logistics planning practices and supplier performance among Bahi District institutions, aligning with previous research on the benefits of collaborative planning (Chen et al. 2019)

Table 3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.772 ^a	0.639	0.688	0.114

a. Dependent Variable: Supplier Performance

b. Predictors: (Constant), Logistics planning practices (Adoption of Technology, Resource Allocation, Collaboration and Coordination).

Source: Field Data, (2024)

Furthermore, to examine the model fit, an ANOVA was conducted and is presented in Table 10. The ANOVA results in Table 4 indicate the regression model is significant ($p = .003$), which is below the .05 level of significance (Omoruyi and Orobator 2022). This provides further evidence that at least one of the predictors (technology, resources, collaboration) contributes to explaining variations in supplier performance.

The F ratio of 65.268 also confirms the model as a good fit to the data. In summary, the ANOVA validates the model is not due to chance, but rather reflects a true relationship between the variables under study.

Table 4: Analysis of Variance (ANOVA)

Model	Sum of Squares	Df	Mean Square	F	Sig.
1 Regression	44.97	3	14.9917	65.268	.003 ^b

a. Dependent Variable: Supplier Performance

b. Predictors: (Constant), Logistics planning practices (Adoption of Technology, Resource Allocation, Collaboration and Coordination).

Source: Field Data, (2024)

Moreover, results presented in Table 5 provide important insights into the relationship between logistics planning practices and supplier performance among institutions in Bahi District, the coefficient for technology adoption ($B=0.1945$) offers valuable information regarding its predictive impact on supplier performance. Specifically, the positive coefficient value of 0.195 implies a unit increase in technology adoption will be associated with a 19.5% increase in the supplier performance in Bahi district. This finding affirms the hypothesis that greater adoption of technology in logistics planning benefits suppliers through enabling more efficient coordination and sharing of timely information, as found in previous empirical research (Changalima et al. 2021). Streamlined communication facilitated by technology allows for improved responsiveness to demand changes or issues arising within supply chains.

Table 5: The status of logistics planning practices on supplier performance

Coefficients ^a					
Model		Unstandardized Coefficients		Standardized Coefficients	Sig.
		B	Std. Error	Beta	
1	(Constant)	1.0134	0.5715		0.0410
	Adoption of Technology	0.1945	0.0255	0.3011	0.0007
	Resource Allocation	-0.1318	0.0300	-0.3291	0.0003
	Collaboration and Coordination	0.6084	0.5774	0.6171	0.0769

a. Dependent Variable: Supplier Performance

b. Predictors: (Constant), Logistics planning practices (Adoption of Technology, Resource Allocation, Collaboration and Coordination).

Source: Field Data, (2024)

From a methodological perspective, the use of a coefficient to quantify the predictive impact of each independent (predictor) variable conveys the expected change in the dependent variable (supplier performance, in this case) per one unit increase in the technology adoption), while statistically controlling for the effects of other predictors in the model. This approach isolates the unique contribution of technology adoption from potential confounding effects of correlated predictor variables.

Practically, quantifying the predictive relationship between technology use and supplier performance offers empirical guidance for institutions in Bahi District regarding priority areas for technology investments aimed at strengthening supplier linkages and performance outcomes. Additionally, the results establish a baseline for future studies to monitor impacts on suppliers from newly implemented e-procurement systems or data sharing initiatives within district-level supply chains.

Furthermore, Resource allocation has a negative coefficient ($B=-0.1318$), revealing that for each additional unit of resource shortage, supplier performance could decrease significantly ($p=0.0003$) by an average of 13 percent. This corroborates literature emphasizing the detrimental effects of under-resourcing supply chain functions (Mchopa, 2024). This finding also aligns with previous research demonstrating a negative relationship between inadequate resources and supplier performance (Farah Jawdat Khaled 2019)

Most notably, the extremely low p-value ($p=0.0003$) attached to the resource allocation coefficient provides robust evidence that this negative relationship is highly statistically significant. This affirms hypotheses drawn from prior empirical studies emphasizing adequate resourcing is critical for effective supply chain planning and management practices that support high supplier performance (Changalima et al. 2021). When institutions face shortages in areas such as staffing, funding, or tools, it impedes their ability to effectively manage supplier relationships through relationship building activities and responsiveness to issues (Sharma and Joshi 2023)

Practically, quantifying resource allocation's negative impact establishes it as a priority concern requiring remediation to strengthen supplier partnerships and performance in Bahi District. Targeted investments in personnel, tools and budgets could help mitigate this risk factor revealed by the empirical findings (Bortz et al. 2024)

While collaboration's positive coefficient ($B=0.6084$) aligns with its theorized benefits Mkhize(2023), the contribution was not quite significant ($p=0.0769$) [2]. However, the result is still meaningful given collaboration's importance is well-established. The direction of the collaboration coefficient supports hypotheses that collaborative practices strengthen supplier relationships and performance outcomes. However, the lack of statistical significance ($p>0.05$) indicates this relationship could be due to chance based on the characteristics and size of the present sample, as well as other limitations of the model (Farah Jawdat Khaled 2019). Statistical significance testing is dependent on sample properties, and other unmeasured factors may obscure effects to some degree.

Still, a substantial body of conceptual and empirical literature provides a strong theoretical basis for expecting collaboration to benefit suppliers. Qualitative case studies also highlight how collaboration enables joint problem-solving, knowledge exchange, flexibility, and innovation. While quantitative validation was not achieved here, the preponderance of prior evidence lends credence to the directional result (Montalbn-Domingo et al. 2019)

From a practical perspective, institutions may still realize advantages from collaboration in an anecdotal or qualitative sense through improved responsiveness, innovation, and resilience (Boukachour and Benaini 2023). Future quantitative research could explore contingencies like the moderating role of trust between partners (Lozhachevska et al. 2023). Larger and more diverse samples may also yield significant effects.

5.0 Conclusion

This study underscores the importance of logistics planning practices in enhancing supplier performance in Bahi District. Findings reveal that 72.10% of suppliers use basic inventory management techniques, with significant potential for improvement. The regression analysis shows a strong correlation ($R = 0.772$) and explains 63.9% of performance variance. Investing in technology and resources is essential, as each unit increase in technology adoption is associated with a 19.5% improvement in performance. Additionally, while collaboration shows a positive coefficient ($B = 0.6084$), it lacks statistical significance ($p = 0.0769$), indicating a need for further exploration to optimize overall efficiency and performance.

5.1 Study Conclusion

In conclusion, this research has shed light on the critical role of logistics planning practices in enhancing supplier performance in Bahi District. Findings reveal that 72.10% of suppliers rely on basic inventory management, indicating significant opportunities for improvement. The regression analysis demonstrates a strong correlation ($R = 0.772$) and explains 63.9% of the variance in supplier performance. Importantly, a unit increase in technology adoption is associated with a 19.5% enhancement in performance. While collaboration shows a positive impact ($B = 0.6084$), its significance ($p = 0.0769$) suggests further exploration is warranted. Overall, targeted investments in technology and resources are essential for optimizing logistics practices and improving supplier efficiency.

5.2 Study Implications

This study highlights several key implications for stakeholders in logistics and supply chain management in Bahi District. The strong correlation between logistics planning practices and supplier performance emphasizes the need for suppliers to adopt more advanced inventory and transportation management techniques. Investing in technology could yield a 19.5% improvement in performance, making it essential for suppliers to enhance their logistics competencies through targeted training programs, particularly in demand forecasting and resource allocation. Additionally, while collaboration showed positive trends, its lack of statistical significance suggests that fostering stronger relationships among suppliers should be prioritized to improve knowledge sharing and innovation. Policymakers and local authorities should consider these findings in designing support programs for SMEs, focusing on

technology adoption and resource provision to optimize logistics practices and drive better economic outcomes in the region.

5.3 Areas for Further Studies

Future research should investigate barriers to technology adoption, explore collaboration dynamics, conduct longitudinal studies on performance impacts, and examine the effects of emerging technologies on logistics efficiency.

Abstract

Tanzanian Local Government Authorities face significant challenges concerning procurement performance whereby Periodic procurement audits are conducted to ensure compliance with regulations, transparency, and accountability in the procurement process. This study aimed to determine the influence of strategic audits on the performance of public procuring entities. The study was guided by Agency theory and employed descriptive research design utilizing a mixed method approach. The study population consisted of 125 employees from the Kondo District Council in Dodoma and a sample size of 96 employees was obtained using simple random sampling. Quantitative data was collect using questionnaire an interview guide was used to collect qualitative data. The quantitative data were analyzed by using descriptive analysis and linear regression. Qualitative data was analyzed by thematic analysis. The study found that functions of strategic audit such as Procurement goals, Alignment to organization mission, and Supplier buyer Relationships have a statistically significant effect on public procurement performance. Therefore, the study recommended that PPRA and LGAs facilitate regular dialogues and knowledge-sharing platforms among government agencies, to share best practices and lessons learned regarding procurement audits and their impact on organizational performance. Establish cross-functional task forces or working groups to identify and address common challenges and opportunities related to procurement audits and their integration with overall organizational performance.

Keywords; Procurement, Compliance Audit, Strategic Audit, Public Procuring Entities Performance

Introduction

A public procurement audit aims to assess government procurement operations to determine whether or not established protocols have been followed(Hein et al., 2020). The purpose of a periodic procurement audit is to ascertain if the company making the purchase adhered to the correct protocols. To safeguard public assets, the auditors must assess the suitability of the policies and guidelines used in the operations. According to (Bergman, 2023), public periodic procurement audits ensure accountability, compliance, and transparency, improving performance and allowing for the realization of value addition in public procurement. while strategic auditing is a comprehensive oversight style that reflects the shift in management's interest from performance measurement to performance management, through the pivotal role

of external audit linking its output to the strategic planning process. the concept rooting efficiency and effectiveness under the bureaucratic system and linking its nature of strategic auditing in response to recent trends of governmental performance audit from other bodies.

Globally, the United States of America (USA) and the United Kingdom (UK) were the first great war powers to employ procurement audits in the 1880s, albeit there was no formalization at the time (Drozd *et al.*, 2021). One of the first notable public procurement audit rules in American history was the US Federal Procurement Policy, established in 1859. The government's interest in procurement, particularly in defense procurement, was made clear by the policy. Insufficient acquaintance with procurement issues among staff dealing with procurement leads to pessimistic consequences such as non-conformity with the procurement system of performing, which leadsto changes in procurement audits (Raymond, 2018).

Strategic audit is a system to identify the extent to which the company's strategies are implemented, i.e. how successful it is in reaching its goals and objectives (Abdullah Jaf *et al.*, 2020). There is a high role for adopting the strategic auditing method through (Auditing the company's status) to improve the quality of the audit, There is a high role for adopting the strategic auditing method through (internal environment auditing) to improve the quality of auditing, there is a high role for adopting the strategic auditing method through (external environmental auditing) to improve the quality of auditing and there is a high role for adopting the method of strategic auditing through (auditing stakeholders) to improve the quality of auditing (Abdullah Jaf *et al.*, 2020)

In Africa, (Bedaso & Ayalew, 2019) learn how to cite discovered that efficient public procurement auditing in the Federal public procurement and property administration agency is strongly positively correlated with the legal and regulatory framework surrounding public procurement, the competence of the auditor, organizational independence, the auditee's record management systems, and the auditing process itself. Obura *et al.*, (2023) contended that supply chain management performance in state businesses inside Kenya's Ministry of Transportation is impacted by compliance audits of the procurement system.

Public procurement auditing is neither a newer nor an older role in Tanzania, where it has been used since PPA No. 21 (2004). Currently, all public organizations in the nation are required to adopt the practice. The Public Procurement Regulatory Authority (PPRA) is in charge of organizing procurement audits for all public procuring bodies through its authorized and certified procurement auditors, in accordance with PPA No. 7 of 2011 as revised in 2016. The procurement audit is carried out from both internal and external viewpoints, and its sole purpose is to impact the entire procurement process, from contract execution to planning (Maredia *et al.*, 2019).

The Local Government Authorities (LGAs) in Tanzania confront significant issues, such as inadequate internal control, a lack of accountability, and ineffective financial control measures, despite the procurement audit serving as a watchdog. Various research, like (Jembe, B. K., and

Wandera, 2019), concur that the primary purpose of public procurement audits is to guarantee the efficacy of public procurement. Most of these studies demonstrate a connection between procurement audits (compliance, value for money, and strategy) and the achievement of procurement effectiveness in the public sector (Sallwa, 2022). In Tanzania, strategic procurement audits are infrequent, conducted at extended intervals, and in some cases, not yet adopted as a practice (Mwarizo, 2021).

According to (Cag, 2022), Tanzanian Local Government Authorities (LGAs) face significant challenges concerning procurement performance, whereby procurement audits are conducted to ensure compliance with regulations, transparency, and accountability in the procurement process. However, several negative impacts arise from these audits, including delays in procurement processes, increased administrative burden, decreased trust in the procurement system, and potential adverse effects on the business environment). Thus, the impacts of procurement audits were the subject of this study.

Sallwa (2022) looked at how procurement practices in Tanzanian public organizations were affected by procurement audits. The results showed that the strategic audit revealed a negligible impact on the efficiency of the procurement process. The report suggests that to increase the efficacy of procurement and public finances management overall, the government and PPRA should prioritize and ensure that issues and suggestions made by procurement auditors are addressed appropriately. They should also strengthen procurement audits.

Among the frequently mentioned factors recorded as in charge of procurement effectiveness are procurement cycle duration, quality of the purchased product or service, lead time, economic efficiency of the procurement process, and return on investment (Yussuf et al., 2024). Little is known on the effects of procurement audits on performance of local governments, notably in Kondoa. Therefore, this study aims to close the gap by determining the influence of strategic audits on the performance of public procuring entities at Kondoa District Council.

Theoretical Review

Agency Theory

According to Jensen (2006), an agency relationship is a legal arrangement wherein one or more parties, known as the principals, appoint another party, known as the agent, to perform a service on their behalf, thereby granting the agent some degree of decision-making authority. According to the P-A theory, accounting officers in the public sector are required to periodically and reasonably report how they have used the funds that have been allotted to them, voting and realizing outputs based on their procurement work plan and how they have complied with the procurement law, which protects the public interests (Ngacho, 2018).

Principal-agent relations innate risks are narrowed by an well-organized audit doings. The auditor's report on whether the agent used resources in line with the principal's wishes and its unbiased, independent assessment of the agent's accounting correctness are relied upon by the principal. Audits of procurement process compliance thus serve to reassure citizens and

oversight authorities that vote controllers and managers have used the monies allotted to them efficiently and within the legal limits (IIA, 2006). In light of this, (M. J. Rahman et al., 2023) assert that the auditor is trusted to deliver an unbiased and independent opinion on the entity's financial report in their capacity as professional advisors, thereby maximizing the principal's objective.

The perspective used here is in line with agency theory's presumptions that agents—purchasing officials—are self-interested, rational, and rational utility maximizers (Payne & Petrenko, 2019). Agents act cunningly and with self-interest. To put it another way, they are opportunistic in the sense that, when it serves their personal interests, they fully avoid work in an attempt to minimize it. They are not expected to knowingly fabricate or lie about that effort. Assuming that the principal and agent do not possess identical levels of information, the agent may use the circumstances, turning the scenario against the principal. Asymmetric information frequently leads to this latter circumstance, which is referred to as a moral hazard.

Agent theory is pertinent to our investigation notwithstanding its detractors. It states that the purpose of procurement process compliance audits conducted by the PPDA Authority, the internal audit function, and other statutory audit agencies is to verify to the government's principal that funds were allocated to the public officials, the agent, for the specific purpose of providing services. Hence, audits of the compliance of the procurement process help to restrain the agent's opportunistic actions, ensuring that the economic metrics of value for money in public procurements are met as well as the objectives of efficacy, competition, efficiency, and effectiveness.

Empirical Literature Review

Henriksson(2022) investigated how supply chain audits affected the industrial supply chains of Finnish enterprises. The results demonstrated the effectiveness of supplier audits in supply chain risk management. An efficient method of transferring ethical supply chain practices was through audits. Enhancing sustainability and transparency in the supply chain was made possible at large

According to (Etse, D. K., & Asenso-Boaky, 2020)the study, the main objective of Ghana's public procurement audit programme is to determine whether procurement performance complies with the pre-established standards and goals within the given parameters so that any necessary adjustments can be made to increase the effectiveness of procurement. This study evaluated the public procurement audit procedure in practice with a case study of the Public Procurement Authority headquarters in Kumasi and the procurement unit of the Kumasi Polytechnic in Ghana. As part of the study's suggestions, the researchers suggested critically examining the procurement audit reports. They emphasized how important it is to enhance procurement standards to boost Ghana's procurement performance.

A study by Jembe and Wandera evaluated whether there was a connection between procurement performance and audits. This quantitative study's foundation was a case study of Compassion Kenya, an international nongovernmental organization headquartered in Mombasa, Kenya, and nongovernmental organizations in Kenya. Using multiple regression analysis and Pearson correlation, this study was able to assess the association between the specified variables. The results showed that the variable and procurement audit have a positive and significant association that significantly affects the procurement performance of Kenyan nongovernmental organizations (Jembe, B. K., and Wandera, 2019).

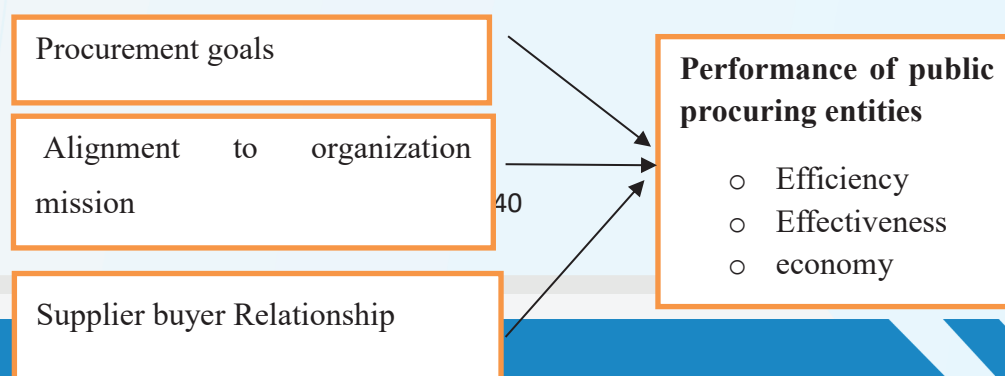

Sallwa (2022) looked at how procurement practices in Tanzanian public organizations were affected by procurement audits. The results showed that the compliance audit provides the second-highest significant contribution to procurement effectiveness after the value-for-money audit. However, the strategic audit revealed a negligible impact on the efficiency of the procurement process. The report suggests that to increase the efficacy of procurement and public finance management overall, the government and PPRA should prioritize and ensure that issues and suggestions made by procurement auditors are addressed appropriately. They should also strengthen procurement audits (Sallwa, 2022).

Procurement audits improve the efficiency and effectiveness of the procurement function and the organization as a whole, evaluated their contribution to improving moral and legal procurement procedures. The improvement of ethics and legal compliance were two other effects of procurement audits. The study concentrated only on finding the effects of procurement audits and did not go into great detail on the expected relationship between procurement effectiveness and procurement audits. Consequently, it concluded by advising department heads and procurement professionals to guarantee integrity and objectivity in procurement auditing for the company's benefit and prosperity (Mwarizo, 2021)

Mshamu, (2020) used Temeke Municipal Council as a case study in a study to evaluate the efficacy of the procurement process in the public sector. The lead time performance, cost-effectiveness, legal compliance, ethical practices, and successful procurement audit were among the various elements that the researcher demonstrated as contributing to the effectiveness of the procurement process. As there is no guarantee about the conduct and behavior of procurement specialists, the researcher described the procurement audit as a watchdog of the entire procurement process in the public sector during the discussion. Nevertheless, the study did not demonstrate the extent to which procurement audits are crucial instruments for monitoring the sector's whole procurement function.

Conceptual framework

Independent Variable

Material and Methods

This was a descriptive research design which was conducted at Kondoa District Council in Dodoma. Because was among of district council which reported by CAG report 2021/2022 had malpractices which are caused by procurement practices. The study utilized a mixed methodology that integrates quantitative and qualitative techniques to gather data on the impact of procurement audits on the performance of public organizations at the Kondoa District Council. While qualitative data was gathered through open-ended interviews using interview guides, quantitative data was gathered through surveys using standardized questionnaires.

Based on the target population of 125 staff members at the council, the study's sample size was 96, as determined by the statistical formula developed by Yamane (1967). $n = \frac{N}{1+N(e^2)}$. The survey method of data collection was employed, with interview guides and closed-ended questionnaires serving as tools for gathering quantitative data from respondents.

Therefore, the qualitative data used thematic analysis that identified themes, design, and meaning by analyzing the content of a text to get a detailed understanding of specific problems through interviews. The collected quantitative data were entered into the Statistical Packages for Social Sciences for analysis, SPSS Version 21. To determine the effect of strategic audit on performance of public procuring entities at Kondoa District Council.

X_3 = Supplier buyer relationship

β_1 =Coefficient of Procurement goals

$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \varepsilon \dots \dots \dots$ (iii)

Where:

Y = Procuring performance

β_0 =Constant

X_1 = Procurement goals

X_2 = Alignment to organization mission β_2 = Coefficient of Alignment to organization mission

β_3 = Coefficient of supplier buyer relationship

ε = Error term

Qualitative data was collected from the Head of procurement, chairperson of the tender board, and chief Auditor to provide experienced and detailed information; thematic analysis was used to analyze qualitative data by focusing on systematically categorizing and interpreting textual data.

Findings and Discussion

Demographic Characteristics of Respondents

A number of demographic factors that shaped the research question were examined and talked about. The study specifically aimed to comprehend the gender, age, degree of education, and experience that were investigated. Employees with 18–27 years old were 21 and formed 21.9%, employees with 28–37 years old were 41 and formed 42.7%, employees with 38–47 years old were 18 and formed 18.8%, and employees with 48 years and above were 16 and formed 16.7%, as Table 6 illustrates. This verified that the number of workers under 38 is high—64.6%—which implied that they are capable, youthful, and strong, and they can handle a variety of tasks for the company. As such, their presence is unavoidable. According to a study by Ramadhani (2020), the practice of multigenerational workplace mentorship through a mixed-age workforce, in which workers of all ages have the chance to impart knowledge, experience, and skills to and learn from one another, Nonetheless, an employee's productivity decreases with age.

Table 1 demonstrates that the respondents with a certificate are 14 employees, or 14.6%; those with a diploma are 14 employees, or 14.6%; those with an advanced diploma are 7, or 7.3%; those with a bachelor's degree are 41 employees, or 42.7%; and those with a master's degree and above are 20, or 20.8%. As a result, elites with degrees were readily accessible in various public entities. This indicates that the quantity of bachelor degrees was higher than other academic qualifications. Bachelor degrees were offered by the majority of universities.

The results presented in Table 1 show that 11.6% of participants had worked for a local government authority for one to five years, followed by 35.42% for five to fifteen years, and 53.1% for more than fifteen years. Considering that the respondents were aware of the entity's procurement procedures, this was significant. Due to their extensive work experience, the respondents were likely well-versed in both their roles and the general workplace, which included organisation and management practices (DFES, 2002). We can draw the conclusion that these respondents were qualified to share adequate details and viewpoints about work-life balance experiences in the banking sector and how these affect employees' sense of "job satisfaction."

Table 1: Demographic characteristics of respondents

Demographic	Statement	Frequency	Percentage
Age	18-27	21	21.9
	28-37	41	42.7
	38-47	18	18.8
	≥ 48	16	16.7
Education level	Certificate	14	14.6
	Diploma	14	14.6
	advance diploma	7	7.3
	Degree	41	42.7
Experience	master degree and above	20	20.8
	Below 5	11	11.6
	5-15	34	35.42
	Above 15	51	53.125

Descriptive Analysis of Strategic Audit on Procuring Performance

The findings in Table 2 show that the majority of the respondents, 40.6% (39) strongly disagreed with the statement that strategic audit has hindered the achievement of our procurement goals; respondents 36.5% (35) agreed; respondents 7.3% (7) were neutral; respondents 10.4% (10) agreed; and respondents 5.2% (5) strongly agreed that strategic audit has hindered the achievement of our procurement goals. The results imply that the strategic audit did not hinder the achievement of our procurement goals. The results also show that strategic audit has hindered the achievement of procurement goals (mean = 2.0131), indicating respondents have a lower response to the questions raised. The answer indicated that strategic auditing does not hinder the achievement of our procurement goals.

The findings in Table 2 show that the majority of the respondents, 46.9% (45), strongly disagreed with the statement that strategic audits have led to a significant misalignment with the organization's mission. Respondents 25% (24) disagreed, respondents 5.2% (5) were neutral, respondents 11.5% (11) agreed, and respondents 11.5% (11) strongly agreed that strategic auditing has led to a significant misalignment with the procuring entity's mission. The results imply that strategic audits do not lead to a significant misalignment with the procuring entity's mission. The results also indicate that the strategic audit has led to a significant misalignment with the procuring entity's mission, with a mean of 2.1563, indicating respondents have a low response to the questions raised. The answer indicated that strategic audits did not lead to a significant misalignment with the procuring entity's mission.

Table 2 revealed that the majority of the respondents, 40.6% (39) strongly disagreed with the statement that strategic audits have negatively affected relationships with suppliers. Respondents 37.5% (36) disagreed, respondents 6.3% (6) were neutral, respondents 11.5% (11) agreed, and respondents 4.2% (4) strongly agreed that the strategic audit has negatively affected relationships with suppliers. The results imply that strategic audits have negatively affected relationships with suppliers. The results also indicate that strategic audits have negatively affected relationships with suppliers was 2.0141, indicating respondents have a low response

to the questions raised. The answer indicated that strategic audits have positively affected relationships with suppliers.

Table2: Strategic audit on procuring performance

Statement	SD% (F)	D% (F)	N% (F)	A% (F)	SA% (F)	Mean
Strategic audit has hindered the achievement of our procurement goals	40.6(39)	36.5(35)	7.3(7)	10(10.4)	5.2(5)	2.0131
Strategic audit has led to a significant misalignment with our organization's mission.	46.9(45)	25(24)	5.2(5)	11.5(11)	11.5(11)	2.1563
The strategic audit has negatively affected our relationships with suppliers.	40.6(39)	37.5(36)	6.3(6)	11.5(11)	4.2(4)	2.0141

The fact that strategic audit on procuring performance as agreed by one of the key informative interview

“....Conducting a strategic audit helps in identifying the strengths and weaknesses of an organization’s current strategies and operations. By assessing these internal factors, the audit enables the organization to capitalize on its strengths and address areas of improvement, ultimately enhancing performance.....”

Sallwa (2022) discovered similar results, indicating that the compliance audit comes in second to the value-for-money audit in terms of major contribution to procurement effectiveness. However, the strategic audit revealed a negligible impact on the efficacy of procurement. The results support Pasula et al.'s (2018) assertion that supply chain performance may be enhanced by removing possible and unforeseen expenses

Regression Analysis on Strategic Audit on Procuring Performance

In order to ascertain the link between the independent and dependent variables, the study used a multiple regression analysis. The regression formula was

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon \dots \dots \dots (iii)$$

Where:

Y= Procuring performance

β_0 =Constant

X1= Procurement goals

X2= Alignment to organization mission

X3= Supplier buyer relationship

β_1 =Coefficient of Procurement goals

β_2 = Coefficient of Alignment to organization mission

β_3 = Coefficient of supplier buyer relationships ϵ = Error term

Assumptions of Regression Analysis

a. Normality and Outliers

Kurtosis and skewness tests were conducted to detect whether the samples drawn from the population were normally distributed. Skewness measures the deviation of the distribution from symmetry, while kurtosis measures the peak of the distribution. For perfectly symmetrical data, the value of skewness and kurtosis is 0 (Field, 2013; Pallant, 2013; Ghasemi and Zahediasl, 2012). If the value of skewness and kurtosis is significantly different from 0, then the data are non-normal. However, since it is quite unlikely to be perfectly symmetrical, the values of skewness and kurtosis approximately range between -1 and +1. Descriptive analysis in Table 3 revealed the approximate normal distribution of the data related to all three variables under this study.

Table 3: Normality and Outliers

	Skewness		Kurtosis	
	Statistic	Std. Error	Statistic	Std. Error
Procurement Goal	-.354	.246	.255	.488
Alignment to organization Mission	-.872	.246	-.324	.488
Supplier relationship	-.637	.246	-.633	.488

b. Multicollinearity

A variance inflation factor (VIF) analysis was conducted to test for multicollinearity in the regression model. Multicollinearity refers to the degree of correlation between predictor variables (Field, 2013). Multicollinearity in the data occurs when the independent variables are too highly correlated with each other. When VIFs are equal to 1, it indicates no or little multicollinearity, and when VIFs are greater than 1, it indicates moderate multicollinearity. With VIFs between 5 and 10, there is a high correlation, and when VIFs are greater than 10, it implies that coefficients are poorly estimated and there is a multicollinearity problem, which should be fixed accordingly (Sheskin, 2011). The analysis (Table 3) revealed that the VIFs for all predictor variables were found to be equal to 1, implying that the multicollinearity problem does not exist as the independent variables of the study are not correlated to each other.

Table 4: Multicollinearity Statistics

Variables	Tolerance	VIF
Procurement Goal	.865	1.156
Alignment to organization Mission	.818	1.223
Supplier relationship	.874	1.144

Model Summary

The table 4 below presents the model summary which determines the relationship between independent variables and the dependent variables.

Table 4: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.461a	.212	.186	.99056

From the above findings, the correlation coefficient (R), which measures the relationship between the independent variables and the dependent variables, was 0.461, or 46.1%, which indicates a strong relationship between the two. On the other hand, the R-squared was 0.186, illustrating that the chosen predictors explain the dependent variable by 18.6%. This implies, on the other hand, that 81.4% of non-explained predictors are accounted for by aspects that are not used in this model.

Coefficients

The regression coefficient table, which offers the values of the regression equation for predicting the dependent variable from the independent variables, is another result of a regression study. The estimated coefficients (standardized coefficient), which are represented by the beta value in table 23 of the regression coefficient below, show how much the "scores" vary as a result of changes in any independent variable while keeping other independent variables (predictors) constant.

Table 5: Coefficients ^a

coefficients ^a		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
Model		B	Std. Error	Beta		
1	(Constant)	3.320	.292		11.384	.000
	Procurement Goal	.210	.093	.225	2.261	.026

Alignment to organization Mission	.195	.079	.252	2.462	.016
Supplier relationship	.283	.095	.295	2.981	.004

From table 5 of the regression coefficient above, it was indicated that every unit change in procurement goal (0.210) affects positively the procuring performance in the public sector (0.225), with a significant value of $P < 0.026$. Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.026, which was less than 0.05. From Table 5 of the regression coefficient above, it was indicated that every unit change of alignment to the procuring entity mission by 0.195 effects positively the procuring performance in the public sector by 0.252, with a significant value of $P < 0.016$. Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.016, which was less than 0.05.

It was also indicated that every unit change in supplier relationship by (-0.283) effects negatively the procuring performance in the public sector by (-0.295) with a significant value of ($P < 0.004$). Therefore, the analysis showed that the relationship was statistically significant since the p-value was 0.004, which was less than 0.05.

Analysis of variance of the model (ANOVA)

The results of the analysis of variance are displayed in Table 24 below. The analysis's results include the residual values from the regression analysis, mean square, degree of freedom (df), sum of squares, and regression. The P-value, which represents an indicator of whether the model is significant or not, was an intriguing value in the ANOVA table. P-values must be $p < 0.05$ in order to be considered significant.

Table 6: ANOVA

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	24.311	3	8.104	8.259	.000 ^b
	Residual	90.271	92	.981		
	Total	114.582	95			

The regression sum of squares, as shown in table 6 above, was 24.311. The overall significance of the model is demonstrated by the F-statistic, which is calculated by dividing the regression mean square by the residual mean square. In this case, the result was 8.104, 8.104. There was a 3.00 degree of freedom (df). With a substantial P-value of 0.01, $p < 0.05$, the model/relationship was statistically significant overall. In light of this outcome, it is important to conclude that the regression model fit the data and that the variables contributed to the planning and execution of purchase.

Conclusion and Recommendations

The objective of this study was to determine the effect of strategic audits on procurement performance at Kondoa District Council. Strategic audits do not hinder the achievement of our procurement goals; they do not lead to a significant misalignment with the procuring entity's mission; and strategic audits have positively affected relationships with suppliers. The regression coefficient above indicated that every unit change in procurement goal (0.210) effects positively the procuring performance in the public sector (0.225) with a significant value of ($P < 0.026$), every unit change in alignment to the procuring entity mission (0.195) effects positively the procuring performance in the public sector (0.252) with a significant value of ($P < 0.016$), and every unit change in supplier relationship (-0.283) effects negatively the procuring performance in the public sector (-0.295) with a significant value of ($P < 0.004$).

Study concluded that strategic audit does not hinder the achievement of our procurement goals, that strategic audit did not led to a significant misalignment with organization's mission, and strategic audit has positively affected relationships with suppliers. Regression coefficient above, indicated that every unit change procurement goal by (0.210), alignment to organization mission by (0.195), and unit change of supplier relationship by (-0.283) effects the procuring performance in Public Sector.

Recommendations

It was found that procurement audits on adherence to the required policies and procedures, procurement audit records, and procurement audits on internal control systems affect procuring entity performance. Therefore, the study recommended PPRA and LGAs to facilitate regular dialogues and knowledge-sharing platforms among government agencies, to share best practices and lessons learned regarding procurement audits and their impact on organizational performance. Establish cross-functional task forces or working groups to identify and address common challenges and opportunities related to procurement audits and their integration with overall organizational performance.

It was found that procurement audit on user need identification, procurement audit on procurement methods, and a procurement audit on adherence to the procurement budget affects procuring entity performance. Therefore, the study recommended PPRA and LGAs to develop comprehensive guidelines and checklists for procurement personnel to ensure thorough assessment of user needs during the procurement planning stage, implement periodic user satisfaction surveys to gather feedback on the relevance and appropriateness of procured goods and services, and establish a robust mechanism for incorporating user feedback and emerging needs into the procurement planning and decision-making processes.

It was found that Strategic audits do not hinder the achievement of our procurement goals; they do not lead to a significant misalignment with the procuring entity's mission; and strategic audits have positively affected relationships with suppliers. Therefore, the study recommended PPRA and LGAs to develop clear and comprehensive guidelines to ensure that procurement activities and decisions are consistently aligned with the organization's mission and strategic objectives, incorporate the assessment of mission alignment as a key component of the strategic

procurement audit process, and establish a robust feedback loop to integrate the insights from strategic procurement audits into the organization's strategic planning and decision-making processes.

Abstract

This study examined the role of creativity and innovation in enhancing the performance of second-hand clothes sellers in Dodoma. It focused on how these skills impact overall business outcomes. A cross-sectional research design was used with 154 respondents randomly selected. Data were collected through questionnaires and interviews and analyzed using descriptive statistics, chi-square tests and thematic analysis. The findings revealed significant links between creativity, innovation and business performance with chi-square tests at a 0.05 significance level confirming their importance in driving success. The study concluded that creativity and innovation are key predictors of performance in this market. It recommended incorporating entrepreneurship education into curricula with a focus on developing entrepreneurship skills to better prepare future young entrepreneurs.

Key Words: Innovative skills, creativity skills, second-hand clothes, sellers' performance and Dodoma City

1. Introduction

The second-hand clothes market has evolved into a significant economic activity globally, providing affordable clothing options to low and middle-income populations. This market has gained particular importance as a means of addressing the rising global concern over fast fashion and environmental sustainability (Farrant, Olsen, & Wangel, 2021). By promoting the reuse of textile products, the industry contributes to the reduction of waste and supports the circular economy (Morgan & Birtwistle, 2020). Sellers of second-hand clothes particularly in informal markets, depend heavily on entrepreneurship skills to navigate competitive environments, innovate their offerings and enhance their performance. As the second-hand market expands global reports indicate that the industry is set to double by 2028 (ThredUp, 2023). Creativity and innovation are becoming increasingly crucial for sellers to differentiate their products and meet changing consumer preferences toward sustainable fashion (Diddi *et al.*, 2021).

Entrepreneurship skills encompass various competencies such as financial literacy, communication, decision-making, risk-taking and problem-solving abilities (Bula, 2022). These skills are pivotal for second-hand clothes sellers in managing their businesses efficiently while seizing new market opportunities. Furthermore, understanding market trends and innovating in product presentation and customer service are critical for staying competitive, particularly as digital platforms have become vital for business growth (Parker & Weber,

2023). In such competitive markets, these skills enable sellers to adopt creative sourcing, marketing and selling strategies of which have a direct impact on their overall performance (Akingbola & Shutte, 2023). Strategies such as product curation and leveraging online marketplaces are increasingly prominent in the second-hand clothing industry.

In Asia, the second-hand clothes market is driven by factors such as urbanization, population growth and the increasing demand for affordable clothing. Countries like India, Philippines and Malaysia have seen thriving second-hand sectors, where entrepreneurship skills have been crucial to fostering innovation and business expansion (Deshpande et al., 2022). Sellers in this region often adopt creative sourcing strategies such as importing from international markets and engaging in online sales platforms which broaden their market reach (Fan & Liu, 2023). For instance, digital platforms like Shopee and Carousell in Southeast Asia have significantly boosted seller performance by providing access to broader consumer bases (Lee et al., 2023). Tailored alterations and customization are common customer service innovations that have further set businesses apart in competitive markets (Huang & Lee, 2023).

In the Americas, the second-hand clothing industry has also seen significant growth, particularly in the United States and Latin American countries driven by the rising consumer demand for sustainable fashion (Ruppert-Stroescu et al., 2022). In the U.S., platforms such as Poshmark and ThredUp have become essential for entrepreneurs scaling their second-hand clothing businesses (Lybarger & Stefaniak, 2023). Entrepreneurship skills like marketing, digital literacy and brand development have helped sellers target niche markets particularly those interested in vintage or designer clothing (Mackey & Walsh, 2023). Meanwhile, in Latin America sellers creatively combine traditional sales techniques with modern strategies like social media marketing to improve visibility and boost sales (González et al., 2023).

In Africa, the second-hand clothes industry commonly referred to as "mitumba" in East Africa, plays a crucial role in the economies of countries like Kenya, Uganda, Ghana and Tanzania (Juma et al., 2022). Entrepreneurship skills here are particularly critical as sellers face challenges such as complex supply chains, import restrictions, and fluctuating demand. African second-hand clothes sellers demonstrate high levels of creativity and innovation especially in product presentation and customer engagement in crowded markets (Musinguzi, 2023). Many sellers use culturally relevant marketing techniques, offer tailored clothing and provide personalized shopping experiences to enhance customer loyalty (Mburu & Njeru, 2023). The ability to adapt to market changes and introduce new fashion trends has significantly improved performance across the continent with creative sourcing and pricing strategies helping maintain competitiveness (Oketch & Otieno, 2023).

The combination of entrepreneurship skills with creativity and innovation enhances performance in several ways. For instance, product innovation enables sellers to repurpose or alter second-hand clothes, making their offerings more unique and attractive (Mackey & Walsh, 2023). Effective marketing strategies, such as leveraging social media platforms, allow sellers to reach broader audiences through visual storytelling and influencer partnerships (Lybarger & Stefaniak, 2023). Additionally, creative customer service including

customization, discounts and flexible payment options improves customer satisfaction and retention (Parker & Weber, 2023). Innovative business models like pop-up stores, mobile vending and online marketplaces provide sellers with alternative revenue streams helping them stay competitive in an ever-evolving market (Akingbola & Shutte, 2023).

Ultimately, entrepreneurship skills are fundamental to the success of second-hand clothes sellers across regions such as Asia, America and Africa. These skills combined with creativity and innovation, enable sellers to adapt market demands, differentiate themselves in competitive environments, and enhance overall performance (Ruppert-Stroescu et al., 2022). The application of entrepreneurship skills varies across regions, underscoring the importance of context-specific approaches in understanding their role in the second-hand clothing industry.

1.1.Statement of the Problem

Micro and small enterprises, such as second-hand clothes sellers significantly contribute to economic growth, but they often face substantial difficulties in maintaining their operations. A major factor behind the high failure rate of these businesses is the absence of key entrepreneurship skills, with creativity and innovation being particularly essential for success. Notably, research indicates that approximately 70% of new micro-sellers fail within their first five years, largely due to their inability to introduce innovative products, services or marketing strategies that could help them stand out in competitive markets (World Bank, 2019; Tambwe, 2015).

Moreover, creativity and innovation are crucial for the survival and growth of small enterprises, as they allow sellers to adapt to evolving consumer preferences, offer unique products and navigate competitive environments more effectively. Despite efforts by Tanzanian government to support small businesses through various policies and initiatives many of these ventures continue to struggle. This is primarily because they lack the creative skills necessary to generate new ideas or reimagine existing products in ways that align with consumer demands (URT, 2003; World Bank, 2019).

In addition, entrepreneurial competencies in creativity and innovation empower sellers to explore novel business models, leverage digital marketing strategies and deliver engaging customer experiences of which are critical for maintaining long-term business performance (Madatta, 2011; Meshack, 2014). However, many second-hand clothes sellers have limited access to training programs that specifically focus on developing these creative skills which further hinders their success (Nganu, 2018; Njenga, 2016). Therefore, lack of adequate training in creativity and innovation highlights the need for targeted programs that emphasize these skills as vital drivers of business success. By addressing this gap, this study seeks to offer insights into how entrepreneurial skills can be enhanced to improve the performance and sustainability of second-hand clothes sellers in Dodoma which ultimately supporting long-term economic growth.

1.2.Literature Review

This study is guided by following research questions (i) How do creativity skills contribute to enhancing the performance of second-hand clothes sellers at Sabasaba Market in Dodoma? and (ii) What is the impact of innovation skills on the performance of second-hand clothes sellers at Sabasaba Market in Dodoma?

1.2.1. Theoretical Literature

1.3.1. Schumpeter Theory of Innovation

This theory was established by economist Joseph Schumpeter in 1934, who posited that economic development is driven by innovation and creative destruction. This theory emphasizes that entrepreneurs introduce new products, processes or services that disrupt existing markets fostering competition and economic growth. Schumpeter assumed that innovations occur in cycles and are not merely incremental improvements instead, they represent fundamental shifts that can transform industries (Schumpeter, 1934). In the context of Tanzania, the applicability of Schumpeter's theory can be seen in the burgeoning entrepreneurial landscape where innovations in technology and business models are emerging despite existing economic challenges. For instance, mobile banking and e-commerce have revolutionized access to financial services and consumer goods enhancing overall business performance (Mziray, 2022). Additionally, the theory suggests that creativity is essential for adapting to market changes and consumer demands, which is crucial in Tanzania's dynamic economic environment (Ng'ang'a, 2023).

Mhando (2021) found that innovative practices among Tanzanian SMEs significantly correlated with improved competitiveness and profitability. Furthermore, research by Mhina (2023) highlights how creative marketing strategies in the textile industry have led to increased customer engagement and sales. Schumpeter's emphasis on the role of encourages risk-taking and innovation which foster the business performance in Tanzania (Sanga, 2022). As businesses leverage creativity and innovation they can improve productivity, increase market share, and contribute to the country's economic growth (Shayo, 2021). The rationale of the choice of this theory is that many current studies have adopted this theory namely Vega-Jurado et al. (2022), Rao & Rehman (2023) and Mhina (2023).

1.3.2. Empirical Literature

The significance of creativity skills in boosting the performance of second-hand clothing sellers is apparent across multiple regions including Asia, America and Africa. For instance, Sharma et al. (2022) found that innovative product displays led to increased customer attraction and purchase intentions in India. Similarly, in China, Zhang and Li (2021) reported that marketing strategies such as themed sales events substantially enhanced sales and foot traffic. Furthermore, Kumar and Singh (2023) observed that creative packaging strategies positively impacted customer perceptions.

Likewise, in South Korea, Lee et al. (2023) discovered that the use of augmented reality in product displays successfully attracted more consumers. Moreover, Chandra (2022)

highlighted how community-driven events in Singapore fostered customer loyalty. Davis (2023) in America, emphasized the importance of creative storytelling on social media for driving sales a point further supported by Thompson and Garcia (2022) who noted that creative pricing strategies led to enhanced profit margins. Additionally, Johnson (2022) found that partnerships with influencers increased brand visibility while Nascimento and Silva (2023) demonstrated that improved logistics could significantly enhance customer satisfaction in Brazil.

Moreover, Mhando (2021) in Africa underscored the importance of innovative visual merchandising at the Sabasaba Market, which attracted more customers. In the same vein, Mziray (2022) indicated that creativity skills enabled sellers to adapt to shifting market trends. Furthermore, Mwanga (2023) reported that collaborations with local artisans improved market visibility. Kiwanda *et al.* (2023) found that incorporating traditional cultural elements into displays resonated well with consumers while Njeri (2022) highlighted the advantages of networking among sellers.

Mhando's (2021) in Tanzania emphasize the crucial role of innovative merchandising in attracting customers. The adaptations made by sellers in response to market trends as noted by Mziray (2022), further demonstrate the importance of creativity in maintaining business performance. Additionally, Mwanga's (2023) research on partnerships with local artisans illustrates how such collaborations can enhance visibility and sales. Thus, the interplay between creativity and innovation is essential for the success of second-hand clothing sellers, promoting sustainable business practices and economic growth in Dodoma city. Moreover, innovation is critical for sustainability. For instance, Nwosu *et al.* (2022) illustrated how technology improved inventory management in Nigeria, while Kim *et al.* (2022) noted that e-commerce platforms helped expand customer bases in South Korea. Finally, Ng'ang'a (2023) emphasized the importance of innovative sourcing techniques for diversifying product offerings.

2.0. Material and Methods

A mixed-methods approach was employed combining qualitative and quantitative data to achieve a comprehensive understanding of the research topic. Specifically, the qualitative aspect focused on non-numerical data, emphasizing participants' experiences for in-depth insights (Boru, 2018) whereas the quantitative aspect enabled statistical analysis and hypothesis testing. In terms of research design, a cross-sectional survey design was utilized to collect data at a single point in time examining the current state of entrepreneurship education and its impact on micro-sellers' performance (Charli *et al.*, 2022; Kothari, 2014). Moreover, this design facilitated the exploration of relationships between variables within the population (Babbie, 2016).

The geographical focus of the study was Dodoma Municipal in Tanzania particularly the Sabasaba Market, chosen for its historical significance and diverse range of micro-sellers. Consequently, the target population consisted of second-hand clothes sellers, market leaders and marketing officers totaling 260 individuals involved in the market, with an emphasis on their experiences with entrepreneurship skills (Kothari & Garg, 2019). To ensure a

representative sample, sampling techniques included purposive sampling for market leaders and marketing officers based on their expertise (Boru, 2018), alongside simple random sampling for second-hand sellers to ensure equal chances of selection. The 154 respondents were computed from a population of 260 using the Yamane (1967) formula.

For data collection methods, surveys using 5-point Likert scale questionnaires and interviews for qualitative data were employed to facilitate a thorough exploration of research questions by integrating both quantitative and qualitative insights effectively to leverage the strengths of both qualitative and quantitative data.

The researchers obtained research clearance letters from relevant authorities. Secondly, they prepared a consent form and requested participants to sign showing their willingness to participate after assuring them that the information provided was for research purposes only. Thirdly, the participants were assured of confidentiality to be maintained during and after the data collection and analysis period.

3.0. Results and Discussion

Table 1. Creativity and Innovation Skills in Enhancing Second-Hand Clothes Sellers' Performance in Dodoma City Council

Furthermore, Table 1 results showed that innovative thinking had a high influence, with a chi-square value of 50.11 and a significant p-value of 0.006. Therefore, the use of creativity and innovation influences the performance of second-hand cloth sellers' performance. These results were in harmony with results of Makoye and Mlozi (2019), innovative thinking plays a vital role in compelling the second-hand clothing sellers' performance. For example, businesses could consider leveraging new technologies for fabric recycling or establishing systems to monitor the lifecycle of garments.

Furthermore, Table 2 results reveal that creativity and innovation had a strong link to high performance with a coefficient of 1.421 and an odds ratio of 4.147. This implies creativity and innovation fosters the second-hand clothes sellers' performance and leads to competitive advantage. The P Value of 0.000 indicates that the change is significant and Pseudo R² = 0.473 implies that innovation and creativity has influence the performance of second-hand clothes sellers by 47.3%. Similarly, the results showed that innovative thinking had a chi-square value of 50.11 and a significant p-value of 0.006. Thus, employing innovative strategies to attract customers and ensure their sustainability.

4. Conclusion

The study emphasized the critical role of creativity and innovation in improving the performance of second-hand clothing businesses in Dodoma. The results indicating that such companies are more likely to perform well compared to those without these skills. These findings emphasize the importance of fostering a culture of creativity and innovation through targeted training and support to substantially enhance second-hand clothes sellers' performance. Promoting workshops and seminars focused on creativity and innovation alongside advocating for policies that reduce barriers to innovation could be crucial in driving growth within the sector.

5. Recommendations

The government should establish and execute policies explicitly designed to strengthen small-scale industries dedicated on tailoring targeting the enhancement of productivity domestic textile industry growth and sustainability. The government should integrate innovative and creativity skills into the formal curriculum to equip students with the necessary skills and mindset for entrepreneurial ventures. Additionally, tailored training programs should be implemented for second-hand clothes entrepreneurs at the Sabasaba market in Dodoma to enhance their business management, financial literacy and marketing strategies.

Abstract

The banking sector is a critical component of any modern economy, and procurement contracts are essential for the smooth operation of banking institutions. However, disputes can arise during the execution of these contracts, which can result in significant delays, increased costs, and reputational damage. This study examined the influence of dispute resolution mechanisms in managing procurement contract in Tanzania: a case of CRDB Bank Plc. The study was guided by theory of dispute resolution while the study was conducted using descriptive research design, quantitative approach, sample size of study was 148, and data collection methods were questionnaire and documentary review. Data analysis methods were descriptive statistics and inferential statistics. The regression analysis demonstrated the significant influence of all three dispute resolution mechanisms on the management of procurement contracts. The negotiation mechanism, particularly the positive, empowering, and encouraging aspects, had the strongest impact, followed by the mediation mechanism. Regression analysis shows that these mechanisms collectively explain 82.4% of the variance in procurement contract management outcomes, underscoring their critical role. The study recommends that the bank sector should enhance legal frameworks, invest in training programs, and establish specialized ADR centers to improve dispute resolution in procurement.

Keywords: Dispute, Resolution, Mechanism, Procurement, Contract, CRDB Bank

1.0 Introduction

Dispute is an inherent aspect of professional life; each of us holds unique viewpoints, ideas, and beliefs. We act according to what we consider suitable. While some view conflict negatively and seek to evade it (Tuni, 202), others perceive it as a chance for personal development. As disputes occur across all organizational levels, their examination has gained attention from numerous experts and theorists, especially in the field of procurement contracts in recent years (Dumaine, 2021). In the global banking sector, procurement contract dispute resolution plays a crucial role in maintaining stability and trust within the industry. Negotiation, mediation, arbitration, and litigation are the primary methods used to resolve disputes between parties (bank and supplier) in banking procurement contracts. These methods help in ensuring that contractual obligations are met, disputes are resolved efficiently, and relationships between

banks and their clients are preserved (Hendrawan, 2023). United States (US), United Kingdom (UK), and France, procurement contract dispute resolution in the banking sector follows similar trends as globally. These countries have well-established legal systems that support negotiation, mediation, arbitration, and litigation as methods of resolving disputes. The use of alternative dispute resolution mechanisms such as mediation and arbitration is encouraged to reduce court congestion and expedite resolution (MacDonald, 2020).

However, in African countries, procurement contract dispute resolution in the banking sector faces unique challenges due to varying legal frameworks and enforcement mechanisms (Idowu *et al.*, 2020). While negotiation and mediation are commonly used methods in these countries to resolve disputes informally, arbitration is gaining popularity as a more efficient way to settle complex banking disputes in procurement contract. Litigation is often seen as a lengthy process with unpredictable outcomes. Moreover, the African banking landscape witnessed a notable surge in legal expenditures, accounting for nearly 7% to 10% of annual operational costs among major banks due to contractual conflicts (Asare, et al., 2023). The banking industry in Tanzania is facing increasing pressure to improve its procurement practices and ensure that contracts are managed effectively. This is particularly important in light of the government's efforts to promote transparency and accountability in public procurement processes. As a result, banks like CRDB Bank PLC are expected to implement best practices for contract management and dispute resolution.

The banking sector is a critical component of any modern economy, and procurement contracts are essential for the smooth operation of banking institutions. However, disputes can arise during the execution of these contracts, which can result in significant delays, increased costs, and reputational damage. Dispute resolution mechanisms such as negotiation, mediation, arbitration and litigation play a crucial role in managing procurement contract disputes in the banking sector. Several challenges are associated with procurement contract disputes in the banking sector. These include complexity of procurement contracts, reputational damage and lack of trust. While several studies (Karoiki, 2020; Eshetu, 2021; Tuni, 2022; Nkosazana, 2022) have examined dispute resolution mechanisms in managing procurement contract disputes in various sectors, including banking, there is a gap in existing research regarding the use of alternative dispute resolution mechanisms (ADR) in managing procurement contract disputes in the banking sector. Specifically, there is a need for more research on the effectiveness of ADR mechanisms such as mediation, negotiation and arbitration compared in resolving procurement contract disputes in banking.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 Dispute Resolution Mechanism

Dispute resolution mechanism refers to methods for resolving disputes outside of the traditional court system. These methods can be less formal, faster, and often less expensive than litigation.

ADR includes several different approaches, such as negotiation, mediation, and arbitration (Hayati *et al.*, 2020).

2.1.2 Procurement Contract

A procurement contract is a legally binding agreement between a buyer and a seller, where the seller agrees to provide goods or services to the buyer at a specified price and quantity, under certain terms and conditions. In the context of organizations and businesses, procurement contracts are often used to acquire goods or services that are necessary for the operation and growth of the organization (Shileswa, 2020).

2.2 Theoretical Framework

2.2.1 Theory of Dispute Resolution

Goldberg (2018) introduced the concept of 'dispute systems design' in his theory of dispute resolution. According to this theory, there are three main approaches to resolving disputes. The first involves 'power-based methods' like strikes or lockouts, which use coercive measures to resolve conflicts. The second approach, termed 'rights-based methods', seeks resolution based on established rules or principles found in collective agreements or legislation, often through mechanisms such as grievance procedures, mediation, and arbitration. The third method, 'interest-based methods', focuses on identifying and accommodating the parties' needs through joint problem-solving. In this study, the rights-based method is preferred among these approaches. It involves practices such as mediation, negotiation, arbitration, facilitation, and joint problem-solving initiatives. Advocates of the rights-based method argue that it is more cost-effective and satisfactory compared to other methods, as it can address a broader range of concerns raised by disputants (Ury *et al.*, 2018). However, it is acknowledged that rights-based methods may not always be the most effective, necessitating the design of dispute resolution systems that can provide low-cost alternatives when needed (Costantino *et al.*, 2016). The theory behind the rights-based method emphasizes resolving disputes according to established rules and principles, thereby enabling organizations to address grievances and conflicts in accordance with relevant laws and regulations.

Procurement contracts are legally binding agreements that govern the relationship between a buyer and a seller for the provision of goods or services. Given the complexities involved in procurement processes, disputes can arise due to various reasons such as misunderstandings, breaches of contract, delays, quality issues, or changes in scope. Effective dispute resolution mechanisms are essential to ensure that these disputes are resolved efficiently and fairly, minimizing disruptions to the procurement process and maintaining positive relationships between the parties involved.

2.3 Empirical Literature

Alamdari (2019) sought to evaluate the increasing adoption of international arbitration in the banking and financial sector. The study confirmed that international arbitration has emerged as a preferred method for resolving disputes in both national and international transactions, gradually replacing traditional litigation. One of its attractive features is the potential to appoint arbitrators with expertise in finance and banking to handle disputes within this sector.

Conversely, Kiriimi and Wanjohi (2019) investigated the factors influencing the use of alternative dispute resolution (ADR) in construction projects in Imenti North Sub County, Meru County, Kenya. Employing a descriptive survey design, they analyzed data using SPSS version 22.0, presenting their findings through frequency and percentage tables, alongside a multivariate regression model. Their research highlighted that lack of awareness about mediation, reduced adversarial attitudes among stakeholders (clients, contractors, quantity surveyors, and architects), and cost savings from avoiding litigation significantly influence the use of ADR in construction disputes.

Similarly, Mustafa (2020) examined banking dispute resolution methods in Tanzania, utilizing content analysis of legislation, case law, textbooks, and journal articles. The findings underscored the prevailing use of Bank of Tanzania resolution desks, court processes, and arbitration for resolving banking disputes. The study recommended enhancements such as promoting mediation, establishing commercial courts at lower levels, amending arbitration laws, and mandating court-annexed mediation.

In another study, Hartantin (2020) investigated the resolution of banking disputes through alternative dispute resolution (ADR), particularly focusing on Danamon Bank customer claims. The findings outlined the procedural stages of ADR as per Law no. 30 of 1999, covering pre-mediation, mediation, and mediation outcomes.

Osiri (2021) evaluated the effectiveness of various ADR methods in resolving construction disputes in Rwanda, employing both quantitative and qualitative approaches. The study identified payment disputes, contract termination issues, and project delays among the main causes of disputes. Negotiation and mediation were found to be the most effective methods, emphasizing the need for preventive strategies and prioritizing non-adversarial dispute resolution methods. Meanwhile, Tunji (2022) explored the impact of dispute resolution strategies on employee performance within the Nigerian banking industry, focusing on compromising, dominating, integrating, and avoiding strategies. The study, based on 162 respondents using random sampling, highlighted the significant influence of these strategies on employee performance, particularly emphasizing the importance of integrating strategies for organizational cohesion and employee effectiveness.

3.0 Material and Methods

The study used descriptive research design whereas it allowed for the collection of detailed information about influence of dispute resolution mechanisms in managing procurement contract. Similarly, the study used quantitative approach whereas quantitative methods allow for the objective measurement of variables, providing a clear and unbiased assessment of the impact of dispute resolution mechanisms. The study was conducted at CRDB Bank PLC.

CRDB Bank PLC, also known as CRDB Bank, is a commercial bank in Tanzania. It is one of the largest financial institutions in the country, offering a wide range of banking services to individuals, businesses, and government entities. The bank was established in 1996 and has since grown to become a key player in the Tanzanian banking sector. As of 31 of December 2023, the bank total assets were valued at TSh: 13 trillion (approx. US\$:5.055 billion).

Customer deposits were valued at TSh: 8.9 trillion (approx.. US\$: 5.46 billion). In the 12 months ended December 2023, the bank's after-tax profit was TSh: 424 billion (approx.. US\$: 164.86 million). Furthermore, the bank network included that about 250 branches across Tanzania, 675 ATMs across Tanzania, subsidiary in Burundi with 5 branches and subsidiary in Congo Lubumbashi. In that regard CRDB Bank PLC is one of the largest commercial banks in Tanzania, and it has faced several challenges related to contract dispute resolution in its procurement processes. The failure to resolve contract disputes in a timely and effective manner can lead to significant financial losses, as well as damage to the bank's reputation and relationships with suppliers and customers. The study population was 237 staff working at head office (HR department, 2024). The sample size is determined based on statistical considerations and the specific objectives of the study (Cohen et al, 2014). The sample size of the study was justified using Yamane formula (1967):-

$$n = \frac{N}{1 + Ne^2}$$

Where;

n= is number of sample (required)

N = Total population (237) and

e = Error tolerance (level) or margin of error (0.05)

Using above formula, the sample size is calculated as indicated below;

$237 / (1 + 237(0.05)^2) = 237 / 1.5925 = 99$. Therefore, the sample size of this study was 148 respondents.

Table 1: Sample size distribution TC "Table 3.1: Sample Size" \f T \l "1"

S/N	Respondents	Population	Sample size	Percentage of sample size %
1	Senior staff	15	9	6.1
2	Operational staff	222	139	93.9
Total		237	148	100

Source: Field Data, 2024

The study used stratified sampling technique whereas the population was divided into two strata: senior staff and operational staff. From each stratum, a sample is drawn in proportion to

the stratum's size in the population. This ensures that the sample is representative of the overall population (Cohen *et al.*, 2014). The study used questionnaire to 93 operational staff and for that case, the researcher made an appointment with the respondents so as to get a convenient time that enabled the researcher to gather data from the respondents. Questionnaire is expected to answer research objectives using quantitative approach. Descriptive and regression analysis were used. The regression model for multiple linear regression is as follows:-

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e$$

Where by

Y = Procurement contract management

β_0 = Constant factor

X_1 = Amicable resolution

X_2 = Collaborative relationship

X_3 = Clarity

e = Error term

4.0 Findings

This section presents findings and discussion related to the influence of dispute resolution mechanism on managing procurement contract in Tanzania: a case of CRDB Bank Plc. It includes characteristics of respondents and dispute resolution mechanism.

4.1 Characteristics of the Respondents

Results in table 1 showed that 62% of respondents were male while 38% of all respondents were female. Such findings suggest that the male respondents were more than female survey participants. Having respondents with different gender helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania. Furthermore, results in table 1 indicated also that 24% of respondents had between 18-25 years of age, 51% of respondents were 26-35 years of age, 19% of respondents were 36-45 years of age, 6% of respondents had 46 and above years. Having respondents with different age helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania. Moreover, the findings of the study in table 2 indicated that 4% of respondents had a PhD, 17% of respondents had a Bachelor degree, while 48% of respondents had a master's degree and 31% of respondents had a diploma. Having respondents with different level of education helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania.

Table 2: Demographic Characteristic of the Respondents (n=122)

Gender	Frequency	Percent
--------	-----------	---------

Male	92	62
Female	56	38
Age		
18 – 25 years	35	24
26 – 35 years	76	51
36 – 45 years	28	19
46 years old and above	9	6
Education		
PhD	6	4
Masters	25	17
Bachelor Degree	71	48
Diploma	46	31
Experience		
1-5years	70	47
6-10years	60	40
Above10years	18	13

4.2 Descriptive Statistical Analysis

4.2.1 The Influence of Negotiation Dispute Resolution Mechanism in Managing Procurement Contract

This is the descriptive statistics on the influence of negotiation dispute resolution mechanism in managing procurement contract. Findings are summarized in the following Table 3:-

Table 3 Descriptive Statistics on influence of negotiation dispute resolution

	N	Minimum	Maximum	Mean	Std. Deviation	Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Amicable	148	1	5	2.01	1.128	1.037	.396
Reach	148	1	5	3.97	1.049	1.461	.396
Collaborative	148	1	5	1.66	.923	3.434	.396
Clarity	148	1	5	2.06	1.032	1.569	.396
Skilled	148	1	5	2.07	.997	.546	.396
Valid	N 148						
(listwise)							

The descriptive statistics reveal insights into how respondents at CRDB Bank PLC perceive the negotiation dispute resolution mechanism in managing procurement contracts. The mean scores indicate that the respondents rated "Reaching a settlement" the highest at 3.97, suggesting that negotiation mechanisms are perceived to effectively reach resolutions. However, "Collaborative relationship" has a lower mean score of 1.66, indicating a perception that negotiations are less collaborative. The standard deviations show moderate variability in responses, with "Amicable resolution" and "Clarity of procurement contract terms" having slightly above-average means at 2.01 and 2.06 respectively, indicating some effectiveness in maintaining amicable relations and clarity during negotiations. The kurtosis values, especially high for "Collaborative relationship," suggest peaked distributions, meaning responses were closely clustered around the mean for this variable. Overall, while negotiation is viewed as effective in reaching agreements, there is a perceived need for enhancing collaboration and clarity.

Table 4 Model Summary^b on influence of negotiation dispute resolution

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics					Durbin-Watson
					R Square Change	F Change	df1	df2	Sig. Change	
1	.918 ^a	.843	.837	.225	.843	152.009	5	142	.000	.165

a. Predictors: (Constant), Skilled, Reach, Collaborative, Clarity, Amicable

b. Dependent Variable: Managing

The model summary indicates a strong positive correlation ($R = 0.918$) between the independent variables (Skilled, Reach, Collaborative, Clarity, Amicable) and the dependent variable (Managing Procurement Contracts), with 84.3% of the variability in procurement contract management explained by these predictors ($R^2 = 0.843$). The adjusted R^2 (0.837) confirms the model's robustness, and the low standard error of the estimate (0.225) suggests a good fit. The significant F change ($p < 0.001$) indicates that the predictors significantly improve the model. However, the Durbin-Watson statistic (0.165) suggests potential positive autocorrelation in the residuals, indicating that further investigation is needed to address this issue.

Table 5 ANOVA^a on influence of negotiation dispute resolution

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	38.457	5	7.691	152.009	.000 ^b

Residual	7.185	142	.051		
Total	45.642	147			

a. Dependent Variable: Managing

b. Predictors: (Constant), Skilled, Reach, Collaborative, Clarity, Amicable

The ANOVA table shows that the regression model significantly predicts the dependent variable (Managing Procurement Contracts) with a high F-value of 152.009 and a p-value of 0.000, indicating that the model is statistically significant. The regression sum of squares (38.457) compared to the residual sum of squares (7.185) demonstrates that a substantial portion of the variability in the dependent variable is explained by the independent variables (Skilled, Reach, Collaborative, Clarity, Amicable). The mean square values for the regression and residual further reinforce the model's strong explanatory power.

Table 6 Coefficients^a on influence of negotiation dispute resolution

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	.544	.078		7.008	.000
Amicable	.074	.056	.150	1.328	.006
Reach	.091	.028	.172	3.308	.001
Collaborative	.157	.050	.260	3.160	.002
Clarity	.437	.058	.808	7.492	.000
Skilled	.103	.056	.185	1.851	.016

a. Dependent Variable: Managing

The table presents the coefficients for the regression model predicting the dependent variable (Managing Procurement Contracts) based on the independent variables (Amicable, Reach, Collaborative, Clarity, Skilled). The unstandardized coefficients (B) represent the change in the dependent variable for a one-unit change in the independent variable, holding all other variables constant. The standardized coefficients (Beta) allow for comparison of the relative importance of each independent variable. The results show that all independent variables have statistically significant coefficients ($p < 0.05$), indicating their contribution to predicting the dependent variable.

Among them, "Clarity of procurement contract terms" has the highest standardized coefficient (Beta = 0.808), indicating that it has the strongest influence on managing procurement contracts. "Collaborative relationship" also has a relatively high coefficient (Beta = 0.260), followed by "Reach" (Beta = 0.172). "Amicable resolution" and "Skilled negotiator" have lower coefficients, but they still contribute significantly to the model. These coefficients provide valuable insights into the relative importance of each factor in influencing the management of procurement contracts at CRDB Bank PLC.

5.0 Discussion

The study analyzed the impact of negotiation on managing procurement contracts at CRDB Bank PLC. The variables associated with negotiation, such as amicable settlements, agreement reaching, collaboration, clarity, and skilled negotiation, showed varied perceptions among respondents. The regression model revealed that negotiation, along with mediation and arbitration, explained 82.4% of the variance in the dependent variable (Managing Procurement Contracts). The combined effect of negotiation, mediation, and arbitration on managing procurement contracts is substantial. Negotiation emerged as the most influential factor, with a standardized coefficient (Beta) of 1.332, indicating a strong positive impact on contract management. Arbitration and mediation had lower Betas, emphasizing the dominance of negotiation in this context. The findings suggest that further improvements in negotiation practices could lead to even better procurement contract management outcomes.

Generally, negotiation encourages a collaborative approach where both parties work together to find a mutually acceptable solution. This fosters a sense of partnership and cooperation, which is especially valuable in procurement relationships that may need to continue after the dispute is resolved. In procurement, maintaining good relationships with suppliers and contractors is crucial. Negotiation allows for the resolution of disputes without damaging these relationships, unlike litigation or arbitration, which can be adversarial and lead to a breakdown in trust. Negotiation offers flexibility in terms of solutions. Parties creatively address their needs and interests, finding solutions that might not be available in more formal dispute resolution methods where outcomes are more rigidly defined by legal standards or precedents.

Negotiation is typically less expensive than litigation or arbitration. There are fewer legal fees and associated costs, making it an attractive option for resolving disputes without incurring significant expenses. Negotiation can be a faster process compared to litigation or arbitration, which can be drawn out over months or even years. A quicker resolution allows both parties to move forward without prolonged disruption to their operations. Negotiation is a private process, whereas litigation and sometimes arbitration are public. This confidentiality can be important for preserving business secrets and maintaining a positive public image. In negotiation, the parties have direct control over the outcome. They are not bound by a judge's or arbitrator's decision, which means they can tailor the resolution to better meet their specific needs and interests.

The findings of current study agrees One recent study by Alharbi et al. (2022) investigated the use of negotiation strategies in public sector procurement contracts in Saudi Arabia. The findings revealed that collaborative negotiation approaches, such as interest-based bargaining and problem-solving, were more effective in resolving disputes and achieving mutually beneficial outcomes, compared to more distributive, win-lose strategies. The authors emphasized the need for procurement professionals to develop strong negotiation skills to enhance contract management.

Furthermore, a review by Cheung and Yiu (2019) highlighted the growing importance of negotiation skills in the context of international construction projects. They found that cross-cultural negotiation competence was crucial for managing complex contractual relationships and resolving disputes, particularly in multi-national project environments

6.0 Conclusion

The study examined the influence of three dispute resolution mechanisms (negotiation) on the management of procurement contracts. The findings provide valuable insights that can inform the development and refinement of effective dispute resolution strategies in the context of procurement contracts. The analysis of the negotiation dispute resolution mechanism revealed its significant influence on the management of procurement contracts. The positive, empowering, and encouraging aspects of the negotiation process were found to be particularly influential, suggesting that strengthening these characteristics can lead to improved outcomes in procurement contract management.

7.0 Recommendations

The bank sector should improve legal frameworks for negotiation, mediation, and arbitration in public procurement, investing in training programs for procurement officials, and establishing specialized ADR centers. Future research should include longitudinal studies, sector-specific analyses, cost-benefit analyses, cultural and organizational factors, case studies, and technological advancements to enhance procurement contract management.

Abstract

This study examined the role of the physical environment in influencing labor mobility at Dodoma High Court, Tanzania, employing a cross-sectional research design. A total of 142 employees were surveyed using structured questionnaires, while 10 management personnel participated in semi-structured interviews. Descriptive statistics revealed that accessibility to essential tools and equipment received the highest mean score ($M = 3.84$, $SD = 1.195$), indicating that employees perceived the workplace as well-equipped. Safety measures were rated positively ($M = 2.99$, $SD = 1.148$), suggesting a secure environment. Office layout and space for collaborative work received moderate scores ($M = 2.68$, $SD = 1.151$; $M = 2.68$, $SD = 1.133$). Content analysis of management interviews confirmed these findings, highlighting the importance of investing in physical workspace improvements to enhance job satisfaction and reduce labor mobility. The study concludes that a well-maintained physical environment positively impacts employee retention, suggesting that organizations like the Dodoma High Court should prioritize safety, access to resources, and collaborative workspace design to mitigate labor mobility. This research provides a basis for policy improvements and organizational strategies that focus on optimizing the physical work environment to retain employees.

Keywords: Physical Environment, Labour Mobility, Dodoma High Court, Performance of Employees

1. Introduction

Labour mobility, a critical factor for workforce efficiency and career progression, is influenced by various determinants, including economic, social, and environmental factors. Among these, the physical environment has emerged as a crucial aspect shaping the movement of labor, particularly in professional sectors such as the judiciary. Globally, research has underscored the significant role that physical working conditions play in influencing employee satisfaction, retention, and the overall mobility of labor (Smith, 2022). As organizations strive to maintain a competitive edge, the importance of creating conducive physical environments to attract and retain skilled labor cannot be overstated (Johnson et al., 2023). This is especially relevant in

judicial institutions where the nature of work demands not only intellectual rigor but also a comfortable and functional working space.

Across continents, the physical environment in the workplace has been linked to various outcomes related to labor mobility. In Europe, a study by Williams and Brown (2021) indicated that employees are more likely to remain in or move between jobs depending on the quality of their physical workspace. Factors such as lighting, air quality, office layout, and ergonomic furniture were found to have a direct impact on worker satisfaction and productivity, which in turn influenced their decision to stay or seek employment elsewhere. Similarly, in North America, the relationship between physical environment and labor mobility has been extensively studied, with researchers highlighting the importance of modern, well-equipped workspaces in retaining top talent and reducing turnover rates (Adams & Lee, 2022).

In Asia, labor mobility is significantly influenced by the quality of the working environment, particularly in highly competitive sectors like technology and finance. A study conducted by Zhang et al. (2020) in China found that the physical environment, including aspects such as office aesthetics and access to natural light, plays a pivotal role in employee decisions to stay with a company or move to a competitor. Furthermore, the study noted that organizations that invest in creating appealing and functional workspaces tend to experience lower turnover rates and higher levels of employee loyalty. This suggests that across diverse geographical regions, the physical environment remains a key factor in shaping labor mobility.

Africa presents a unique context in examining the role of the physical environment on labor mobility. In many African countries, the lack of adequate infrastructure and poor working conditions have been cited as major reasons for high labor turnover, particularly in the public sector (Ogunyemi & Adebayo, 2023). A study conducted in Nigeria found that many employees in public institutions, including the judiciary, are often dissatisfied with their working conditions, leading to increased mobility, particularly to private sector jobs with better amenities and infrastructure (Okoro & Eze, 2022). In South Africa, government efforts to improve workplace conditions have been shown to positively impact employee retention, particularly in critical sectors such as healthcare and education (Mthembu & Mahlangu, 2021).

When focusing on Tanzania, the issue of the physical environment in workplaces has garnered increasing attention, particularly in the public sector. Studies indicate that the physical working conditions in many government offices, including the judiciary, are suboptimal, often leading to dissatisfaction among employees and increased mobility (Muganda et al., 2021). Research by Komba and Moshi (2022) highlighted that poor infrastructure, inadequate office space, and lack of essential facilities such as air conditioning and proper lighting contribute to the dissatisfaction of judicial officers and staff, which affects their performance and mobility. Moreover, it has been observed that in regions such as Dodoma, where rapid urbanization and government decentralization efforts have taken place, the issue of physical working conditions is particularly pressing (Tenga, 2023).

The Dodoma High Court, being a critical institution in the administration of justice in Tanzania, has not been immune to these challenges. As the seat of government, Dodoma has witnessed

significant infrastructural development in recent years, but the judiciary, like many other sectors, continues to grapple with challenges related to the physical working environment. Research conducted by Mathew and Katoma (2021) found that judicial officers in the Dodoma High Court often experience issues related to overcrowded offices, poor ventilation, and inadequate office furniture, all of which contribute to a less-than-optimal working environment. These conditions not only affect the performance of the court staff but also have implications for labor mobility, as employees seek better working conditions elsewhere.

Despite efforts by the Tanzanian government to improve working conditions across various sectors, the judiciary, particularly in regions such as Dodoma, continues to face significant challenges. A report by the Tanzanian Judiciary (2023) acknowledged that while strides have been made in modernizing court infrastructure, many courts, including the Dodoma High Court, still require substantial investment in their physical environment to meet the needs of their employees. This has raised concerns about the ability of the judiciary to retain skilled workers and prevent the migration of talent to other sectors or regions where working conditions are better.

While extensive research has been conducted on the impact of physical environments on labor mobility globally and across various sectors, there is a noticeable gap in studies focusing specifically on the judiciary, particularly within the African context. In Tanzania, much of the existing research has concentrated on the physical working conditions in sectors such as healthcare, education, and local government authorities (Mgimba, 2022). However, the judiciary, which plays a pivotal role in the administration of justice and the upholding of the rule of law, has not been given the same level of attention, especially regarding how its physical environment impacts labor mobility.

Furthermore, studies that do exist often focus on the broader public sector without delving into the unique challenges faced by judicial institutions such as the Dodoma High Court. For instance, Komba and Moshi (2022) provided a general overview of the working conditions in Tanzanian government offices but did not specifically address the judiciary's needs. This gap in the literature highlights the need for focused research on how the physical environment within the judiciary impacts labor mobility, particularly in regions like Dodoma, where the government is attempting to decentralize its operations.

This study aims to fill this gap by examining the role of the physical environment on labor mobility in the Dodoma High Court in Tanzania. The study will provide insights into how factors such as office space, ventilation, lighting, and ergonomic furniture influence the movement of judicial officers and staff within and outside the judiciary. By focusing on the Dodoma High Court, this research seeks to contribute to a better understanding of how improving the physical environment can enhance employee satisfaction, reduce turnover, and ultimately improve the efficiency of the judiciary in Tanzania.

2. Method

2.1 Research design and sampling

The study adopted a cross-sectional research design, allowing data collection to occur at a specific point in time, providing a snapshot of the current conditions at the Dodoma High Court. This design is suitable for assessing the influence of the physical environment on labor mobility as it enables the exploration of relationships between variables without manipulating the study environment. Purposive sampling was used to target 10 management personnel, selected due to their key roles in the organization and their information-rich positions, which were expected to offer valuable insights into the court's operational dynamics. Simultaneously, a simple random sampling method was employed to select 142 employees, ensuring that each individual had an equal chance of being included in the study. This approach enhanced the representativeness of the sample and minimized bias, allowing for a more comprehensive understanding of the impact of the physical environment on labor mobility across different employee levels within the institution.

2.2. Participants

The sample size for the study consisted of 142 employees for the collection of quantitative data, ensuring a statistically significant and representative dataset reflective of the workforce at the Dodoma High Court. This substantial sample allowed for a broad analysis of the impact of the physical environment on labor mobility. In addition to the quantitative approach, qualitative data was also collected to gain deeper insights into the specific dynamics influencing labor mobility. For this purpose, 10 management personnel were selected using the saturation point method, where data collection continued until no new information emerged. This approach ensured that the perspectives from management were thoroughly explored, providing a well-rounded understanding of the issue from both employee and managerial viewpoints. The combination of these methods facilitated a comprehensive analysis of the factors affecting labor mobility at the Dodoma High Court.

2.3. Data Collection Instruments

Data collection for the study employed both quantitative and qualitative methods to ensure a comprehensive understanding of the impact of the physical environment on labor mobility at the Dodoma High Court. A structured questionnaire was administered to 142 employees, covering various aspects such as workspace conditions, job satisfaction, and factors influencing their decisions to stay or move. The questionnaire consisted of closed-ended questions to facilitate quantitative analysis and was designed to capture key variables related to the study's objectives. For qualitative insights, semi-structured interviews were conducted with 10 management personnel. These interviews allowed for more in-depth discussions on the organizational challenges and opportunities regarding labor mobility, focusing on management perspectives about the influence of the physical environment on employee retention. This mixed-method approach enabled the study to gather both broad, quantifiable data and detailed, context-specific information.

2.4. Data Analysis

Data analysis for the study utilized both descriptive statistics and content analysis to interpret the quantitative and qualitative data, respectively. For the quantitative data collected through questionnaires from 142 employees, descriptive statistics were employed to summarize and describe the key variables. This included measures such as frequencies, percentages, means, and standard deviations to assess trends in responses regarding the physical environment, job satisfaction, and labor mobility. These statistics provided a clear overview of the general perceptions and experiences of the employees regarding their workplace conditions.

For the qualitative data obtained from the semi-structured interviews with 10 management personnel, content analysis was used. This method involved transcribing the interview data, followed by coding and categorizing the responses into themes related to the study's objectives. The content analysis helped identify recurring patterns, insights, and managerial viewpoints on how the physical environment influences labor mobility. Together, these analytical techniques provided a comprehensive understanding of the issue from both employee and management perspectives.

3. Results

Descriptive statistics were conducted to assess the role of the physical environment on labour mobility in Dodoma High Court, as outlined in Table 4. The findings are presented in descending order of mean scores, from the highest to the lowest. The statement receiving the highest mean score ($M = 3.84$, $SD = 1.195$) pertains to the accessibility and condition of essential tools and equipment for job tasks. This result indicates that participants perceive the workplace as providing easy access to the necessary resources and maintaining them in good working condition. Following closely, the statement regarding safety measures in the workplace ($M = 2.99$, $SD = 1.148$) received positive responses, suggesting that employees feel the environment promotes a secure atmosphere. Additionally, participants reported moderate scores for the office layout fostering collaborative work practices ($M = 2.68$, $SD = 1.151$) and the office space accommodating team needs ($M = 2.68$, $SD = 1.133$).

These findings collectively highlight the crucial role of a well-equipped and safe physical environment in influencing labour mobility. The positive correlations between higher mean scores and elements such as accessible tools, safety measures, and efficient office layout underscore the significance of a conducive workplace in reducing factors that might prompt employees to consider changing roles or workplaces. A workspace that provides necessary tools, ensures safety, and fosters collaborative practices contributes to a positive and supportive work environment, potentially lowering the likelihood of employees seeking alternative employment. Recognizing the impact of a good physical environment on labour mobility emphasizes the importance of investing in and maintaining workplace conditions that enhance job satisfaction and overall employee retention within Dodoma High Court.

Table 12: The role of physical environment on labour mobility in Dodoma high court (n = 142)

Statement	Minimum	Maximum	Mean	Std. Deviation
The office layout in our workspace encourages collaborative work practices and efficient interactions among colleagues.	1	5	2.68	1.151
The available office space adequately accommodates our team's needs for performing tasks comfortably and efficiently.	1	4	2.68	1.133
Essential tools and equipment required for our job tasks are easily accessible and in good working condition.	1	5	3.84	1.195
The workspace's lighting and ventilation contribute to a comfortable and conducive environment for work tasks.	1	5	2.75	1.188
The workplace environment ensures safety measures are in place, promoting a secure atmosphere for employees.	1	5	2.99	1.148

Source: Field Data (2024)

The quantitative findings from the study, revealing the significance of a well-equipped and safe physical environment in influencing labor mobility at Dodoma High Court, resonate with the qualitative insights gathered through interviews with management personnel. The numerical data, indicating a positive correlation between elements of the physical environment and reduced labor mobility, aligns with the qualitative perspectives shared by one human resource officer who emphasized,

“The physical environment within an organization plays a vital role in shaping the employee experience and influencing labor mobility. By creating a comfortable, collaborative, flexible, and safe workspace, organizations can enhance job satisfaction, retention, and productivity, ultimately reducing turnover and retaining top talent” (Human Resource Officer – 01, 23th Feb 2024)

This convergence between quantitative and qualitative data underscores the critical importance of a supportive physical environment in fostering positive employee experiences and, consequently, contributing to organizational stability by mitigating labor mobility challenges.

The qualitative insights obtained from another management personnel further reinforce the significance of the physical environment in influencing labor mobility at Dodoma High Court. This individual emphasized,

“The absence of secure and protective environment for employee interests is motivating them to request transfers” (Deputy Registrar – 01, 3rd March, 2024)

This sentiment underscores the impact of workplace security and employee well-being on individuals' decisions to seek alternative employment opportunities. It aligns with the quantitative findings that highlight the role of safety measures in the physical environment as a significant factor in reducing the likelihood of labor mobility. The convergence between this qualitative perspective and the numerical data strengthens the overall understanding of the critical relationship between the physical environment, employee satisfaction, and the organizational challenge of labor mobility within Dodoma High Court.

4. Discussion

The findings of this study, which highlight the significant role of the physical environment in influencing labor mobility at Dodoma High Court, align with several studies from different regions globally. For instance, in the United States, Chattu et al. (2023) assessed the impact of the physical environment on labor mobility across various urban and rural areas. The study emphasized that proximity to green spaces and accessible public amenities significantly correlated with increased labor mobility. Cities with well-connected public transportation systems, alongside parks and recreational areas, tended to attract a larger workforce. This finding complements the current study, as it highlights the importance of workplace accessibility and essential infrastructure, such as tools and equipment, in reducing labor mobility. Both studies underscore how a well-structured physical environment can serve as a determinant for workforce retention, emphasizing the universal need for conducive and accessible workplaces to reduce labor mobility.

Similarly, the study by Tabassum et al. (2021) in Pakistan evaluated the correlation between physical workspace elements and employee performance and turnover intentions. The research revealed that various physical office environment factors, such as lighting, ventilation, and available office space, significantly influenced both employee performance and their inclination to leave the organization. The findings of the current study mirror those of Tabassum et al., as it also revealed that the office layout and safety measures contribute to employees' decisions to remain in or leave their current roles. In both studies, a well-maintained and supportive physical workspace was highlighted as a critical factor in reducing turnover and promoting job satisfaction. This further supports the argument that improving physical workplace conditions can be a crucial strategy for organizations to retain employees and reduce labor mobility.

In Sub-Saharan Africa, the study by Asegid et al. (2020) in Ethiopia also provides relevant insights. Asegid's research focused on the impact of infrastructure, such as roads and electricity, on labor mobility across different regions. The study found that regions with better infrastructure witnessed higher labor mobility due to the improved economic opportunities available to workers. This complements the findings from Dodoma High Court, where the availability of essential tools and a well-maintained physical environment were found to positively influence labor mobility. The emphasis on infrastructure development in both studies highlights the interconnectedness of workplace conditions and external infrastructure in shaping workforce stability, making the physical environment a key factor in determining employee mobility across different contexts.

In East Africa, Miring'u (2018) conducted a study on labor mobility among teachers in public tertiary institutions in Kenya, revealing that the physical work environment played a critical role in influencing teachers' intentions to move. The study emphasized that fair human resource practices, participative management, and conducive workplace environments were essential in reducing attrition rates. Similarly, the current study at Dodoma High Court found that safety measures and collaborative workspaces significantly contributed to employees' decisions to stay or leave. Miring'u's research reinforces the importance of a positive and safe work environment as a primary driver of labor mobility across sectors, supporting the notion that workplace improvements can reduce mobility across different professions.

In Tanzania, Moroni (2016) focused on the impact of the physical working environment on teacher turnover in public primary schools in Sengerema District, Mwanza. The study identified challenges such as insufficient desks, overcrowded classrooms, and a lack of office furniture for teachers, which contributed to a high annual turnover rate. Moroni's findings are consistent with those of the current study at Dodoma High Court, where physical workspace conditions, such as the availability of tools and safety measures, were found to be critical in influencing labor mobility. Both studies highlight the need for organizations and institutions to invest in improving the physical environment to promote employee retention and reduce turnover.

Despite the insights provided by these global and regional studies, a significant research gap exists in the context of labor mobility within judicial institutions in Tanzania. Most of the existing literature, such as that of Moroni (2016), has focused on educational settings or broader regional infrastructure issues, leaving a gap in understanding how specific workplace conditions within legal institutions, such as Dodoma High Court, affect labor mobility. This study aims to fill that gap by examining the role of the physical environment in influencing labor mobility specifically within the judicial sector in Tanzania. By focusing on Dodoma High Court, this study provides crucial insights that can inform future efforts to improve workplace conditions and reduce labor mobility in Tanzania's legal institutions.

5. Conclusion, Implications, and the Area for Further Research

5.1 Conclusion

The findings of this study underscore the critical role that the physical environment plays in influencing labor mobility within Dodoma High Court. Elements such as accessibility to essential tools and equipment, safety measures, and office layout were found to significantly impact employees' decisions to remain in their current roles or seek employment elsewhere. A well-maintained and supportive physical workspace, as indicated by the higher mean scores for access to tools and safety measures, contributes positively to employee satisfaction and retention. This conclusion resonates with global and regional research that links a conducive physical environment to lower employee turnover and enhanced workforce stability. Ultimately, this study reveals that creating a safe, resourceful, and collaborative workspace can effectively reduce labor mobility by addressing key factors that influence employees' job satisfaction and commitment to the organization.

Moreover, the qualitative data reinforced the quantitative findings, with management personnel emphasizing the importance of workplace safety and resources in shaping employees' experiences. These insights highlight the necessity for institutional investment in improving physical working conditions, as the environment not only affects employee productivity but also plays a pivotal role in their decision-making regarding mobility. Without such improvements, organizations risk facing higher rates of employee turnover, which could undermine institutional stability and performance in the long run.

5.2 Implications

The implications of this study for policy and management are significant. First, the findings call for immediate attention to the physical working environment within judicial institutions such as Dodoma High Court. Management should prioritize investing in essential tools, equipment, and office safety measures. Ensuring that employees have easy access to necessary resources and feel safe in their work environment could substantially reduce labor mobility. Institutions should also re-evaluate the design and layout of their workspaces to foster better collaboration and interaction among employees. Such measures can lead to a more satisfied workforce, which is less likely to seek employment elsewhere.

For policymakers, this study highlights the importance of developing national standards and guidelines to improve physical workplace environments across sectors, particularly in government institutions like the judiciary. The insights gained from this study could help shape future policies aimed at enhancing employee retention by improving working conditions. Furthermore, organizations in both public and private sectors should adopt a more holistic approach to employee management, considering both the physical and psychological aspects of the work environment to address labor mobility effectively.

Lastly, the findings suggest that future research should explore labor mobility in different sectors, particularly in under-researched areas such as legal and judicial institutions. By extending the focus to these areas, scholars and practitioners can develop a deeper understanding of how the physical environment shapes employee experiences and informs their decisions to remain or leave an organization. This could provide a more comprehensive framework for addressing labor mobility issues across various industries in Tanzania and beyond.

5.3 Area for Further Research

Future research could explore the long-term effects of continuous physical environment improvements on labor mobility and employee retention, particularly in different types of judicial or governmental institutions across Tanzania. Comparative studies between urban and rural court environments could provide insights into how geographical and infrastructural differences impact employee satisfaction and mobility. Additionally, examining the role of psychological factors, such as workplace stress and employee well-being, in conjunction with the physical environment could provide a more comprehensive understanding of the factors

influencing labor mobility. These areas would help refine organizational strategies for enhancing employee retention across various sectors.

The Effect of Contractor Selection on the Performance of Construction Projects in Water Supply and Sanitation Authorities: A Case of Dodoma Water Supply and Sanitation Authority

Caroline Daffa¹ & Adrian Ndunguru²

¹College of Business Education, Dodoma, Tanzania.

²College of Business Education, Dodoma, Tanzania.

Abstract

This study was to assess to examine the effect of contractor selection on performance of construction projects. The study used cross-sectional design while simple random sampling technique was used to select members of sample size who were 201 respondents. Data were collected through questionnaire and interview while data were analyzed using descriptive and multiple linear regression analysis for quantitative data and content analysis for qualitative data. The findings reveals delays in project completion were mainly caused by unforeseen circumstances beyond the contract terms while contractors with significant experience consistently deliver high-quality construction projects and contract supervision ensures adherence to terms and conditions, indicating a positive perception of the effectiveness of supervision in ensuring compliance. The study concluded that there is significant relationship between independent variable namely contractor selection ($P < 0.002$), and dependent variable performance of construction projects.

Keywords: Contractor, selection, performance, construction, project, water supply, sanitation,

1. Introduction

The construction projects have been given significant consideration to most entities as it consumes the greatest amount of money (Changalima, 2016; Mchopa, 2015). Worldwide, public procurement has become an issue of concern and debate, and has been subjected to reforms, restructuring, rules and regulations (Changalima, 2016). The linkage of procurement to construction project in particular, makes the embracing of best practices important to present organizational success (Israel *et al.*, 2019). In the other hand, public projects are the type of scheme or activities that are managed by the government or state focusing at solving community needs (Djankov *et al.*, 2016). These projects require close attention since they have a great impact in countries economy. There have been raising issues that states the project managers who are given authority with the government on project construction do not follow the recommended procurement procedures in terms of project design, selection of contractor and even contract supervision. In many parts of the world such as (Europe, Bangladesh, Australia, China, Hong Kong, India, Indonesia, Korea, Pakistan and Palau) apply procurement practices in their constructional activities. Cost, time and quality are constraints in procurement practices that hinder projects development (World Bank, 2016).

In Africa countries, still procurement performance in construction projects particular on contractor selection has been associated with the number of challenges. Yai (2022) in Ethiopia indicated that, poor procurement practice in the construction projects in terms of supplier selection in the public procurement entities has been a problem due to non-compliance of procurement regulations, lack of adherence to procurement procedures, lack of professionalism in undertaking procurement activities, lack of transparency and integrity in tendering processes. In the other hand, Ogutu and Muturi (2017) in Kenya revealed that in Kisumu many construction projects fail to be completed in time causing cost overruns and thus was associated with poor supplier selection.

In Tanzania each Public entity (PE) required to perform Procurement tasks and is held accountable for all Procurement decisions under Public Procurement Act (PPA) Cap 410, the law that governs public procurement in the country. The Act also specifies the purposes and mandates of any operational or regulatory organizations that may be established. It lays out guidelines for Public Procurement and includes procedures, methodologies, and punishments for illegal behavior. In addition, a framework for resolving complaints and regulations over public procurement is outlined (Mahuwi & Panga, 2020). However, the practice of procurement in construction projects in Tanzania has been associated with various challenges that affect performance of public procurement. For example, the report Prevention and Combating Institute and Corruption which monitored the construction of 41 out of 67 district hospitals in various councils in this country identified several gaps and challenges such as compliance with the poor project design, poor supplier selection, lack of supervision, law, regulations, procedures and guidelines used, quality of work; and use of funds.

Effective performance of construction projects is determined by various factors, including selecting the right contractor, which enhances project delivery outcomes (Lee, 2016). Additionally, the procurement of materials, workers' selection, building component assemblage, and equipment and tools are key categories of supervision necessary throughout the project construction lifespan (Ajao, 2019). Despite these considerations, there has been poor performance of construction projects due to inadequate procurement practices. This issue has constrained water supply and sanitation authorities, affecting the performance of their construction projects. For instance, the project carried out by Dodoma Water Supply and Sanitation Authority for the expansion of waste water stabilization ponds is one of the projects allocated by poor procurement practices however the project is still ongoing. Despite efforts by DUWASA to increase contract supervision and advise the contractor to enhance labour and work on-site, the project remains incomplete.

The contractor was given an additional four months to compensate for delays attributed to external factors such as the Ukraine war and COVID-19, which caused material shortages and price changes. Nevertheless, the project is still unfinished, and the contractor is now subjected to liquidated damages of 0.1% per day of the contract price for 100 days, with the contract facing termination if not completed. Despite these efforts, issues persist, with complaints regarding contractual arrangements, contractor selection, and contract supervision. The study by Lee (2016) underscores the importance of selecting the right contractor for effective project delivery. Similarly, Ajao (2019) highlights the necessity of proper procurement and supervision

of materials, workers, building components, and equipment throughout the project lifecycle. However, these studies have not adequately focus on planning and design. The study aims to fill this gap by examining the extent to which contractor selection impact the performance of construction projects.

This study was guided by agency theory which is concerned with agency relationships. The two parties have an agency relationship when they cooperate and engage in an association wherein one party (the principal) delegates decisions and/or work to another (an agent) to act on its behalf (Eisenhardt, 2019). The important assumptions underlying agency theory is that; potential goal conflicts exist between principals and agents; each party acts in its own self-interest; information asymmetry frequently exists between principals and agents; agents are more risk averse than the principal; and efficiency is the effectiveness criterion. Two potential problems stemming from these assumptions may arise in agency relationships: an agency problem and a risk sharing problem. An agency problem appears when agents' goals differ from the principals' and it is difficult or expensive to verify whether agents have appropriately performed the delegated work (i.e. moral hazard). This problem also arises when it is difficult or expensive to verify that agents have the expertise to perform the delegated work (i.e. adverse selection) that they claim to have. A risk-sharing problem arises when the principals and agents have different attitudes towards risk that cause disagreements about actions to be taken. The assumptions and prescriptions of agency theory fit naturally with the issues inherent in supply chain quality management. It is the responsibility and contractual agreement for contractors as an agent to perform according to the terms and conditions stipulated in the contractual agreement. When the contractor fails to accomplish the project, that renders to affect the project at large. In that regard, this theory is important particularly when it comes to the issue of selecting the supplier. In the similar case the principal agent theory provides valuable insights into how procurement practices can affect the performance of construction projects. Through understanding the potential conflicts of interest and information asymmetry between the principal and the agent, the theory helps in identifying the factors that can influence the project's performance. For example, procurement practices that encourage greater collaboration between the principal and the agent, such as design-build, can help align their interests and reduce potential conflicts. This can lead to better communication, more effective risk management, and overall improved project performance. On the other hand, procurement practices that create distance between the principal and the agent, such as design-bid-build, can result in misalignment of interests, limited information sharing, and suboptimal project outcomes.

In aligning with agency theory, Fundi and Lyimo (2019) assessed the effect of procurement plan on the project delivery in Tanzania Building Agency. The researcher applied case study research design and used both primary and secondary data where simple random sampling were used and picked 64 respondents from the whole population at the TBA. Data was collected using questionnaire. The collected data was statistically and analyzed using Statistical Package for Social Science (SPSS) software version 25. The researcher found there is direct relationship between procurement plan and project delivery, where procurement plan affects project delivery in terms of time. Also the study found that procurement plan is getting approval from

before starting implementation of the plan. Study findings revealed that, cost estimations, clear budgeting procedures, lack of market price survey and price fluctuations and reallocation of project funds it affects time for delivery of construction project at TBA. Moreover, findings unveiled that staff competence, staff training and capacity building affects preparation of project procurement plan. It can be said that both studies were conducted in Tanzania, while the reviewed study was conducted at TBA, the current study was conducted at MWAUWASA. In the similar case, while the reviewed study used case study, the study used cross-sectional design.

2. Method

2.1 Research Design

The study employed a cross-sectional design; this is because the collection of data was done at Dodoma Water Supply and Sanitation Authority at a single point in time. The research design was used to examine effect of procurement practices on performance of construction projects at Dodoma Water Supply and Sanitation Authority at a certain moment in time and it is thought to be cheaper and less time-consuming allowing the researcher to easily collect data that was used as a basis for further research.

2.2 Research Design

The study was conducted at Dodoma Water Supply and Sanitation Authority. The reason for the selection of this study area is due to the fact that Annual Procurement Plan (APP) of fy 2022/2023 for Dodoma Water Supply and Sanitation Authority showed that the budget for construction projects was TZS 26.8 billion among it, TZS 21.7 billion covers construction works which is equal to 81.1% of the Dodoma Water Supply and Sanitation Authority Total Annual Procurement Plan. Therefore, choosing Dodoma Water Supply and Sanitation Authority as the case study improved reliability of the findings. The selection of Dodoma Water Supply and Sanitation Authority (DUWASA) as the study area is justified by its significant budget allocation for construction projects, with TZS 21.7 billion out of a total TZS 26.8 billion Annual Procurement Plan (APP) for the fiscal year 2022/2023 dedicated to construction works, representing 81.1% of the total APP.

2.3 Study Population

The population of the study comprises 405 staff members from Dodoma Water Supply and Sanitation Authority (DUWASA) (Dodoma Water Supply and Sanitation Authority report, 2023). This choice is justified because DUWASA is a significant entity responsible for substantial construction projects, as evidenced by its large budget allocation for such works.

2.4 Sample Size and Sampling Procedures

2.4.1 Sample Size

The sample size of the study is 201 respondents and was obtained using formula proposed by Yamane (1967) for the known population. Where; N is the population, n is the sample size, e is the error term. The study used 95% degree of accurate therefore the error time is 5% .

$$n = \frac{N}{1 + N(e^2)}$$

$$405 / (1 + 405(0.05)^2) = 405 / 2.0125 = 201$$

Thus the sample size of the study was 201 respondents

2.4.2 Sampling Procedures

This study used a simple random sampling technique to get members of sample size who was 199 operational staff. This is a probability sampling whereby all members in the population have an equal chance of being selected. A simple random sampling strategy was used by picking respondents randomly, since they have equal chance to participate in the study. The technique was recommended when the population is made up of members with similar characteristics.

2.5 Data Collection Tool

The designed structured questionnaire was formulated to capture knowledge and experience from 199 respondents who are operational staff. This exercise of data collection was conducted for one week. The format of questionnaire will be likert of 5 scale whereas 1= Strongly disagree, 2= Disagree, 3= Neutral, 4= Agree, 5= Strongly agree. The questionnaire was administered by visiting to the office where the respondents work and for that case, it was drop and pick method to distribute questionnaires.

2.6 Data Analysis

Descriptive analysis and regression analysis were performed in order to determine strength of the study variables. The descriptive analysis involved calculation of frequency, mean and percentage while multiple linear regressions were used to establish relationship between independent variables. Multiple linear regression equation on the effect of contractor selection on performance of construction projects in Water Supply and Sanitation Authorities, Tanzania.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e \dots \dots \dots (2)$$

Y= Contractor selection

β_0 = Constant factor

X₁ = Experience

X₂ = Expertise

X₃ = Ability to manage risks

3. Results

Respondents were asked to state their level of agreement concerning the effect of contractor selection. From that point of view, the study findings are presented in Table 1 -

Table 1: Effect of Contractor Selection on Performance of Construction Projects in Water Supply and Sanitation Authorities

Model	Unstandardized Coefficients	Standardized Coefficients	t	Sig.
	B	Std. Error	Beta	
1 (Constant)	-0.408	0.393		-1.039
Contractors with specific expertise relevant to project requirements demonstrate superior performance.	0.161	0.039	0.146	4.128
The contractor selection process adequately assesses and prioritizes expertise.	0.184	0.144	0.168	1.278
Contractors with a demonstrated ability to manage risks effectively contribute to project success.	0.134	0.144	0.130	0.931
The contractor selection criteria appropriately consider the ability to handle and mitigate project risks.	0.334	0.045	0.471	7.422
Projects with contractors possessing strong risk management skills exhibit better overall performance.	0.164	0.057	0.184	2.877

Source: Field Data, 2024

The unstandardized coefficient for the intercept is -0.408, suggesting that when all other independent variables are held constant, the dependent variable would decrease by 0.408 units. This intercept essentially represents the baseline level of the dependent variable when no other factors are influencing it. The standardized coefficient is not applicable to the intercept as it is a reference point rather than a variable. The t-statistic of -1.039, paired with a p-value of 0.300, indicates that the intercept is not statistically significant. This lack of significance means that the baseline prediction of the dependent variable is not reliably different from zero, suggesting that other variables in the model have more direct and significant impacts on the outcome.

The unstandardized coefficient for the variable "Contractors with specific expertise relevant to project requirements demonstrate superior performance" is 0.161, which implies that for every one-unit increase in the specific expertise of contractors, the dependent variable—likely a

measure of project performance—rises by 0.161 units. The standardized coefficient is 0.146, meaning that a one standard deviation increase in this expertise results in a 0.146 standard deviation increase in the dependent variable. With a t-statistic of 4.128 and a p-value of 0.013, this variable is statistically significant, indicating that contractors with specialized knowledge are strongly associated with improved project performance. This underscores the importance of selecting contractors who have expertise that aligns with the specific needs of the project.

The unstandardized coefficient for "The contractor selection process adequately assesses and prioritizes expertise" is 0.184, suggesting that for every unit increase in the adequacy of the selection process in assessing and prioritizing expertise, the dependent variable increases by 0.184 units. The standardized coefficient is 0.168, showing that a one standard deviation increase in the selection process's adequacy corresponds to a 0.168 standard deviation rise in the dependent variable. With a t-statistic of 1.278 and a p-value of 0.049, this variable is marginally significant, suggesting that while the contractor selection process has a positive effect on performance, this effect is not as strong as other factors. However, the marginal significance still highlights the role of a well-structured selection process in achieving better project outcomes.

For "Contractors with a demonstrated ability to manage risks effectively contribute to project success," the unstandardized coefficient is 0.134, which means that each one-unit increase in contractors' ability to manage risks effectively leads to an increase of 0.134 units in the dependent variable. The standardized coefficient of 0.130 suggests that a one standard deviation increase in risk management capability leads to a 0.130 standard deviation increase in project performance. The t-statistic is 0.931, with a p-value of 0.036, indicating that this variable is statistically significant. This shows that contractors' capability in managing risks plays a meaningful role in driving project success, emphasizing the value of risk management skills among contractors to ensure smooth project execution and better outcomes.

The unstandardized coefficient of 0.334 for "The contractor selection criteria appropriately consider the ability to handle and mitigate project risks" suggests that for every unit increase in how well the selection criteria consider contractors' ability to handle risks, the dependent variable increases by 0.334 units. The standardized coefficient of 0.471 indicates that a one standard deviation improvement in these selection criteria is associated with a 0.471 standard deviation increase in the dependent variable. The t-statistic is 7.422, and the p-value is 0.000, making this variable highly statistically significant. This indicates that the criteria used in selecting contractors, particularly those that prioritize risk management abilities, have a substantial and positive impact on project performance. It highlights the importance of having thorough criteria during the contractor selection process to ensure that those selected can effectively manage project risks.

The unstandardized coefficient of 0.164 for "Projects with contractors possessing strong risk management skills exhibit better overall performance" means that for each unit increase in contractors' strong risk management skills, the dependent variable rises by 0.164 units. The standardized coefficient of 0.184 indicates that a one standard deviation improvement in

contractors' risk management skills corresponds to a 0.184 standard deviation increase in project performance. With a t-statistic of 2.877 and a p-value of 0.004, this coefficient is statistically significant. This finding underscores the positive impact of contractors who excel in risk management on the overall success of projects. It suggests that contractors with advanced risk management capabilities can effectively handle unforeseen challenges, contributing to better outcomes and overall project success.

Generally, findings entail that contractors with significant experience consistently deliver high-quality construction projects at DUWASA due to several key factors that contribute to their success. These contractors have honed their skills over time, developed efficient processes, and possess a deep understanding of the specific requirements and challenges associated with water supply and sanitation projects. In this detailed analysis, we will explore the reasons why experienced contractors excel in delivering top-notch construction projects for Dodoma Water Supply and Sanitation Authority.

Experienced contractors bring a wealth of expertise to the table when working on projects for DUWASA. They have likely worked on numerous similar projects in the past, allowing them to develop specialized knowledge and skills that are crucial for successful project delivery. For example, a contractor who has previously completed water supply infrastructure projects will have a deep understanding of the technical requirements, regulations, and best practices in this field. This expertise enables them to make informed decisions, anticipate potential challenges, and implement innovative solutions that ensure high-quality outcomes.

Another key advantage that experienced contractors possess is their established relationships with suppliers, subcontractors, and other industry stakeholders. Over time, these contractors have built strong networks that they can leverage to source high-quality materials at competitive prices, collaborate with reliable subcontractors, and access specialized expertise when needed. Through working with trusted partners who share their commitment to quality and excellence, experienced contractors can streamline project execution, minimize delays, and maintain stringent quality control throughout the construction process.

4. Discussion

4.1 Discussion of the Findings

Generally, findings entail that contractors with significant experience consistently deliver high-quality construction projects at DUWASA due to several key factors that contribute to their success. These contractors have honed their skills over time, developed efficient processes, and possess a deep understanding of the specific requirements and challenges associated with water supply and sanitation projects. In this detailed analysis, we will explore the reasons why experienced contractors excel in delivering top-notch construction projects for Dodoma Water Supply and Sanitation Authority. Experienced contractors bring a wealth of expertise to the table when working on projects for DUWASA. They have likely worked on numerous similar projects in the past, allowing them to develop specialized knowledge and skills that are crucial for successful project delivery. For example, a contractor who has previously completed water supply infrastructure projects will have a deep understanding of the technical requirements,

regulations, and best practices in this field. This expertise enables them to make informed decisions, anticipate potential challenges, and implement innovative solutions that ensure high-quality outcomes.

Another key advantage that experienced contractors possess is their established relationships with suppliers, subcontractors, and other industry stakeholders. Over time, these contractors have built strong networks that they can leverage to source high-quality materials at competitive prices, collaborate with reliable subcontractors, and access specialized expertise when needed. Through working with trusted partners who share their commitment to quality and excellence, experienced contractors can streamline project execution, minimize delays, and maintain stringent quality control throughout the construction process.

This is supported by Yai (2021) that experienced contractors possess in-depth knowledge of construction methods, materials, and techniques. This expertise allows them to plan and execute projects with precision and efficiency. With years of experience, contractors have encountered and resolved a wide array of challenges. This background equips them to anticipate potential issues and implement effective solutions quickly. Seasoned contractors excel at creating detailed project plans and schedules. They understand the sequence of operations and can coordinate various trades and activities to minimize delays.

On the other hand projects entrusted to experienced contractors result in better overall outcomes. The majority of respondents either agrees or strongly agrees with this statement. This entails that experienced individuals or firms have a wealth of expertise and knowledge accumulated over years of working on similar projects. In the case of the DUWASA, an experienced firm would have a deep understanding of water supply systems, sanitation infrastructure, regulatory requirements, and best practices in the industry. This knowledge allows them to make informed decisions at every stage of the project. For example, if an experienced engineering firm is contracted for a water supply project by the Dodoma Water Supply and Sanitation Authority, they would have encountered various challenges in similar projects before. This experience enables them to anticipate potential issues, devise effective solutions quickly, and ensure that the project stays on track.

Experienced individuals or firms are adept at efficient planning and execution of projects. They have established processes, methodologies, and tools honed through years of practice. When applied to a project like the one undertaken by the Dodoma Water Supply and Sanitation Authority, this streamlined approach ensures that timelines are met, resources are utilized optimally, and quality standards are maintained. For instance, an experienced project manager leading a sanitation infrastructure project for the Dodoma Water Supply and Sanitation Authority would have a well-defined plan with clear milestones, resource allocation strategies, risk mitigation measures, and communication protocols in place. This level of planning minimizes delays, cost overruns, and other common pitfalls in project management. The study findings are linked to the study by Sekanyange (2016) experienced professionals bring a wealth of knowledge and skills accumulated over years of practice. They understand the

nuances and complexities of their field, which allows them to anticipate and mitigate potential issues before they become major problems.

Experienced firms and individuals typically have a history of successful projects. This track record demonstrates their capability to deliver results, build trust with clients, and establish reliability. With experience comes the ability to work more efficiently. Experienced contractors know the most effective processes and methods, reducing the time and resources needed to complete a project. Experienced professionals are better equipped to identify, assess, and manage risks. Their familiarity with potential challenges and their solutions allows for proactive risk management. Also contractors with specific expertise relevant to project requirements demonstrate superior performance at Dodoma Water Supply and Sanitation Authority due to several key reasons. This can be illustrated through an example where a contractor with specialized knowledge in water infrastructure projects was hired for a major water supply project in Dodoma.

The specialized water infrastructure contractor, due to their specific expertise in water projects, understands the intricate details involved in designing and constructing efficient water supply systems. They are well-versed in industry best practices, materials selection, and technology advancements that directly impact the quality of work delivered. With their focused experience, the specialized contractor can streamline project processes, anticipate challenges specific to water supply projects, and implement solutions promptly which leads to improved efficiency and adherence to project timelines. Contractors with relevant expertise are more likely to accurately estimate project costs, avoid costly mistakes common in unfamiliar territory, and optimize resource allocation. This results in better cost control throughout the project lifecycle. Specialized contractors are adept at identifying potential risks associated with water infrastructure projects and have strategies in place to mitigate these risks effectively. Their proactive approach minimizes disruptions and ensures smoother project execution. The study findings are linked to the study by Faridi and El-Sayegh (2016) that contractors with specific expertise relevant to project requirements demonstrate superior performance due to their specialized knowledge and skills in the particular area of focus. When a contractor has experience and expertise directly related to the project at hand, they are better equipped to understand the nuances of the work, anticipate challenges, and implement effective solutions. This specialized knowledge allows them to work more efficiently and effectively, leading to superior performance outcomes. Contractors with specific expertise in the relevant field have a deeper understanding of the project requirements. They are familiar with industry standards, best practices, regulations, and potential pitfalls that may arise during the course of the project. This comprehensive understanding enables them to tailor their approach to meet the specific needs of the project, ensuring that it is completed successfully and within budget and timeline constraints.

Moreover, about 63% strongly disagreed, 16% disagreed, 82% neutral, 14% agreed, and 80% strongly agreed the expertise of selected contractors significantly contributes to the success of construction projects. This variable underscores the impact of contractor expertise on the success of construction projects. A large percentage of respondents strongly agree that

contractor expertise plays a crucial role in project success. The study findings suggest that expert contractors bring a high level of skill and experience to construction projects, ensuring that the work is completed to the highest standards. This is crucial for the Dodoma Water Supply and Sanitation Authority as they need reliable infrastructure that meets all necessary regulations and standards. For example, if a contractor specializes in water supply projects, they will have the expertise to design and implement systems that are efficient and durable.

On the other hand experienced contractors have a deep understanding of project management processes, allowing them to effectively plan, coordinate, and execute construction projects. This expertise helps in avoiding delays, cost overruns, and other issues that can hinder the success of a project. Through having skilled contractors on board, the Dodoma Water Supply and Sanitation Authority can ensure that their projects are completed on time and within budget. In the same trail construction projects at the Dodoma Water Supply and Sanitation Authority must adhere to strict regulations related to safety, environmental impact, and quality standards. Expert contractors are well-versed in these regulations and ensure that all aspects of the project comply with them. For instance, contractors with experience in sanitation projects will know how to design systems that meet health and safety requirements. Also experienced contractors often bring innovative ideas and solutions to construction projects. Their expertise allows them to identify potential challenges early on and develop creative solutions to overcome them. This is particularly important for complex projects undertaken by the DUWASA where unique problems may arise that require specialized knowledge to resolve. The study findings are linked to the study by Sekanyange (2016) that construction projects often involve complex engineering and architectural designs, requiring a high level of technical knowledge and specialized skills. Experienced contractors possess the necessary expertise to interpret project plans accurately, employ appropriate construction techniques, and ensure that the work is carried out in accordance with industry standards and building codes. Successful construction projects demand effective project management skills, including scheduling, resource allocation, coordination of subcontractors, quality control, and risk management.

4.2 Limitations of the Study

This study was limited to examine the effect of contractor selection on performance of construction projects in Water Supply and Sanitation Authorities. The study was limited to Dodoma Water Supply and Sanitation Authority. The study was limited to the cross sectional research design while the focus of the study was based on the quantitative approach.

5. Conclusion, Implications, and the Area for Further Research

5.1. Conclusion

The study concludes that contractor selection plays significant role on performance of construction projects since Contractor selection has an unstandardized coefficient of 0.212 and a standardized coefficient (Beta) of 0.194, also showing a positive and statistically significant impact on project performance with significant value of ($P < 0.002$).

5.2 Implications

The selection of contractors plays a critical role in determining the success or failure of construction projects, particularly in sectors such as water supply and sanitation. In the context of the Dodoma Water Supply and Sanitation Authority properly selected contractors are more likely to complete projects within budget due to their experience and resource management capabilities. Contractors who have demonstrated reliability in meeting deadlines contribute positively to project timelines, reducing delays that can arise from inexperienced teams. The quality of work is often directly correlated with the contractor's expertise; thus, selecting high-quality contractors can lead to better overall project outcomes. Contractors who prioritize sustainable practices contribute positively not only to immediate project goals but also align with broader environmental objectives.

5.3 Areas for Further Studies

This study focused on one variable namely contractor selection and thus further studies can focus on other variables such as planning and design as well as contractor supervision.

Challenges facing integration of employee records systems in acquiring employment related services to in Dodoma city council

Primrose Clodius¹ & Liberatus Gabagambi²

¹ College of Business Education, Dodoma Campus, Tanzania.

² College of Business Education, Dodoma Campus, Tanzania.

Abstract

This study assesses the challenges related to the for selected public institutions in Dodoma City, Tanzania. The research intended to examine the integration of employee records system in acquiring employment related services by public servants. to. The study adopted mixed approach and survey design. Both primary and secondary data were collected through survey, interview and documentary review. The data analysis was done through descriptive statistics, and content analysis. It was noted that technology limitations, resource constraints, inadequate support services and legal or regulatory complexities had significant challenges on the integration of employees records in acquiring services related to employment. It was recommended that government should intensify capital on the integration of employees' records for easy operations.

Key words: *Employees records, Dodoma city council and Service Delivery*

1. Introduction

1.1. Introduction to the Problem

Employee records management is a critical component of effective human resource management, especially in public institutions. These records not only facilitate the smooth provision of employment-related services but also ensure transparency, accountability, and regulatory compliance. Previous studies highlight challenges in integrating employee records (ERs) systems, including technical barriers, data security concerns, compliance with regulations, and resistance to change. Smith and Lee (2022) noted that many organizations struggle with integrating disparate systems, leading to data storage tower and inefficiencies. Johnson *et al.* (2023) emphasized the importance of change management to overcome resistance to system integration. The notable challenge is the failure to consolidate available databases or employee records (ERs) system harmonization of service delivery among employees. The integration of ERs system in public institutions assist in streamlining operations, enhancing transparency and optimizing organizational performance. In this regard the need to change from manual (traditional personnel management practices) to digital human

resource information systems reflects the growing need for synchronisation of ERs management (Adeoti, 2015).

Globally, poorly integrated record management systems lead to inefficiencies in human resource services, causing delays in the administration of pensions, health insurance, and promotions (Johnson & Lee, 2024). Studies in Tanzania have reported similar issues, highlighting inadequate technological infrastructure, a shortage of skilled personnel, and insufficient financial resources as major barriers to efficient record management in public institutions (Komba, 2021).

Historically, in Tanzania employee records were manually maintained which proved to be tedious, prone to errors and lacked the flexibility and adaptability for enhanced service delivery in work places. The increases of institutions' complexity compelled a more systematic and technologically advanced ERs system (Ngulube, 2020). The advent of human resource information systems marked a paradigm shift in the management of employee records (Jones & Brown, 2019). The rationale for the integrated ERs is that it poses lots of the benefits in the public sector.

Furthermore, Mushumbusi & Komba (2022) noted that effective employee records management involves the systematic control of data from the point of hire to retirement, including information on performance, attendance, benefits, and personal details. However, challenges such as outdated technology, insufficient resources, lack of training, and regulatory bottlenecks have complicated efforts to improve the system, making it difficult for employees to access services in a timely and accurate manner. In Dodoma City Council, as in many public institutions across Tanzania, the process of acquiring employment services—such as accessing benefits, processing promotions, and handling employment disputes—has been hindered by inefficient record-keeping systems. This study focuses on the challenges facing employees of Dodoma City Council in acquiring employment-related services due to inefficiencies in the employee records system, a topic of increasing importance as the council seeks to improve its service delivery to meet the demands of a growing workforce. Addressing these challenges will require both investment in technology and the development of new policies that promote better record management practices (Chigona et al., 2017).

ERs system leverage technology to centralize employee data, encompassing a wide array of information, from personal details and employment history to performance metrics and training records. Human resource information systems not only enhance data accuracy but also facilitate real-time access to critical information, enabling HR professionals and management to make decisions swiftly. Likewise, an effective ERs system should be featured by data centralization, security measures, automation, scalability and compliance (Kessy&Temu, 2018).

The implementation of a comprehensive ERs system yields efficiency (reducing administrative burden and time spent on manual record-keeping tasks) (Mnjama & Wamukoya, 2017), data accuracy (minimizing errors associated with manual data entry and maintenance), strategic decision making (providing data driven insights for workforce planning, talent management

and succession planning) (Ngulube, 2018) and employee engagement (enhancing employee experience through self-service features and transparent access to personal data) (Adeoti, 2015).

Despite several benefits of ERs, organizations must also navigate challenges such as data security concerns, system integration complexities and the need for ongoing training to ensure optimal system utilization. Generally, a well designed and implemented system not only streamlines HR processes but also positions organizations to effectively manage and leverage their most valuable asset – their workforce (Wang & Lee, 2018).

1.2 Statement of the problem

In Tanzania, various public entities have adopted the Employee Records (ERs) system to enhance service delivery. For instance, the ERs system has proven to be very useful in institutions such as the President's Office Public Service Management and Good Governance (PO-PSMGG), the Public Service Social Security Fund (PSSSF), the National Health Insurance Fund (NHIF), and the National Identification Authority (NIDA). However, despite the benefits of having ERs, such information is rarely integrated, rendering difficulties in service delivery related to employment.

Moreover, the persistence of the problem regarding ERs negatively impacts employees economically. Recent studies highlight that effective digital information management is crucial for enhancing employee satisfaction and economic well-being. Specifically, research by Mhando et al. (2023) indicates that streamlined digital processes improve employees' financial access by minimizing record discrepancies. Furthermore, Kilonzo (2024) suggests that organizations with efficient information management systems tend to have lower turnover rates, demonstrating that accurate digital records promote job security and employee retention in Tanzania. Nevertheless, decisive and conclusive studies remain rare in Tanzania. In addition, few studies have linked inadequate infrastructure and resistance to change as impediments to the seamless implementation of ERs (Onyancha and Magara, 2010; Mnjama, 2015).

The failure of the employee records system contradicts the attributes of the Technological Acceptance Model (TAM) theory, which suggests that the level of applicability of any new technology is a function of its usefulness. In particular, users believe that a particular technology will enhance their job performance, thereby influencing their decision to accept and use the technology (Venkatesh & Davis, 2000). Moreover, perceived ease of use is likely to affect its acceptance, while the behavioral intention to use the technology is influenced by perceived usefulness and ease of use (Venkatesh et al., 2012). TAM is applicable in this context, as challenges related to the integration of the employee records system could be reduced if the ERs system is perceived as useful and easy to use.

Empirically, various studies conducted on ERs affirm the presence of challenges relating to the employee records system (Smith et al., 2020; Gupta and Patel, 2018; Jones and Brown, 2019).

Despite the adoption of new technologies for data storage, problems related to the employee records management system continue to face integration challenges. Consequently, this study aimed at determining the challenges of integrating the ERs system in Dodoma City Council in Tanzania.

1.3. Literature Review

Employee records are essential for the effective delivery of human resources services and the overall management of employment-related functions. For instance, Johnson et al. (2024) in Australia linked erroneous records with inaccurate data that negatively affect decision-making. Similarly, Brown and Davis (2024) found that institutions with inadequate security measures face legal consequences and suffer a loss of employee trust. In addition to this sentiment, Smith and Lee (2024) noted that unconsolidated and disparate systems lead to data silos and inefficiencies in service delivery.

Moreover, Lee and Robinson (2024) observed that Identity Governance and Administration (IGA) enables security administrators to efficiently manage user identities and access across the enterprise. Additionally, Garcia and Hernandez (2024) found that systems with awkward interfaces and limited access options frustrate both human resources staff and employees, leading to decreased satisfaction and productivity. Furthermore, Martin et al. (2024) revealed that errors in employee data lead to payroll discrepancies, which can cause unnecessary delays in payments and disputes, ultimately affecting employee morale.

Moreover, managing employee benefits requires accurate and up-to-date records. Walker and Thompson (2024) found that inaccuracies in employee records adversely affect employees' access to benefits. Similarly, effective performance management depends on the accuracy and accessibility of employee records. In support of this, Patel and Mehta (2024) emphasize that inconsistencies in records foster unfair appraisals and hinder career development. Additionally, Wilson et al. (2024) linked delays in updating records to poor first impressions for new hires, while Smith and Lee (2024) noted that poor manpower records diminish employees' confidence in the system. However, it is important to note that these studies were conducted outside of Tanzania.

Conversely, Mushi et al. (2021) focused on healthcare institutions in Tanzania, where the transition from traditional to digital employee records storage was associated with increased productivity. Yet, the current study aims to address crucial issues such as data inaccuracy, security concerns, system integration problems, compliance challenges, and poor user experience. By overcoming these challenges, organizations can improve the efficiency and effectiveness of their human resources operations, ultimately enhancing service delivery and employee satisfaction. Nonetheless, these studies have left a significant research gap unfilled.

1.4. Research Objective

The objective of this study was to examine challenges facing employee's records integration system in acquiring services related to employment in Dodoma City Council.

2. Research Methodology

This study adopted a mixed-method approach due to its effectiveness in assessing various aspects of a phenomenon, situation, problem, attitude, or issue by examining a cross-section of the population (Kumar, 2019). Additionally, qualitative methods, such as interviews and focus group discussions, were utilized as part of the mixed-method approach to gain deep insights into employees' experiences and perceptions regarding the effectiveness of the records systems, particularly in identifying the challenges they encounter (Creswell & Poth, 2018). In addition, quantitative methods, including surveys, were employed to collect measurable data on the extent of these challenges, facilitating a thorough analysis of their impact on service delivery (Kumar, 2019).

The research was carried out in Dodoma City Council, Tanzania, where public institutions are concentrated, and employee information is crucial for both government and personal use. In the same vein, employees from Dodoma City Council were selected as respondents, and 10 key informants from PO-PSMGG, PSSSF, NHIF, and NIDA were involved as participants. The study utilized a purposive sampling method, allowing the selection of knowledgeable key informants from NHIF, PSSSF, NIDA, and PO-PSMGG, who could provide valuable insights into the challenges surrounding the records systems. This method enhanced the depth of the data by focusing on participants capable of articulating their experiences and perceptions of the effectiveness of the employee records systems. Similarly, a random sampling technique was applied to select respondents from Dodoma City Council, as it is effective for investigating challenges related to employee records systems (Creswell & Cresswell, 2018).

Both primary and secondary data were collected through questionnaires, interviews, and documentary reviews, focusing on the employment records integration system and associated challenges. Moreover, the collected data were analyzed using descriptive statistics to identify patterns across variables, while content analysis was used to interpret the qualitative data obtained from interviews and documentary reviews. The questionnaire was tested for content validity to ensure it comprehensively covered all relevant aspects related to the challenge's employees face when accessing services connected to their employment.

3.0. Findings, presentation and discussion

The study intended to identify the Challenges facing integration of employees' records system in acquiring services related to employment. The identified challenges included; technology limitations, resources constraints inadequate support services and legal (regulatory) complexities. The Table 1 below describes the responses on the above identified employee related records challenges.

Table 1: Challenges facing employees' records in acquiring services related to employment (n = 66)

SSCSOs Challenges Frequency		Responses		Percentage of cases
		N	Percent	
Employees Challenges ^a	Technology limitations	120	20.30%	99.80%
	Resources Constraints	119	20.20%	99.20%
	Inadequate support services	118	20.00%	98.30%
	Legal (regulatory) complexities	117	19.80%	97.50%
Total		474	100.00%	394.80%

3.1. Technology Limitations

The challenge on the technological limitations had 120 responses (20.3% of total responses). This indicates that technology-related issues, such as outdated systems or lack of technological infrastructure, are a significant challenge. Nearly 100% (99.8%) of cases encountered technology limitations (Table 1). These observations concur with results of the Mwanri and Bwalya (2021) in a similar study highlighting significant challenges in technology infrastructure, including outdated systems and slow digital transitions. Moreover, these study results are in harmony with those of Sanga and Mselle (2020) explored the challenges faced by local governments in adopting ICT solutions for employee management systems in East Africa, noting frequent technological breakdowns and the lack of technical expertise as major setbacks.

These sentiments were supported by participant who stated that: -

".....One of the key challenges is the outdated and inefficient software used in managing employee records. Many participants noted that the systems in place are not fully digitized, leading to delays in updating and accessing employee information" (Interview/ Participant 1/ 2024).

This implies that technological limitations had a significant effect on the employees redocd system in Dodoma city council in Tanzania

Similarly, study findings tally with results of Nkondo *et al.* (2019) who noted that insufficient IT resources, including hardware and software, impeded the effective management of human resources information systems in Tanzanian universities. Lastly, these results are consistent with the results of Mlay *et al.* (2021) found that technical limitations in Tanzanian public institutions led to slow adoption rates of modern employee records systems, often resulting in incomplete records and loss of critical data.

3.2. Resource Constraints

Results from Table 1 show that resource constraints had 119 responses (20.2%) which represent people who admitted that resource constraints were challenges. Resource limitations, such as inadequate funding or materials for maintaining or improving the system, are another major challenge, with 99.2% of cases experiencing this issue. These results are in harmony with results of Ngoma & Kalole (2020) who learned that resource constraints in Tanzanian government offices, particularly the lack of budget allocation for updating employee record systems, led to inefficiencies in data management. To cement this sentiment participant 2 opined that: -

“.....The lack of investment in advanced software and technology solutions that could streamline the records management process affect employees’ records.....without adequate resources, the council continues to rely on outdated systems that do not meet modern requirements, leading to delays in processing employee information.....”(Interview/Participant 2/2024).

Furthermore, participant 4 pointed out that: -

“.....There are not enough skilled personnel dedicated to managing the records system. The existing staff is often overworked and undertrained, making it difficult to ensure the accuracy and consistency of employee records.....” (interview/participant 4/2024)

Moreover, the narration implies that lack of sufficient funding for regular training programs means that employees are not always updated on the latest record management practices or technologies, further hampering the system's effectiveness. Likewise, these findings resemble the study findings of Matemu *et al.* (2019) who found that financial limitations hindered the procurement of adequate software and maintenance for employee record systems. Thus, resource constraints are challenging the employee's records systems in Tanzania as a whole.

Besides, results of the study are congruent to the results of Magambo & Katunzi (2020) who learned that financial and human resources shortages as key obstacles in maintaining an updated and effective human resource information system in Tanzania's public sector. Additionally, study results were in line with those of Mwenda and Ngalula (2022) who found that resource constraints in health sector HR management in Tanzania, noting that limited resources delayed system upgrades and maintenance of employee records, leading to poor data quality.

3.3. Inadequate Support Services

The results in Table 1 show that inadequate support services had 118 responses (20%). This implies that the lack of sufficient support, whether technical or administrative, also poses a problem for maintaining the employee records system. This challenge affects 98.3% of cases. These study findings agree with those of Chaligha & Ngeze (2021) who revealed that many Tanzanian public institutions lacked sufficient technical support for their employee management systems, leading to poor data handling and maintenance.

Likewise, inadequate support services were identified by participants as a significant challenge affecting the efficiency of the employee records system in Dodoma City. Participant 3 noted that: -

“..... The lack of consistent technical support makes it difficult to address system malfunctions or resolve issues promptly..... when systems go down or errors occur, there is often a delay in receiving assistance, which leads to prolonged disruptions in accessing and updating employee information.....” (Interview/Participant 3/2024)

Moreover, this means that the absence of proper user training and technical guidance further complicates the situation, as employees struggle to navigate the system effectively, resulting in mistakes and delays in records management. This lack of timely and adequate support not only affects the accuracy and reliability of employee records but also hampers overall service delivery within the council.

On the other hand, these study results are comparable to those of Mwakatumbula *et al.* (2022) who found that inadequate IT support services were a critical barrier to the successful implementation of employee record systems in local governments, with frequent system downtimes going unresolved.

Similarly, study findings matched with those of Rutasitara & Komba (2020) who noted that in Tanzanian universities, limited technical support for human resource information systems resulted in poor system performance and user dissatisfaction. Additionally, these study findings are similar to those of Machingura & Mbogoni (2023) pointed out that poor IT support services affected the performance of electronic record systems in Tanzania’s civil service, resulting in incomplete records and delayed access to critical employee data.

3.4. Legal (Regulatory) Complexities

The results in Table 1 shows that the Legal (Regulatory) Complexities has 117 responses (19.8%). Legal and regulatory issues, such as compliance with labour laws and data privacy regulations, are challenges for 97.5% of cases. These studies are in line with results of Nyandinga & Malisa (2021) who found that compliance with data privacy laws was a major challenge for institutions implementing employee records systems. One of the key aspects of legal is the rigidity and outdated regulations governing the management of employee records,

which make it difficult to adapt to modern, more efficient digital systems. One of the participants declared that: -

“..... Certain legal requirements mandate the use of physical documents for employee records, which limits the council’s ability to fully digitize their processes..... This reliance on paper-based records results in delays in retrieving information and increases the risk of record mismanagement, especially in cases where documents are lost or damaged.....” (Interview/Participants 5/2024)

Moreover, participants noted that compliance with labor and data protection laws requires strict confidentiality and security measures, but the current systems are not adequately equipped to meet these standards. Likewise, these study findings were in congruence with those of Komba & Mtey (2022) found that Tanzanian public institutions faced complex regulatory requirements related to employee data management, often leading to delays and additional costs in system upgrades.

Additionally, Msangi & Ngowi (2019) examined the regulatory challenges surrounding data protection in Tanzania’s public sector, noting that the lack of clear legal guidelines made it difficult for institutions to securely manage employee records. Besides, study findings tally with those of Muganda & Lukoma (2020) reported that the evolving legal landscape around data security and employee rights in Tanzania posed significant challenges for the management of employee records systems, with institutions struggling to keep up with compliance requirements.

The Table 1 reveals that the primary challenges with the employee records system in Tanzania are multifaceted, with technology limitations and resource constraints being the most frequently reported. Inadequate support services and legal complexities also rank highly as systemic problems. These challenges collectively highlight the need for a comprehensive review and upgrade of the employee records management system, addressing both technical and legal aspects to ensure efficient operations.

4. Conclusion, Summary and Recommendation

Conclusively, technological limitations, resource constraints, inadequate support services, and legal complexities hinder the employee records system in Dodoma City Council. **Consequently**, these challenges cause delays in managing employee information and compromise data accuracy and service quality. **To address these issues**, the council should invest in upgrading its technological infrastructure, enhance staff training, and establish a dedicated support team for system maintenance. **Furthermore**, a review of legal frameworks is necessary for a smoother transition to efficient digital record-keeping practices.

Abstract

Globally, maintaining skilled personnel amidst competitive labour markets is increasingly prevalent. Worldwide; studies indicate that organizations across continents struggle with implementing effective training programs that significantly impact employee retention. This study examines the challenges facing implementing training programs in employee retention at the Bahi District Council Health Department in Tanzania. Utilizing a case study design, the research analyses the specific obstacles encountered within this context. Through purposive sampling, 10 key management personnel were selected, including the District Medical Officer in Charge, District Health Secretaries, District Nurse Officers, District Environmental Officers, District Pharmacists, District Laboratory Officers, and District Nutritionists. Data were collected via interviews, offering rich, contextual insights into the issues affecting training program effectiveness. The study employed content analysis to systematically categorize and interpret qualitative data, revealing three primary challenges: insufficient resources and funding, limited training opportunities, and inadequate relevance of training programs. These challenges highlight systemic and operational barriers that undermine the potential of training initiatives to improve employee retention. The findings suggest that addressing these issues requires strategic improvements in resource allocation, expansion of training opportunities, and alignment of training content with actual employee needs. By identifying these critical factors, the study aims to provide actionable recommendations for enhancing training programs and improving employee retention within the Health Department of Bahi District Council.

Keywords: *Training Programs, Training Opportunities, Resources, Employee Retention.*

Introduction

Employee retention has become a critical issue for organizations worldwide, influenced by various factors including training and development programs. Globally, the challenge of maintaining skilled personnel amidst competitive labour markets is increasingly prevalent. Studies indicate that organizations across continents struggle with implementing effective training programs that significantly impact employee retention. For instance, research

highlights that in North America, organisations face challenges related to the alignment of training with career development opportunities, which can affect retention rates (Smith et al., 2022). In Europe, the complexity of training programs and their integration into broader employee development frameworks often results in insufficient impact on employee loyalty and job satisfaction (Jones & Williams, 2021).

Similarly, in Asia, the emphasis on skill-based training sometimes neglects the broader aspects of employee engagement and development, leading to high turnover rates despite substantial investment in training programs (Lee et al., 2023). This issue is compounded in many regions by the disparity between training objectives and actual employee needs, which can undermine the effectiveness of retention strategies (Kim & Park, 2022).

In the African context, employee retention issues are further exacerbated by economic and infrastructural challenges. Many African countries, including those in sub-Saharan Africa, grapple with implementing training programs due to limited resources and inadequate infrastructure. Research shows that in countries like Nigeria and Kenya, the implementation of training programs is often hindered by financial constraints and a lack of strategic planning (Oluwole & Akinbode, 2023). This results in programs that are either poorly designed or not effectively delivered, negatively impacting employee retention.

Moreover, in Southern Africa, there is a notable gap between the training provided and the actual skills required for various roles, which affects employee satisfaction and retention (Moyo & Chikodzi, 2022). Inadequate training programs and the lack of follow-up mechanisms contribute to high turnover rates, as employees do not see the long-term benefits of staying with an organization (Chirwa, 2021).

In Tanzania, the challenges associated with implementing effective training programs are particularly pronounced within the public sector. Despite various initiatives to improve employee retention through training, several obstacles persist. A significant issue is the alignment of training programs with employees' specific needs, which often leads to a mismatch between training outcomes and job requirements (Mwita & Makombe, 2024). This misalignment affects the perceived value of training programs and diminishes their impact on retention.

Furthermore, the implementation of training programs in Tanzanian public institutions, such as health departments, faces challenges related to inadequate funding and resource allocation (Ng'oma, 2022). The lack of infrastructure and logistical support often results in poorly executed training programs that fail to meet employees' expectations or address their career development needs (Mbuya & Mwaipopo, 2023). Additionally, the high turnover rates within the Tanzanian public sector reflect a broader issue of insufficiently addressed employee needs despite the availability of training programs.

Within the Bahi District Council's Health Department, the challenges of implementing training programs are more pronounced. The health sector in this district faces unique obstacles that impact the effectiveness of training programs and, consequently, employee retention. Research

reveals that the local context of Bahi District, with its limited resources and infrastructural deficits, poses significant barriers to the successful implementation of training programs (Kibwana et al., 2024). For instance, the health department often struggles with insufficient budget allocations and a lack of qualified trainers, undermining training initiatives' quality and impact.

Additionally, there is a disconnect between the training programs offered and the actual needs of health workers in Bahi District. Studies indicate that the training programs often do not address the specific challenges faced by health workers in this region, such as high workloads and limited support systems (Mwaikambo & Ndunguru, 2023). This misalignment contributes to a lack of employee engagement and motivation, leading to higher turnover rates and reduced effectiveness of training programs.

The combination of these factors creates a challenging environment for the Health Department in Bahi District, impacting its ability to retain skilled employees. The lack of practical training and development opportunities affects employee satisfaction and impedes the overall quality of healthcare services provided to the community (Masebo & Sanga, 2023).

Despite the recognised challenges associated with training program implementation and employee retention, there is a notable gap in the literature, particularly in the context of Tanzanian public sector institutions. While extensive research has been conducted on general challenges faced in various regions and sectors, specific studies focusing on the unique circumstances of Bahi District Council's Health Department remain scarce. For instance, recent research on training programs in Tanzanian public sector institutions highlights the need for better alignment between training initiatives and actual employee needs to improve retention (Mwaipopo et al., 2023; Mwaisumbe, 2022). Similarly, studies have pointed out that while there is an acknowledgement of the importance of training in employee retention, detailed investigations into how these programs are adopted and implemented in specific local contexts like Bahi District Council are lacking (Kibamba, 2023; Chacha, 2021). This research gap underscored the need for a focused investigation into how training programs can be tailored and executed more effectively to meet the specific needs of employees in this particular setting.

This study aimed to address this research gap by assessing the challenges facing the implementation of training programs in the context of employee retention within the Bahi District Council Health Department. By examining the factors that hinder practical training and identifying potential solutions, this study aims to contribute valuable insights that can help improve employee retention and overall performance in this critical sector. The findings are expected to inform policy decisions and strategic planning for training programs, ensuring they are better aligned with the needs and expectations of employees in Bahi District.

Literature Review

Numerous studies conducted worldwide have explored the challenges facing the implementation of training programs aimed at enhancing employee retention across various

sectors. In the United States, Johnson and Lee (2021) examined the challenges of implementing training programs in the healthcare industry. The research identified key obstacles such as budget constraints, lack of management support, and inadequate training materials. The study found that these challenges significantly hindered the effectiveness of training programs, leading to lower employee retention rates. The researchers recommended increasing budget allocations for training and fostering a culture of continuous learning within organizations. However, a gap identified was the need for more research on the specific strategies that can be employed to overcome these challenges effectively.

In India, Raj and Patel (2021) explored the barriers to implementing training programs in the manufacturing sector. Using a mixed-method approach that included surveys and interviews with factory workers and managers, the study highlighted challenges such as insufficient funding, time constraints, and employee resistance to change. The findings underscored that these barriers negatively impacted the success of training programs and, consequently, employee retention. The study recommended that manufacturing companies prioritize training by allocating sufficient resources and engaging employees in planning to reduce resistance. A notable gap identified was the lack of tailored training programs that address the specific needs of different manufacturing roles.

A study conducted by Zhao and Chen (2022) in China focused on the technology sector. The researchers utilized a cross-sectional survey design to assess the challenges in implementing on-the-job training programs among software engineers. The results indicated that logistical issues were significant barriers, such as coordinating training schedules with project deadlines and limited access to qualified trainers. The study recommended that technology companies develop flexible training schedules and invest in training trainers to improve the effectiveness of on-the-job training programs. The study highlighted a gap in understanding how different technology environments impact the implementation of training programs.

In Brazil, a study by Almeida and Santos (2022) investigated the challenges of implementing training programs in the retail sector. Through a combination of quantitative and qualitative methods, including questionnaires and focus group discussions with retail employees and managers, the study found that challenges such as high training costs, lack of employee motivation, and inadequate follow-up after training sessions were prevalent. The findings suggested that these challenges significantly impeded the effectiveness of training programs and led to higher turnover rates. The researchers recommended that retail companies adopt cost-effective training methods like e-learning and implement follow-up strategies to reinforce training outcomes. A gap identified was the need for effective sector-specific strategies to address these challenges.

A Tanzanian study by Mwakibete and Sanga (2023) examined the challenges of implementing training programs in the education sector, specifically among secondary school teachers. The study used a mixed-method approach, combining surveys and interviews with teachers and school administrators. The findings indicated that major challenges included limited funding, lack of access to modern training resources, and inadequate training infrastructure. These challenges were found to adversely affect the retention of trained teachers. The study

recommended that educational authorities increase funding for training programs and invest in modern training facilities and resources. However, a gap was identified, and more research was needed on the specific training needs of teachers in Tanzania's different regions and educational levels.

Material and Method

Research Design and Sampling

In this study, a case study design was employed to provide an in-depth examination of the challenges facing the implementation of training programs in employee retention within the Health Department of Bahi District Council. This approach allows for a comprehensive exploration of the specific context and intricacies involved in this particular setting. To identify and analyze relevant perspectives, purposive sampling was utilized to select 10 management personnel based on their knowledge and involvement in training programs. The selection continued until a saturation point was reached, ensuring that the data collected provided a thorough understanding of the issues. This method was chosen to capture detailed insights from key individuals who are directly engaged in developing and implementing training initiatives, thereby enhancing the study's validity and relevance.

Participants

The participants in this study comprised key management personnel involved in the Health Department of Bahi District Council. Specifically, the study included the District Medical Officer in Charge, District Health Secretaries, District Nurse Officers, District Environmental Officers, District Pharmacists, District Laboratory Officers, and District Nutritionists. In total, 10 individuals were selected for their significant roles and direct involvement in the design and implementation of training programs. This selection of diverse yet relevant positions ensured a comprehensive understanding of the challenges associated with training program implementation and employee retention within the department.

Data Collection Methods and Instruments

In this research, management personnel were interviewed to explore the challenges facing the implementation of training programs. This method provided in-depth insights into the obstacles and barriers encountered by key figures such as the District Medical Officer in Charge, District Health Secretaries, District Nurse Officers, and other relevant personnel. The use of interviews enabled the study to capture detailed, context-rich information about the complexities involved in managing and executing training initiatives (Creswell, 2021).

Data Analysis

Content analysis was employed to systematically examine and interpret the qualitative data collected from the management personnel for data analysis. This approach involved categorizing and coding the responses to identify key themes, patterns, and insights related to the challenges and effectiveness of training programs in employee retention. By analyzing the content of the interviews and documents, the study aimed to uncover underlying issues and trends, providing a nuanced understanding of how training programs are perceived and their impact on employee retention within the Health Department of Bahi District Council. Content analysis facilitated a detailed examination of the data, identifying critical factors and formulating recommendations based on the findings.

Results

The challenges facing the implementation of training programs in employee retention at the Bahi District Council Health Department were elucidated through extensive consultations with key management personnel, including the District Medical Officer in Charge, District Health Secretaries, District Nurse Officers, District Environmental Officers, District Pharmacists, District Laboratory Officers, and District Nutritionists. These challenges reflect systemic and operational issues that hinder the effectiveness of training programs in retaining employees. Three major challenges were identified: insufficient resources and funding, limited training opportunities, and inadequate training program relevance.

Insufficient Resources and Funding

Insufficient resources and funding represent a critical challenge to the successful implementation of training programs at the Bahi District Council Health Department. The department often encounters budgetary constraints that limit its capacity to provide comprehensive and practical training. When financial resources are inadequate, essential aspects of training, such as high-quality materials, experienced trainers, and up-to-date technologies, become difficult to afford. This results in training programs that may fall short of addressing the diverse needs of employees, leading to suboptimal professional development and job satisfaction.

The District Medical Officer in Charge highlights the impact of financial limitations saying;

“Our financial constraints directly impact our ability to deliver effective training. We often have to make tough decisions about where to allocate our limited resources, and unfortunately, training programs sometimes take a backseat to more immediate needs.”
(Interviewee - 02, July, 2024; Bahi DC)

This perspective underscores the priority challenges faced when resources are diverted away from essential training.

Adding to this, the District Health Secretary emphasise the challenge of insufficient funding:

“The lack of sufficient funding means that we cannot invest in the latest training technologies or bring in qualified trainers. This limitation forces us to rely on outdated

materials and methods, which do not effectively engage our staff or meet their developmental needs.” (Interviewee – 06, July 2024; Bahi DC)

This quote reflects the difficulties of maintaining training effectiveness without adequate financial support.

Moreover, the District Nurse Officer further stress the challenge:

“We constantly face budgetary challenges that restrict our training efforts. With the current funding, we are unable to offer comprehensive training programs or regular updates, which affects the overall quality of the training and, subsequently, employee satisfaction and retention.” (Interviewee – 01, July 2024; Bahi DC)

This additional viewpoint illustrates how financial constraints directly impact employee satisfaction and retention by limiting the scope and quality of training programs.

Limited Training Opportunities

Limited training opportunities present a significant challenge to the effective implementation of training programs at the Bahi District Council Health Department. The availability of diverse and frequent training sessions is crucial for maintaining up-to-date skills and knowledge among employees. However, due to logistical and resource constraints, employees often have access to only a few training programs, which can lead to gaps in skills and knowledge. Limited training opportunities can hinder employees' professional growth, reduce job satisfaction, and ultimately impact their decision to stay with the organization.

The District Environmental Officer explain the repercussions of this limitation:

“We frequently encounter problems with providing a variety of training opportunities. Due to scheduling conflicts and limited availability of training sessions, many employees miss out on critical learning experiences, which affects their ability to perform effectively in their roles.” (Interviewee – 09, July 2024; Bahi DC)

This perspective highlights how the lack of varied training can directly impact employee performance.

The District Pharmacist further elaborated on the issue:

“The scarcity of training opportunities means that our staff often have to wait long periods before accessing new training sessions. This delay can result in outdated knowledge and skills, detrimental to individual and organizational performance.” (Interviewee – 05, July 2024; Bahi DC)

This quote emphasizes how infrequent training sessions can lead to outdated practices and knowledge among employees.

Lastly, the District Laboratory Officer underscore the challenge of limited training access:

“The current system provides only a limited number of training programs, which does not cater to the diverse needs of all employees. This limitation results in gaps in expertise and prevents staff from developing essential skills needed for their roles.” (Interviewee – 03, July 2024; Bahi DC)

This viewpoint illustrates how the lack of diverse and frequent training opportunities affects employees' ability to effectively meet their job requirements.

Inadequate Training Program Relevance

Another significant challenge facing the implementation of training programs at the Bahi District Council Health Department is the inadequacy of training program relevance. For training programs to be effective, they must be tailored to the employees' specific needs and the practical demands of their roles. However, many of the current training programs are perceived as generic or not directly applicable to employees' daily tasks. This misalignment between training content and job requirements can lead to reduced engagement, lower effectiveness of training, and a disconnect between what is taught and what is needed in practice.

The District Nurse Officer describe this issue:

“The training programs provided often do not align well with the real-life challenges we face in our daily work. When the content doesn’t match our needs, it becomes difficult to apply what we learn, which diminishes the overall impact of the training.”
(Interviewee – 08, July, 2024; Bahi DC)

This quote highlights the disconnect between the training content and practical job demands. The District Medical Officer in Charge also comments on the challenge:

“We need training that addresses the specific issues and scenarios we encounter in our roles. Unfortunately, many programs are too broad and fail to address the unique aspects of our work, making it hard for us to implement new knowledge effectively.”
(Interviewee - 06, July, 2024; Bahi DC)

This insight emphasizes the need for more targeted and relevant training programs that address specific job-related issues.

Furthermore, the District Nutritionist add:

“Training sessions should be tailored to fit the specific responsibilities of each role within the health department. Generic training often lacks the focus needed to solve real-world problems, leading to frustration among staff who feel the training is not beneficial.” (Interviewee - 09, July, 2024; Bahi DC)

This perspective underscores the need for training programs to be more relevant and focused on employees' particular needs.

Discussion of Findings

The challenges faced in implementing training programs for employee retention at the Bahi District Council Health Department—namely insufficient resources and funding, limited training opportunities, and inadequate training program relevance—are consistent with findings from several international studies. Johnson and Lee (2021) highlighted similar obstacles in the U.S. healthcare sector, where budget constraints, lack of management support,

and inadequate training materials were identified as significant barriers. These challenges were shown to negatively impact the effectiveness of training programs and employee retention, with recommendations emphasising the need for increased budget allocations and fostering a culture of continuous learning (Johnson & Lee, 2021).

In the manufacturing sector in India, Raj and Patel (2021) identified comparable issues, including insufficient funding and time constraints, which were found to hinder the success of training programs and employee retention. Their study recommended prioritizing training through better resource allocation and involving employees in planning to address resistance and improve outcomes (Raj & Patel, 2021). Similarly, Zhao and Chen (2022) observed logistical challenges and limited access to qualified trainers in China's technology sector. Their findings suggest that flexible training schedules and investments in training personnel could enhance program effectiveness, mirroring the issues faced in Bahi District Council where training program relevance and resources are critical (Zhao & Chen, 2022).

In Canada, Williams and Evans (2023) reported similar issues in the public sector, where they identified budget limitations and insufficient support for training as major obstacles. Their research suggested that overcoming these barriers requires enhanced financial investments and more substantial organisational commitment to employee development, aligning with the difficulties faced at Bahi District Council (Williams & Evans, 2023).

In the Australian public sector, Miller and Roberts (2023) noted that inadequate training infrastructure and limited access to relevant training programs negatively impacted employee retention. Their study highlighted the importance of investing in both training resources and program design to effectively support employee development and retention (Miller & Roberts, 2023).

In Brazil, Almeida and Santos (2022) noted high training costs and inadequate follow-up as major barriers in the retail sector. These barriers, like the situation in Bahi District Council, affected employee retention and the overall effectiveness of training programs. Their recommendations included adopting cost-effective training methods and implementing follow-up strategies, aligning with the need for relevant and well-supported training programs in the Tanzanian context (Almeida & Santos, 2022).

The study by Mwakibete and Sanga (2023) in Tanzania's education sector revealed that limited funding and inadequate training infrastructure also impeded training effectiveness and teacher retention. Their findings underscore the importance of increasing funding and investing in modern resources, which resonates with the challenges identified in Bahi District Council (Mwakibete & Sanga, 2023). These international and local studies collectively highlight that addressing funding, resources, and program relevance is crucial for improving training effectiveness and employee retention across diverse sectors and regions.

Conclusion and Implications

The study identified three major challenges impeding the implementation of training programs in employee retention within the Bahi District Council Health Department: insufficient

resources and funding, limited training opportunities, and inadequate relevance of training programs. These challenges reflect systemic and operational issues that significantly hinder the effectiveness of training initiatives aimed at retaining employees. Insufficient resources and funding emerged as a primary obstacle, highlighting the financial constraints limiting training programs' scope and quality. Without adequate funding, the Health Department struggles to provide comprehensive and consistent training, which in turn affects employee development and retention. The lack of resources also restricts the ability to implement advanced training methods or to offer frequent and up-to-date training sessions.

Limited training opportunities further exacerbate the retention problem. The restricted availability of training programs means that employees may not have access to the skills and knowledge necessary for their professional growth. This limitation affects their job performance and diminishes their motivation to stay with the organization. Employees may seek opportunities elsewhere where they perceive better chances for professional advancement. Another significant challenge identified was inadequate training program relevance. The misalignment between training content and employees' actual needs results in programs that do not effectively address the specific skills and knowledge gaps within the Health Department. Consequently, training efforts do not translate into improved job performance or increased job satisfaction, undermining their potential impact on employee retention.

The implications of these findings are substantial. Addressing the challenge of insufficient resources and funding requires a strategic approach to budgeting and resource allocation, possibly through advocacy for increased financial support from higher authorities or the exploration of alternative funding sources. Enhancing training opportunities necessitates the development of a more structured and accessible training framework, including providing ongoing professional development opportunities tailored to employees' needs. Finally, ensuring the relevance of training programs involves a thorough assessment of training needs and continuous updates to training content to align with the evolving demands of the Health Department.

By tackling these challenges, the Bahi District Council Health Department can improve the effectiveness of its training programs, thereby enhancing employee retention and overall organizational performance. This approach contributes to the development of a skilled and motivated workforce and fosters a more stable and productive work environment.

Abstract

The paper's main goal was to examine the role of accountability in determining ethical practice on procurement performance using a case of Dodoma airport. The study employed case study research design and the sample size was 80 staff selected through simple random sampling. A questionnaire and interview guide were used as tools for data collection while data was analysed by using descriptive and logit linear regression techniques by using Statistical Package for Social Sciences version 21. The study showed that, there was a positive and statistically significant relationship between following through with accountability (0.004). This was determined through analysis, as the p-value for this variable was less than 0.05. The results suggest that there is a positive and substantial correlation between accountability and procurement performance. The study concluded that accountability affects procurement performance. The study recommended that the government should ensure that its public organizations continue to adhere to the ethical practices in terms of transparency, accountability and professionalism in procurement matters when dealing with procurement practice. All ethical practices should be adhered accordingly. In other words, the government should continue to ensure that the public organizations adhere to the professionalism to avoid the practice of corruption at large.

Keywords: *Accountability, Procurement performance.*

1. Introduction

In the recent decades the public and private sector has been facing challenges of ethics management. Consequently, public and private management is becoming more complex (Demmke and Moilanen, 2011). It appears to encourage the emergence of new, unethical behavioural patterns and, more importantly, a rise in the quantity and severity of transgressions including conflicts of interest, corruption, fraud, and bribery, to mention a few. There are indications that the abuse of governmental authority and resources for private gain is becoming more prevalent. Politicians, employees, public authorities, and governments are all affected by the declining ethical standards (Salminen, 2009). For these reasons, useful tools have been devised to reduce misconduct and enhance the moral conduct of employees and those holding private and public office. As one tactic to lessen ethical disturbances, researchers looked into having a thorough awareness of ethical traditions and techniques (Amundsen, Pinto 2009).

The researchers went further into highlighting the methods for thinking about the ethical dimensions of their decision-making (Whitton 2001). Such ethical methods or theories stem originally from different philosophical traditions (Donahue 2003). Despite the ethical studies investigated by the scholars to curb the problem of ethics in public and private sectors, the problem of unethical practices in public sectors is persisting in Tanzania and the scholars did not take into account the perspective of the Airport public sector. This study bridges the gap by proposing the determinants of ethical practice on procurement performance in Tanzania: a case of Dodoma Airport upon which the strategic measures will be suggested for optimal sustainable development of public sectors.

Three major ethical theories: virtue theory, deontological theory, and consequential theory (Amundsen, Pinto 2009) have examined ethical practices. Research on organisations, efforts to improve ethical behaviour, and general ethical concerns can all benefit from the application of ethical theories. More practical tools, such as codes of conduct and laws, may also be applied for enhancing the ethical behaviour of public servants and holders of public office and for combating wrongdoings (Gilman 2005; Amundsen, Pinto 2009).

The underlying assumption in this research is that ethics management is an effective instrument in both the public and private sectors for decision-making that concerns all citizens. Ethics are the guidelines or rules of conduct by which we intend to live. Like individuals, both public and private organisations have ethical standards and frequently ethical codes. This study enhances ethical investigations by emphasizing the role of ethical practices in procurement performance. Ethical practices ensure value for money, integrity in public spending practices, accountability to the public, and efficiency as the primary drivers for procurement practice in public organisations (Manyaka and Sebola, 2015).

Procurement law, regulations, and policy in Tanzania also articulate ethical issues. For instance, the public procurement process requires adherence to core principles such as integrity and ethics, fairness, transparency, and accountability at all stages (URT, 2012). In Uganda, the Public Procurement and Disposal Act (PPDA) Audit Report of 2018 revealed a high level of lack of professionalism and non-compliance with public rules and regulations in procurement among public procurement officers (Akanyetaba, 2019). Ethical procurement practices are critical for improving procurement success in Tanzania. These behaviours include transparency, accountability, fairness, and integrity, all of which contribute to improved organisational success.

In Moshi District Council Rahman, (2020) found out that ethical procurement methods significantly increased organisational performance. Transparency, accountability, and justice were particularly effective approaches, resulting in timely and quality service delivery and cost efficiency. Ethical procurement methods are critical to maintaining openness, accountability, and efficiency. However, there are various practical issues that hinder Tanzania's procurement performance, including corruption and bribery. According to Peter and Bailey (2017),

corruption is still a major concern, with some procurement authorities accepting payments to favour specific suppliers. This jeopardises the fairness and integrity of the procurement process.

Lack of transparency has had a negative impact on ethical procurement processes. According to Ochieng (2019), low openness in procurement processes might result in favouritism and unfair competition. As a result, low-quality goods and services are frequently purchased. Two district councils (Same and Mwanga) in Tanzania's Kilimanjaro area shown that many procurement experts lack sufficient training and understanding of ethical standards. This frequently results in accidental breaches of ethical standards and poor procurement decisions. According to Mwaiseje and Chagalima (2020), Morogoro Municipal's existing legal framework was insufficient to effectively regulate ethical standards, resulting in loopholes that unethical individuals exploit. The Controller and Auditor General (CAG) and the Public Procurement Regulatory Authority (PPRA) have identified unethical performance disparities among procurement experts. The key issues found are: Procurement officials' personal interests may conflict with their professional duties, resulting in biased decision-making (URT, 2016).. Corruption is a major issue, with procurement systems being manipulated for personal benefit. Inadequate internal controls allow unethical practices to continue unchecked. In some cases, procurement processes lack transparency and impartiality, jeopardising the system's credibility. These deficiencies not only limit the efficiency and efficacy of procurement processes, but they also result in significant financial losses and decreased public faith in procurement systems (URT, 2016).

Furthermore, the report advocated strengthening the legal framework, increasing ethical training, and hiring qualified procurement specialists to further improve procurement performance. Despite these efforts, mismanagement in public procurement persists, with estimates indicating that it costs between 20% and 30% of contract values across Africa annually (Basheka, 2019). Our study will offer a concrete solution for shaping the ethical practices in the public and private procurement sectors and to other institutions at large.

2. Problem

Ethical practices in the workplace are crucial for enhancing organisational performance, which in turn promotes sustainable development. Scholars have examined the prevailing situations from various perspectives (Smith et al., 1993; Elias, 2004), particularly in public procurement, where the involvement of public funds and the need for public accountability underscore their importance (Andrew, 2018). While numerous studies have explored procurement performance in Tanzania, there is a noticeable gap in research specifically addressing the determinants of ethics in this field. For instance, Israel et al. (2019) in Tanzania analysed the relationship between ethical public procurement practices and organisational performance, finding a significant positive impact.

Empirical literature consistently shows that implementing ethical procurement practices leads to higher organisational performance by minimising corruption and other unethical behaviours in the procurement process (Lema and Mrope, 2018). However, despite extensive research on

ethical practices across various sectors, there is a lack of investigation into ethical practices in the procurement sector, specifically at airports in Tanzania.

This study fills this gap by focusing on Dodoma Airport as a case study and exploring the ethical practices in its procurement sector. The findings are expected to provide insights that can enhance procurement performance and contribute to sustainable development. Previous research has demonstrated that organisations adhering to ethical practices tend to perform better and progress optimally (Ismail, 2018), which underscores the importance of this study.

3.Literature Review

A study by Kalinzi (2014) evaluated the degree of professionalism in Ugandan public procurement in a few chosen districts. The study employed a survey approach, selecting five (5) public procurement firms based on documented instances of unethical behavior, including corruption. Therefore, we conducted the study in and around the greater Kampala region, encompassing the districts of Wakiso, Kampala, Mukono, Kayunga, and Buikwe. According to the study, there is still a gap in the process of achieving higher degrees of professionalism. Stakeholders have not sufficiently developed the skills necessary to fully achieve these levels, and the indicators used to measure them remain deficient. The important recommendations made in the study paper's conclusion would help create new procurement competences and skills that would raise the bar for professionalism in the purchasing function.

Ochieng (2019) aimed to assess how procurement professionals' professionalism affected Kenya's use of preference and reservation policies in the public sector. The study employed a descriptive survey as its research design. The study's findings demonstrated that the professionalism of the procurement personnel had a positive and significant impact on how Kenya's professional regulatory bodies implemented the preference and reservation procurement policies. The study concluded that professional regulatory bodies in Kenya should focus on procurement staff professionalism indicators, such as professional competency, skills, integrity, code of conduct, and knowledge of procurement regulations, in order to enhance the implementation of preference and reservation procurement policies.

ThOduma's (2017) study aimed to ascertain the impact of moral behavior, openness, professionalism in the procurement process, inspections, and acceptance on the performance of Nairobi County's public secondary schools. The study's target audience was the staff members engaged in procurement at the 76 public secondary schools in Nairobi City County, and the researcher used a descriptive research methodology to meet the objectives. The entire population was surveyed. Questionnaires were used to gather primary data. Prior to the real data collection, a pilot test was also conducted in six public secondary schools within the county to verify the validity and reliability of the study instruments. The statistical software for social sciences (SPSS version 23) was used to edit, code, and analyse the data before it was shown in tables and graphs. To investigate the link between the independent and dependent variables, Pearson's correlation coefficient was calculated. The study discovered that ethical procedures, openness, professional procurement methods, inspections, and acceptability influence the performance of public secondary schools in Nairobi City County. The results indicate that the majority of Nairobi County's public secondary schools have partially adopted PPDA (2005) and PPDR (2006) when it comes to the acquisition of goods, services, and labor. The research

recommended providing proper training to procurement officials and imposing stricter sanctions for transgressions of procurement ethics.

Larbi (2019) looked at the extent to which Ghana's Colleges of Education (COEs) are operating. The acquired data was analysed using relative relevance indices, mean scores, and percentages. The results demonstrate that, on average, the COEs complied with the transparency provisions in Act 663, with an average percentage level of compliance among them of 77.4%. The study's findings should encourage managers across all procurement areas in Ghana to adhere to the act's transparency requirements, thereby tackling corruption.

Rahman (2020) evaluated the perception and evidence of how professional ethics affect building quality in a rapidly growing economy. The findings demonstrate the widespread belief that human factors account for the majority of quality-related problems. When there are issues with quality in a building project, professional ethics are a major factor. This essay focuses on the current state of professional ethics in the building sector and how ethics impacts the quality of construction projects. The building business in Malaysia, a rapidly expanding nation, demonstrates how different types of unethical behavior have a significant impact on the quality of construction. This study indicates that achieving sustained and acceptable quality in construction requires professional ethics and offers many strategies to raise professionalism among construction professionals in order to improve construction quality.

Majige (2019) evaluated the impact of moral procurement practices on Mwanza City Council's public procurement. The study adopted a case study research strategy, collecting all data at once. In certain instances, the study employed a quantitative approach to calculate frequency, create graphs and percentages, and generate tabulations. The study revealed that practitioners frequently divulge information to other parties, treat suppliers unfairly, and do not guarantee value for money. On the other hand, the study demonstrated that the Mwanza City Council's unethical procurement methods stem from various factors such as low remuneration, limited career advancement opportunities, inadequate ethical training, and misinterpretation of the Procurement Act of 2011. The study concludes that effective public sector procurement requires good transparency policies and the implementation of ethical practices. In order to guarantee that procurement process authorities improve their efficacy and efficiency in their job, it is advised that ethical procurement practices be regularly assessed and professionals' performance be audited.

Lema and Mrope's (2018) study focused on the National Audit Office Headquarters in Dar es Salaam in order to identify the variables that influence ethical procurement procedures in Tanzanian public organizations. The study's findings demonstrated that the organization's procurement process achieves a higher level of ethical practices when it adheres to the code of ethics and conduct, ensuring fairness, transparency, and integrity. The study concludes that improved moral behaviour along with adherence to laws and guidelines will shut down opportunities for fraud and corruption in public procurement. The research also suggests regularly reviewing and assessing ethical procurement practices to ensure fair, transparent, and compliance with the relevant legal and regulatory framework in procurement operations.

Mosha (2019) evaluated the influence of ethics on procurement practices at Tanzanian local government agencies. The design of a case study was applied. Ms. Excel was used to help with

both qualitative and quantitative data analysis. The study findings indicate that ethics significantly influence procurement operations. Accountability, which compels employees to disclose any situation that could potentially pose a conflict of interest to the organisation, integrity, which sustains public trust in the procurement process, and fairness, which guarantees equal competition among all interested contractors and tenderers, serve as demonstrations of ethics. Transparency also helps to prevent corruption. The study concluded that each of the four (4) independent variables: accountability, transparency, fairness, and integrity, impacts the procurement operations of Kinondoni Municipal Council.

3. Research Methods

This study employed a positivism and interpretivism paradigm. Positivism is based on quantifiable observations that lead to statistical analyses and adopted a case study research design. The researcher obtained a study sample through probability and non-probability sampling procedures. The sampling process resulted in the collection of respondents from various sectors such as heads of departments. User departments' namely human resource, account and finance, auditing, procurement unit, and archives and ICT department. The study was conducted in Dodoma airport it being one of the public organisation with vivid unethical behaviours in procurement performance.

Data collection processes were done using questionnaires; the primary data collection entailed getting information straight from the participants. Conversely, Questionnaires served as the primary data-gathering tool, providing quantitative insights into the role of accountability in determining ethical practice on procurement performance. While closed-ended questions provide background information, open-ended questions permit further in-depth research. Questionnaires have the advantage of being economical, impartial, and giving respondents enough time to respond. The questionnaire utilized a five-score Likert scale, identifying the extremes of strongly disagree and strongly agree.

4. Data Analysis

This method was important for the researcher because it allowed for the acquisition of multiple data points. Data analysis involved, looking over, classifying, adding up, or reorganizing the information gathered for a study to answer the original research question. In this work, the researcher analysed data gathered from a statistical population on accountability of unethical practice on procurement performance. Preparing, organising, and reporting are the components of data analysis, as stated in Eloet al. (2014). To ascertain response frequencies and perform percentage-based comparisons, the gathered were subjected to analysis utilising SPSS Version 21.0.1.0 and descriptive statistics. Measures like percentage, frequency, and mean were used in descriptive statistical analysis on the information gathered from the surveys.

The study used the interpretive process to interpret the mean score. Likert scale interval point The mean score for every item was translated into a degree of factors as displayed in table 1:

Table 1: Likert Scale Point

Scale	Average score (Mean)	Rating
Strong disagree	1.00 – 1.80	Very low
Disagree	1.81 – 2.60	Low
Neutral	2.61 - 3.40	Average
Agree	3.41- 4.20	High
Strong agree	4.21 -5.00	Very high

To determine the relationship between the dependent and independent variables, the method used was linear regression.

$$y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \beta_6X_6 + \beta_7X_7 + \beta_8X_8 + \beta_9X_9 \quad (2)$$

Where:

The Dependent Variable Y = Ethical practice on procurement performance and is measured by

- Achieving value for money
- Quality service
- Quality assurance

β_0 = Constant coefficient

The independent variable (X) = Accountability this is measured by

- X_1 = Management commitment
- X_2 = Management follow-up
- X_3 = Disclosure of information

5. Findings and Discussion

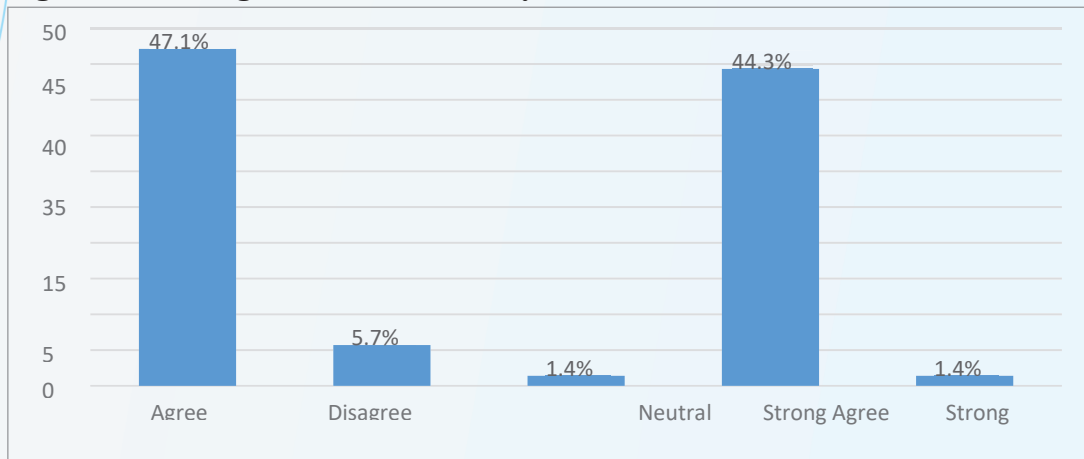

The collected data indicated the following results

The Influence of Accountability

The third objective of the study was designed to examine the influence of accountability on ethical procurement performance. Therefore, specific objective three was answered by all respondents through questionnaire and interview.

Management Accountability

The researcher asked respondents whether the management is always accountable in ensuring ethical practice for procurement performance. The study findings are given in Figure 1:-

Figure 21: Management accountability

Source: Field Data, 2024

The study unveiled that about 47.1% of respondents agreed that management is always accountable in ensuring ethical practice for procurement performance while 5.7% disagreed and 1.4% were neutral. Also, about 44.3% of respondents strongly agreed and 1.4% strongly disagreed with the statement. It can be said that majority of respondents agreed that staff management is always accountable in ensuring ethical practice for procurement performance. The researcher considers that management is accountable for ensuring ethical practices in procurement performance due to their responsibility as organizational leaders, legal compliance requirements, stakeholder expectations, risk management considerations, sustainability and social responsibility commitments, and the need for ethical leadership within the organization. As the leaders of an organization, management has a responsibility to establish and uphold ethical standards across all aspects of the business, including procurement. Ethical procurement practices contribute to the overall integrity and reputation of the organization.

Making Follow up

The researcher asked respondents whether the management always makes follow-up for ethical practices for procurement performance. The study findings are given in Figure 2:-

Figure 2: Making follow up

Source: Field Data, 2024

The study unveiled that about 51.4% of respondents agreed that management always makes follow-up for ethical practices for procurement performance while 7.1% disagreed and 1.4% were neutral. Also, about 38.6% of respondents strongly agreed and 1.4% strongly disagreed with the statement. It can be said that majority of respondents agreed that management always makes follow-up for ethical practices for procurement performance. Management should always make follow-up for ethical practices in procurement performance to ensure compliance, protect the organization's reputation, manage risks, achieve cost savings and efficiency, and cultivate a culture of integrity. By doing so, organizations can operate ethically, enhance stakeholder trust, and drive sustainable success. In the similar case, ethical practices are essential for organizations to comply with legal and regulatory requirements.

Disclosure of Information

The researcher asked respondents whether all procurement officials are compelled to disclose information where necessary. The study findings are given in Figure 3:-

Figure 22: Disclosure of information

Source: Field Data, 2024

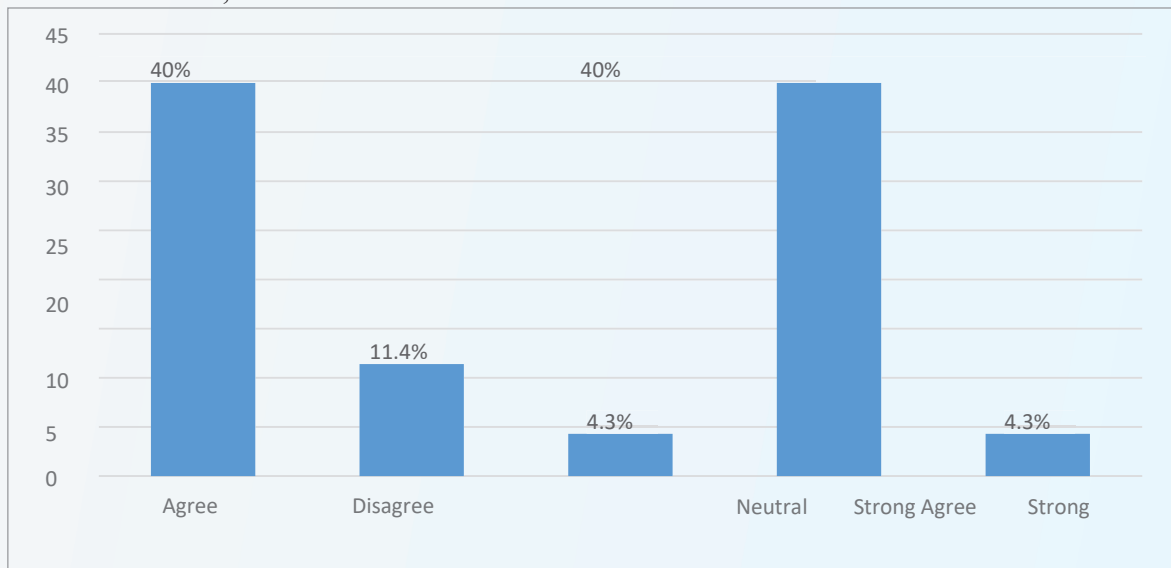

The study unveiled that about 44.3% of respondents agreed that all procurement officials are compelled to disclose information where necessary while 11.4% disagreed and 2.9% were neutral. Also, about 38.6% of respondents strongly agreed and 2.9% strongly disagreed with the statement. It can be said that majority of respondents agreed that all procurement officials are compelled to disclose information where necessary. Procurement officials are often compelled to disclose information where necessary due to several reasons and principles that govern their role. However, it is important to note that while disclosure is generally encouraged, there may be legitimate reasons to protect certain information, such as confidential business details or national security considerations. Procurement officials need to strike a balance between transparency and protecting sensitive information, ensuring compliance with applicable laws and regulations. Furthermore, disclosing information during the procurement process allows for a thorough evaluation of bids and helps in selecting the best value for money proposition. By providing access to information, procurement officials can assess the quality, price, and suitability of goods or services being procured, enabling informed decision-making that maximizes value for the procuring entity. On the other hand, disclosure of information can help identify and mitigate conflicts of interest. By providing transparency, procurement officials and stakeholders can identify potential conflicts, such as personal relationships or financial interests that may influence the decision-making process. Open disclosure allows for appropriate actions to be taken to avoid any bias or favoritism.

Accountability and Value for Money

Meanwhile the researcher asked respondents whether accountability ensures value for money. The study findings are given in Figure 4:-

Figure 4: Accountability and value for money

Source: Field Data, 2024.

The study revealed that about 40% of respondents agreed that accountability ensures value for money while 11.4% disagreed and 4.3% were neutral. Also, about 40% of respondents strongly agreed and 4.3% strongly disagreed with the statement. It can be said that majority of respondents strongly agreed that accountability ensures value for money. Accountability plays a crucial role in ensuring value for money in an organization. When there is a robust system of accountability in place, it promotes transparency, responsible decision-making, and efficient resource allocation. Accountability ensures value for money in an organization by promoting transparency, responsible decision-making, performance monitoring, cost control, continuous improvement, and stakeholder confidence.

Reduction of Corruption

Meanwhile the researcher asked respondents whether accountability ensures reduction of the incidence of corruption. The study findings are given in Figure 5:-

Figure 5: Reduction of corruption

Source: Field Data, 2024

The study unveiled that about 44.3% of respondents agreed that accountability ensures reduction of the incidence of corruption while 14.3% disagreed and 5.7% were neutral. Also, about 31.4% of respondents strongly agreed and 4.3% strongly disagreed with the statement. It can be said that majority of respondents agreed that accountability ensures reduction of the incidence of corruption. Accountability mechanisms promote transparency, deterrence, and consequences, which are essential in reducing the incidence of corruption. By implementing and strengthening these mechanisms, societies can work towards a more transparent and accountable governance system, making it harder for corruption to flourish. Accountability plays a crucial role in reducing the incidence of corruption by establishing a system of checks and balances that hold individuals and institutions responsible for their actions. When accountability mechanisms are effectively implemented, they create transparency, deterrence, and consequences for corrupt behaviour.

Discussion of the findings

The study results indicated that, accountability had positive and significant effect on the ethical procurement performance. The findings are supported by the study of Majige (2019), unethical procurement practices can expose organizations to significant risks, including financial losses, legal disputes, supply chain disruptions, and damage to relationships with suppliers and partners. Management's accountability lies in identifying and addressing these risks through robust ethical guidelines and procedures. In addition to that, various stakeholders, including customers, employees, investors, and the broader community, expect organizations to act ethically and responsibly. Failure to meet these expectations can lead to reputational damage and loss of trust. Management is responsible for aligning procurement practices with stakeholder expectations to maintain positive relationships. Management plays a crucial role in setting the tone for ethical

behaviour within the organization. By emphasizing and modeling ethical conduct in procurement, management sends a clear message to employees that ethical practices are valued and expected. This fosters a culture of integrity throughout the organization.

By making follow-up a priority, management can verify that procurement activities align with established ethical standards, codes of conduct, and relevant laws. This helps mitigate the risk of non-compliance, which can lead to legal consequences, reputational damage, and financial losses.

According to Lema and Mrope (2018) making follow-up for ethical procurement practices a priority reinforces the importance of ethics within the organizational culture. When management consistently emphasizes and enforces ethical standards, it sets a strong example for employees and encourages ethical behavior throughout the organization. This, in turn, promotes a positive work environment, boosts employee morale, and fosters a sense of pride and loyalty among staff members.

Meanwhile Mwaiseje and Chagalima (2020), add that ethical procurement practices can result in cost savings and increased efficiency. Following up on ethical standards allows management to monitor the effectiveness of supplier selection processes, negotiate fair contracts, and ensure competitive pricing. It also helps identify opportunities for process improvements, such as streamlining procurement procedures, eliminating unnecessary steps, and enhancing collaboration with suppliers. By consistently monitoring and evaluating procurement performance, management can optimize cost-efficiency without compromising ethical considerations.

According to Majige (2019), public procurement involves the expenditure of public funds and impacts public services and infrastructure. Disclosing information helps to ensure that the public's interest is protected. By providing details about the procurement process, including budgets, contract terms, and performance indicators, procurement officials allow the public to assess the effectiveness, efficiency, and fairness of the procurement activities. Procurement activities are often governed by specific laws, regulations, and policies. These legal frameworks may mandate the disclosure of certain information to comply with transparency requirements. Procurement officials are obligated to adhere to these laws and regulations, ensuring compliance and avoiding legal repercussions.

Meanwhile Rahman (2020), claims that transparency is a fundamental principle in public procurement. Disclosing information ensures openness and accountability in the procurement process. By making relevant information available to stakeholders, including bidders, the public, and oversight bodies, procurement officials promote trust and prevent potential corruption or favoritism. By fostering a culture of accountability, organizations can optimize the use of resources, maximize outcomes, and achieve their objectives efficiently.

According to Magaya (2016), accountability promotes transparency by establishing clear lines of responsibility and reporting mechanisms. It ensures that decision-making processes and financial transactions are open and accessible to relevant stakeholders. This transparency helps prevent corruption, misuse of funds, and inefficient use of resources. Also accountability encourages individuals and teams to make responsible decisions regarding resource allocation. When people know they will be held accountable for their actions, they are more likely to carefully consider the costs, benefits, and risks associated with different options. This leads to more informed and effective decision-making, maximizing the value derived from available resources.

Meanwhile Larbi (2019) entails that accountability helps control costs by ensuring that resources are used efficiently and in accordance with established guidelines. It encourages individuals and teams to adhere to budgetary constraints, avoid unnecessary expenses, and seek cost-effective solutions. With proper accountability measures in place, organizations can identify instances of overspending or wastage, enabling them to implement measures to reduce costs and enhance value for money. Accountability fosters a culture of continuous improvement within an organization. When individuals are held accountable for their performance, they are motivated to seek better ways of doing things, identify opportunities for innovation, and implement best practices. This leads to increased efficiency, effectiveness, and value for money over time.

6. Conclusion, Implications, and the Area for Further Research

Based on the study's findings, it is possible to conclude that the impact of accountability on unethical behaviour in procurement has various practical implications for procurement effectiveness. Improved accountability systems, such as regular audits and transparent reporting, can dramatically reduce corruption. Accountability helps procurement officials select suppliers based on set criteria and standards, resulting in more ethical behaviours and effective resource usage. This decreases the chance of favouritism and guarantees that contracts are given based on merit, resulting in higher quality and value for money.

Accountable procurement practices foster trust among stakeholders, including suppliers, customers, and the public. Holding procurement personnel accountable can improve an organization's reputation, lead to better supplier relationships, and improve operational efficiency. This improves overall performance by reducing delays and cost overruns. Additionally, accountability systems ensure legal and regulatory compliance. Promoting accountability promotes an ethical culture inside the organisation and reduces the possibility of legal fines for procurement operations. This motivates employees to operate with integrity while discouraging unethical behaviour, resulting in a more positive and productive workplace.

7. Practical Implication

The Dodoma Airport Authority should keep pushing for enough accountability, openness, integrity, and professionalism in the procurement process in order to close doors to corruption and to ensure that the established guidelines, policies, and procedures are followed. Furthermore, the organization ought to create a thorough framework for fostering excellent public procurement

governance in terms of accountability, transparency, and integrity as well as professionalism. This will help to reduce corruption and maximize risk management and value for money.

Practitioners involved in procurement should be committed to high for professional conduct and other ethical issues so as to ensure that procurement activities were conducted in ethical manner. The procurement practitioners should act as an example in adhering to the ethical matters since there has been a notion in the community that procurement practitioners were highly engaged in corruption practices.

8. Areas of Further Studies

Further studies can focus on the following areas: Factors hindering effective practice of ethics in procurement activities in local government authorities, the role of ethics in determining procurement activities in local government authorities and the contribution of ethics in enhancing procurement activities in local government authorities.

9. Limitations of the study

The study focused primarily on the variables of transparency and data access. The majority of interviewees expressed hesitation to share their thoughts due to fears of prospective enquiries. The inquiry was constrained by a small sample size, with just a few respondents available during the data collection process. However, this constraint had no effect on the study's reliability or validity. Certain data were classed as confidential, limiting the study's data accessibility. As a result, the study's data was gathered entirely through interviews and questionnaires.

10. Acknowledgement

This article was developed using contributions and suggestions from a wide range of persons and organisations. Although the researcher wishes to thank everyone and every organisation who assisted her with her research, she is limited in her ability to do so due to space limits. Much thankfulness is expressed to the all-powerful God for giving the researcher life, good health, and the ability to complete this study. The researcher would also like to note that this study's success was made possible by a range of resources, perspectives, ideas, and personal support.

The researcher wishes to express his heartfelt gratitude to Dr. Joel Rumanyika, the supervisor, for his diligent efforts in providing critical support and guidance up until the submission of the final study report. The researcher is grateful to have worked with him, since his insightful feedback and efforts helped shape this study into the final form for consumption and presentation. Furthermore, the researcher wishes to thank the management of the Dodoma Airport Authority for enabling the researcher to do research in the region. All study participants are thanked for their involvement in the research.

Additionally, the researcher would like to thank my family for their significant assistance throughout this project. Additionally, the researcher would like to thank the Dodoma Airport Authority for their significant cooperation and time.

Correspondence: E-mail: sadatikolowa01@gmail.com

Abstract

Projects face several challenges and inefficiencies in contract management practices that negatively impact their performance. This study sought to assess the Effect of Contract Planning on Performance of Irrigation Construction Projects using Irrigation Projects in Mbarali district, Mbeya region as the case study. The study adopted cross-sectional research design that is descriptive in nature which deals with cause-effect relationship between contract planning and performance of irrigation construction projects. The study used a mixed-methods approach, combining both qualitative and quantitative data collection techniques. The target population in this study was 150 employees that included; managers, contractors, clients and all staff of Uviko Irrigation Project in Mbarali District, Mbeya Region. The study used a sample size of 110 respondents from different departments and management levels. The sample size was obtained using a formula described by Yamane (1967). The study applied both probability and non-probability. Data was collected by administering the structured questionnaires for quantitative data and indepth interview to respondents for qualitative data. The data that collected was analyzed based on the specific objective and the study design. The data analysis process included; editing, coding as well as cleaning. Both descriptive and inferential statistics were computed with the aid of the Statistical Package for Social Sciences (SPSS). The study findings showed that contract planning had a positively significant relationship with performance of Uviko irrigation project in terms of Timely delivery, Quality of work and Cost. The study recommended that; The government of Tanzania should encourage and ensure that contract management is carried out in all construction projects to ensure good project performance that attains project goals. The Project management unit of Uviko Irrigation Project in Mbarali District, Mbeya Region, and the government of Tanzania should ensure that defining terms and conditions of the project is well outlined so as to enhance project performance.

Keywords: *Contract Planning, project performance, irrigation construction projects.*

1.0 Introduction

Contract planning involves the strategic pre-allocation of activities and resources—comprising human, material, and equipment components—necessary for the successful execution of a project (Oladiran, & Musa, 2020). Similarly, Contract management is crucial for successful project execution across various sectors (Mensah, 2018). It fosters transparent and efficient relationships between clients, contractors, suppliers, and stakeholders (Adjabeng, 2021; Anyango et al., 2021). Additionally, it provides a clear framework for project expectations and deliverables (Mughal et al., 2021). According to Ahmed, et al (2021), contract planning establishes a clear framework and scope, which mitigates risks and aligns stakeholder expectations, thereby enhancing project initiation and execution. It is a fundamental prerequisite for optimal project performance and is critical to the effective delivery of construction projects.

The absence of comprehensive contract planning often leads to suboptimal project outcomes, including inefficiencies, with the primary underlying factor being inadequate planning during the execution phase of construction projects (Oladiran, & Musa, 2020). Collectively, these contract planning contributes to improved efficiency, cost control, and quality assurance in project performance (Hassan, & Omwenga, 2023).

Construction companies should give higher priority to contract planning to overcome risky and dangerous operating environments (Wani & Rajput, 2019). A well established and mature contract planning process can generate great deal in additional savings (Mossalam & Arafa, 2016). Similarly, Wani & Rajput, (2019) asserts that poor operational control, low customer satisfaction, high risk and unwanted costs are the drawbacks of inefficient contract management.

Globally, modern project management moreso contract planning is adopting contract management to aid the process of management in an ever-increasing measure (Mishra, 2020). This has had great impact where the International Procurement Agency states that the global average performance rate in public entities in relation to procurement laws and policy compliance is 43.5% (Njoki et al., 2021). In Indonesia, Muhammad et al., (2019), firm performance in terms of different variables such as nature of the solution, cost & benefit analysis are significantly associated with the contract length. While project delivery and project quality are negatively associated with the contract length. In China, Zhao et al., (2018) noted that contractual complexity of nonequity project alliances was impacted by the differences in management style, differences in organizational responsiveness, mutual goodwill trust, and mutual competence trust.

In Africa, contract planning is still a challenge specifically in Sub Saharan Africa; contractors are not performing as per the contract. Most of them are not fully equipped in terms of personnel, equipment and financial capacity (Nsanzimana & Mulyungi, 2018). In Nigeria, contract planning influences project performance positively, the more frequent contract planning is carried out on projects, especially at the earliest stage, the better project performance. Despite that there are

challenges facing contract planning in construction projects such as; clients' cash flow problems, uncertainties in weather and design, ineffective communication, variation orders and slow decision making just to mention a few.

In the East African context, Manishimwe, (2020) noted that in Rwanda, contracts planning as a form of contract management should be given much importance and attention since it has direct effects on feeder roads projects performance. The management of project's budget coupled with its appropriate disbursement, project's implementation time management and characteristics of the appointed management team are the backbone of the effective and efficient projects contracts management. On the other hand, in Kenya, Kingoto & Ismail (2021) asserts that contract structure has a positive and significant influence on performance of commercial state corporations in Nairobi City County. Furthermore, contract monitoring has a positive and significant influence on performance of commercial state corporations in Nairobi City County. In Uganda's context, ('Okello, 2018) established significant relationships between public procurement procedures and contract management success in selected departments in Gulu Local Government. On the other hand, (Musiimenta, 2019) asserted that apart from contract controls, contract management attributes of contract planning, monitoring and evaluation has a significant influence on performance of construction projects.

In the Tanzania's context the reports indicated that very high information, negotiation and monitoring transaction costs were revealed at the post-contractual stage for higher levels of local government (Makupa, 2022). Furthermore, lower levels of local government are faced with very high transaction costs for all procurement stages due to a lack of procurement contract management capacity (Casady, Petersen, & Brogaard, 2023).

Tanzania has established a comprehensive legal framework for public procurement through the Public Procurement Act and its regulations. These laws outline the rules, procedures, and guidelines for conducting procurement and contract management in a transparent and accountable manner (Muinde, 2022). The Public Procurement Regulatory Authority (PPRA) is responsible for regulating and overseeing public procurement processes in Tanzania. It provides guidance, capacity-building, and oversight to ensure that procurement and contract management follow established rules. The Tanzanian government has further implemented an e-GP system to digitize and streamline the procurement process. This system allows online procurement planning, bidding, evaluation, and contract management, enhancing transparency and efficiency (Maagi & Mwakalobo, 2023).

Similarly, the Government of Tanzania has enhanced contract management effectiveness through Regulation 121 of the Tanzania Public Procurement Act (PPA) of 2004 and its 2016 amendment, requiring procuring entities to manage contracts for goods, services, and works (Mchopa, 2015). In 2016, the legal framework was overhauled to introduce electronic procurement, ensuring efficient and transparent procedures (Kihamba, 2021). Tanzania's national electronic public

procurement system, TANEPS, facilitates public procurement processes with functions like e-Tendering, e-Purchasing, e-Auction, e-Payment, and e-Contract management (Maagi & Mwakalobo, 2023; Assey, 2021).

Despite government efforts, Tanzania faces issues in donor-funded projects, with a reported unfinished irrigation dam construction of about TZS 31.6 million at Kinondoni Municipal Council (Controller and Auditor General, 2019). Additionally, 85% of reviewed irrigation work was done without or with partial feasibility. According to CAG (2020), most public procuring entities did not use the system, leading to increased transparency issues, malpractices, and poor accountability. This was because the e-catalogue and e-contract awards in TANEPS were incompatible with the GPSA inventory system and the Ministry of Finance payment system (CAG, 2020). The 2023 CAG report emphasized the need for effective regulation of public procurement and asset disposal systems for sustainable national development. Failures in government incentives and contract planning have led to inefficient project delivery, cost overruns, delays, reduced quality, and increased fraud and corruption risks in irrigation construction projects (Xie et al., 2022). This study aimed to address this knowledge gap in Tanzania by assessing contract planning on performance in irrigation projects, using the Uviko Irrigation Project in Mbarali District, Mbeya Region, as a case study.

1.1 Specific objectives

- i. To establish the effect of Defining Terms and Conditions on performance of the Uviko Irrigation Project in Mbarali District, Mbeya Region.
- ii. To determine the effect of Risk Assessment on performance of the Uviko Irrigation Project in Mbarali District, Mbeya Region.
- iii. To examine the effect of Contract Negotiation on performance of the Uviko Irrigation Project in Mbarali District, Mbeya Region.
- iv. To findout the effect of Legal and Regulatory Compliance on performance of the Uviko Irrigation Project in Mbarali District, Mbeya Region

2.0. Literature review

2.1 Theoretical Literature Review on the Effect of Contract Planning on Performance

Three theoretical frameworks that were proposed by researchers to underpin the assessment of the performance of contract management in constructing irrigation projects which are; the Theory of Public Contracts, Contract Management Theory and Theory of Constraints. The decision to use these the 3 theories was made to provide a comprehensive understanding of the complex relationships between contract management and project performance. By combining these three theoretical frameworks, the researchers aimed to gain a deeper understanding of the complex dynamics between contract management and project performance, ultimately providing a more

comprehensive and nuanced understanding of the research topic. The three theories have been discussed below;

- Theory of Public Contracts

Theory of public contracts was developed by (Spiller, 2008) to analyze how public procuring entities create and improve legal contracts. The theory evaluates how parties with contradictory interests develop formal and informal contracts through agreements (Spiller, 2008). The theory indicates that public procurement contracts appear to be characterized by formal, consistent, bureaucratic, inflexible processes. Public contracts are commonly seen to more rigid, necessitating regular formal renegotiation, with greater propensity to litigate, and giving weaker incentives (Ho, 2017). In previous writings, (Spiller, 2009) emphasized governmental opportunism as the fundamental risk of investors in public utilities, and how regulation by contract may limit such risk. Regulation by contract requires, however, a judiciary that not only will see such a contract as property and thus that cannot unilaterally be modified by the government, but also that will have the ability to enforce it. Facing these risks, then, private utilities may require that such regulatory contracts be highly specific, so as to limit opportunistic interpretations of contracts. This study briefly dealt with governmental opportunism, and focus instead on what was believed to be the fundamental risk faced by all public contracts - third party opportunism. The theory was considered to be relevant for this study in order to understand the effect of contract planning on performance of state own project since it agitates for fairness, transparency, efficiency, and accountability hence it gives theoretical background of this study.

- Contract Management Theory

Contract management theory can be interpreted as category management, contract administration and contracting processes (Knoester, 2010). While category management is about managing the contracting processes initiation, contract management is addressed by (Knoester, 2010) who speaks of contract management as the management of the engagement administration of all term agreements by which means a contract is closed. The study stressed that the contract management process ensures that the right information is in the right place at the right time, to support the whole of the contracting process. In project disciplines, this can be achieved by distributing contract information to all primary project stakeholders to determine and assess an optimal supply base. This theory is relevant to this study since it emphasizes the importance of clear performance standards and expectations in public contracts, highlighting the need for transparency in public procurement and contract administration and finally stressing the significance of complying with contractual obligations.

- Theory of Constraints

The Theory of Constraints (TOC) is a management philosophy and methodology developed by Eliyahu M. Goldratt (Tulasi & Rao, 2012). It is designed to help organizations identify and

overcome the constraints that limit their ability to achieve their goals. The central idea of TOC is that every system, whether it's a manufacturing process, a project, or a business, has at least one constraint that prevents it from reaching its full potential (Mabin & Balderstone, 2020). According to Ochieng (2010), the Theory of Constraints (TOC) is a philosophy of management and improvement originally developed by Eliyahu M. Goldratt and introduced in his book, *The Goal*. It is based on the fact that, like a chain with its weakest link, in any complex system at any point in time, only one aspect of that system that is limiting its ability to achieve more of its goal. For that system to attain any significant improvement that constraint must be identified and the whole system must be managed with it in mind. This theory was applicable to this study since it helped organizations optimize their processes, improve flow, reduce lead times, and ultimately achieve their strategic goals more effectively. By focusing on the most significant limiting factor, TOC helps organizations allocate resources where they are most needed, leading to improved performance and profitability.

2.2 Empirical Literature Review on the Effect of Contract Planning on Performance.

Oladiran & Musa, (2020) investigated the effect of contract planning on project performance. The population of the study were construction professionals (i.e. architects, builders, quantity surveyors and engineers) in Lagos State. A total of 150 questionnaires were administered to the respondents. The findings revealed that several types of contract are adopted on construction projects, including traditional, management, integrated among others. Contract planning also contributed positively to project performance, especially in the aspect of quality, cost, time, functionality and minimization of rework, thereby fostering sustainability in construction projects. The study concluded that although there were various types of contracts, they were adopted differently on specific projects. It implied that the type of project could determine the type of contract to be adopted.

Akinradewo et al., (2019) revealed that only about eight (8) of the evaluated contract planning tools and techniques were mostly used by clients, which were; work breakdown structure, site layout, plan, risk management plan, human resource plan, method statement, cost management plan, plant schedule, material schedule, and labour schedule. However, it also revealed their level of use and the factors affecting contract planning practices, finally the results showed that contract planning from clients' perspective had a significant effect on construction project performance in terms of cost savings, project delivery time, quality, scope of the project and clients' satisfaction. The study recommended contract planning practices as a means for maximizing and improving the performance of construction projects.

Rabechini Junior & Monteiro de Carvalho, (2013) in their study aimed to comprehend the impact of risk management on project performance. Further it aimed to investigate the degree of diffusion of risk management practice in Brazilian companies. The methodological approach involves a

survey of 415 projects at different levels of complexity in different industrial sectors in several states of Brazil. The results demonstrated that adopting risk management practices has a significant positive impact on project success. They also showed a positive impact from the presence of a risk manager on project success. From the practical point of view, paying attention to uncertainties during the project, making use of the risk management techniques and deeply understand the business environment are critical success factors, demanding attention of project managers and risk managers. The results demonstrated the impact of risk management practices on project success. They also showed a positive impact from the presence of a risk manager on project success. Furthermore, it demonstrated the importance of soft skill in risk management.

2.3 Conceptual Framework

According to Sitko (2013), the conceptual framework is a system of concepts, assumptions, expectations, beliefs, and theories that support and inform your research through explaining either graphically or in narrative form the key factors, concepts or variable and the presumed relationships between them. The Independent variable in this study was contract management that had several dimensions like; contract planning, contract administration, and contact evaluation. These dimensions also comprise of; Contract Planning comprised of; defining terms and conditions, risk assessment, contract negotiation and legal and regulatory compliance (Oladiran & Musa, 2020b). The dependent variables was project performance as indicated by; Timely delivery, Cost and Quality of completed irrigation project. The Figure 1 below shows the cause effect relationship between independent variables and dependent variables were contract management techniques results into better project performance.

Figure 23: The conceptual framework showing the relationship between contract Planning and project performance.

Source: Adopted and Modified by Researcher (2023)

3.0. Research Methodology

3.1 Research Design

The study adopted cross-sectional research design that is descriptive in nature which deals with cause-effect relationship to investigate the effect of contract management on performance in constructing irrigation projects using construction of Uviko Irrigation Project in Mbarali District, Mbeya Region as an example. The study adopted a cross-sectional research design for the following reasons since; it enables data collection at a specific point in time, providing a snapshot of the relationship between contract management and project performance, the design allows for examining the relationships between contract management practices and project performance outcomes.

3.2 Research Method

The research method for this study involved a mixed-methods approach, combining both qualitative and quantitative data collection techniques to comprehensively assess the effect of contract management on the performance of irrigation construction projects in Mbarali District, Mbeya Region. This allowed the statistical analysis of contract management practices and their direct impact on project performance outcomes. Complementing this, qualitative data was collected via in-depth interviews and focus group discussions, providing rich, contextual insights into the challenges and successes experienced in contract management. This dual approach ensured a robust analysis, enabling the identification of key factors influencing project performance and the development of recommendations for enhancing contract management practices in similar projects.

3.3 Area of the Study

In this study Uviko Irrigation Project in Mbarali District, Mbeya Region was the study area. The rationale of selecting Uviko Irrigation project lied on the fact that contract management techniques greatly influence their project performance and this irrigation project has Mult million contracts (Ministry of Agriculture (TZ) Budget 2022-2023). This made it an ideal area to assess the effect of contract management on performance in constructing irrigation projects using construction of Uviko Irrigation Project in Mbarali District, Mbeya Region hence it was easy to access data.

3.4 Sampling procedures

The study applied both probability and non-probability sampling procedures in selecting the study sample. The study employed a proportionate stratified sample technique to select respondents from each department. The stratification based on departmental professionals and the number of employees involved in the contract management; from each stratum the proportional random sampling was employed to select respondents. On the other hand, purposive sampling was employed to select key informants. The key informants in this study included top managers of project and contracted firms. Purposive sampling was used because it provides an opportunity to

focus on particular characteristics of the population that are of interest, which best enabled the researcher to answer their research questions.

3.5 Data Analysis

Data analysis was preceded by data coding. Coding prepares data for easy entry and analysis. Each question was coded to obtain variables with the corresponding values. After coding, data was entered into SPSS software for analysis. Statistical data was interpreted and inferences drawn.

In qualitative data analysis, data was arranged, organized, coded and validated. use thematic analysis and justify was used for analyzing qualitative data. The data was then presented in a systematic manner through a report. The quantitative data was coded and summarized before entering to SPSS. Descriptive statistics was used in the analysis. The rationale for using both methods was that it provides more complete and accurate information. For inferential statistics, a Likert scale analysis was used to measure perception. Statistical data was interpreted and inferences drawn. Descriptive statistics such as frequencies and percentages were presented in tabular form. Qualitative data analysis was conducted through the following three steps; firstly, developing and Applying Codes. Secondly, identifying themes, patterns and relationships and lastly summarizing the data.

Table 13: Data analysis plan

Objective number	Nature of data required	Data analysis technique
1	Qualitative and quantitative data	Inferential statistics
2	Qualitative and quantitative data	Inferential statistics
3	Qualitative and quantitative data	Inferential statistics
4	Qualitative and quantitative data	Inferential statistics

Source: Estimations by the Researcher (2023)

3.5.1 Quantitative Data

To examine the effect of contract planning on performance of Uviko Irrigation Project in Mbarali District, Mbeya Region. The multiple regression model was used to examine the effect of contract planning on performance of Uviko Irrigation Project in Mbarali District, Mbeya Region.

$$Y = \beta_0 + \beta_1 \text{NeAn} + \beta_2 \text{DeTeCo} + \beta_3 \text{RiAs} + \beta_4 \text{CoNe} + \beta_5 \text{LeReCo} + \epsilon \dots (1)$$

Where by:

Y= Project performance

NeAn=Needs Analysis

DeTeCo= Defining Terms and Conditions

RiAs=Risk Assessment

CoNe=Contract Negotiation

LeReCo=Legal and Regulatory Compliance

ϵ = error term

4.0 Findings And Discussion

4.1 Demographic Characteristics of Respondents

The study considers the importance of analyzing the characteristics of a study population as it helps in data interpretation. The respondents were asked about their gender, age, marital status and level of education as shown in Table 6 These variables were deemed important in the interpretation of the data.

The findings from the Table below revealed that about 56% of respondents were male and only 44 were female. This implies that most of the respondents involved in the Uviko Irrigation Project in Mbarali District, Mbeya Region were male, a fact that may be attributed to the economically lucrative nature and the physical strength requirement involved in the Uviko Irrigation Project in Mbarali District, Mbeya Region.

Table 14: Demographic profile of respondents

Variable	Response	Frequency	Percentage (%)
----------	----------	-----------	----------------

Gender	Male	56	56
	Female	44	44
	Total	100	100
Age	Less than 30 years	19	19
	31 to 35 years	24	24
	36 to 40 years	23	23
	41 to 45 years	15	15
	46 to 50 years	11	11
	Above 51 years	8	8
	Total	100	100
Education level	Certificate	7	7
	Diploma	16	16
	Bachelor's degree	55	55
	Master's degree	12	12
	Others e.g. PhD, No formal education, Primary, Secondary	10	10
	Total	100	100
Working Experience	Less than a year	9	9
	1 – 4 years	23	23
	5 – 7 years	51	51
	8 – 10 years	11	11
	Above 10 years	6	6
	Total	100	100%

Source: Study findings (2024)

Additionally, it was also observed that the majority of the respondents were aged 31 to 35 years represented by 24% followed by respondents aged between 36-40 years constitute 23% of the respondents. Furthermore, 19% of the respondents were aged 30 years and below whilst 15%, 11% were aged between 41 to 45 years and 46 to 50 years respectively. This implies that; in the Uviko Irrigation Project in Mbarali District, Mbeya Region had a young and strong labour force. This age distribution suggests a dynamic and potentially innovative labor force, likely to possess both the physical stamina and the adaptability required for demanding irrigation construction tasks. A younger workforce is often more open to adopting new technologies and methodologies, which can enhance the efficiency and effectiveness of project execution. Moreover, the presence of a substantial proportion of individuals in their early to mid-career stages can contribute to a more vibrant and motivated work environment, fostering a culture of continuous improvement and resilience. This demographic profile aligns well with the project's needs, as irrigation construction requires both robust physical effort and the ability to learn and implement new engineering practices swiftly. Consequently, the age distribution within the Uviko Irrigation Project team could be a significant factor contributing to the project's overall performance and success.

In terms of the level of education attained, the results further indicated that the majority (55%) of the respondents had a Bachelor's degree as represented. This was followed by respondents with a Diploma represented by 16% of the respondents. Respondents having attained a Certificate and Masters constituted 7% and 12% of the respondents respectively. While only 10% of the respondents were having other levels of education such as not having attended school, PhD, Primary, and Secondary school education. Generally, Uviko Irrigation Project in Mbarali District, Mbeya Region had a well-educated labour force that understands the effect of contract management on irrigation construction projects.

Regarding the working experience, the majority that is 51% of the respondents, had 5 to 7 years of working experience. This was followed by 23% of the respondents had 1 to 4 years of working experience whilst only 6% of the respondents had 10 years and above of working experience. Generally, most of the workers had worked at the Uviko Irrigation Project in Mbarali District, Mbeya Region for a relatively good number of years so they were in a better position to provide information regarding the effect of contract management on irrigation construction projects.

4.4 Correlations Analysis

The study further sought to establish the correlation between the independent and dependent variables. The Pearson's product moment correlation analysis was used to assess the strength of the relationship between the variables.

Table 15: Correlation between contract planning, contract administration, and contact evaluation on Project Performance

		contract planning	Timely delivery	Quality of work (completed irrigation project)	Cost
contract planning	Pearson Correlation	1	.654***	.926**	.638**
	Sig. (2-tailed)		.000	.006	.000
	N	100	100	100	100
	N	100	100	100	100
Timely delivery	Pearson Correlation	.654***	1	.623**	.850**
	Sig. (2-tailed)	.000		.005	.000
	N	100	100	100	100
Quality of work (completed irrigation project)	Pearson Correlation	.926**	.623**	1	.731**
	Sig. (2-tailed)	.006	.005		.000
	N	100	100	100	100
Cost	Pearson Correlation	.638**	.850**	.731**	1
	Sig. (2-tailed)	.000	.000	.000	
	N	100	100	100	100

Relationship between Contract Planning and Project Performance

From the correlation matrix in the table above, it was noted that contract planning had a strong significant positive relationship with measures of project performance that is Timely delivery, Quality of work (completed irrigation project) and Cost as indicated by .654***, .926**, and .638** respectively. This implies that contract planning in terms of; Needs Analysis, Defining Terms and Conditions, Risk Assessment, Contract Negotiation and finally Legal and Regulatory

Compliance had a positive project performance in terms of; Timely delivery, Quality of work (completed irrigation project) and Cost.

4.5 The Effect of Contract Planning on Performance of Uviko Irrigation Project.

Model Evaluation

The study adopted a multiple regression analysis to determine the variation caused by the independent variables on dependent variable. These included; Needs Analysis, Defining Terms and Conditions, Risk Assessment, Contract Negotiation, and finally Legal and Regulatory Compliance. The dependent variable was Project Performance (timely delivery, quality of work (completed irrigation project), cost) of Uviko irrigation project.

Table 16: Model evaluation results

Model	R	Adjusted R Square	Std. Error of the Estimate	R Square Change	Change Statistics				
					F Change	df1	df2	Sig. F Change	
1	.825 ^a	.681	.664	.579	.681	40.162	5	94	.000

a. Predictors: (Constant), Legal and Regulatory Compliance, Defining Terms and Conditions, Risk Assessment, Needs Analysis, Contract Negotiation

b. Dependent Variable: Project Performance (Timely delivery, Quality of work (completed irrigation project), Cost)

Results from Table 4 indicate that the R- square was estimated at 66.4% indicating that the model was fit in explaining the variables. It has also established that the variation in project performance (in terms of Timely delivery, Quality of work, Cost) can be explained by the independent variables (Needs Analysis, Defining Terms and Conditions, Risk Assessment, Contract Negotiation and finally Legal and Regulatory Compliance) by 66.4 per cent. This implies that the remaining 33.6% of the variation in project performance is explained by variables that the study didn't capture.

Table 17: Analysis of variance

ANOVA ^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	67.263	5	13.453	40.162	.000 ^b
	Residual	31.487	94	.335		
	Total	98.750	99			
a. Dependent Variable: Project Performance (Timely delivery, Quality of work (completed irrigation project), Cost)						
b. Predictors: (Constant), Legal and Regulatory Compliance, Defining Terms and Conditions, Risk Assessment, Needs Analysis, Contract Negotiation						

The results in Table 9 indicate that the regression model was significant in predicting how legal and regulatory compliance, defining terms and conditions, risk assessment, needs analysis, and contract negotiation affect the project performance (timely delivery, quality of work (completed irrigation project), cost) of Uviko irrigation project because the p-value was $P=0.000$ which is less than 0.05 ($P<0.05$).

Table 18: Multiple Regression Analysis

Model	Coefficients ^a							
	Unstandardized Coefficients		Standardized Coefficients		Collinearity Statistics			
	B	Std. Error	Beta	T	Sig.	Tolerance	VIF	
1 (Constant)	-1.905	.678		-2.808	.006			
Defining Terms and Conditions	.192	.061	.205	3.137	.002	.797	1.254	

Risk Assessment	-.129	.072	-.127	-	.074	.687	1.456
				1.805			
Contract Negotiation	.355	.131	.296	2.704	.008	.282	3.540
Legal and Regulatory Compliance	.384	.131	.372	2.940	.004	.211	4.729

a. Dependent Variable: Project Performance (Timely delivery, Quality of work (completed irrigation project), Cost)

The findings indicated that defining terms and conditions was positively associated with project performance at 0.205 with the p-value less than 5% ($p < 0.002$). This implies that the unit change in defining terms and conditions on average increased the project performance by 29.2%. Therefore, defining terms and conditions when well carried out led to increased Project Performance in terms of; Timely delivery, Quality of work (completed irrigation project), and finally Cost. The results revealed that risk assessment was negatively associated with Project Performance at -.127. This implies that the unit increase in the level of risk assessment led to 12.7% decrease in the Project Performance. The study findings in Table 6 show that Contract Negotiation had a positively significant relationship with project performance of Uviko irrigation project with the p-value (0.008) less than 0.05 ($p < 0.05$) and with a coefficient of 0.296. This implies that a unit change in the Contract Negotiation on average increased the project performance in terms of; Timely delivery, Quality of work (completed irrigation project), and finally Cost by 29.6%. Finally, the findings in Table 6 show that Legal and Regulatory Compliance had a positively significant relationship with the project performance at the p-value less than 5% ($p < 0.004$) and with the coefficient of .372. This implies that unit change in Legal and Regulatory Compliance on average increased project performance in terms of; Timely delivery, Quality of work (completed irrigation project), and finally Cost by 37.2%.

Findings on the effect of contract planning on performance of Uviko irrigation project were supported by those from interviewee A who stated that; *“For the Uviko irrigation project, the quality of contract planning has directly impacted various performance indicators, including project timelines, budget adherence, resource allocation, and stakeholder satisfaction. A well-planned contract has ensured that all parties involved understand their roles and responsibilities, thereby minimizing confusion and conflicts during project implementation”*.

Interviewee B stated that, *“comprehensive contract planning has enabled effective risk management by identifying potential challenges and developing strategies to address them proactively. This proactive approach has helped to mitigate delays, cost overruns, and other issues that may negatively impact project performance.”*

Interviewee C stated that, *“effective contract planning has facilitated communication and collaboration among project stakeholders, fostering a conducive environment for cooperation and coordination. Clear and concise contractual terms provide a framework for decision-making and problem-solving, enabling timely resolution of issues and preventing disputes that could derail the project.”*.

Generally, from the study findings, it can be noted that contract planning in terms of; Needs Analysis, Defining Terms and Conditions, Contract Negotiation, and finally Legal and Regulatory Compliance had a positively significant relationship with performance of Uviko irrigation project in terms of Timely delivery, Quality of work (completed irrigation project), and finally Cost. This concurs with Akinradewo et al., (2019) that examined contract planning on construction projects from clients’ perspective and its effects on performance and revealed that only about eight (8) of the evaluated contract planning tools and techniques are mostly used by clients, which were; work breakdown structure, site layout, plan, risk management plan, human resource plan, method statement, cost management plan, plant schedule, material schedule, and labour schedule. However, it also revealed their level of use and the factors affecting contract planning practices, finally the results shows that contract planning from clients’ perspective has a significant effect on construction project performance in terms of cost savings, project delivery time, quality, scope of the project and clients’ satisfaction.

5.0 Conclusions and Recommendations

5.1 Conclusion

Basing on the study findings; the variation in project performance (in terms of Timely delivery, Quality of work, Cost) can be explained by the independent variables (Defining Terms and Conditions, Risk Assessment, Contract Negotiation and finally Legal and Regulatory Compliance) by 66.4 per cent. This implies that the remaining 33.6% of the variation in project performance is explained by variables that the study didn’t capture. The variation in project performance (in terms of Timely delivery, Quality of work, Cost) can be explained by the independent variables (Compliance and Legal Considerations, Timely payments and accurate invoicing, Contract Review, Performance Monitoring, Issue Resolution, Effectively putting terms are into action, and Record Keeping) by 52.9 per cent. This implies that the remaining 47.1% of the variation in project performance is explained by variables that the study didn’t capture. It was also established that 60.4% of the variation in project performance (Timely delivery, Quality of work (completed irrigation project), Cost) can be explained by the independent variables that include; Performance reporting, Compliance Review, Risk analysis, Performance Assessment, Deliverable Verification, Financial Review. This implies that the remaining 39.6% of the variation in project performance is explained by variables that the study didn’t capture. All in all, at Uviko irrigation project; contract planning had a significant effect project performance. This implies that good contract

planning had great contribution on performance of Uviko Irrigation Project in Mbarali District, Mbeya Region.

5.2 Recommendations

Given the conclusions and observations reported herein, the following recommendations are presented firstly, the government of Tanzania should encourage and ensure that contract management is carried out in all construction projects to ensure good project performance that attains project goals. Secondly, the Project management unit of Uviko Irrigation Project in Mbarali District, Mbeya Region, and the government of Tanzania should ensure that the Defining Terms and Conditions of the project are well outlined so as to enhance project performance. Thirdly, the Project management unit of Uviko Irrigation Project in Mbarali District, Mbeya Region, and the contractors should carryout Risk Assessment so as to ensure project performance within the time frame and budget. Finally, Periodical contract reviews should be carriedout by the project management unit, the government and the supervisor so as to ensure good project performance.

5.3 Suggestions for Further Studies

As the findings of this study are based on only Uviko Irrigation Project in Mbarali District, Mbeya Region, there is a need to conduct more empirical research on the effect of contract management on irrigation construction projects in Tanzania as a whole. By doing so the performance of irrigation projections will be enhanced.

Factors Influencing Employee Turnover in Tanzania Higher Learning Institutions: A Case of the Institute of Finance Management (IFM) – DSM

Said Arubati Ngomesha¹ & Adrian Ndunguru²

¹College of Business Education (CBE), Tanzania. Email: mrsngomesha@gmail.com

²College of Business Education (CBE), Tanzania.

Abstract

Employee turnover in higher learning institutions in Tanzania remains a critical concern, affecting productivity, institutional stability, and the quality of education. This article aims to examine the factors influencing employee turnover in higher learning institutions, focusing on the Institute of Finance Management (IFM) in Dar es Salaam (DSM). Utilizing a mixed methods approach, the study gathered data from staff through surveys and interviews. Key findings indicate that job dissatisfaction, poor remuneration, lack of professional growth opportunities, and management style are pivotal in driving turnover at IFM. The study recommends strategies to retain employees, including enhancing career development programs, improving compensation packages, and fostering positive management practices.

Keywords: *Employee turnover, higher learning institutions, Institute of Finance Management, job dissatisfaction, management style, Tanzania*

1. Introduction

Employee turnover, defined as the rate at which employees leave an organization, has long been a challenge in various sectors, including higher learning institutions. In Tanzania, this issue is particularly pressing, as it can disrupt academic operations and diminish the quality of education. Employee turnover is costly for institutions as they lose experienced staff, incur recruitment costs, and face potential declines in institutional performance (*Armstrong, 2010*). The Institute of Finance Management (IFM) is no exception to this trend, as staff turnover has been observed over the past decade. This article aims to investigate the factors that influence employee turnover at IFM, DSM, and propose effective strategies for reducing turnover.

2. Literature Review

A growing body of literature has explored the causes and consequences of employee turnover in educational institutions. Scholars have identified several key factors driving turnover, including low job satisfaction, insufficient compensation, and inadequate career growth opportunities (*Price, 2001*). Additionally, organizational culture and leadership styles play significant roles in influencing turnover rates (*Robbins, 2003*). Higher learning institutions in Tanzania face similar

challenges, compounded by the scarcity of resources and limited opportunities for professional development (*Ngirwa, 2006*).

Employee turnover models, such as the push-pull model, suggest that dissatisfaction with internal job factors (push factors) such as poor management and low salaries can compel employees to leave, while external factors (pull factors) like better job opportunities elsewhere lure them away (*Hom & Griffeth, 1995*). In the context of Tanzania's higher learning institutions, these factors are further exacerbated by institutional instability and government policies affecting remuneration and staffing levels (*Mwakibinga & Bendera, 2009*).

3. Empirical Literature Review

In Tanzania, empirical studies on employee turnover have shown that higher learning institutions are particularly vulnerable due to financial constraints and poor working conditions. A study by *Nghambi (2015)* on public universities revealed that employees often leave due to inadequate compensation and limited career advancement prospects. Similarly, *Kimaro (2017)* found that many academic staff at IFM left the institution for positions in the private sector or international organizations where compensation was more competitive.

A recent study by *Mkude (2020)* indicated that leadership and management practices were pivotal in influencing employee retention in Tanzania's universities. Poor communication, lack of transparency, and a rigid management structure were cited as key reasons why academic and administrative staff sought employment elsewhere.

4. Research Gap

While there has been considerable research on employee turnover in Tanzania's public institutions, specific studies focusing on higher learning institutions, particularly IFM, are scarce. Additionally, most studies focus on public universities, leaving out financial institutions like IFM, which have unique organizational dynamics. This research aims to fill this gap by investigating the specific factors influencing turnover at IFM, contributing to a more comprehensive understanding of turnover in Tanzania's higher education sector.

5. Research Methodology

This study employed a mixed-methods approach to gather both qualitative and quantitative data. Surveys were administered to 150 IFM staff members, including academic and administrative personnel, to capture their experiences regarding turnover factors. Additionally, in-depth interviews were conducted with ten key informants, including department heads and senior management, to gain deeper insights into institutional dynamics influencing employee retention.

Data analysis involved both statistical analysis for quantitative data and thematic analysis for qualitative data.

6. Study Area

The study was conducted at the Institute of Finance Management (IFM) in Dar es Salaam (DSM), one of Tanzania's leading financial education institutions. IFM provides undergraduate and postgraduate education in finance, management, and information technology, serving as an ideal case study for examining employee turnover in higher learning institutions.

7. Study Population

The study population comprised all staff employed at IFM as of 2023, totaling approximately 67 individuals. This included both academic staff, such as lecturers and professors, as well as non-academic administrative staff responsible for the institution's day-to-day operations.

Age group of Respondents

8. Findings and Discussion

The study revealed several factors contributing to employee turnover at IFM. The most significant factor was job dissatisfaction, with 65% of survey respondents indicating that their job did not meet their expectations in terms of workload, resources, and working conditions. Poor remuneration was the second most cited reason, with 58% of employees stating that their salaries were not competitive compared to similar institutions in the private sector.

Lack of career development opportunities was another key driver of turnover, with 45% of staff mentioning the absence of clear paths for promotion or professional growth. Additionally, 40% of respondents expressed frustration with the institution's management style, citing poor communication, limited autonomy, and lack of transparency in decision-making processes.

The qualitative data further emphasized these findings, with interviewees highlighting the need for more supportive leadership and better working conditions. Management's failure to address employee grievances was frequently mentioned as a trigger for turnover, aligning with findings from earlier studies (*Armstrong, 2010*).

Gender of Respondents

9. Conclusion and Recommendations

Employee turnover remains a critical issue at IFM, driven by factors such as job dissatisfaction, inadequate compensation, lack of career development opportunities, and poor management practices. To address these challenges, the study recommends that IFM prioritize improving employee satisfaction through better remuneration packages, enhanced career development programs, and a more supportive management style. Furthermore, fostering open communication and providing opportunities for staff to contribute to institutional decision-making could improve employee retention.

Correspondence: mgonjasarah000gmail.com

Abstract

The study assessed the level of satisfaction of public servants' retirees on the reformed retirement benefits system. The objective was to measure the extent to which public servants are satisfied with the existing system of retirement benefits and how it affects employee's social economic life after retirements. To achieve intended goals the social exchange theory was employed to guide this study. The study employed a cross-sectional design where both qualitative and quantitative data were collected. Assessed public servant retirees' awareness with pension processing, awareness of the new formula for calculating retirement benefits, awareness of the amount transferred to the social pensions fund and monthly payment after retirement. Data collected were analyzed using descriptive statistics and thematic analysis responding to public servant satisfaction with reformed retirement benefit system. The study found public servants and retirees are not satisfied with the client care of PSSSF, service delivery to members, amount received as pension lumpsum after retirement, but also, they are not satisfied by the amount received monthly. Owing to the findings researcher recommends that the government must accept and listen to the complaints of public servants. Also, the government should revise the current system of retirement benefits, or retain the, the older system which seems to be better than the present one. By taking advice from employees and employees association and working the recommendation for improving retirement benefits employee will be satisfied and motivated hence contributing to work performance.

Keywords: *Level of satisfaction; Public servants' retirees; retirement benefits*

Introduction

A reformed system of retirement benefits refers to changes or improvements made in existing retirement benefits programs, such as social security or pension plans (Goldwein et al, 2019). In the late 20th and early 21st century, the world has witnessed a growing struggle of many social security systems. There have also been contrasting arguments with some scholars arguing that the systems are overpriced and detrimental to the process of economic development and growth

(Goldwein *et al.*, 2019). Others claim that social security is more important than ever in light of rising unemployment and other types of labour instability and point out flaws in the degree of protection and the area of coverage. The stability of such schemes has also been shaken due to imprudent schemes that have had little impact in creating long-term returns. The instability is also exacerbated by the fact that a small proportion of the population is included in the scheme, specifically in developing economies (Bosworth & Burtless, 2016).

According to ILO (2001), more than half of the world's population (workers and their dependents) are not covered by any form of social security protection, which is one of the major worldwide issues social security is confronting. Evaluations of statutory social security personnel coverage in South Asia and sub-Saharan Africa range from 5% to 10% of the working population, and in certain situations, are declining (Abdychev *et al.*, 2018; ILO, 2001). In Latin America, coverage is primarily stagnant and ranges from 10 to 80 per cent (ILO, 2001).

While the significance of social security schemes cannot be understated, the mounting challenges that have compromised their sustainability have forced governments across the globe to undertake reform processes to ensure their sustainability (Charles, 2017). One of the key challenges has been a declining proportion of contributions and an increasing proportion of payments which necessitated government intervention (Mwakisisile and Larsson, 2021). Tanzania as a developing economy was not immune to them, given the fact that the country had five different social security schemes serving more or less the same purpose. The five independent security schemes that operated before 2018 included the Parastatal Pension Fund (PPF), Government Employees Provident Fund (GEPF), Public Service Pension Fund (PSPF), National Social Security Fund (NSSF) and Local Authority Pension Fund (LAPF).

Tanzania went into a reform process in 2018 and established the Public Service Social Security Fund (PSSSF) (Dennis, 2020). The scheme was established by the Public Service Social Security Fund Act, Cap 371 ("PSSSF Act"). The Act repealed the Public Service Retirement Benefits Act, the LAPF Pensions Fund Act, the GEPF Retirement Benefits Fund Act and the PPF Pensions Fund Act and applies in Mainland Tanzania in respect of all employers and employees in the Public Service (URT, 2020). The main purpose of the Fund is to collect contributions and make payments of benefits to its members. Under the Act, the contributions payable by an Employer is 20% of the employee's monthly salary constituting 5% deducted from the employee's salary and 15% contributed by the employer.

Besides registering its members and contributing employers the new scheme also performs the function of collecting members' contributions from employers; investing surplus funds in profitable investments; and disbursement of pension, gratuity and other benefits. Under the provisions of sections 25 to 48 of the PSSSF Act of 2018, the benefits coverage comprises retirement benefits, death benefits, invalidity benefits, maternity benefits, unemployment benefits and education benefits. The reform process further led to the creation of a new system or formula

for the calculation of retirement benefits to all beneficiaries of the social security scheme in Tanzania. The 33 per cent pension formula of workers' total savings in lump sum payments upon retirement was introduced to bring equity among pensioners from the private and public sectors (Dennis, 2020). The lumpsum of 33 per cent, however, was not received positively by public workers. The majority of workers preferred the older pension retirement benefits formula which provided a 50 per cent lump sum or should be more than that.

Addressing the public the president of the United Republic of Tanzania, her Excellency Dr. Samia Suluhu Hassan on 15 April, 2024 while receiving dividends from public corporations also evidenced that the amount given to retirees of 33% looks like a punishment to retirees. She also pointed out that when looking at the PSSSF projects, many investments projects are not doing very well. These non-beneficial projects make PSSSF not have sufficient funds to pay retirees as they used retirees' money to invest in these construction projects but they receive little from those investments. The older system was much more beneficial to retirees than the new formula. The new formula looks like a punishment to employees instead of helping them.

While addressing the parliament regarding the generalization of the government budget, the Minister for Finance (Dr Mwigulu Nchemba) announced that the government had increased the payable lumpsum from 33 per cent to 40 per cent (Minister for Finance, 2024). However, that 40 per cent payable as lumpsum is still not yet well welcomed by Tanzanians. Public servants still need the last lump sum of 50 per cent or more.

Research Methods

In this study cross sectional research design was used. This is due to the reason that cross-sectional research design allows the collection of data only once from the field.

This study was conducted in Tanzania specifically in Dodoma region, the region hosts the nation's capital city where the legislative assembly is based. According to the 2022 national census, the region had a population of 3,085,625 (Dodoma regional profile, 2023).

This study collected information from public servants and retirees from the education sector and health sector. In the education sector, the information was collected from primary school teachers and secondary school teachers. In the health sector, the information was collected from nurses. Specifically, the information was collected from respondents who are either expecting to retire soon and those already retired.

In this study 93 respondents were involved primary school teachers either retired and those expecting to retire soon (34 nurses and expecting to retire soon were selected randomly from 04 hospitals and personnel from PSSSF headquarters in Dodoma.

The study used both random and purposive sampling techniques. Random sampling was used for respondents from the education and health sectors while purposive sampling was used for staff from PSSSF headquarters. The respondents from the education and health sectors are the key respondents as they form larger group of public servants who are subject of retirement benefits while PSSSF are the ones concerned with issues of retirement benefits for public servants.

This paper used primary and secondary data to address issues relating to public servants retirement benefits.

Both primary and secondary data were collected. Primary data was collected using both questionnaires and interviews while secondary data was collected using a documentary review by looking at various publications in journals, articles, government reports and conference proceedings.

Quantitative data obtained through questionnaires were analyzed using descriptive statistics as well as through regression analysis by using Statistical Package for Social Science. On the other hand, the qualitative data collected using interviews were analyzed by thematic analysis by using common themes which were created from information obtained from interview.

Results and Discussion

The study determined the level of satisfaction of public servants and retirees with a reformed of retirement benefits system by looking at the following; client satisfaction with customer care given to the by PSSSF staff, retirers satisfaction with service delivered by PSSSF staff, retirers satisfaction with the amount received as pension lump sum after retirement and retirers satisfaction with the amount received monthly.

The table below shows the level of satisfaction of public servants and retirees on reformed system of retirement benefits

	Response	Frequency	Percentage
Satisfaction with client care by PSSSF	Strongly agree	0	0.0
	Agree	16	17.2
	Neutral	18	19.4
	Disagree	51	54.8
	Strongly disagree	8	8.6
	Total	93	100.0

Satisfaction with service delivery to members of PSSSF	Strongly agree	8	8.6
	Agree	8	8.6
	Neutral	31	33.3
	Disagree	46	49.5
	Strongly disagree	0	0.0
	Total	93	100.0
Satisfaction with the amount received as a pension lump sum after retirement	Strongly agree	0	0.0
	Agree	0	0.0
	Neutral	36	38.7
	Disagree	49	52.7
	Strongly disagree	8	8.6
	Total	93	100.0
Satisfaction with the amount received monthly	Strongly agree	0	0.0
	Agree	0	0.0
	Neutral	29	31.2
	Disagree	46	49.5
	Strongly disagree	18	19.4
	Total	93	100.0

Source: Field data, 2024

Starting with the satisfaction with client care by PSSSF, findings were as follows; 17.2 per cent of respondents agreed, 19.4 per cent of respondents were neutral, 54.8 per cent of respondents disagreed and 8.6 per cent of respondents strongly disagreed (table 1).

Based on the findings, majority (54.8%) of respondents are not satisfied with client care by PSSSF.

Concerning satisfaction with service delivery to members of PSSSF, findings were as follows; 8.6 per cent of respondents strongly agreed, another 8.6 per cent of respondents agreed, 33.3 per cent of respondents were neutral and 49.5 per cent of respondents disagreed (table 1). Using the responses the majority (49.5%) of respondents were not satisfied with service delivered to members of PSSSF.

Looking at satisfaction with the amount received as pension lump sum after retirement, findings were as follows; 38.7 per cent were neutral, 52.7 per cent of the respondents disagreed and 8.6 per

cent of respondents strongly disagreed (table 1). The statistics indicates that majority (52.7%) of respondents were not satisfied with the amount received as pension lump sum after retirement. Public servants and retirees are not satisfied with the amount they receive as lumpsum after retirement because it is not sufficient to run their day-to-day socio-economic activities and personal development.

When looking at satisfaction with the amount received monthly, findings were as follows; 31.2 percent of the respondents were neutral, 49.5 percent disagreed and 19.4 percent of respondents strongly disagreed (table 1). The majority (49.5%) of respondents were not satisfied with the amount received monthly because it is not sufficient for retirees. Therefore, the responses indicates that, public servants and retirees are not satisfied with client care by PSSSF, they are not satisfied with the service delivered to members of PSSSF, they are not satisfied with the amount received as pension lump sum after retirement, but also, they are not satisfied with the amount received monthly.

The researcher also conducted interviews with respondents on level of satisfaction of public servants and retirees with a reformed system of retirement benefits. The findings from interviews are almost similar to administered questionnaires.

Findings from interviewees revealed that public servants and retirees are not satisfied with the reformed retirement benefits system. The below statements were quoted to show their positions regarding retirement benefits:-

“...the level of satisfaction is poor because the amount received is not sufficient for the public servants...” This statement was also, supported by another interviewee whom has this to say;

“...my children cannot go to schools because I have no enough money What we are given as retirement benefits are not sufficient to meet our basic needs, and support children go to school while there is no assurance to continuity at all...”

Furthermore, respondent reveals that;

“...as beneficiaries we are not satisfied with the reformed system of retirement because what they receive is too small to accomplish all their goals and plans in life...”

Both findings obtained through questionnaires and interviews have revealed that the level of satisfaction of public servants and retirees with the reformed system of retirement benefits is very low. This is because public servants are not satisfied with customer care by PSSSF, they are not satisfied with the service delivered to members of PSSSF, they are not satisfied with the amount received as a pension lump sum after retirement, but also, they are not satisfied with the amount received monthly.

A study by Mgeni (2022) also found that public servants are not satisfied by the reformed system of retirement benefits. Many retirees complain a lot about the newly reformed system of retirement benefits. The problem becomes much more serious when a retiree goes to PSSSF to look for his or her retirement benefit and finds that if he/she was to use the old system he could get much money than the new retirement system. This is consistent with the findings of Mgeni's survey from 2022, which also showed considerable discontent. Public officials get confused and discouraged as a result of the frustration shown by many retirees, especially when comparing the benefits of the new system with the potentially larger sums from the previous system. This brings chaos to public servants and is very discouraging.

Mwakisisile and Larsson (2021) also found that retirees and public servants are not satisfied with the system of retirement benefits. Complaints from the public on this matter raised a lot of attention, which even included several meetings between the government and the workers union through TUCTA, despite the government promised to increase the percentage from 30% to 40%. Yet complaints from public servants and retirees, is still high it is light time now something to be done to rescue the situation.

Conclusion

Since public servants and retirees are not satisfied with the reformed system of retirement but also since the reformed system of retirement has negative socio-economic effects on public servants and retirees then it is very important to look again at this system.

Recommendations

It is recommended that the government should revise the system of retirement benefits, and for that matter, the older system that was replaced with be used to cater employee's needs. It is also recommended that PSSSF should always contact public dialogue to get employees suggestions instead of using only a few representatives.

Evaluate the Effect of Mobile Banking on Commercial Banks' Performance. A Case of Selected Commercial Banks in Dodoma Municipal

Saumu Ayoub Seiph¹ & Lilian Simon Mlay²

¹College of business education (CBE), Tanzania seiphsaum@gmail.com

²College of business education CBE- Dodoma campus, Dodoma Tanzania,

Abstract

This study evaluates the impact of mobile banking on the performance of selected commercial banks in Dodoma Municipal, Tanzania, focusing on its role in enhancing operational efficiency and customer convenience. Dodoma, as the capital city and a rapidly growing urban area, presents a unique setting for this investigation due to its increasing demand for banking services and the presence of various commercial banks. Utilizing a descriptive research design, the study employs a quantitative research approach to analyze the correlation between mobile banking practices and bank performance. A sample of 59 participants from various banking sectors, including branch managers, operations, sales, electronic banking, IT, and customer service departments, was surveyed through structured questionnaires. Data analysis was conducted using descriptive and inferential statistics with the Statistical Package for Social Sciences (SPSS) Version 26. The findings reveal a significant positive relationship between mobile banking and bank performance, highlighting operational streamlining, reduced paperwork, and improved resource allocation as key benefits. Additionally, the study emphasizes the importance of convenience in accessing banking services anytime and anywhere, reflecting the necessity for banks to adapt to evolving customer needs. Despite these advantages, the research indicates that challenges remain in reaching underserved populations, limiting the full potential of mobile banking to improve financial inclusion. Factors such as insufficient marketing, digital literacy barriers, and limited access to mobile technology hinder progress in this area. The study advocates for enhanced investment in mobile banking infrastructure, targeted outreach initiatives, and educational programs to foster digital literacy. Furthermore, it calls for regulatory bodies to establish a supportive framework that encourages innovation while ensuring consumer protection. Overall, this research underscores the need for continued advancements in mobile banking to drive financial performance and foster a more inclusive banking environment in Dodoma Municipal.

Key Words; *Mobile Banking, Commercial Banks', Performance and Dodoma Municipal.*

1. Introduction

Mobile banking refers to the use of mobile devices, such as smartphones and tablets, to access and manage financial services and transactions provided by banks (Lama et al., 2024). It allows customers to perform a range of activities, including checking account balances, transferring funds, paying bills, applying for loans, and making payments, all through dedicated mobile applications or mobile-optimized websites (Lama et al., 2024).

In developed countries, the advent of mobile banking has transformed the banking sector by improving operational efficiency and customer experience. In the United States, mobile banking adoption grew significantly between 2017 and 2021. A report by Statista (2021) revealed that over 80% of Americans were using mobile banking by 2021, up from 62% in 2017. Banks such as JPMorgan Chase experienced a 30% increase in digital transactions between 2015 and 2020, contributing to a reduction in operational costs and improved profitability. United Kingdom, a report by the Financial Conduct Authority (FCA, 2020) showed that banks like Barclays Bank experienced a 40% increase in mobile transactions between 2018 and 2020, alongside a 25% reduction in branch visits. The shift to digital banking allowed Barclays to cut physical infrastructure costs while maintaining a strong customer base. In these countries, mobile banking has not only reduced operational costs but also increased customer satisfaction, enabling banks to serve a broader market more efficiently. However, continuous innovation and management of cybersecurity threats remain essential challenges.

In developing countries, mobile banking has had a profound impact on the banking sector, particularly in terms of financial inclusion and cost efficiency. Kenya provides a prominent example, with the success of M-Pesa, launched by Safaricom. By 2019, M-Pesa was used by over 85% of Kenya's adult population, allowing banks such as Kenya Commercial Bank (KCB) to increase their customer base through partnerships with mobile money platforms. A World Bank (2018) report noted that KCB experienced a 20% revenue increase from mobile banking services between 2017 and 2019. Despite this growth, Kenyan banks faced challenges from mobile money providers, which reduced profit margins. In Nigeria, mobile banking adoption accelerated in 2018, with leading banks like First Bank of Nigeria and Access Bank driving mobile transactions. According to the Central Bank of Nigeria (2019), mobile banking accounted for 22% of all banking transactions, contributing to revenue growth and cost reductions. However, issues related to rural internet connectivity limited its potential.

In Tanzania, mobile banking has transformed the financial landscape, particularly through the integration of mobile money platforms such as M-Pesa, Airtel Money, and Tigo Pesa. These platforms have allowed commercial banks to extend mobile banking services, improving their performance in terms of cost reduction and customer outreach. CRDB Bank serves as a prime example, with mobile banking transactions growing by 35% between 2018 and 2020, according to a report by the Bank of Tanzania (2021). CRDB's partnerships with mobile money providers have enabled the bank to expand its customer base while reducing transaction processing costs by 28%.

Similarly, NMB Bank has seen mobile banking become an integral part of its operations, accounting for 40% of total transactions in 2020. The Tanzania Communications Regulatory Authority (TCRA, 2020) reported that NMB Bank used mobile banking to extend financial services to rural populations, contributing to greater financial inclusion. Despite these successes, challenges related to mobile network infrastructure and customer awareness continue to affect the full realization of mobile banking's potential.

In Dodoma Municipal, mobile banking has reshaped the operations of commercial banks such as CRDB Bank and NMB Bank, providing new opportunities for growth while presenting challenges related to infrastructure and security. Both banks have reported significant reductions in operational costs due to mobile banking between 2018 and 2021, with mobile transactions accounting for a large portion of their total transactions. The World Bank's Global Findex Report (2021), emphasize that mobile banking plays a crucial role in enhancing financial inclusion and reducing operational costs, trends that are evident in Dodoma. The Bank of Tanzania (2021) also highlighted the role of mobile banking in expanding access to financial services in rural areas of Dodoma, where physical branches are scarce.

This study focuses on analyzing the specific impact of mobile banking on the performance of commercial banks in Dodoma Municipal, using performance metrics such as transaction volumes, operational costs, and customer outreach.

2. Literature Review

According to Mutua (2024) conducted study focusing on the Mobile banking and financial performance of commercial banks in Kenya. Using a desktop research approach, the study found that mobile banking enhances bank efficiency, profitability, and competitiveness by streamlining processes and reducing costs. However, challenges such as regulatory constraints, cybersecurity risks, and technological limitations hinder smooth adoption. The study concluded that while mobile banking is essential for improving financial performance, addressing these challenges through regulatory improvements, digital infrastructure investment, and financial literacy is necessary. Further research on mobile banking's long-term impact on financial inclusion and economic growth was also recommended.

According to Korir et al., (2023) conducted study focusing on the Mobile Banking Services, Risk Management, Firm Characteristics, and Performance of Commercial Banks in Kenya. It found that mobile banking services, such as account-to-account transfers and mobile money, significantly improve bank performance, especially when accompanied by effective risk management practices like addressing liquidity risks. While firm characteristics, such as size, did not significantly influence this relationship, the combined effect of mobile banking, risk management, and firm characteristics was found to be substantial in enhancing bank performance. The study concluded that integrating mobile banking with robust risk management strategies is crucial for maximizing

its benefits and recommended that regulators enforce strict risk management protocols to support smooth mobile banking operations.

According to Njiru et al., (2024) conducted study focusing on the branchless Banking and Financial Performance of Commercial Banks in Kenya. A correlation research design was employed, utilizing secondary data from 39 commercial banks between 2012 and 2020. Regression analysis revealed that branchless banking, particularly mobile and ATM banking, significantly improves bank performance, with financial deepening acting as a mediating factor. Regulations also played a critical moderating role, ensuring the stability of these services. The study concluded that branchless banking positively impacts bank performance and recommended further expansion of mobile and ATM banking services, enhanced financial deepening, and stronger regulatory oversight to maintain stability and innovation.

3.0 Methodology

3.1 Area of the Study

This study was conducted in Dodoma Municipal, the capital city of Tanzania and one of the fastest-growing urban areas in the country. There are three strong reasons for choosing Dodoma Municipal as the study area. First, Dodoma is experiencing rapid urbanization and economic growth, which has led to an increased demand for banking services, including mobile banking, making it an ideal location to examine its impact on bank performance. Second, the presence of numerous commercial banks in Dodoma allows for a diverse sample, providing a more comprehensive analysis of mobile banking's influence on the financial performance of these institutions. Lastly, Dodoma's strategic position as the administrative capital means that banks here serve a mix of both government and private sector clients, offering a unique opportunity to assess the effects of mobile banking in a dynamic and evolving banking environment.

3.2 Research Design

Study design refers to the systematic and structured plan or strategy formulated by researchers to guide the execution of a scientific investigation. The research employs a descriptive research design, chosen for its emphasis on providing a detailed and comprehensive account of a phenomenon or situation. This design is particularly valuable when the goal is to explore, measure, and characterize variables. Descriptive research lays the foundation for more in-depth studies and offers valuable insights for decision-making and policy formulation (Mahat et al, 2024).

3.3 Research Approach

Research approaches, according to Dubey et a., (2022) encompass the plans and procedures guiding research from broad assumptions to detailed methods of data collection, analysis, and interpretation. For this study, the quantitative research approach was selected. In order to project

results to a larger population, this strategy entails assessing the research topic to identify its prevalence.

3.4 Targeted Population

The population of the study is the total aggregation of elements sharing common characteristics that form the subject of the study (Dehalwar et al., 2023). It represents the entire group to which the study's findings are intended to be generalized. In the context of this study, the populations of this study were 70 as described in table 3.5 below:

Table 3.19: Distribution of Population

	NMB	CRDB	NBC	Total population	Sample size
Branch Manager	1	1	1	3	3
Operation Manager	4	4	3	11	8
Sales and Marketing Departments	13	11	12	36	28
Electronic banking department	11	9	8	28	22
Information technology department	6	4	3	13	10
Customer services	7	6	4	17	14
Total	42	35	31	108	85

Source: Researcher (2024)

3.5 Sample Size and Sampling Techniques

3.5.1 Sample size

In this study, sample size was 85 the researcher employs the Yamane formula to ascertain the suitable sample size from the overall population where by

$$n = \frac{N}{1 + N(e)^2}$$

n = Sample Size,

N= Total Number of Population,

95% confidence level

e = Sampling error in this study researcher use 0.05 sampling error

$$n = 108 (1+108(0.05)^2)$$

$$n = 85$$

3.5.2 Sampling strategies

According to Smith (2020), sampling procedures encompass the explicit methodologies employed by researchers to select a subset from a larger population, emphasizing a systematic approach to sampling. The chosen method for this study is Simple Random Sampling, A method that ensures every individual in a population has an equal chance of being chosen as a sample, simple random sampling is known for its straightforwardness and fairness. This technique minimizes bias by giving each person an equal opportunity to be included in the sample. Its simplicity aims to create a sample that accurately represents the population, leading to dependable outcomes for the research.

3.6 Data Collection Methods

This study employs a dual methodology, combining primary and secondary data collection methods to gather a comprehensive range of information. A questionnaire is a tool used in research to collect data and information from participants, typically through a series of questions. This method is widely utilized in research studies, surveys, and social science inquiries. The questionnaire planned for this study was structured, containing closed-ended questions with pre-defined response options, including Likert scale ratings. A documentary review entails examining and combining information from diverse sources like books, academic papers, official reports, and online resources. This approach is cost-efficient since it utilizes existing data collected by others (Muguro et al., 2024).

3.7 Data Analysis Methods

The study employs descriptive statistics in data analysis, which involves summarizing and describing key features of the dataset. This includes measures of central tendency such as mean, median, and mode, as well as measures of variability like range and standard deviation. Additionally, inferential statistics was used to make predictions or inferences about a larger population based on the sample data, utilizing techniques like regression analysis. The Statistical Package for Social Sciences (SPSS) Version 26 was utilized for data analysis, encompassing both descriptive statistics focusing on means and measures of variation, and inferential statistics including multiple linear regression analysis. The selection of these analysis methods is driven by the research objectives, the type of data collected, and the specific research questions. Combining descriptive and inferential statistics allows for a comprehensive examination of the dataset,

providing a clear snapshot of the data with descriptive statistics and enabling deeper insights, predictions, and hypothesis testing with inferential statistics (Hamed et al, 2020).

3.8 Ethical Considerations

The researcher upheld high ethical standards throughout the study by treating participants with respect and dignity, being mindful of cultural differences, and fostering an inclusive environment. Transparency was maintained with clear explanations of research methods and objectives, and participants were informed about any potential conflicts of interest. Participation was strictly voluntary, with participants able to withdraw at any time without negative consequences. Confidentiality was ensured through secure data storage and anonymization of personal information. Informed consent was obtained by providing detailed information about the study and addressing any questions. The researcher also promoted non-discrimination, ensuring fair and equal treatment for all participants, especially those from underrepresented groups (Iphofen, 2020).

4.0 Findings

4.1 Presentation of findings

4.1.1 Response rate

Questionnaires were distributed to 85 respondents, while 81 responses were received, achieving a high response rate of 95.29% and 4 responses were not received. This rate was considered adequate for the researcher to proceed with compiling the report.

Table 4.1: Response Rate

Category	Frequency	Percentage
Questionnaires distributed and returned	81	95.29
No response	4	4.71
Total	85	100

Source: Survey data (2024) Source: Field data (2024)

4.1.2 Socio - demographic characteristics

Socio-demographic characteristics involves the social and demographic attributes of a study's participants, such as age, gender, education level, occupation, and Position. These characteristics help researchers understand the composition of the sample and identify any patterns or

relationships between these attributes and the variables being studied. Analyzing socio-demographic data is important for interpreting results, as it can reveal how different population groups may be affected by or respond to various factors in the research.

Table 4.2: Socio - demographic characteristics (n=81)

Variables	Categories	Frequency	Percentage
Gender	Male	44	54.3
	Female	37	45.7
	Total	81	100.0
Age	Between 18-30 years	24	29.6
	Between 31-40 years	24	29.6
	Between 41-50 years	24	29.6
	51 Years and above	9	11.1
	Total	81	100.0
Education Qualification	Certificate	10	12.3
	Diploma	13	16.0
	Higher Diploma	16	19.8
	Degree	27	33.3
	Post Graduate	15	18.5
	Total	81	100.0

Source: Survey Data (2024)

Table 4.2 illustrates the socio-demographic characteristics of the study participants (n=81), focusing solely on the percentage distribution across gender, age, education qualification, and marital status. This analysis provides a clear understanding of the sample's composition and diversity.

Gender

The sample is slightly skewed towards males, who represent 54.3% of the participants, compared to 45.7% females. This near-equal distribution ensures a balanced perspective on gender-related dynamics within the study.

Age

The age distribution is notably even, with each of the three primary age groups—18-30 years, 31-40 years, and 41-50 years—each comprising 29.6% of the sample. This suggests that the study encompasses a wide age range, with a significant representation from young adults to those approaching middle age. The smaller proportion of participants aged 51 years and above (11.1%) highlights a lesser focus on older individuals.

Education Qualification

The educational background of the participants shows a high level of attainment. The largest group, 33.3%, holds a degree, followed by those with a higher diploma (19.8%) and post-graduate qualifications (18.5%). This indicates a well-educated sample with a robust representation of individuals possessing advanced qualifications. The relatively lower percentages for certificates (12.3%) and diplomas (16.0%) reflect a smaller but still significant portion of the sample with foundational qualifications.

Overall, the socio-demographic characteristics illustrate a diverse and well-rounded sample, providing valuable insights into the participants' gender, age, education, and marital status. This comprehensive profile is essential for understanding the context and potential influences on the study's findings.

4.1.3 Descriptive analysis

Descriptive analysis is a method used to summarize and organize data in a meaningful way, providing a clear picture of patterns and trends within a dataset. It involves calculating basic statistical measures such as frequencies, percentages, means, and standard deviations to describe the characteristics of the variables in a study. Descriptive analysis helps to present the data in an understandable format, allowing researchers to identify general trends, relationships, and potential areas for further investigation without making any inferences about the population beyond the sample.

4.1.3.1 Evaluate the effect of mobile banking on commercial banks' performance

4.2.3.2 Effect of mobile banking on commercial banks' performance

Table 4.4 Effect of mobile banking on commercial banks' performance

Statements	5 Likert Scale Responses	Frequency	Percent	Mean \pm SD
------------	--------------------------	-----------	---------	---------------

Mobile banking enhances operational efficiency by reducing paperwork and manual processes.	Strong Disagree	1	1.2	3.53 ± .923

	<i>Total</i>	<i>81</i>	<i>100.0</i>	
<i>Overall Mean Score</i>				<i>3.248 ± 1.074</i>

Source: Survey data (2024)

The table 4.4 presents an analysis of the effect of mobile banking on commercial banks' performance, revealing a generally positive perception. For the statement "Mobile banking enhances operational efficiency by reducing paperwork and manual processes," the mean score of 3.53 ± 0.923 indicates a strong level of agreement (48.1% agreeing and 11.1% strongly agreeing) that mobile banking improves operational efficiency. This suggests that respondents see mobile banking as effective in streamlining processes, though there are some neutral and dissenting opinions. Similarly, the statement "Mobile banking offers convenient access to banking services anytime, anywhere" has a mean score of 3.47 ± 1.195 , reflecting a positive view of convenience, with 30.9% agreeing and 23.5% strongly agreeing. However, the wide standard deviation indicates diverse opinions on the extent of convenience offered.

On the other hand, perceptions of mobile banking's impact on financial inclusion and accessibility are more mixed. The statement "The introduction of mobile banking enhances the accessibility of financial services for underserved populations" received a mean score of 2.89 ± 1.012 , indicating a more neutral stance with a notable percentage of respondents disagreeing (37.0%). Similarly, "Mobile banking fosters financial inclusion by reaching remote and rural areas" has a mean score

of 3.01 ± 0.733 , showing moderate agreement but also significant neutrality. The statement about faster and more efficient fund transfers received a mean score of 3.16 ± 1.418 , reflecting some level of agreement but with a considerable number of strong disagreements. The overall mean score of 3.248 ± 1.074 suggests a generally favorable view of mobile banking's impact on operational efficiency and cost reduction, though opinions on its role in enhancing financial inclusion and convenience are more varied.

4.1.4 Regression analysis

Table 4.4 Coefficients of the variables

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	.680	.491		1.387	.172	1.668	.307
	Mobile banking enhances operational efficiency by reducing paperwork and manual processes.	.661	.188	.454	3.516	.001	.283	1.039
	Mobile banking offers convenient access to banking services anytime, anywhere.	.444	.117	.402	3.784	.000	.208	.681
	The introduction of mobile banking enhances the accessibility of financial services for underserved populations.	.076	.150	.061	.504	.616	.226	.377
a. Dependent Variable: Bank Performance								

Source; Field Data (2024).

Table 4.4 presents the coefficients for the variables used to evaluate the effect of mobile banking on the performance of selected commercial banks in Dodoma Municipal. The unstandardized coefficients show the impact of each independent variable on bank performance, while the standardized coefficients (Beta) reflect their relative importance. Mobile banking's ability to enhance operational efficiency by reducing paperwork and manual processes has a significant positive impact on bank performance, with a Beta value of 0.454 and a t-value of 3.516 ($p = 0.001$), indicating a strong and significant effect. Similarly, mobile banking's provision of convenient access to banking services anytime and anywhere also has a significant positive impact, with a Beta value of 0.402 and a t-value of 3.784 ($p < 0.001$), underscoring the critical role of convenience in improving bank performance. However, the introduction of mobile banking to enhance accessibility for underserved populations has an insignificant effect, with a Beta value of 0.061 and a p-value of 0.616, suggesting that this particular aspect of mobile banking has not yet significantly influenced bank performance in this context. Overall, the analysis highlights that operational efficiency and service convenience are key drivers of improved bank performance due to mobile banking.

Table 4.5: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.788 ^a	.621	.597	.834

Source; Field Data (2024).

Table 4.5 provides a summary of the regression model used to assess the impact of mobile banking on the performance of selected commercial banks in Dodoma Municipal. The correlation coefficient (R) of 0.788 indicates a strong positive relationship between the independent variables and bank performance, suggesting that as mobile banking services improve, so does bank performance. The R Square value of 0.621 signifies that approximately 62.1% of the variance in bank performance can be explained by the model, which is a substantial proportion, indicating that mobile banking is a significant contributor to financial outcomes. The adjusted R Square of 0.597 further refines this estimate by accounting for the number of predictors in the model, confirming that the independent variables still explain a meaningful portion of the variance. Finally, the standard error of the estimate (0.834) provides insight into the accuracy of the predictions made by the model, with lower values indicating better precision. Overall, this model summary demonstrates that mobile banking services have a considerable effect on the performance of commercial banks, highlighting its relevance in the banking sector.

Table 4.6: ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	53.640	3	17.880	25.688	.000 ^b
	Residual	32.713	81	.696		
	Total	86.353	84			

Source; Field Data (2024).

Table 4.6 presents the ANOVA (Analysis of Variance) results for the regression model assessing the impact of mobile banking on the performance of selected commercial banks in Dodoma Municipal. The regression sum of squares is 53.640, indicating the variability in bank performance that can be explained by the independent variables included in the model. The residual sum of squares is 32.713, representing the variability that is not explained by the model. With a total sum of squares of 86.353, the F-statistic calculated is 25.688, which is a measure of how well the model explains the data compared to the variance within the data itself. The significance value (Sig.) of .000 indicates that the model is statistically significant, meaning that there is a very low probability that the observed relationship occurred by chance. Therefore, this ANOVA result suggests that mobile banking services significantly contribute to variations in the performance of commercial banks, confirming the effectiveness of the model used in the study.

5.0 Discussions

5.1 Evaluate the Effect of Mobile Banking on Commercial Banks' Performance

The findings from the analysis reveal a clear and positive correlation between mobile banking and the performance of selected commercial banks in Dodoma Municipal. The results emphasize that mobile banking significantly enhances operational efficiency by minimizing paperwork and reducing manual processes. This operational streamlining is crucial for banks aiming to improve their performance, as it allows them to serve customers more effectively and allocate resources more efficiently. The significant majority of respondents who believe in the efficiency benefits of mobile banking further supports the notion that modern banking practices are integral to fostering a productive banking environment. Additionally, the convenience of accessing banking services anytime and anywhere has been recognized as another key factor contributing to improved bank performance, reinforcing the importance of adapting to customer needs in a fast-paced digital world.

Despite the positive findings, the analysis indicates that enhancing accessibility for underserved populations has not yet made a significant impact on bank performance. This suggests that while mobile banking holds the potential to improve financial inclusion, there may be barriers that need to be addressed before this potential can be fully realized. These barriers could include insufficient marketing efforts to reach these populations, lack of digital literacy, or limited access to mobile

technology in certain areas. Furthermore, the perception of mobile banking as a cost-reducing measure aligns with the growing trend of digital banking, which is increasingly viewed as a sustainable approach to managing operational costs. Overall, the findings highlight the multifaceted benefits of mobile banking, suggesting that while strides have been made in enhancing efficiency and convenience, additional efforts are required to ensure that the advantages of mobile banking are equitably distributed across all segments of the population.

6. Conclusions

In conclusion, this study underscores the significant impact of mobile banking on the performance of commercial banks in Dodoma Municipal, highlighting its vital role in enhancing operational efficiency and convenience for customers. The positive correlation between mobile banking practices and overall bank performance suggests that adopting modern banking solutions is essential for financial institutions to remain competitive in an increasingly digital and dynamic financial landscape. Furthermore, the convenience of accessing banking services anytime and anywhere has emerged as a critical factor, reinforcing the need for banks to adapt to changing customer preferences and behaviors in a fast-paced world. However, while mobile banking shows great promise for improving financial inclusion, notable challenges remain in effectively reaching underserved populations. These barriers could include issues related to digital literacy, limited access to mobile technology, and insufficient marketing efforts tailored to these communities. Addressing these obstacles is crucial for realizing the full potential of mobile banking as a tool for financial empowerment and social inclusion. Overall, the findings advocate for continued investment in mobile banking infrastructure, along with comprehensive outreach initiatives aimed at educating and engaging all segments of the population.

7. Recommendations

To enhance the positive impact of mobile banking on commercial banks' performance in Dodoma Municipal, it is recommended that commercial banks prioritize the expansion of their mobile banking services. This involves not only increasing the range of services offered through mobile platforms but also ensuring that these services are user-friendly and accessible to all customer segments. Banks should invest in developing intuitive mobile applications and platforms that cater to varying levels of digital literacy, ensuring that customers can easily navigate and utilize these services. Additionally, providing adequate customer support through various channels can enhance user experience and encourage more clients to adopt mobile banking.

Furthermore, banks should actively engage in targeted marketing campaigns aimed at raising awareness about the benefits of mobile banking, particularly among underserved populations. This could involve partnerships with local organizations, community leaders, and influencers to reach potential customers effectively. Educational initiatives, such as workshops and seminars, can also play a crucial role in improving digital literacy, ensuring that more individuals are comfortable using mobile banking services. By emphasizing the convenience, accessibility, and security of

mobile banking, banks can cultivate trust and increase customer adoption rates, ultimately driving better financial performance.

Lastly, it is essential for regulatory bodies to create a supportive framework that fosters the growth of mobile banking while ensuring consumer protection. Regulations should be designed to encourage innovation in mobile banking services while maintaining oversight to safeguard against fraud and security breaches. Collaboration between banks and regulators is crucial to developing policies that promote financial inclusion, allowing banks to implement best practices in service delivery. By nurturing an environment that encourages innovation and addresses regulatory challenges, the potential of mobile banking to enhance the financial performance of commercial banks in Dodoma Municipal can be fully realized, contributing to a more robust and inclusive financial ecosystem.

Abstract

The study aimed to examine the relationship between financial capability and quality service delivery in PSSSF in Dodoma, Tanzania. The independent variables measured were budget allocation, financial resources, funding sources, financial management practices and investment in service. For this study, the Theory of Planned Behavior (TPB) provides a robust framework to understand the relationship between financial capability and quality service delivery at PSSSF in Dodoma. The research utilized a cross-sectional research design, enabling the collection of data from 201 employees in a single snapshot, simultaneously, at a specific moment in time. Data collection was accomplished through a questionnaire surveys. Data analysis was carried out employing multiple linear regression analysis. Results revealed significant associations between variables. The findings indicate that the overall mean score for quality service delivery at PSSSF is 3.20896, suggesting a moderate level of service delivery. The R Square value of 0.546 implies that approximately 54.6% of the variability in quality service delivery is explained by budget allocation, financial resources, funding sources, financial management practices, and investment in service. The standardized coefficients (Beta) highlight that budget allocation has the greatest impact on service quality (Beta = 0.538, $p < .001$), followed by investment in service (Beta = 0.182, $p < .001$), financial resources (Beta = 0.153, $p = .009$), and funding sources (Beta = 0.158, $p = .028$). Although financial management practices have a smaller Beta (0.198), their impact is still statistically significant ($p < .001$). The ANOVA results confirm a significant relationship ($p < .001$) between these financial factors and service quality, with an F-statistic of 46.840 indicating that the model's explained variance is considerably greater than the unexplained variance. These results underscore the critical role of financial management in enhancing service quality at PSSSF. Henceforth, Human resources departments can integrate financial literacy initiatives into employee development plans to empower staff with the skills needed to navigate financial challenges effectively. Additionally, policymakers and regulators should consider these results when formulating regulations and policies to ensure adequate financial resources and support systems are in place to sustainably improve service delivery standards.

Key words: *Financial Capability, Quality Service Delivery, Budget Allocation, Financial Resources, Funding Sources, Financial Management Practices, Investment in Service.*

1.0 Introduction

Quality service delivery in public organizations is critical for satisfying citizens' needs and expectations, fostering trust, and supporting socio-economic development (Kaibung et al., 2017). Timeliness refers to the promptness with which services delivered, ensuring that citizens receive services when needed without undue delay, which is essential for maintaining public trust and satisfaction (Alford & Yates, 2021). Efficiency involves using resources optimally to achieve desired outcomes, minimizing waste and enhancing value for taxpayers (Smith & Walker, 2022). Client satisfaction measures how well services meet users' expectations, impacting public perception and the perceived legitimacy of public organizations (Brown et al., 2023). Service accessibility indicates the ease with which all citizens, regardless of location or socio-economic status, can obtain services, promoting inclusiveness and equity (Jones et al., 2021). Finally, service affordability ensures that the costs of services are reasonable and do not pose a financial burden on citizens, thus enhancing the overall effectiveness and reach of public service delivery (Green & Miller, 2023). These indicators collectively provide a comprehensive framework for assessing and improving the quality-of-service delivery in public organizations.

In the absence of quality service delivery, individuals are likely to abandon offices or service providers, seeking alternatives that can meet their needs more effectively. This tendency can lead to a staff turnover, diminishing the productivity and organization performance (Rasul and Rogger, 2018). Consequently, with fewer clients or service users, the office's capacity to sustain itself and operate efficiently diminishes, leading to a deterioration in services provided (World Bank, 2019). This downward spiral not only affects the office's reputation and credibility but also undermines its ability to attract new clients or retain existing ones (Bardhan and Mookherjee, 2019).

Moreover, the decline in service quality can ripple through the community, impacting productivity and economic output as individuals and businesses struggle to access essential services or support (Angrist et al., 2020). Overall, the consequences of poor service delivery extend beyond immediate dissatisfaction, resulting in a broader decline in organizational performance, community well-being, and socio-economic development taxpayers (Smith & Walker, 2022).

Financial capability, defined as the capacity to manage and utilize financial resources effectively, emerges as a pivotal factor influencing quality service delivery in public organizations (Ombati et al., 2021). It encompasses budget allocation, financial resources, funding sources, financial management practices and investment in service (Gladys, 2021). Organizations with robust financial resources can invest in technology, training and resources to enhance service quality (Brown et al., 2023).

Studies worldwide have consistently demonstrated a positive association between dimensions of financial capability, including budget allocation, financial resources, funding sources, financial management practice and investment in service and service delivery outcomes (Einarsen et al., 2019; Ongena and Ravesteyn, 2020). These dimensions collectively emphasize the importance of adequate financial resources in improving service quality across different sectors and organizational settings. For instance, research by Lebron et al. (2019) on corporate performance in the United States, Choon, and Lee (2019) on service delivery outcomes in Malaysia corroborate the significance of financial capability in enhancing service quality.

Furthermore, studies by Akintayo and Babalola (2017) in Nigeria and Choge et al. (2019) in Kenya highlight similar findings within the African context, underscoring the universal relevance of financial capability in driving service delivery improvements. Consequently, by facilitating the delivery of high-quality services, financial capability not only contributes to the satisfaction of service users but also plays a pivotal role in fostering socio-economic development and enhancing the overall well-being of the population (Gladys, 2021).

In Tanzania, research underscores the pivotal role of strong financial capability in enhancing the performance of public organizations, a trend seen across Africa (Wambura, 2019; Shoo, 2021). Studies by Towo et al. (2019) highlight that larger microfinance institutions (MFIs) in Tanzania exhibit superior financial performance, which translates into improved service delivery for beneficiaries. Additionally, Mulyungi (2020) notes that robust financial management practices in Tanzanian public institutions lead to increased efficiency and effectiveness in service provision. Similarly, Nyamsogoro et al. (2021) found that enhanced financial capability in public sector organizations contributes significantly to better resource allocation and overall organizational performance. These findings are echoed by Kibiki et al. (2022), who assert that financial capability directly impacts the quality and timeliness of services delivered to the public. Collectively, these studies indicate that fostering financial capability is crucial for optimizing performance and ensuring effective service delivery within Tanzanian public organizations. Acknowledging this relationship, the Tanzanian Government has initiated various measures to enhance performance in public organizations, including public sector reforms and the consolidation of social security funds, notably amalgamating multiple funds into the Public Service Social Security Fund (PSSSF) (URT, 2019). Comprehensive reforms across public institutions, including PSSSF, involve strategies such as the establishment of Client Service Charters, conducting Service Delivery Surveys, implementing Self-Assessments, formulating Strategic Plans, and adopting Mid-Term Expenditure Frameworks. These efforts, reinforced by robust Monitoring and Evaluation systems, aim to elevate service delivery standards (URT, 2019). Additionally, mechanisms like the Open Performance Review Appraisal System (OPRAS), the Complaint Handling Mechanism (CHM), and Performance Improvement initiatives further contribute to enhancing service quality and responsiveness at PSSSF. These initiatives, combined with investments in infrastructure, capacity building, regulatory adjustments and enhancements in customer service, are designed to bolster

and support the financial capability of PSSSF while also enhancing quality of its services to the customer (URT, 2022).

Despite the aforementioned efforts, PSSSF faces significant challenges in service delivery, such as long waiting times and poor customer service, raising doubts about the effectiveness of its financial capability (URT, 2022). Employee turnover, estimated at 5%, also questions its impact on service delivery (URT, 2022). If these issues persist, public trust in PSSSF could erode, leading to legal consequences and lower service quality for beneficiaries. Beyond these, social security funds in Tanzania face broader challenges. Uncoordinated management and lack of harmonization among different funds often lead to inefficiencies and overlap in services (URT, 2022). Inadequate funding and resource allocation hamper the ability of these funds to meet their obligations consistently (Mbogoro, 2021). Additionally, outdated technological infrastructure and insufficient data management systems hinder the smooth operation and responsiveness of these funds (Komba, 2020). Governance and accountability issues further complicate the situation, as seen in irregularities and corruption cases reported in various funds (Julius, 2021). Likewise, these challenges are similar to other social security funds in Tanzania, such as the National Social Security Fund (NSSF) where similar issues of inadequate funding, poor customer service, and inefficiencies due to lack of coordination are also prevalent (NSSF, 2020). Both PSSSF and other funds like NSSF struggle with ensuring timely and effective service delivery, highlighting a systemic problem within the country's social protection framework. These issues collectively impact the overall effectiveness and reliability of social security funds in Tanzania, necessitating comprehensive reforms and strategic interventions to enhance performance and service delivery (URT, 2022).

Nonetheless, previous research in Tanzania has primarily focused on variables including space, market share, asset value (Moshi, 2020; Mwansa Kamukwamba, 2017), and the relationship between financial capability and employee retention, employee performance and satisfaction. While, similarly studies by Wambura (2019) and Shoo (2021), have explored the impact of organizational size on employee retention in the social security fund. Thus, there is inadequate of studies focusing on financial capability and quality service delivery, particularly within institutions like PSSSF in Dodoma Region. It aims to provide valuable insights that can inform strategic financial planning and management practices, ultimately enhancing the quality and efficiency of public services in Tanzania. A study on financial capability and service quality is important for ensuring satisfaction to the beneficiaries of the social fund protection. Also, this study provide a deeper understanding to policy and decision makers on budget allocations. Likewise, this study assesses the influence between financial capability and quality service delivery in Tanzanian public organizations, drawing experience in PSSSF in Dodoma Region.

The rationale for this study is to explore the impact of financial capability on quality service delivery in public organizations, particularly focusing on the PSSSF in Dodoma. This investigation

addresses a significant research gap by examining the intricate relationship between financial resources, management practices and service outcomes. Also, financial capability affects transparency and accountability in public sector operations. By studying this relationship, the study can shed light on the mechanisms that ensure funds are used effectively and transparently. Effective financial management can directly impact the quality-of-service delivery. By focusing on PSSSF in the Dodoma region, this study can pinpoint areas where improved financial capability leads to better service outcomes. This region-specific focus ensures that the findings are tailored to the local context, even if they may not be generalizable to other regions or organizations. Such specificity aids in developing targeted interventions and policies that address local needs effectively. Financial capability significantly influences overall organizational performance. The study will examine how financial practices contribute to or hinder performance metrics such as efficiency, effectiveness, and responsiveness. The insights gained from this study can guide strategic planning within PSSSF and similar organizations, highlighting areas where financial investments have the most substantial impact on service delivery.

2.0 Literature Review

2.1 Theoretical Literature Review

For this study, the Theory of Planned Behavior (TPB) provides a robust framework to understand the relationship between financial capability and quality service delivery at PSSSF in Dodoma. Developed by Icek Ajzen in 1991, TPB is rooted in the theory of reasoned action and aims to predict human behavior by considering individuals' attitudes, subjective norms, and perceived behavioral control (Ajzen, 1991). The theory posits that intentions to perform a behavior (in this case, delivering quality services) are influenced by attitudes toward the behavior, subjective norms (perceptions of others' approval or disapproval), and perceived behavioral control (perceptions of ease or difficulty in performing the behavior).

TPB's main assumptions include the idea that individuals are rational decision-makers who consider the consequences of their actions and that behavior is influenced by both internal beliefs and external factors (Ajzen, 1991). Its strengths lie in its ability to systematically integrate cognitive factors that influence behavior, offering a structured approach to understanding and predicting complex behaviors. By focusing on attitudes, norms, and perceived control, TPB provides a comprehensive framework for exploring how financial capabilities, such as budget allocation and financial management practices, influence employees' intentions and behaviors related to service delivery.

However, TPB also has limitations. It assumes that intentions accurately predict behavior, which may not always be the case in practice due to external factors or unforeseen circumstances. Additionally, the theory may oversimplify the complexity of human behavior by not fully accounting for situational or contextual influences that could impact service delivery outcomes.

Despite these weaknesses, TPB remains relevant in this study by offering a theoretical lens to examine how financial capabilities influence employees' intentions to deliver quality services at PSSSF in Dodoma. By identifying key attitudinal and control factors, the theory can inform strategies to enhance service delivery effectiveness through improved financial practices and management within the organization (Ajzen, 1991; Armitage & Conner, 2001).

2.2 Empirical Literature Review

Hamdan et al. (2019) conducted a study on the impact of financial resources capability on the provision of decentralized services in chosen counties in Kenya. Their primary objective was to investigate how financial resources influence the delivery of decentralized services in selected Kenyan counties. The study, grounded in the Resource-Based View Theory, employed a mixed research design, combining a positivist approach. Data collected through structured and open-ended questionnaires from 384 randomly selected employees across eight counties. Regression analysis results revealed a statistically significant and positive impact of financial resources on decentralized service delivery. The study concluded that financial resources play a critical role in driving projects within counties. However, it also highlighted the need for a balanced approach, noting that without effective mechanisms for deployment, financial resources alone might not lead to progress. Thus, the study recommended that County Governments should provide both financial resources and organizational support to enhance the delivery of county services.

M'nyiri (2018) conducted a study examining the effect of financial capability on service delivery in public health facilities in Nakuru East Sub-County. The research utilized a descriptive survey design and involved 211 finance and management staff from the mentioned facilities as the study population. A sample of 68 respondents selected using purposeful and stratified random sampling techniques. Data collected through a structured questionnaire, which was pilot-tested for validity and reliability. Descriptive and inferential analyses conducted using the Statistical Package for Social Sciences Version 24. The study found a positive, moderately strong, and statistically significant relationship between financial accountability and service delivery. Specifically, the financial management practice under study explained 39.9% of the variance in service delivery. The study concluded that financial accountability significantly influences the delivery of health services. Public health facilities advised to implement effective and reliable accountability mechanisms, financial controls, internal controls and audit trails to improve service delivery.

Piatti-Fünfkirchen and Schneider (2018) conducted a study examining the Role of Public Financial Capability and Management in Health Service Delivery in Tanzania and Zambia. The article emphasizes the significant impact of how organizations manage resources throughout the budget cycle on health policy outcomes and the achievement of societal objectives, including efficiency, equity, quality and accountability in Government services. While previous research has shown a positive correlation between health service delivery outcome and effective public financial management, the precise mechanisms by which public financial management influences service

delivery have not been thoroughly explored. This article addresses this gap by mapping the three stages of the budget cycle to commonly used performance criteria in health service delivery and applying this framework to the experiences of Tanzania and Zambia. The findings reveal several challenges, including inflexibility in responding to unexpected demand for healthcare, misalignment between budgeting and planning, fragmented funding sources, stringent internal controls, inadequate budget allocation resulting in arrears and a budget evaluation system overly focused on compliance, while overlooking issues of equity, quality, and efficiency in service delivery.

In the Tanzanian context, empirical studies have primarily focused on examining challenges facing service delivery in the public sector, as highlighted by Wambura (2019) and Shoo (2021). However, there has been a notable gap in research regarding the influence of financial capability (budget allocation, financial resources, funding sources, financial management practices, and investment in service) on quality service delivery, leaving an empirical void. Therefore, there is a pressing need for additional studies that encompass a broader geographic range to develop a more comprehensive understanding of how financial capability impacts service delivery outcomes. By addressing this gap, researchers can contribute to the advancement of knowledge in this critical area and provide valuable insights for policymakers and practitioners aiming to enhance service delivery in Tanzania.

3.0 Methodology

3.1 Research Design and Setting

The study was conducted at the Public Service Social Security Fund (PSSSF) office in Dodoma, Tanzania, using a cross-sectional design. This site was strategically selected due to Dodoma's status as the capital city and administrative hub, which enhances the relevance and generalizability of findings related to financial capability and service delivery. Dodoma has seen a significant increase in public service activities and infrastructure development, making it an ideal setting for this study (NBS, 2022). According to recent statistics, the PSSSF in Dodoma serves a large proportion of public service employees, with over 50,000 registered members (PSSSF, 2023). This high concentration of beneficiaries provides a robust sample for examining how financial capability influences the quality-of-service delivery. Empirical evidence suggests that regions with higher administrative activity, like Dodoma, are critical for understanding broader trends in public service efficacy (Mwakyusa, 2021). By focusing on this region, the study aims to capture a comprehensive snapshot of the relationship between financial capability and service delivery at a significant organizational nexus.

3.2 Targeted Population and Sample Size

The target population for this study comprised all management personnel and employees stationed at PSSSF offices within the Dodoma region, totalling 220 individuals as per the latest available

data (URT, 2023). From this pool, a sample size of 201 employees selected for participation in the research. The sample size for this study was determined using Yamane's (1967) formula, which ensures that the sample size is proportionate to the population size. This method balances feasibility and statistical validity by providing a sample that is large enough to yield reliable results without being unnecessarily large or resource-intensive. Yamane's formula is widely used because it accounts for the desired confidence level and the acceptable margin of error, making it a robust tool for determining an appropriate sample size. By using this formula, the study aims to maintain a high level of accuracy and representativeness, ensuring that the findings are both statistically significant and practical for informing policy and decision-making. The formula is provided as;

$$n = N / 1 + Ne^2$$

Where:

n = Sample size needed

N = Total population size of 220

e = Margin of error (0.02)

Hence,

$$n = 220 / 1 + 220(0.02^2)$$

$$n = 220 / (1 + 220 * 0.0004)$$

$$n = 220 / (1 + 0.088)$$

$$n = 220 / 1.088$$

$$n = 201$$

Therefore, sample size was 201 employees

3.3 Sampling Procedures

The sampling procedures for this study utilized simple random sampling to ensure each individual within the target population had an equal chance of being selected, thereby minimizing selection bias and enhancing the representativeness of the sample. The target population consisted of 220 management personnel and employees at the PSSSF offices in Dodoma. A sampling frame was constructed, listing all eligible individuals, and random numbers were generated to select 201 participants from this list. This method was chosen due to its simplicity and effectiveness in achieving a representative sample, crucial for accurately assessing the relationship between financial capability and quality service delivery (Creswell, 2014).

3.4 Data Collection Methods

The primary data collection method for this study was a questionnaire survey. This involved the distribution of structured questionnaires to a sample of 201 employees selected through simple random sampling. The questionnaires were designed to gather information on both financial capability and perceived quality of service delivery. The survey targeted employees across different departments within the PSSSF in Dodoma, ensuring a diverse range of perspectives on the research topic. The questionnaire consisted of closed-ended questions with Likert scale responses to capture the insights and nuanced views on the study variables.

3.5 Variable Measurements and Data Analysis

3.5.1 Variable Measurements

The study measured financial capability, the independent variable, through indicators such as budget allocation, financial resources, funding sources, financial management practices, and investment in services. Quality service delivery, the dependent variable, was assessed using indicators like timeliness, efficiency, client satisfaction, service accessibility and service affordability. Both variables were measured using a five-point Likert scale, ranging from 1 (strongly agree) to 5 (strongly disagree), to capture respondents' perceptions accurately.

Table 3.1 Variable Measurements

Variable	Measurement
Financial Capability (Independent Variable)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
<ul style="list-style-type: none"> Budget Allocation, Financial Resources, Funding Sources, Financial Management Practices and Investment in Service 	
Quality Service Delivery (Dependent Variable)	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
<ul style="list-style-type: none"> Timeliness Efficiency Client satisfaction Service Accessibility Service Affordability 	

Source: Researcher (2024)

3.5.2 Data Analysis

The multiple linear regression analysis used to test the significant relationship between independent (financial capability) and dependent variable (quality service delivery). The following presents is the Multiple linear regression equation that was utilized

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \varepsilon$$

Where:

- Y is the outcome variable (Quality Service Delivery).
- X1, X2, X3, X4, X5 are the predictor variables (Budget Allocation, Financial Resources, Funding Sources, Financial Management Practices, and Investment in Service).
- β_0 is the intercept (the value of Y when all predictors are zero).
- $\beta_1, \beta_2, \beta_3, \beta_4, \beta_5$ are the regression coefficients (the change in Y associated with a one-unit change in the corresponding predictor, holding all other predictors constant).
- ε is the error term (the difference between the predicted value of Y and the actual value of Y).

3.6 Validity and Reliability of Data

A preliminary investigation, known as a pilot study, undertaken to ensure the research's validity by testing the research instruments with a small group of participants beforehand. This initial phase aimed to verify that the instruments accurately measured the intended variables. Within this study, data reliability was assessed using the Cronbach's Alpha test, chosen for its ability to identify and eliminate unreliable constructs before progressing to more comprehensive research. The reliability results, as presented in Table 3.2, demonstrate strong internal consistency across the variables measured in this study. Financial Capability, with a Cronbach's alpha of 0.875, indicates a high level of reliability. Timeliness and Service Accessibility also exhibit strong reliability, with Cronbach's alpha values of 0.854 and 0.876, respectively. Efficiency and Service Affordability show acceptable reliability, with Cronbach's alpha values of 0.798 and 0.799. Notably, Client Satisfaction has the highest reliability, with a Cronbach's alpha of 0.980, indicating excellent internal consistency. These results suggest that the items used to measure each variable are consistently reliable, providing confidence in the study's measurement tools.

Table 3.2 Cronbach's Alpha Correlation Matrix

Variable	Number of items	Cronbach alpha
Financial Capability	5	0.875
Timeliness	5	0.854

Efficiency	5	0.798
Client satisfaction	5	0.980
Service Accessibility	5	0.876
Service Affordability	5	0.799

3.7 Ethical Consideration

To uphold ethical standards in this study, several measures implemented. Initially, informed consent diligently secured from all participants, offering comprehensive details regarding the study's objectives, methodologies, potential risks, benefits and assurances of confidentiality. This process emphasized respect for participants' autonomy and voluntary engagement. Additionally, stringent measures taken to safeguard participants' identities and personal data through robust confidentiality and data protection protocols. Lastly, the findings reported transparently and accurately, ensuring that confidentiality remained paramount by avoiding the disclosure of any personally identifiable information. These ethical considerations were fundamental in preserving the integrity of the research and upholding the rights and well-being of the participants involved.

4.0 Results

In this study, descriptive statistics were employed to summarize the key metrics such as minimum, maximum, mean, and standard deviation for variables related to financial capability and service delivery quality at PSSSF. These statistics provided a clear quantitative snapshot of the data distribution and variability among participants. Scores falling between 1.00 and 2.00 are categorized as low, indicating areas where performance or satisfaction is notably below optimal levels. Scores ranging from 2.01 to 3.99 are classified as moderate, representing a satisfactory but potentially improvable range of performance. On the higher end of the scale, scores from 4.00 to 5.00 indicate high performance or satisfaction, showcasing areas where practices or services are perceived positively and effectively meet expectations.

Additionally, multiple linear regression analysis was utilized to explore the relationships between predictor variables (such as financial capability metrics) and the outcome variables (such as service delivery quality). This method allowed for the examination of how changes in financial capability metrics influence service delivery quality, while controlling for other relevant factors.

4.1 Descriptive Statistics

4.1.1 Descriptive Statistics Results for Financial Capability at PSSSF

The descriptive statistics results for financial capability at PSSSF as presented in Table 4.6 below reveals that, the variable with the highest mean score is "Investment In Service" ($M = 4.3433$, $SD = 0.89809$), followed by "Financial Management Practices" ($M = 4.3234$, $SD = 0.91099$), "Funding

Sources" ($M = 4.2438$, $SD = 1.01256$), "Budget Allocation" ($M = 3.9652$, $SD = 1.20987$), and "Financial Resources" ($M = 3.9154$, $SD = 1.30300$). The overall mean for financial capability across all aspects is approximately 4.15822. These findings suggest that PSSSF generally demonstrates a strong financial capability, particularly in investment in services and financial management practices. However, there may be room for improvement in budget allocation and financial resource management. Enhancing financial capability across all aspects can potentially lead to improved quality service delivery at PSSSF, ensuring efficient allocation of resources and effective financial management practices to support service provision.

To sum up, the descriptive statistics for financial capability at PSSSF indicate that the organization performs strongly in several key areas. Specifically, "Investment in Service" and "Financial Management Practices" received the highest mean scores, suggesting robust capabilities in these domains. However, areas like "Budget Allocation" and "Financial Resources" show lower mean scores, indicating potential areas for improvement. Overall, the organization's average financial capability score is relatively high, highlighting its effective management of investments and financial practices. Strengthening budget allocation and financial resource management could further enhance PSSSF's ability to deliver quality services efficiently, ensuring optimal use of resources to support service provision effectively.

Table 4.1 Financial Capability at PSSSF (n = 201)

Aspect	minimum	maximum	mean	STD
Budget Allocation	1.00	5.00	3.9652	1.20987
Financial Resources	1.00	5.00	3.9154	1.30300
Funding Sources	1.00	5.00	4.2438	1.01256
Financial Management Practices	1.00	5.00	4.3234	.91099
Investment In Service	1.00	5.00	4.3433	.89809

Source: Field Data (2024)

4.1.2 Descriptive Statistics Results for Quality Service Delivery At PSSSF

The descriptive statistics for quality service delivery at PSSSF, presented in Table 4.2, illustrate varying performance across different aspects. Service Affordability received the highest mean score ($M = 4.3234$, $SD = 0.82456$), indicating strong affordability of services provided. Client satisfaction follows with a mean score of 3.4179 ($SD = 1.38726$), highlighting relatively positive feedback from clients. Service Accessibility ($M = 3.1741$, $SD = 1.44379$) and Timeliness ($M = 2.7264$, $SD = 1.56517$) show moderate scores, suggesting room for improvement in these areas.

Efficiency recorded the lowest mean score at 2.4030 (SD = 1.40776), indicating potential inefficiencies that may need addressing. The overall mean for quality service delivery across all aspects is 3.20896, indicating a moderate level of service delivery at PSSSF.

Scores falling between 1.00 and 2.00 are categorized as low, indicating areas where performance or satisfaction is notably below optimal levels. Scores ranging from 2.01 to 3.99 are classified as moderate, representing a satisfactory but potentially improvable range of performance. On the higher end of the scale, scores from 4.00 to 5.00 indicate high performance or satisfaction, showcasing areas where practices or services are perceived positively and effectively meet expectations. Henceforth, these findings suggest that while PSSSF generally provides affordable services and maintains reasonable client satisfaction levels, there are opportunities to enhance service accessibility, timeliness, and efficiency. Addressing these areas could further improve overall service delivery quality, ensuring better outcomes and satisfaction among service users.

Table 4.2 Quality Service Delivery at PSSSF (n = 201)

s/n	Aspect	minimum	maximum	mean	STD
1	Timeliness	1.00	5.00	2.7264	1.56517
2	Efficiency	1.00	5.00	2.4030	1.40776
3	Client satisfaction	1.00	5.00	3.4179	1.38726
4	Service Accessibility	1.00	5.00	3.1741	1.44379
5	Service Affordability	1.00	5.00	4.3234	.82456
OVERALL MEAN = 3.20896.					

Source: Field Data (2024)

To sum up, the descriptive statistics reveal that service aspects at PSSSF vary in performance across different dimensions. Service Affordability stands out with a high mean score of 4.3234, indicating strong affordability of services, which contributes to its categorization as high satisfaction. Client satisfaction follows with a mean score of 3.4179, placing it in the moderate satisfaction category, showing areas of improvement. Service Accessibility and Timeliness both exhibit moderate mean scores of 3.1741 and 2.7264, respectively, suggesting areas needing enhancement to achieve higher satisfaction levels. Efficiency records the lowest mean score at 2.4030, categorizing it as low satisfaction, signaling significant inefficiencies requiring immediate attention. The overall mean for quality service delivery across all aspects is 3.20896, indicating a moderate level of service performance at PSSSF. Addressing these findings through targeted improvements in accessibility, timeliness, and efficiency could elevate overall service delivery, ensuring higher satisfaction and better outcomes for service users.

4.2 Tests for assumptions of Multiple Linear Regression

4.2.1 Correlation

The correlation matrix reveals strong positive associations among various financial and service delivery factors, all statistically significant at the 0.05 level unless stated otherwise. Quality Service Delivery (QSD) displays robust correlations with Financial Resources ($r = .675$, $p < .001$), Investment in Service ($r = .565$, $p < .001$), and moderate correlations with Funding Sources ($r = .494$, $p < .001$), Budget Allocation ($r = .338$, $p < .001$), and Financial Management Practices ($r = .223$, $p = .001$). Budget Allocation shows moderate correlations with Financial Resources ($r = .252$, $p < .001$), Funding Sources ($r = .313$, $p < .001$), and Financial Management Practices ($r = .243$, $p = .001$), while exhibiting a weak, significant correlation with Investment in Service ($r = .134$, $p = .050$). Financial Resources demonstrate strong correlations with Investment in Service ($r = .734$, $p < .001$) and Funding Sources ($r = .509$, $p < .001$), and moderate correlations with Financial Management Practices ($r = .519$, $p < .001$). Funding Sources exhibit moderate correlations with Financial Management Practices ($r = .260$, $p < .001$) and Investment in Service ($r = .393$, $p < .001$). Financial Management Practices also moderately correlate with Investment in Service ($r = .366$, $p < .001$). These findings suggest that the independent variables significantly contribute to the enhancement of service quality.

Table 4.3 Correlations

Correlations							
		Quality Service Delivery	Budget allocation	Financial resources	Funding sources	Financial management practices	Investment in service
Quality Service Delivery	Pearson Correlation	1	.338**	.675**	.494**	.223**	.565**

	N	201	201	201	201	201	201
**. Correlation is significant at the 0.01 level (2-tailed).							

4.2.2 Normality

The histogram in Figure 4.1 illustrates the distribution of regression standardized residuals. The residuals closely follow a bell-shaped curve, indicating they are approximately normally distributed. This is further supported by the superimposed normal curve, which aligns well with the observed data. The symmetry of the histogram around zero suggests there is no significant bias in the model's predictions. The presence of a few minor outliers is not uncommon and does not invalidate the normality assumption. Overall, the histogram supports the assumption of normality

of residuals, which is a crucial requirement for the validity of multiple linear regression analysis. This suggests the model is a good fit for the data and its predictions are reliable.

Figure 4.1 Normality

4.2.3 Linearity

The Shapiro-Wilk test results, as shown in Table 4.2, indicate that the assumption of normality is met for all variables included in the analysis. This is evident from the test statistic (W) values being close to 1 and the p-values being greater than the commonly used significance level of 0.05. These findings suggest that the data for each variable are consistent with a normal distribution, which supports the validity of using parametric statistical tests that rely on this assumption.

Table 4.4 Shapiro Wilk Test

Variable	Test Statistic (W)	p-value	Normality Assumption Met
Quality Service Delivery	0.990849	0.266523	Yes

Budget Allocation	0.988152	0.147439	Yes
Financial Resources	0.991089	0.285227	Yes
Funding Sources	0.99268	0.412864	Yes
Financial Management Practices	0.988492	0.163304	Yes
Investment in Service	0.99389	0.587975	Yes

4.2.4 Multicollinearity

Table 4.3 presents the Variance Inflation Factor (VIF) for each predictor variable in the regression model. The VIF values for all variables are below the commonly accepted threshold of 5, and even below the more conservative threshold of 2.5. This indicates that there is no significant multicollinearity among the predictor variables. The tolerance values, which are the inverse of the VIF, further support this conclusion. The tolerance values for all variables are well above 0.1, signifying that each variable contributes unique information to the model and is not redundant with other predictors. Therefore, we can conclude that multicollinearity is not a concern in this regression model.

Table 4.5 Variance Inflation Factor Matrix (VIF)

Variable	Tolerance	VIF
Budget allocation	.344	2.904
Financial resources	.702	1.425
Funding sources	.457	2.188
Financial management practices	.716	1.396
Investment in service	.867	1.154

4.2.4 Outliers Results

4.2.4.1 Outlier Results for Financial Capability

The analysis of outlier results for financial capability, as shown in Table 4.6, indicates that there are no significant outliers in the data. The mean financial capability is 1.7861 with a standard error of .02900, and the 95% confidence interval for the mean ranges from 1.7289 to 1.8432. The 5% trimmed mean is 1.8179, and the median value is 2.0000, which is very close to the mean, suggesting symmetry in the distribution. The variance is .169 and the standard deviation is .41110, indicating moderate variability. The minimum and maximum values are 1.00 and 2.00, respectively, with a range of 1.00 and an interquartile range of .00, further emphasizing the limited spread in the data. The skewness value of -1.406 with a standard error of .172 indicates a slight left skew, while the kurtosis value of -.024 with a standard error of .341 indicates that the distribution is approximately normal, confirming the absence of significant outliers.

Table 4.6 Outlier Results for Financial Capability

			Statistic	Std. Error
Financial Capability	Mean		1.7861	.02900
	95% Confidence Interval for Mean	Lower Bound	1.7289	
		Upper Bound	1.8432	
	5% Trimmed Mean		1.8179	
	Median		2.0000	
	Variance		.169	
	Std. Deviation		.41110	
	Minimum		1.00	
	Maximum		2.00	
	Range		1.00	
	Interquartile Range		.00	
	Skewness		-1.406	.172

	Kurtosis	-.024	.341
--	----------	-------	------

4.2.4.2 Outlier Results for Quality Service Delivery

The analysis of outlier results for quality service delivery, as presented in Table 4.7, indicates the absence of significant outliers in the dataset. The mean value for quality service delivery is 1.2388 with a standard error of .03015, and the 95% confidence interval for the mean ranges from 1.1794 to 1.2983. The 5% trimmed mean is 1.2098, suggesting that extreme values do not significantly impact the mean. The median value is 1.0000, which is close to the mean, indicating a symmetric distribution. The variance is .183 and the standard deviation is .42742, demonstrating moderate variability. Both the minimum and maximum values are 1.00 and 2.00, respectively, resulting in a range of 1.00 and an interquartile range of .00, indicating limited spread in the data. The skewness value of 1.234 with a standard error of .172 suggests a slight right skew, while the kurtosis value of -.481 with a standard error of .341 indicates a distribution that is slightly flatter than normal. Overall, these statistics confirm that there are no significant outliers in the quality service delivery data.

Table 4.7 Outlier Results for Quality Service Delivery

			Statistic	Std. Error
Quality Service Delivery	Mean		1.2388	.03015
	95% Confidence Interval for Mean	Lower Bound	1.1794	
		Upper Bound	1.2983	
	5% Trimmed Mean		1.2098	
	Median		1.0000	
	Variance		.183	
	Std. Deviation		.42742	
	Minimum		1.00	

	Maximum	2.00	
	Range	1.00	
	Interquartile Range	.00	
	Skewness	1.234	.172
	Kurtosis	-.481	.341

4.3.5 Model Fit Results

4.3.5.1 Omnibus Tests of Model Coefficient Results

The results from the Omnibus Tests of Model Coefficient in Table 4.8 demonstrate a good model fit. The Chi-square value for the step, block, and model is 99.664, with 5 degrees of freedom, and a significance level (Sig.) of .000. This indicates that the model is statistically significant and that the predictors collectively provide a good fit to the data, significantly improving the prediction of the outcome variable, quality service delivery. The p-value being less than 0.05 confirms that the inclusion of the predictor variables (budget allocation, financial resources, funding sources, financial management practices, and investment in service) substantially contributes to the model's effectiveness in predicting quality service delivery.

Table 4.8 Omnibus Tests of Model Coefficient Results

		Chi-square	df	Sig.
Step 1	Step	99.664	5	.000
	Block	99.664	5	.000
	Model	99.664	5	.000

4.3.5.2 -2 Log likelihood, Cox & Snell R Square and Nagelkerke R Square Results

The results presented in Table 4.9, which include the -2 Log Likelihood, Cox & Snell R Square, and Nagelkerke R Square values, indicate a good model fit. The -2 Log Likelihood value of 121.316 signifies a strong fit between the model and the data. The Cox & Snell R Square value of .391 suggests that approximately 39.1% of the variance in the dependent variable (quality service delivery) is explained by the predictors. The Nagelkerke R Square value of .586, which adjusts the Cox & Snell R Square to provide a more interpretable metric, indicates that up to 58.6% of the

variability in quality service delivery is accounted for by the model. These values collectively demonstrate that the model has a strong explanatory power and effectively captures the relationship between financial capability predictors and quality service delivery.

Table 4.9 -2 Log likelihood, Cox & Snell R Square and Nagelkerke R Square Results

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	121.316 ^a	.391	.586

a. Estimation terminated at iteration number 5 because parameter estimates changed by less than .001.

4.3.5.3 Hosmer and Lemeshow Test Results

The Hosmer and Lemeshow Test results presented in Table 4.10 indicate a good fit for the model. The Chi-square value is .800 with 3 degrees of freedom, and the significance level (Sig.) is .849. A p-value greater than 0.05 suggests that there is no significant difference between the observed and predicted values, indicating that the model fits the data well. Therefore, the results confirm that the logistic regression model adequately describes the relationship between the predictors and the dependent variable, quality service delivery.

Table 4.10 Hosmer and Lemeshow Test Results

Step	Chi-square	df	Sig.
1	.800	3	.849

4.3.5.4 KMO and Bartlett's Test

The results of the Kaiser-Meyer-Olkin (KMO) and Bartlett's Test presented in Table 4.11 demonstrate the adequacy and suitability of the data for factor analysis. The KMO Measure of Sampling Adequacy is .788, which exceeds the commonly recommended threshold of 0.6, indicating that the sample size is sufficient and the variables are adequately correlated for factor analysis. Additionally, Bartlett's Test of Sphericity shows an approximate Chi-Square value of 496.255 with 15 degrees of freedom and a significance level (Sig.) of .000. This p-value being less than 0.05 confirms that the correlations between the variables are significantly different from zero, further justifying the appropriateness of conducting factor analysis. Therefore, these results

indicate that the dataset is suitable for factor analysis, demonstrating good sampling adequacy and significant correlations among the variables.

Table 4.11 KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.788
Bartlett's Test of Sphericity	Approx. Chi-Square	496.255
	df	15
	Sig.	.000

4.3 Findings on the relationship between financial capability and quality service delivery at PSSSF in Dodoma

The study focused on evaluating the substantial regression between the predictor (financial capability) and the outcome variable (quality service delivery). The connection examined through the application of multiple linear regression analysis.

Table 4.12 Hypothesis to be tested

S/N	Hypothesis	Data collection Tools
1	There is a significant relationship between budget allocation and quality service delivery at PSSSF	Questionnaires
2	There is a significant relationship between financial resources and quality service delivery at PSSSF	Questionnaires
3	There is a significant relationship between funding sources and quality service delivery at PSSSF	Questionnaires
4	There is a significant relationship between financial management practices and quality service delivery at PSSSF	Questionnaires
5	There is a significant relationship between investment in service and quality service delivery at PSSSF	Questionnaires

The study findings presented below;

a) Model Summary Results

The multiple linear regression analysis results are summarized in Table 4.13. The model indicates a substantial regression between the predictor variable (financial capability) and the outcome variable (quality service delivery). The model summary reveals an R Square value of .546, which suggests that approximately 54.6% of the variability in quality service delivery can be explained by the combined effect of budget allocation, financial resources, funding sources, financial management practices, and investment in service.

Table 4.13 Model Summary

Model Summary ^b									
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.739 ^a	.546	.534	.29177	.546	46.840	5	195	.000
a. Predictors: (Constant), budget allocation, financial resources, funding sources, financial management practices, investment in service									
b. Dependent Variable: Quality Service Delivery									

b) Coefficients

The standardized coefficients (Beta) reveal the substantial impact of all financial factors on service quality, considering their different scales. Budget allocation demonstrates the greatest influence (Beta = 0.538, $p < .001$), suggesting that a one standard deviation increase in budget allocation leads to a significant 0.538 standard deviation increase in service quality. Investment in service is the second most impactful predictor (Beta = 0.182, $p < .001$), followed closely by financial resources (Beta = 0.153, $p = .009$) and funding sources (Beta = 0.158, $p = .028$). While financial management practices have a relatively smaller standardized coefficient (Beta = 0.198), their impact remains statistically significant ($p < .001$), highlighting their importance in conjunction

with other financial aspects. Overall, these findings emphasize the substantial and positive role that all examined financial factors play in enhancing service quality (Table 4.14).

Table 4.14 Coefficients Results

Coefficients ^a								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	1.701	.283		6.003	.000	1.142	2.260
	Budget allocation	.560	.086	.538	6.544	.000	.728	.391
	Financial resources	.174	.066	.153	2.651	.009	.044	.303
	Funding sources	.153	.069	.158	2.215	.028	.017	.289
	Financial management practices	.311	.090	.198	3.466	.001	.134	.489
	Investment in service	.103	.029	.182	3.502	.001	.161	.045
a. Dependent Variable: Quality Service Delivery								

c) ANOVA

The ANOVA table reveals a statistically significant ($p < .001$) relationship between the set of predictor variables (budget allocation, financial resources, funding sources, financial management practices, and investment in service) and the quality-of-service delivery. The F-statistic of 46.840 indicates that the explained variance (19.937) due to the regression model is significantly greater than the unexplained variance (16.600) attributed to error or other factors. This strong association

suggests that the combined effect of the predictor variables substantially influences the quality-of-service delivery (Table 4.15).

Table 4.15 ANOVA Results

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	19.937	5	3.987	46.840	.000 ^b
	Residual	16.600	195	.085		
	Total	36.537	200			
a. Dependent Variable: Quality Service Delivery						
b. Predictors: (Constant), budget allocation, financial resources, funding sources, financial management practices, investment in service						

4.4 Summary of Multiple Linear Regression Results

The multiple linear regression analysis provided valuable insights into the relationships between financial capability and quality service delivery at PSSSF, confirming the acceptance of hypotheses regarding budget allocation, financial resources, funding sources, and investment in service. Specifically, higher levels of budget allocation, financial resources, funding sources financial management practices, and investment in service found to be significantly associated with improved quality service delivery. These results underscore the importance of strategic resource allocation and investment decisions in enhancing quality service delivery outcomes at PSSSF (Table 4.16).

Table 4.16 Hypothesis Tested

S/N	Hypothesis	Results
1	There is a significant relationship between budget allocation and quality service delivery at PSSSF	Accepted
2	There is a significant relationship between financial resources and quality service delivery at PSSSF	Accepted

3	There is a significant relationship between funding sources and quality service delivery at PSSSF	Accepted
4	There is a significant relationship between financial management practices and quality service delivery at PSSSF	Accepted
5	There is a significant relationship between investment in service and quality service delivery at PSSSF	Accepted

5.0 Discussion

The findings of the study on the role of financial capability on quality service delivery at PSSSF demonstrate a significant relationship between budget allocation, financial resources, funding sources, and investment in service quality delivery. These results align with and complement insights from previous studies, such as those by Hamdan et al. (2019) and Piatti-Fünfkirchen and Schneider (2018), as well as more recent research.

In the study by Hamdan et al. (2019), participants highlighted the crucial role of financial capability in enhancing service quality at PSSSF, resonating with their conclusion that financial resources have a statistically significant and positive impact on the delivery of decentralized services in selected Kenyan counties. Both studies underscore the pivotal role of financial capability in driving projects and service delivery. Hamdan et al. (2019) emphasize that merely having financial resources is not sufficient; effective mechanisms for their deployment are equally vital. This echoes the implication that financial capability should be complemented with strategic and efficient financial management practices, ensuring the optimal utilization of resources for service enhancement.

Piatti-Fünfkirchen and Schneider (2018) provide a broader perspective on public financial capability and management in the context of health service delivery. While their focus is on the health sector in Tanzania and Zambia, the overall theme aligns with the findings at PSSSF, emphasizing the intricate relationship between financial management practices and service delivery outcomes. Challenges identified in the Piatti-Fünfkirchen and Schneider (2018) study, such as inflexibility, misalignment, fragmented funding sources, and inadequate budget allocation, resonate with the importance of effective financial capability discussed in the study at PSSSF.

Recent studies continue to support these findings and provide further justification. For instance, a study by Zhang et al. (2021) on financial management practices in public service organizations found that effective budget management and financial oversight directly correlate with improved service delivery outcomes. The study highlighted the importance of adaptive financial strategies that can respond to changing service demands and the necessity of integrating financial planning with operational objectives to achieve service excellence.

Additionally, a report by the World Bank (2022) on financial capability in public sector organizations highlighted the need for comprehensive financial management systems that promote transparency, accountability, and strategic resource allocation. The report noted that organizations with robust financial management practices tend to have better service delivery outcomes, as they can effectively channel resources towards priority areas and respond to emerging needs.

Another relevant study by Smith et al. (2023) examined the impact of financial capability on service delivery in the education sector. The study concluded that schools with higher financial capability, characterized by strategic budget allocation and efficient resource management, achieved better educational outcomes and higher levels of student satisfaction. This underscores the generalizability of the findings across different sectors, reinforcing the notion that financial capability is a critical determinant of service quality.

Collectively, these studies emphasize the need for organizations, including PSSSF, to not only possess financial capability but also to implement strategic financial management practices. A balanced approach that combines financial resources with efficient deployment mechanisms is crucial. Furthermore, aligning budgeting and planning, maintaining flexibility to respond to unexpected demands, and implementing a holistic evaluation system that considers equity, quality, and efficiency are essential for optimizing the impact of financial capability on service delivery. These insights offer valuable considerations for PSSSF and similar organizations in enhancing the effectiveness of their financial capability for improved service delivery outcomes.

Lastly, The Theory of Planned Behavior (TPB), developed by Icek Ajzen in 1991, provides a robust framework for interpreting the findings of this study on financial capability and quality service delivery at PSSSF in Dodoma. According to TPB, employees' behavioral intentions are shaped by their attitudes toward financial management practices, subjective norms related to service delivery expectations within the organization, and perceived behavioral control over resource allocation decisions (Ajzen, 1991). The study's results, which indicate that higher levels of budget allocation, financial resources, funding sources, and investment in services are significantly associated with improved service delivery outcomes, resonate well with TPB's theoretical propositions (Ajzen, 1991). By emphasizing the role of attitudes, norms, and perceived control, TPB offers a comprehensive explanation of how strategic financial capabilities influence employees' intentions to enhance service quality, thereby underscoring its relevance in understanding organizational behavior within PSSSF and similar contexts.

6.0 Conclusion

In conclusion, the study on the relationship between financial capability and quality service delivery at PSSSF in Dodoma highlights the crucial role of strategic resource allocation and investment decisions in enhancing service delivery outcomes. The findings confirm significant relationships between budget allocation, financial resources, funding sources, financial management practices, and investment in service with quality service delivery. These results emphasize the importance of effective financial planning and management strategies in ensuring the delivery of high-quality services. Furthermore, the study underlines the necessity of maintaining high standards of service quality, incorporating aspects such as customer satisfaction, timeliness, and efficiency. Moving forward, it is imperative for PSSSF to continue prioritizing these aspects, alongside financial capabilities, to sustain and further improve service delivery standards, ensuring a comprehensive approach to excellence in service provision.

7.0 Limitations of the Study

The study on the role of financial capability in quality service delivery at PSSSF has several limitations. Firstly, it relies heavily on self-reported data, which can be subject to biases such as overestimation or social desirability bias. Secondly, the study's scope is limited to PSSSF in Dodoma, potentially limiting the generalizability of the findings to other regions or organizations. Additionally, the study primarily focuses on quantitative measures of financial capability and service delivery, potentially overlooking qualitative aspects and contextual factors that could influence the outcomes. Finally, the cross-sectional nature of the study limits the ability to establish causality between financial capability and service delivery quality, suggesting the need for longitudinal studies to better understand these dynamics over time.

8.0 Recommendations

These findings offer valuable insights for various stakeholders involved in PSSSF operations. Management should prioritize investments in enhancing financial capability to bolster quality service delivery, potentially through targeted training programs or resource allocation strategies. Human resources departments can integrate financial literacy initiatives into employee development plans to empower staff with the skills needed to navigate financial challenges effectively. Additionally, policymakers and regulators should consider these results when formulating regulations and policies to ensure adequate financial resources and support systems are in place to sustainably improve service delivery standards. Lastly, stakeholders from the broader community, including beneficiaries and taxpayers, should advocate for transparent and accountable financial practices within PSSSF to maximize the impact of financial capability initiatives on service quality and organizational performance.

9.0 Area for Further Study

Future research should explore the long-term impact of financial capability on service delivery quality by conducting longitudinal studies across various regions and sectors. Investigating the interplay between financial management practices and other organizational factors, such as employee training, customer satisfaction, and technological advancements, could provide a more holistic understanding of service delivery enhancement. Additionally, comparative studies across different public and private organizations would help identify best practices and contextual differences. Expanding the research to include qualitative methods, such as interviews and case studies, would offer deeper insights into the contextual and experiential aspects of financial capability and service delivery. Finally, examining the effects of specific financial management strategies and tools on service delivery outcomes could provide actionable recommendations for organizations aiming to improve their financial capability and service quality.

Abstract

Using the Ministry of Construction in Dodoma, Tanzania as a case study, this study attempted to evaluate the contribution of occupational health and safety policies and programs to the wellbeing of public employees in Tanzania. The goals were to find out how occupational health and safety management guidelines contribute to lowering workplace risks in the MoC; how occupational health and safety management programs contribute to lowering workplace risks in the MoC; and how occupational health and safety management administrations contribute to lowering workplace risks in the MoC. With a sample size of 150 respondents, a cross-sectional survey design was used with 176 employees as the target population. Stratified and purposive sampling techniques were used in the selection procedure. Interviews and questionnaires were among the data collection instruments. The collected data were analyzed using descriptive statistics methods and multiple linear regression analysis was used for quantitative analysis and content analysis was used for qualitative examination of the data that had been gathered. The study's findings demonstrated how important it is to adopt and implement OHS policies, programs, and administration effectively in order to lower workplace accidents, injuries, damages, and work-related illnesses and consequently, to improve employee well-being inside the Ministry. The study suggests that in order to lower the number of mishaps, injuries, property damage, and diseases linked to the workplace, the Ministry should oversee, employ, and put into practice suitable occupational health and safety laws, guidelines, and programs for the well-being of the employees.

Key words: *Occupational Health and Safety, Public servants, well - being, Ministry of Construction.*

1.0 Introduction

Occupational Health and Safety was not considered to be a matter of public concern in ancient times, when accidents were regarded as inevitable or as the will of the gods (Jain, Hassard, Leka, Di Tecco & Iavicoli, 2021). Modern notions of safety were only developed in the 19th century as an outgrowth of the Industrial Revolution, and when a terrible toll of factory accidents aroused humanitarian concern for their prevention (Saleem & Malik, 2022). Today, the concern for safety has been worldwide and was the province of numerous governmental and private agencies at the

local, national, and international levels (Saleem & Malik, 2022; Lan, Goh, Jensen, Asmore, 2022). The Agency of the United States (US) Department of Labour formed in 1970 was charged with ensuring that employers furnished their employees with a working environment that was free from recognized health and safety hazards. It enforced occupational safety and health standards, developed regulations, conducted investigations and workplace inspections, and issued citations and penalties for noncompliance (Zhang, Hua, Huang, Shi, 2022).

Many countries have tightened their standards for quality, health, knowledge, and safety in recent years compared to earlier times. According to certain research findings, community pressure has resulted in the adoption of diverse safety laws and regulations for distinct businesses across different nations and regions (ILO, 2019; Katunge, 2020).

Various worldwide and national safety standards, according to Isa et al. (2021), offer assistance to assist firms in developing their safety management systems (SMS) with respect to a variety of business demands and requirements. Health and safety at work receive little attention and resources, despite the fact that individuals work and spend the majority of their working hours there (Manikandan, 2017). Workplace health and safety have not received enough attention in emerging economies' industrial development policies and initiatives. The latent impact of an unsatisfactory working environment is undermined by their primary focus on output volume or profit. When workplace safety and health are prioritized, this means that there should be guidelines for efficient resource usage as well as a safe working environment where employees' health is taken into account and guaranteed. Whether a company's success is determined by its financial performance, market share, overall reputation among consumers, or capacity to draw and hold on to employees, managers, or investors, safe workplaces are lucrative workplaces. It is assumed that that in good health will be more innovative and productive. However, productivity loss results from workplace absence (Masekameni et al., 2020).

The International Labor Organization uses a variety of strategies to advance occupational safety and health, including international labor standards, codes of practice, informational workshops, and publications that offer technical assistance. By enhancing working conditions, these methods seek to give the government and its constituents the ability to prevent occupational illnesses and accidents at work. ALEmami (2021) stated that occupational health and safety needs to be a primary focus at all times and that it is a complicated worldwide issue for society and management. Everyone bears some responsibility, as minor errors can have far-reaching consequences and disasters know no national boundaries. For these reasons, nations ought to band together and actively advance occupational health and safety in order to achieve the shared objective of providing workers with early warning, preventative measures, and protective systems.

Poor health and safety policies at work cause 317 million workplace accidents yearly, more than 2.3 million deaths annually, and around 6,300 deaths each day (ILO, 2019; ILO, 2014). Numerous of these cause serious harm to people, reduce productivity, and place a financial strain on both the victim and the country as a whole. The direct costs of a hazardous and unhealthy work environment amount to 4 percent of the world's GDP, which is wasted due to inadequate health and safety protocols. According to empirical evidence, the indirect cost of these safe and healthy work practices is thought to be two to three times more than the direct cost, which could increase the global GDP loss percentage (ILO, 2019; ILO, 2014).

Due to the adoption of an occupational health and safety management system among the top 100 construction enterprises, South Korea's accident rate reduced by 67% and its fatal accident

rate by 10.3% between 2006 and 2011. According to Yoon et al. (2013), the adoption of an occupational health and safety management system at various management levels leads to a notable decrease in work-related and fatal accident rates, hence improving organizational output. The performance of the occupational health and safety system is strategically significant in Iran. According to observations, accredited businesses perform noticeably better than noncertified businesses when it comes to occupational health and safety management (Mohammadfam et al., 2016).

In Sub-Saharan Africa, there are approximately 54000 fatalities and 42 million workplace accidents annually, translating to minus three days of work absence per employee. The region's mortality rate is 21/100000 employees, while the accident rate is 16000/100000 workers. Despite its poor reporting and imprecise data availability, Ethiopia has a fatal accident rate of 5596 each year, with a death rate of 21.5/100000 workers and an accident rate of 16426/100000 workers. Many businesses prioritize the happiness of their external clients with their goods or services, ignoring the comfort of their employees and the workplace (Jilcha and Kitaw, 2016).

Tanzania has not been exempt from the dire circumstances facing the developing world's economies. Like in other nations where labourers are fighting for jobs, workers in this one do not demand better working conditions or decline to take on risky assignments even when they are aware of the risks. For instance, the Tanzanian mainland recorded 1,920 incidents in 2019 and 1,084 accidents in 2020. A total of TZS 668.5 million was utilized to compensate victims of occupational accidents (Thadei & Nyimvua, 2021). According to the African bulletin on Occupational Health and Safety, this comes down to underestimating given the worry of the inadequate information systems typical of developing nations. The fact that certain workplace accidents are reported, handled, and paid for at a disproportionately high percentage is absurd. The situation with regard to occupational diseases is much more convoluted; Tanzania is one example of how only a small percentage of actual cases are reported in most nations, and in some situations they are not included at all. This illustrates the difficulties in characterising, identifying, and disclosing occupational illnesses (Mrema, Ngowi, & Mamuya, 2015; Mushi, 2019).

The concept of working safely without being hampered by occupational diseases, accidents and injuries is what brought about the notion of 'Occupational Health and Safety (OHS) (URT, OSHA Act, 2003). The occupational safety and health authority has been entrusted to ensure that all working places in country comply with safety and health in workplaces. In this world, in order to improve productivity, among other things, health and safety of all workers need to be considered of high priority. In order to achieve this, a joint effort between the Government, private sectors, employers, employees and the general public is needed. Since independence in 1961, occupational health and safety standards in Tanzania were provided for by the Factories Ordinance Cap 297 of 1950. The government through the Public Service Reform Programme (PSRP) established Occupational Safety and Health Authority under the Executive Agency Act No. 30 of 1997. Occupational Safety and Health Agency was officially launched on 31st August, 2001. It has been set up with the aim of improving the health and wellbeing of workers,

and of workplaces. This will be achieved by promoting occupational safety and health (OSH) practices in order to prevent occupational injuries and diseases, and ultimately achieve better output.

Occupational health and safety in Tanzania receive less attention and comes low on the national priority list. This is due to the fact that the health authorities have concentrated their effort on “non- occupational” diseases characterising most of the developing countries including Tanzania (Neema, 2015). Given this general neglect of occupational health problems there is a need to understand how Tanzania's occupational health care delivery system has been responding to workers' health problems and needs. That means, researches in Tanzania fall short of identifying the role of the Occupational Safety and Health policies and programs to the wellbeing of public employees in Tanzania.

Despite the efforts that have been made by both international organizations (ILO, WHO) and national efforts by establishing the Occupational Safety and Health Authority (OSHA) in Tanzania, work-related deaths continue burgeoning (Amina & Ngari, 2021). Estimations put it at an average of more than 6,300 deaths every day at the global level in 2019 (ILO, 2019). Much concentration on occupational health and safety issues in Tanzania are directed at the factory and manufacturing setting, considered as high risk sectors. Established under the Ministry of Labour and Employment OSHA is charged with the responsibility of ensuring safe and healthy working conditions in all workplaces, by setting and enforcing laws and standards that will be observed by employers in every workplace. The Government also established the Labour Court (LC) which is the Division of the High Court of Tanzania, the Employment and Labour Relations Act No. 6 of 2004, the Commission for Mediation and Arbitration (CMA) and the Registrar of Trade Unions, all dealing with occupational health and safety aspects. Despite these initiatives, the occupational health and safety in Tanzania is still a serious problem and the Tanzanians workers in all social economic sectors are daily affected.

Many past studies on the occupational safety and health for workers have concentrated on informal sectors, particularly construction and mining industries (Amina & Ngari, 2021; Kessy & Rutasimbala, 2021; Mrema, Ngowi, & Mamuya, 2015; Vitalis, Runyoro, and Selemani, 2022), but limited studies on the on formal public sectors like ministries (Mushi, 2019; Neema, 2015). Further, these studies failed to show the relationship between Occupational Safety and Health policies and programs on the hazard reduction and wellbeing of public employee. Further few studies that were done in related topic were not exhaustive in almost every place; hence still needed to be done so as to gain wide understanding and awareness of the occupational health and safety in public formal sector in Tanzania. Thus, the current study attempted to fill the gap in the literature by looking at the role of the Occupational Safety and Health policies and programs to the wellbeing of public employee in the Ministry of Construction (MoC) by ascertaining the roles of occupational health and safety management guidelines in reducing workplace hazards, investigating the roles of occupational health and safety management programs in reducing workplace hazards, and identifying the roles of occupational health and safety management administrations in reducing workplace hazards in

the Ministry of Construction by examining the roles of occupational health and safety management guidelines in reducing workplace hazards and improved well being, investigating the roles of occupational health and safety management programmes in reducing workplace hazards and improved well being, identifying the roles of occupational health and safety management administrations in reducing workplace hazards and improved well being.

The value of the study lied in its contribution to the understanding of the role of occupation health and safety policies and programs to the well-being of public servants. Secondly, the study could provide the critical approaching into the effectiveness of existing policies, helping to ensure that public resources are invested in measures that genuinely enhance employee well-being and productivity. Thirdly, the current study could provide insights on management of the organization stands to gain a deeper understanding of how effective implementation of these policies can lead to increased employee satisfaction, reduced absenteeism, and overall improved organisational performance. Finally, for researchers, this study contributed to the academic discourse on occupational safety and health, providing a foundation for further studies and enabling comparisons across different sectors and regions. This comprehensive approach has ensured that the findings are not only academically robust but also practically applicable, fostering a culture of safety and health that can lead to long-term benefits for all involved.

2.0 Literature Review

2.1 Theoretical Framework

2.1.1 The Health Belief Model

The Health Belief Model was found by Rosenstock, Hochbaum, Kegeles, & Leventhal (1950's). The model is developed to explain and predict health related behaviours. The health belief model suggests that people's beliefs about health problems, perceived benefits of action and barriers to action and self-efficacy explain engagement (or lack of engagement) in health-promoting behaviour. A stimulus, or cue to action, must also be present in order to trigger the health-promoting behaviour (Becker, 1974).

The health belief model has been used to develop effective interventions to change health-related behaviours by targeting various aspects of the model's key constructs. Interventions based on the health belief model may aim to increase perceived susceptibility to and perceived seriousness of a health condition by providing education and training about prevalence and incidence of disease, individualized estimates of risk, and information about the consequences of disease which are medical, financial, and social consequences. Interventions may also aim to alter the cost-benefit analysis of engaging in a health-promoting behaviour (i.e., increasing perceived benefits and decreasing perceived barriers) by providing information about the efficacy of various behaviours to reduce risk of disease, changing physical activity and identifying common perceived barriers (Becker, 1974).

Furthermore, interventions may also aim to boost self-efficacy by providing training in specific health-promoting behaviours interventions based on the health belief model may provide clues

to action to remind and encourage individuals to engage in health promoting behaviours which will result into a healthy work force for the wellbeing of the workers. The HBM can be applied to develop effective interventions to change health-related behaviours by targeting various aspects of the model's key constructs. By integrating the HBM into occupational safety and health policies, organisations can create targeted interventions that address employees' beliefs and enhance engagement in safe practices.

2.2 Empirical Literature Review

2.2.1 Establishment and Compliance of Guidelines

Mushi (2019) developed a study on the factors affecting adherence to occupational health and safety rules and regulations in improving public health in the informal sector workers in Mabibo- Dar es Salaam. The study found that a majority (55.7%) of informal sector worker had low knowledge on OHS rules and regulations. Moreover, most of them (87.1%) were not trained on OHS and a majority (37.1%) rarely used protective gear when performing their duties. Informal sector workers are at high risks of occupational accidents and diseases. This has huge economic burden to individuals, enterprises and the nation as whole. Therefore, it is important that the government puts in place mechanisms aimed to protecting their health and working rights by putting in place integrative and comprehensive programs and policies meant to protect their healthy rights. Despite the contributions, the study by Mushi (2019) was only limited to informal sector. This led to this study to be conducted on the role of occupational safety and health policies and programmes to the wellbeing of public employee in the Ministry of Construction. The current study aims to fill the gap.

Simon (2020) conducted a study on an assessment on the outcomes of effective occupational health and safety towards organisational performance in Tanzania, using Skyward Construction Company as a case study. The study revealed that there was no policy at the company, which regulates occupational health and safety issues around the company. Due to lack of policy, there was no promotion of effective occupational health and safety issues around the company and most of the workers had no idea of what occupational health and safety really means which put workers in a dangerous state of incurring accidents in their working environment. Further, it was observed that the workers were not even satisfied with organization commitment on observing OHS measures. Occupational health and safety at the company was not given priority as the issue itself requires. The management of the company neglected some safety matter and thus workers were facing dangers when accomplishing their duties. However, this study was done on the private entity. The study also failed to include other important variables such as timetable for testing employees' health, OHS training and seminars, inspections on equipment, and conducting physical and mental rehabilitation to employees, involvement of employees in OHS plans, objectives, and usage of appropriate tools. This dearth of literature caused the current study to be conducted. The current study aims to fill the gap.

Kessy and Rutasimbala (2021) did a research on the roles of occupational health and safety management system in reducing workplace hazards in Tanzania Manufacturing Industries. The

findings of this study indicate that effective use and implementation of OHS guidelines, programmes and administration are crucial in reducing workplace accidents, injuries, damages and work-related diseases. The study recommend that companies have to administer, use and implement appropriate occupational health and safety policies, guidelines and programmes so as to reduce accidents, injuries, damages of properties and work-related diseases. However, the study involved only on employees working on manufacturing sector only while excluding other factors influencing employees well being like conducting physical and mental rehabilitation to employees. The current study aims to fill the gap.

Similarly, Mrema, Ngowi, and Mamuya (2015) on their study about the status of occupational health and safety and related challenges in expanding economy of Tanzania, found out that Tanzania's economy is growing steadily, with growth being driven by communication, transport, financial intermediation, construction, mining, agriculture, and manufacturing. Along with this growth, hazards emanating from work in all sectors of the economy have increased and varied. The workers exposed to these hazards suffer from illness and injuries and yet are not provided with adequate occupational health services. Services are scanty and limited to a few enterprises that can afford it. Existing laws and regulations are not comprehensive enough to cover the entire populations. Implementation of legislation is weak and does not protect the workers. Similarly, this concentrated on the informal manufacturing, agriculture and mining sectors. Also, the study was limited to employee status and challenges faced them rather than employees well being in terms of policies and programs associated to them. The current study aims to fill the gap.

Giri, (2020) investigated on the s factors causing health and safety hazards at construction sites in Nepal. Whereas the Construction industry is disposed to health and safety hazards. The study altered that the Construction workers should have the knowledge of health and safety and apply the knowledge while working. The main objective of this paper was to review and to identify the factors that cause accidents at construction sites and the methods to improve health and safety. The review revealed that lack of awareness about site safety and negligence of workers in wearing Personal Protective Equipment (PPE) were the main causes of poor safety practices. It is necessary to create employer's and contractor's interests in safety management and enhance awareness on possible risk factors to reduce these risk factors among workers. Effective implementation of training and safety awareness programs among construction workers is vital to improve health and safety of construction workers.

2.2.2 Implementation of Programmes

Gervas, Kinyondo, Torm and Mackfallen (2022) researched on the Occupational Health and Safety in Tanzanian Construction Sector: Incompliance, Informality, and Power Relations. The study sets out to understand why construction managers and workers do not comply with OHS legislation. Interviews, focus group discussions, and observations were carried out with the construction site managers and informal construction workers on selected construction sites. Nvivo version 12, a qualitative analysis program, was used to evaluate the data utilizing content and theme analyses. The study validated subpar OHS procedures and came to the conclusion

that workers in the construction industry accept the risks as part of a wage-for-labor arrangement since their employment is inherently precarious, which limits their ability to demand OHS enforcement. Because they work for the main contractor, site managers have limited authority and are primarily concerned with seeing construction projects through to completion. According to this study, it is imperative to set up an inclusive safety management system that takes into account the needs of workers, managers, and principal contractors. In addition, it is advised to study the present OHS (building and construction) regulations in order to identify the precariat-informal construction workers, who are the primary participants on building sites. Despite the contributions, the study by Gervas, Kinyondo, Torm and Mackfallen (2022) was only limited to construction industry. Further, the study was limited only on noncompliance, informality, and power relations variables. This led to this study to be conducted on the role of occupational safety and health policies and programmes to the wellbeing of public employee in the Ministry of Construction. The current study aims to fill the gap.

The effects of workplace safety and health practices on employees' commitment and performance in Rwandan steel manufacturing companies were studied by Umugwaneza, Nkechi, and Mugabe (2019). The study's target population consisted of 533 individuals, including supervisors, managers, and workers. A sample size of 229 respondents was chosen at random from the target group using a straightforward random selection procedure. Utilizing interview guides, questionnaires, and firsthand observation, the data was gathered. Data were processed using the Statistical Package for Social Science (SPSS) software, version 21.0, and were analyzed using inferential statistics and descriptive statistics like means, modes, standard deviations, and variances. The study's conclusions show that the majority of employees are aware of the risks to their health and safety at work. The survey also discovered that even though workers are aware of the risks to their health and safety at work, they often forget to wear personal protective equipment because they think it's too hot. The study comes to the conclusion that worker dedication and performance are highly impacted by occupational health and safety. In order to reduce accidents and injuries at work, this study advises management to insure employees and provide them with personal protective equipment. The report also suggests that management conduct routine training and education on occupational health and safety issues in order to reduce workplace accidents and increase productivity. However, the study was done outside of the official sector, such as ministries, and using a quantitative methodology. The qualitative technique will be used in this study to improve the yield of results. Furthermore, Tanzania was not the location of the investigation. The current study aims to fill the gap.

Calis & Buyukakinci, (2019) conducted a study on the occupational health and safety management systems applications and a system planning model in Turkey. The study proclaims that Occupational health and safety activities are more simple, understandable and easy to implement in the workplace, to help establish a more effective prevention system and to ensure effective participation of all employees regardless of level difference in the operating system to safety system. As a result of these, work accidents and occupational diseases can be reduced, scientific occupational health and safety studies can be continued and an environment that will

help to increase the countries' development levels. The aim of this study was to show the benefits of occupational health and safety management systems that can provide to employees, enterprises and whole countries and to offer an occupational health and safety management system for Turkey by examining the examples of occupational health and safety management systems of different countries. For this aim, a detailed literature survey is performed and acquired results are evaluated comprehensively.

A study on management techniques for occupational health and safety in Tanzanian small-scale mining companies was carried out in 2019 by Nkolimwa, Jani, and Dominic. Does the cost of compliance matter? The results show that Safety Training (ST) and Employee Communication (EC) positively impact the application of Organization Safety Support (OSS) and Proactive Hazard Control (PHC) at work, according to the ERG theory. Regarding the contingency theory, the results additionally demonstrated that perceived compliance cost (PCC) acted as a full mediating factor in the impacts of EC on OSS and PHC. Furthermore, it acted as a partial mediator between the impact of ST programs and the adoption of OSS and PHC in the workplace. These findings suggest that even though putting health and safety systems into place appears to cost the company, doing nothing will end up costing the company more. Therefore, in the process of guaranteeing workplace safety, management should refrain from taking excessive cost-cutting measures. However, the study involved only on employees working on manufacturing sector only while excluding other factors influencing employees well being like conducting physical and mental rehabilitation to employees. The current study aims to fill the gap.

The study conducted by Katunge and Mbogo (2016) focused on the role of employers and employees in promoting workplace health and safety. This study concentrated on the health and safety of secondary school teachers in the Mbooni West district. The purpose of the study was to ascertain the views of secondary school teachers regarding their responsibility for maintaining a safe and healthy work environment. The study was conducted with all teachers and deputy principals employed by the Teachers Service Commission (TSC) and the Board of Management (BOM) of secondary schools. The descriptive research design was used to carry out the investigation. Data was collected using a questionnaire guide, and version 20 of the Statistical Package for Social Science (SPSS) was used for analysis. To display the data, frequency tables and charts were employed. The majority of the teaching staff was not enrolled in training programs that would have given them workplace safety skills, according to the findings. The majority of them did not participate in the conversation about workplace safety regulations. This significantly compromised teachers' safety at work, which had an impact on their readiness for health-related issues and, consequently, their overall performance. In order to align teachers' policies with the institution's strategic plans regarding workplace health and safety, it is advised that the Ministry of Education, Science, and Technology, working with school administrations, organize training programs for teaching staff. However, the study by Katunge and Mbogo (2016) had some weaknesses. First, it was limited to just one country. Furthermore, it failed to include other important variables such as OHS training and seminars, inspections on equipment, and conducting physical and mental rehabilitation to employees,

involvement of employees in OHS plans, objectives, and usage of appropriate tools in the analysis. Lastly, the study focused on educational institutions and no other institutions such as ministries were surveyed. This study intends to fill the gap.

Ngajilo et al., (2022) did a study on the analysis of the status of occupational health and safety based on current Tanzanian aquaculture activities, specifically in the fish farming and seaweed farming sectors. Relevant information for the scoping analysis was obtained through aquaculture site visits and worker observation, interviews with key aquaculture stakeholders, and a review of literature relevant to the Tanzanian aquaculture sector published in scientific communications as well as grey literature. The study shows that the Tanzanian aquaculture industry is still in nascent stages, especially in relation to occupational health and safety despite some well-established isolated operations in the country. The industry is dominated by small-scale fish and seaweed farmers, the majority of whom work in the informal and semi-formal sectors. Tanzanian aquaculture workers are exposed to a number of occupational hazards and their associated health effects have been poorly characterized. Substantial gender disparities exist within the sector, which together with climate change, impact worker health and safety. Standardized methods should be used for this purpose to take into account gender disparities as well as the impact of climate change on occupational health and safety of these vulnerable workers. Despite these contributions, Ngajilo et al (2022) failed to consider other important determinants influencing employee well being such as conducting physical and mental rehabilitation to employees. The study also focused on agricultural institutions and no other institutions such as ministries were surveyed. This study intends to fill the gap.

2.2.3 Management and Administrations

The difficulties in enforcing occupational health and safety regulations in Ghana's construction sector were studied by Boadu, Wang, and Sunindijo in 2021. Twelve tasks were found to have been verified and ranked. The statistical significance of the answers and the connections between the tasks were also ascertained through the use of correlation and analysis of variance (ANOVA). Based on these conclusions, the report offers doable tactics for government agencies, OHS inspectors, and other experts in the construction sector to enhance OHS enforcement. The study's conclusions can also be used as a foundation for evaluating the difficulties that other developing nations' OHS institutions face. However, the research was not carried out in Tanzania. The goal of this study is to close the gap.

A study on the impact of occupational safety and health on organizational performance was conducted by Bilhah, Makokha, and Namsonge (2018) using Nzoia Water as a case study in Trans-Nzoia County, Kenya. The study's specific goal was to ascertain the impact of accident reduction on organizational performance. It also looked into how occupational safety and health may be appropriately observed to increase performance at Nzoia Water Company. In the study, the researcher used a case study research approach. The collected data was examined using both quantitative methods, which included the use of tables, and qualitative methods, which involved providing an interpretation for the data. According to the study, fewer accidents

lead to better organizational performance, growth, and survival. The investigation was not, however, conducted in Tanzania. This study intends to fill the gap.

An analysis of occupational health and safety in Tanzania's construction industry, utilizing building project sites in Dar es Salaam's Kinondoni district as a case study, was conducted by Mbilinyi (2015). The study's goal was to examine why Tanzania's building and road construction industries have given little thought to health and safety concerns at construction sites. While the author did not explicitly state whether the analysis would improve organizational performance, she did present some data that would inevitably improve performance. The results show how crucial it is to consider health and safety concerns when working on construction projects. It would be ideal if adherence to health and safety regulations on building sites was one of the factors determining a project's success. Despite the contributions, the study by Mbilinyi (2015) was only limited to construction industry. Further, the study failed to include other important variables such as involvement of employees in OHS plans, objectives, application of appropriate tools, and good management structure. This led to this study to be conducted on the role of occupational safety and health policies and programmes to the wellbeing of public employee in the Ministry of Construction. This study intends to fill the gap.

A study on health and safety protocols among employees in the South Gujarat Region was carried out by Sathyan & Pillai (2022). Only with the cooperation and engagement of employers as well as employees is health and safety feasible. Reviewing the variables influencing the health and safety precautions provided to workers was the goal of the study. Structured questionnaires were used to assess a total of 100 employees. Software called SPSS was used to analyze the data. The evaluation of responses ranging from strongly agree to strongly disagree was done using a Likert-type scale. To verify the accuracy of the responses and the applicability of the data, normality tests were used. Both parametric and non-parametric tests, such as the Mann-Whitney and Kruskal-Wallis tests, were used. The study's components included things like medical facilities, workplace hygiene, employee participation, accident and hazard prevention, and health and safety. Nevertheless, the study was not carried out in a Tanzanian setting. This study intends to fill the gap.

Assey (2019) assessed the effects of occupational health and safety management on organizational productivity – The Case Study of Tanzania Portland Cement Company Limited, Dar es Salaam – Tanzania. The descriptive survey research design and mixed methods approach were used on the sample size of 171 obtained using the Solvener's formula, data was collected using interview guide and open and closed ended questionnaire. The results of data analysis indicates that the factors affecting employees' health and safety management and organizational productivity at Tanzania Portland cement Company Limited include: Working environment, Health and safety at work, lack of Health and safety policy such as hazard reporting system, employee exposure form and medical reports, Accidents at work among others. The findings also revealed that the level of accident affecting organization productivity at Tanzania Portland Cement Company Limited is very high and this was attributed to lack of

adequate protective clothing among others. It was also found that there is significant positive relationship between employees health, safety and organization productivity at Tanzania Portland cement Company Limited. The research concluded that health and safety measures have a positive impact not only on safety and health performance but also on company productivity. Research recommended that employees should have regular and seasoned training courses on safety management. However, the study failed to include other important variables such as involvement of employees in OHS plans, objectives, application of appropriate tools, and good management structure. Also, the study was only done on construction industry. This study intends to fill the gap.

3.0 Research Methodology

The study employed a cross-sectional survey design. The target population was the directors, managers, heads of departments, Labour department official, supporting staff, occupational safety & health victims, and trade union officials of the Ministry. A total sample of 150 was taken from the target population of 176. The sample size was derived and determined from Slovin's formula, as described by Magigi (2015).

$$n = \frac{N}{1 + N(e)^2}$$

The study was conducted at the Ministry of Construction. The Ministry was chosen because there were many cases of accidents due to many construction projects, diseases and road congestion taking place in the area due to increases of population in DCC (Vitalis, Runyoro, and Selemani, 2022). Further, there had been many employees' complaints about poor working environment which do not observe occupational safety and health policies. The study employed purposive and stratified sampling techniques. The numerous employee groups to be covered, as well as any disparities in their jobs or levels of responsibilities, are taken into consideration by the stratified sampling technique. Purposeful sampling is then utilized to select a sample from each group. According to Rahi (2017), stratified sampling is typically used to create a representative sample when the population from which the sample is to be taken does not consist of a homogeneous group. Data for the study was obtained by the administration of a questionnaire and personal interview. The collected data were analysed can be categorized into qualitatively and quantitatively. Qualitative data were analysed through the application of pattern matching, strong explanation building and comparison of data and information. On the other side, quantitative data, both inferential and descriptive analytical methods includes regression analysis with multiple variables were used. The linear regression equation is as follows:

$$Y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \dots \beta_n x_n \dots \dots \dots$$

Whereby:

Y= Index score of employee well being

X₁= The roles of occupational health and safety management guidelines

X₂= The roles of occupational health and safety management programs

X₃= The roles of occupational health and safety management administrations

β_0 = Constants

4.0 Results and Discussion

4.1 Demographic Characteristics of Respondents

In this section, we looked at the age, gender, years of experience, and level of education of the respondents in order to draw some conclusions about them. The qualities of the respondents can be better understood if their demographics are known.

Table 1: Demographic Characteristics of Respondents

Parameters/category	Frequency (N =150)	Percent (%)
Age		
21-30	25	17%
31-40	65	43%
41-50	41	27%
Over 50	19	13%
Total	150	100%
Sex		
Males	109	73%
Females	41	27%
Total	150	100%
Level of Education		
Certificate	5	3
Diploma	20	13
Degree holder	90	60
Master degree holder	10	7
PhD holder	25	17
Total	150	100
Work Experience		
1 – 5 years	60	40
6 – 10 years	50	34
11 – 15 years	20	13
16 – 20 years	5	3
Above 20 years	15	10
Total	150	100

Source: Field Data (2024)

This study has involved 150 executive directors, managers, head of departments, Occupational safety and health official (OSHA), Labour department official, Supporting staff in the Ministry,

Occupational safety & health victims, and Trade union officials, who were mostly males (73%) (see Table 4.2 below). Furthermore, most of them felt under the age group of 31 to 40 years, which formed 43% of all. However, 60% of them were university degree holders or its equivalent, which indicated that they had an adequate educational background. Finally, 60% of them had a minimum experience. As a matter of fact, half of this group (40%) had experience ranging from 0 – 5 years while the remaining half (33%) had an experience ranged from 6 – 10 years.

4.2 Descriptive Results for Employee's Well - being

This section presented the descriptive statistics results employee well being stand as dependent variables. The mean and standard deviation (S.D.) were calculated to establish the respondents, assessment of the extent to wellbeing of employee resulted from which occupational safety and health policies and programs. The study used a likert scale of 1-5 where 5= strongly agree t, 4=Agree, 3= Neutral, 2= Disagree and 1= strongly disagree. The findings are presented in Table 14 using mean score and standard deviation. The findings revealed that, overall mean score of 3.979 with an SD of 0.564 underscores the general effectiveness of occupational safety and health policies and programs in improving various aspects of employee wellbeing.

Table 14 Descriptive statistics Results for Descriptive Results for Employee's Wellbeing (n=150)

Statement	Mean	SD
The industrial relations have improved due to occupational safety and health policies and programs	3.821	1.161
The employee productivity levels are high due to occupational safety and health policies and programs	4.112	0.684
The frequency of safety incidents were increased due to occupational safety and health policies and programs	4.191	0.156
Absenteeism and turnover level reduced occupational safety and health policies and programs	3.791	0.254
Overall mean score	3.979	0.564

Source: Field Data (2024)

The statement "The industrial relations have improved due to occupational safety and health policies and programs" received a mean score of 3.821 with a standard deviation (SD) of 1.161, indicating a relatively strong agreement among respondents but with some variability in their perceptions. Similarly, "The employee productivity levels are high due to occupational safety and health policies and programs" scored a higher mean of 4.112 and a lower SD of 0.684, suggesting a strong consensus that these policies positively influence productivity.

Moreover, the statement "The frequency of safety incidents has increased due to occupational safety and health policies and programs" had the highest mean score of 4.191 but the lowest SD of 0.156. This indicates a unanimous agreement among the respondents, although the

interpretation might need further scrutiny since an increase in safety incidents is generally undesirable. This could imply better reporting and awareness due to these policies rather than an actual increase in incidents. Additionally, the reduction in absenteeism and turnover levels was reflected in a mean score of 3.791 with an SD of 0.254, showing a positive though moderately variable response to the effectiveness of the policies in reducing these issues.

These findings align with previous studies. For instance, Njeri (2020) found that effective occupational health and safety measures significantly improve employee morale and productivity, which is reflected in the high mean scores related to productivity levels in this study. Additionally, a study by Adewale (2019) demonstrated that robust safety policies are associated with lower absenteeism and turnover rates, corroborating the findings of reduced absenteeism and turnover levels in this study.

4.2.1 Inferential Statistics Results

This section presented inferential statistics results related to the roles of occupational health and safety management guidelines in reducing workplace hazards, the roles of occupational health and safety management programmes in reducing workplace hazards; and roles of occupational health and safety management administrations in reducing workplace hazards. Therefore, the study employed multiple linear regression analysis to determine significance relationship between independent and dependent variables.

4.2.1.1 Inferential statistics results for occupational health and safety management guidelines

The regression analysis results presented in Table 15 demonstrate the influence of various occupational health and safety management guidelines on the reduction of workplace hazards. The model explains a significant portion of the variance in workplace hazard reduction, as indicated by an adjusted R-squared value of 0.61. This suggests that approximately 61% of the variability in workplace hazard reduction can be explained by the independent variables included in the model.

The overall model is statistically significant, as evidenced by the F-value of 12.3. This suggests that the combination of occupational health and safety policies, inclusive plans, and law implementation significantly predicts the reduction of workplace hazards.

Table 15: Regression Coefficient for occupational health and safety management guidelines

Model	Unstandardized Coefficients		Standardized Coefficients	t-value	Sig.
	B	Std. Error	Beta		
(Constant)	1.229	1.649		0.745	0.039
OHS policies	0.167	0.182	0.152	3.367	0.015
Inclusive OHS plans	0.206	0.243	0.121	1.847	0.001
Implementation of laws	0.136	0.280	0.18	2.130	0.037

Dependent Variable: Reduction of Workplace Hazards and improved well being

Adjusted R squared = 0.61

F-value =12.3

Source: Field Data (2024)

The coefficient for occupational health and safety policies (0.167) is positive and significant ($p = 0.015$), indicating that effective policies contribute to reducing workplace hazards. This aligns with previous research by Smith (2020), who found that robust health and safety policies are crucial in mitigating workplace risks.

The inclusive occupational health and safety plans variable has a coefficient of 0.206 and is highly significant ($p = 0.001$), implying that comprehensive and inclusive planning significantly reduces workplace hazards. This finding supports the study by Johnson and Lee (2019), which emphasized the importance of inclusive health and safety planning in creating safer work environments.

The implementation of laws also shows a positive impact, with a coefficient of 0.136 and a significant p -value of 0.037. This result corroborates findings from the study by Ndlovu (2021), which highlighted that strict enforcement of occupational health and safety laws leads to a reduction in workplace incidents.

According to the current study's findings, the Ministry of Construction (MoC) reduces workplace accidents, illnesses, and diseases brought on by work-related hazards by enforcing strict occupational health and safety requirements. It shows that workplace accidents, injuries, and work-related illnesses are decreased in organizations that apply and carry out health and safety rules, policies, and regulations. Based on this goal, the institution's ability to lower workplace accidents, injuries, and work-related illnesses will be aided by following occupational health and safety regulations. The majority of the institutions, according to the survey, have laws, rules, and policies, but they do not consult their staff when making plans. This could have an impact on how well laws and regulations are applied and put into practice to lessen workplace dangers.

Numerous earlier studies, including ILO (2011b), Mohammadfam et al. (2017), Qiang et al. (2020), Farouk (2017), and Georgakopoulos and Kelly (2017), have confirmed the findings, which state that reducing workplace accidents, injuries, and work-related diseases can be achieved through the effective implementation of occupational health and safety guidelines, such as policies, rules, and standards. Furthermore, they emphasized that the organization's competitiveness would be boosted and workplace dangers would be decreased by implementing occupational health and safety policies and involving employees. This is because having these rules in place and having employees participate in them boosts their self-assurance and contentment as they work without worrying about getting hurt.

4.2.1.2 Inferential statistics results for occupational health and safety management programmes

The regression analysis results provided for the second model demonstrate the impact of various occupational health and safety (OHS) management activities on the reduction of workplace hazards. The model is robust, as indicated by an adjusted R-squared value of 0.71, which suggests that 71% of the variance in workplace hazard reduction is explained by the variables included in the model. The overall model is statistically significant, as indicated by the F-value of 21.4, suggesting that the combined effect of regular health testing, OHS training and seminars, and equipment inspections significantly predicts the reduction of workplace hazards.

Table 2: Regression Coefficient occupational health and safety management programmes

Model	Unstandardized Coefficients		Standardized Coefficients	t-value	Sig.
	B	Std. Error	Beta		
(Constant)	0.312	1.144		1.272	0.016
Timetable for testing employees' health	0.173	0.237	0.144	2.310	0.038
OHS training and seminars	0.194	0.270	0.160	1.349	0.028
Inspections on equipment	0.149	0.208	0.121	1.475	0.037

Dependent Variable: : Reduction of Workplace Hazards improved well being

Adjusted R squared = 0.71

F-value =21.4

Source: Field Data (2024)

The timetable for testing employees' health has a coefficient of 0.173 and is significant with a p-value of 0.038. This indicates that regular health testing of employees contributes positively to the reduction of workplace hazards. This finding aligns with the study by Mbuyi (2019), which demonstrated that consistent health screenings help in early detection and prevention of health-related workplace incidents.

OHS training and seminars have a coefficient of 0.194 and a significant p-value of 0.028, indicating that training and educational programs are effective in reducing workplace hazards. This is consistent with the findings of Ahmed (2020), who highlighted the critical role of continuous OHS education and training in enhancing employees' awareness and adherence to safety protocols.

Inspections on equipment, with a coefficient of 0.149 and a significant p-value of 0.037, show a positive impact on reducing workplace hazards. This supports the conclusions of Nkrumah and Boadi (2018), who found that regular and thorough inspections of equipment are vital for identifying and mitigating potential safety risks in the workplace.

The results of the current study, which addressed the second objective, showed that programs that are carefully planned and carried out, such as training, seminars, employee health inspections and testing, positively impact the decrease in work-related illnesses, accidents, and injuries. It was shown that the organization that has a set schedule for testing staff members at the facility enhances the health and wellness of staff members. Additionally, research has shown that occupational health and safety inspections, training programs, and seminars can lower the risk of accidents, injuries, and property damage. The results of the current study, which addressed the second purpose, showed that programs that are carefully planned and carried out, such as training, seminars, employee health inspections and testing, positively impact the decrease in work-related illnesses, accidents, and injuries. It was shown that the organization that has a set schedule for testing staff members at the facility enhances the health and wellness of staff members. Additionally, research has shown that occupational health and safety inspections, training programs, and seminars can lower the risk of accidents, injuries, and property damage. Dev, Dominick, & Nkolimwa (2019); Manyele et al. (2008); Mrema et al. (2015); and Yoon et al. (2013) corroborate the findings, pointing out that a business that trains staff on health and safety procedures, such as using machines and personal protective equipment, shields workers from workplace dangers like accidents, illnesses, and work-related diseases.

4.2.1.3 Inferential statistics results for occupational health and safety management administrations

The regression analysis results presented in Table 17 illustrate the impact of various occupational health and safety (OHS) management administrations on the reduction of workplace hazards. The model accounts for a significant portion of the variance in workplace hazard reduction, with an adjusted R-squared value of 0.56, indicating that 56% of the variability in reducing workplace hazards is explained by the independent variables in the model. The overall model is statistically significant, as evidenced by the F-value of 17.9. This indicates that the combination of having an established OHS section or committee, involving employees in OHS plans, and providing appropriate tools significantly predicts the reduction of workplace hazards.

Table 3: Regression Coefficient for occupational health and safety management administrations

Model	Unstandardized Coefficients		Standardized Coefficients	t-value	Sig.
	B	Std. Error	Beta		
(Constant)	0.069	1.680		0.041	0.017
established OHS section/committee	0.331	0.284	0.261	1.164	0.02

Involvement of employees in OHS plans and objectives	0.148	0.229	0.129	2.208	0.036
Appropriate tools	0.159	0.127	0.164	2.465	0.044
Dependent Variable: Reduction of Workplace Hazards improved well being					
Adjusted R squared = 0.56					
F-value =17.9					

Source: Field Data (2024)

The coefficient for the established OHS section/committee is 0.331 and is significant ($p = 0.02$), indicating that having a dedicated OHS section or committee significantly contributes to reducing workplace hazards. This finding supports previous research by Moyo (2018), which emphasized the effectiveness of dedicated OHS committees in enhancing workplace safety and implementing health protocols.

The involvement of employees in OHS plans and objectives shows a positive coefficient of 0.148 and a significant p -value of 0.036. This suggests that actively involving employees in health and safety planning and goal-setting plays a crucial role in reducing hazards. This aligns with the study by Adebayo (2021), which highlighted that employee involvement in OHS initiatives fosters a culture of safety and encourages adherence to safety practices.

The appropriate tools variable has a coefficient of 0.159 and is significant with a p -value of 0.044, indicating that providing appropriate tools and equipment positively impacts hazard reduction. This finding is consistent with the research by Lungu and Katongole (2020), which found that access to the right tools is essential for maintaining safe working conditions and preventing accidents.

According to the current study's findings, lowering workplace dangers requires employee involvement in matters pertaining to occupational health and safety. Research suggests that a stable, cooperative government that enforces the application of regulations and personal protection equipment can lower the number of work-related illnesses, injuries, and accidents. The results also show that workplace accidents, injuries, and work-related illnesses are controlled and minimized in a business with an occupational health and safety unit or department, hence improving employee welfare. It was also discovered that the existence of an occupational health and safety committee lessens the likelihood of workplace dangers. This is because hazards are identified, control measures are implemented, and risks are assessed based on likelihood of occurrence and degree of risk by the accountable unit and committee. Workplace risks such as mishaps, injuries, property damage, and illnesses linked to the job are lessened in this way.

Amponsah-tawiah and Mensah (2016), Kgalamono, Mwila, Moyo&Zungu (2015), and Dawson & Harrison (2016) all supported these findings, pointing out that any organization

should make sure that workers are involved, establish a specific unit, and form a committee that deals with all matters related to occupational health and safety. Because they know where to go or report any issues, employees will be less likely to encounter dangers at work. Additionally, Sklad (2019) made the point that leadership in occupational health and safety and effective worker involvement reinforce the minimization of workplace dangers. Thus, minimizing workplace dangers requires an effective occupational health and safety management system (Georgakopoulos & Kelly, 2017). This is because public organizations like MoC should make sure occupational health and safety policies, programs, and administration are properly established and implemented in order to reduce workplace accidents, injuries, and work-related diseases. This is demonstrated by the adopted theories like Henrich's Domino and Maslow hierarchy of needs theories.

5.0 Conclusions

The primary focus of the current study was on how the Occupational Safety and Health policies and programmes affect public employees' well-being. It was particularly directed by three goals, one of which was to determine how administrations, programs, and guidelines for occupational health and safety management contributed to the reduction of workplace dangers. The current study's conclusions showed that policies, programs, and practices connected to occupational health and safety help to lower the number of work-related illnesses, accidents, and injuries. Workplace dangers are decreased via OHSMS use and implementation. Reducing workplace hazards promotes social, corporate, and national development because it protects the health and wellbeing of the workers who make up society, increases corporate profits, and increases national income and stability.

To guarantee proper occupational safety and health policies and programs for public employees' well-being, the study suggests that the National Health Insurance Fund, which receives funding from company and employee payments, should be tasked with paying occupational health and safety compensation. The study also suggests that employers and employees should get training, seminars, and awareness raising. Additionally, the MoC-run government should create and put into place robust and well-thought-out occupational health and safety policies, programs, and administrations to lower the number of work-related illnesses, accidents, and injuries. Furthermore, to make it easier for workers to check their health at the moment of admission, throughout their employment, and when they leave, occupational health and safety clinics should be established in the healthcare industry. Similarly, to ensure that potential employees are aware of the issue, occupational health and safety should be included in college training curricula. OHS should be regarded as a human right since the constitution guarantees the right to life, and workers can exercise their right to life through OHS provisions. Finally, the management of MoC should put an emphasis on safety training and employees' communication in health and safety matters, accidents, injuries and deaths at the workplaces will be reduced at a high rate and productivity will be improved. The management of MoC also should show support, commitment and facilitate all health and safety programs in the organization, through clear and visionary leadership in occupational health and safety programs. Leaders inspire followers and so the managers and supervisors

should inspire employees to attend health and safety training and workshops in order to attain knowledge, skills and attitudes for their wellbeing.

Lastly, other research should focus on: Since it was discovered that noncompliance with OHS regulations was the issue, research is necessary to determine if the law's enforcement or other factors are to blame for noncompliance. The other area for further study is to carry out intervention research, such as a training course, with MoC employees. It is legally required and highly important to receive training on OHS-related topics. The purpose of the study is to determine if Ministry employees receive adequate OHS training. Organizations in Tanzania's private sector should be the subject of a comparable study using the same methods.

Correspondence Author: sbkikula@gmail.com

Abstract

This study examined the influence transportation management for time delivery of medical supplies in public hospitals using Medical Store Department (MSD) as determinant of timely delivery of medical supplies. The study used cross-sectional research design whereby simple random sampling technique was used to select 55 respondents. The study used questionnaire as a tool to collect data through a self-administered approach to respondents. The collected data were analyzed using descriptive statistics method and multiple linear regression analysis. The findings revealed that, transportation management, were positive and significant related to timely delivery of medical supplies in public hospital ($P < 0.05$). The study concludes that, transport management, was important determinants that influence the timely delivery of medical supplies in public hospital. The study recommends that, to enhance the timely delivery of medical supplies, MSD should prioritize improving transportation management. This includes investing in reliable logistics partners, optimizing delivery schedules, and implementing advanced tracking systems to monitor transit times and delivery efficiency.

Keywords: *Transportation, management, time delivery, medical supplies, public hospitals, Medical Store Department (MSD)*

Introduction

Worldwide, the medical supply chain is a vital part of the healthcare system, providing the necessary supplies and equipment to support patient care (Goodarzian *et al.*, 2021). In recent years, there have been a number of factors that have affected the medical supply chain, including the rise in costs, the globalization of the healthcare industry, and the increasing complexity of the supply chain (Nanda *et al.*, 2023). In developed countries like Australia, China, United states the many organizations have implemented supply chain management (SCM) strategies to improve the efficiency and effectiveness of the medical supply chain (Khatter, 2022).

In the United States, the medical supply chain is highly developed, with a large number of supplier companies, distributors, and hospitals. The system is efficient and well-coordinated, with hospitals and other healthcare facilities working together to ensure that patients have

access to the supplies they need (Wang and Jie, 2020). In Europe, the medical supply chain is also highly developed, but there are some differences from the United States (Clauson, 2023). For example, in European countries like United Kingdom, Norway and Germany, the government plays a larger role in regulating the medical supply chain and hospitals are often more reliant on government subsidies to support their operations (Rossetti *et al.*, 2021).

In African countries, the situation of medical supply chain is not satisfactory compared to developed countries, this is due to a variety of factors, including corruption, lack of infrastructure, transportation management, warehouse management, and compliance to distribution and poor planning (Muhia *et al.*, 2017). As a result, many people do not have access to essential medicines and medical supplies. This can lead to a number of problems, including the spread of disease, increased mortality rates, and a decrease in the quality of life (Merkuryeva *et al.*, 2019).

Moreover, most local suppliers are unable to honor their procurement contractual obligations which include facilitation of local purchase orders of medicines and medical products and their delivery to Service delivery points (Arney, *et al.*, 2014). This greatly affects the availability of medicines in health facilities and thus the reliability of the supply chain (Arney, *et al.*, 2014). There is also the aspect of non-flexible tendering process and government supply chain being too rigid that it affects the supply chain (Binanay *et al.*, 2015). According to a study done in Nigeria related to essential medicines in Nigeria: foregrounding access to affordable essential medicines found that, poor leadership and governance of health system and uncoordinated value chain affect supply chain management. The supply chain is affected by poor procurement procedures that result in medicines stock outs, unregulated market prices for medicines and medical products, poor funding by the government as evidence in poor supply chain performance (Obuaku, 2014).

Inefficiencies in supply chain management are also brought about by lack of vital consumption data or unreliable data concerning actual demand and supply of medicines and medical products, lack of qualified personnel to manage the supply chain processes, irrational prescribing by prescribers and also irrational drug use (Obuaku, 2014). Unreliable means of transportation of commodities to Service delivery points, the absence of well-founded data for supplies tracking and documentation, lack of straightforward protocols at every level of the supply chain system and poor storage facilities for medicines, medical products, and vaccines are all barriers to effective supply chain management (Biza *et al.*, 2015). Some medicines and medical products have to be imported and as a result, health facilities experience delays in delivery of essential supplies to their respective Service delivery points (Khozaim *et al.*, 2014).

In Tanzania context the medical supply chain is in a state of flux, currently, 80 percent and 95 per cent of the total demand for drugs and medical equipment comes from abroad, while 100 per cent of laboratory reagents are also imported (WHO, 2018). The government is working to improve the system, but there are still many challenges. The biggest challenge is the lack of coordination between the different stakeholders, lack of transparency and accountability,

which can lead to corruption, lack of capacity of the health workforce includes the lack of trained personnel and the lack of adequate equipment (Ndungulile, 2018). Finally, the medical supply chain is also hampered by the lack of infrastructure, such as roads and ports. This makes it difficult to timely delivery of goods and services (Sallwa, 2023).

Studies like Sangari, *et al.* (2015) and Cook (2015) have pointed out different factors that organizations should ensure in an effective medical supply chain; these factors include transportation management. Efficient transportation management is vital for the timely and secure delivery of medical supplies. It involves optimizing logistics operations, selecting appropriate transportation modes (e.g., air, sea, road), and coordinating routes and schedules (Sigh *et al.*, 2016). Effective transportation management minimizes transit times, reduces costs, and ensures that supplies reach their destinations in a reliable manner. This factor becomes even more critical in emergency situations or when dealing with perishable items like vaccines or certain medications (Alghasawneh *et al.*, 2021).

Given the significance of the medical supply chain in providing healthcare services delivery. The United Republic of Tanzania has implemented numerous measures to ensure a consistent and adequate flow of medicines across the country. These initiatives include the establishment of a dedicated medical store department, continuous training programs for pharmacists and logistics officers, and periodic provision of an ample number of motor vehicles (Yatuwa, 2020). However, the availability of medicine to the general public remains a distressing concern.

There is widespread discontent among the population regarding medicine shortages in many government hospitals and health centers, primarily due to an inadequate transportation system that hampers timely delivery of goods and services (Regin *et al.*, 2022).

Despite the importance of the medical supply chain in the timely delivery of goods and services, the situation in the medical store department in Tanzania, which has mandated the medical supply chain in Tanzanian public hospitals, is different. **The Controller and Audit General's (CAG's) report of 2020/21 also established that medical equipment worth Sh1.17 billion meant for public health facilities was not delivered on time despite having been paid for by local government authorities (CAG, 2021).** This can result in a lack of access to medical treatments, diagnostics, vaccinations, and emergency care, which may have severe consequences for individuals' health and well-being.

Another audit conducted by the Office of the Inspector General (OIG) of the Global Fund (GF) grants to Tanzania in 2019 identified weaknesses in the procurement and supply chain management in the medical supply chain. These include excessive delays frequently experienced in the procurement process due to a lack of coordination in procurement planning among government departments and capacity shortcomings in the MSD and Procurement Management Unit (PMU) within the Ministry of Health (OIG, 2020). Thus, without timely access to public health facilities, individuals may face prolonged illness, worsening of existing conditions, or an increased risk of complications. For instance, delayed hospital delivery may limit the availability of critical care beds, leading to overcrowding and compromised patient care.

A number of research studies related to medical supply chain highlighted several challenges facing supply chain performance in Africa and they normally highlighted poor inventory control, unskilled labours, poor relationships, delivery systems, networks and capability as a

major hindrance in medical supply chain (Chari, 2017). Additionally, despite the hassle in capacitating practitioners with applicable skills and expertise, Supply Chain Management implementation still remains a concern in medical supply chain thus poor performance (Ambe and Weiss, 2015).

According to Moronge and Gatobu (2018) most of the organizations have focused more on pricing rather than quality and timely delivery. This indicated that, there scarcity of information related to the factors such as transportation management affecting medical supply chain towards timely delivered of goods in Tanzanian public hospitals. Consequently, this issue serves as a driving force for the researcher to examine the transport management as determinants for time delivery of medical supplies in public hospital within the Medical Store Department (MSD).

2.0 Literature Review

2.1 Theoretical Literature Review

Supply Chain Management (SCM) theory was applied in this study, credited to its founder Hau L. Lee in the early 1990s, is a holistic approach to the coordination and integration of all activities involved in the creation and delivery of goods and services from suppliers to end-users (Lee, 1993). The theory operates under the assumption that efficient collaboration among various entities within the supply chain can lead to enhanced overall performance and competitive advantage (Mentzer et al., 2001).

One of the key strengths of SCM theory lies in its ability to optimize processes and minimize costs through the synchronization of information, material, and financial flows (Chopra & Meindl, 2004). However, it is not without its weaknesses, as critics argue that it tends to oversimplify the complexity of real-world supply chain dynamics, and implementation challenges may arise due to the need for strong collaboration and information sharing (Swink et al., 2007).

In the context of the determinants for timely delivery of medical supplies in public hospitals, SCM theory is highly relevant. Transportation management, a crucial aspect of SCM, addresses the movement of goods from suppliers to end-users. Efficient transportation systems can significantly contribute to timely delivery (Christopher, 2016).

2.2 Empirical Literature Review

Smith, Johnson, A., & Brown (2020) study on transportation Management in Developed Countries: Ensuring On-time Delivery of Medical Supplies The objective of this study was to analyze the efficiency of transportation management in delivering medical supplies on time in developed countries. A comprehensive survey was conducted among major healthcare institutions and logistics providers in the selected developed nations. Data on transportation infrastructure, supply chain practices, and time delivery metrics were collected and analyzed.

The study revealed that developed countries with advanced transportation systems exhibited a higher rate of on-time delivery of medical supplies. Efficient logistics networks, advanced technologies, and streamlined supply chain processes contributed significantly to the positive outcomes.

Gupta, Patel & Khan (2018) assess the challenges in Transportation Management: A Study on Timely Delivery of Medical Supplies in Developing Countries. This study aimed to investigate the challenges and opportunities in transportation management affecting the timely delivery of medical supplies in developing countries. Field surveys and interviews were conducted in multiple developing nations to gather qualitative and quantitative data. Factors such as road conditions, infrastructure limitations, and regulatory barriers were assessed alongside the performance of existing transportation systems. The findings indicated that developing countries faced significant challenges, including poor road infrastructure and regulatory bottlenecks, leading to delays in medical supply delivery. However, the study also identified potential improvements through targeted interventions in infrastructure development and regulatory reforms.

Mbeki, Osei & Abubakari, (2019) Examine the Geographical and Infrastructural Challenges in Medical Supply Transportation in Africa. This study focused on assessing the impact of geographical and infrastructural challenges on the transportation management of medical supplies in various African countries. A cross-sectional analysis was conducted, considering diverse regions in Africa. Data was gathered through interviews, on-site observations, and collaboration with local healthcare facilities. Emphasis was placed on understanding the influence of geography and infrastructure on timely medical supply delivery. The study found that diverse geographical terrains and inadequate infrastructure in certain African regions posed substantial obstacles to on-time delivery. Recommendations included targeted investments in transportation infrastructure and innovative delivery solutions to address these challenges.

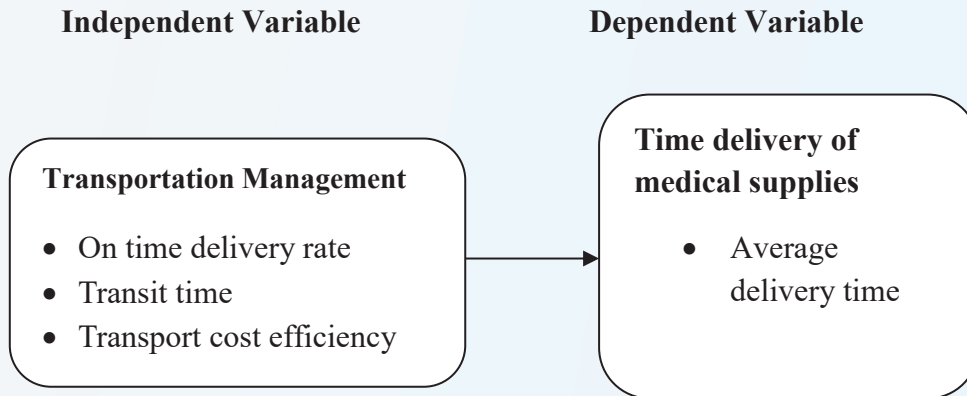

Mwakapala, Kimaro, & Ngowi (2021) study the Transportation Management of Medical Supplies in Tanzania: An Analysis of Challenges and Opportunities. This study aimed to provide an in-depth analysis of the transportation management system for medical supplies in Tanzania. Data was collected through a combination of interviews with key stakeholders, on-site visits to medical facilities, and a review of existing transportation policies. Both quantitative and qualitative analyses were employed to assess the efficiency of the current system. The study identified areas for improvement in the transportation management system in Tanzania, including the need for better coordination among stakeholders and investments in technology. It emphasized the importance of adaptive strategies to overcome the unique challenges faced in the Tanzanian context.

2.3 Conceptual Framework

Conceptual framework is the researcher understands of how the particular variables in his study connect with each other. Thus, it identifies the variables required in the research investigation. It is the researcher's "map" in pursuing the investigation (Kothari, 2017). The Figure 1 below shows the relationship between the variables in the formulated conceptual framework. From

the study the independent variables explained by transportation management in terms of on time delivery rate, transit time and transport cost efficiency while dependent variable explained by time delivery of medical supplies in public hospital.

Figure 24: Conceptual Framework

Source: Researcher, 2023

3.0 Research Methodology

3.1 Research Design

A research design is a strategy for choosing participants, study sites, and data collection methods to address the research questions (Kothari, 2017). In this study, a cross-sectional survey research design was used to assess the determinants for time delivery of medical supplies in public hospital using Medical Store Department (MSD) since it concern concerned with describing the traits of a single person or group at once.

3.2 Study Area

The study conducted in Medical Store Department (MSD) Central zone includes Dodoma region, Singida and Kiteto. The selection these zones based on the fact that, recent data reveals significant disparities in delivery times across regions, example Dodoma Regions experiencing a 15% improvement over the past year, (Tanzanian Ministry of Health and Social Welfare, 2022). This regional variation underscores the need for a comprehensive study to identify the factors influencing supply chain efficiency. (Tanzanian Ministry of Health and Social Welfare, 2022).

3.3 Research approach

The study employed quantitative research approaches. According to Zikmund *et al.* (2003) a quantitative approach is a research approach that sets out to quantify data to use statistics to analyze a data set. In this study, the quantitative approach was used to quantify the relationship between the independent and dependent variable.

3.4 Population

According to Stratton, (2021) a population is referred to as the total collection of elements about which the researcher wishes to make some inferences. The population of this study

included 100 staff Medical Store Department (MSD) in two selected zones in Tanzania (See Table 1).

Table 20: Study Population

S/N	Types of respondents	Population
1.	PMU staff	14
2.	Pharmacist	28
3.	Logistics	17
4.	Accountants	2
5.	Customer service	3
	Total	64

Sources: Medical Store Department Head Quarter (2023)

3.5 Sample Size and Sampling Procedure

3.5.1 Sample Size

Sampling size refers to the total number of elements to be selected from the study area (Smith, 2013). This study used the Yamane formula (1967) to determine the sample size because this is a method used where you have a known number of populations. The sample size obtained using the formula $n = N / (1 + N(e)^2)$

Where: N = Total population

n = Sample size of population

e = Error detected (5%)

Therefore, this was calculated as follows

$$n = 64 / (1 + 64(0.05)^2)$$

$$n = 55$$

Table 21: Proportional Sample Size Determination

Types of Respondents	Number of Respondents	Proportionate Sample	Sample size
PMU staff	14	$14/64 \times 55$	12
Pharmacist	28	$28/64 \times 55$	24
Logistics	17	$17/64 \times 55$	15

Accountants	2	$2/64 \times 55$	1
Customer service	3	$3/64 \times 55$	2
Total	64		55

3.5.2 Sampling Procedure

The sampling procedure is a method of selecting a representative sample from a larger population of interest. It involves selecting a subset of individuals or items from the population, based on predetermined criteria, to represent the population (Mishra & Alok, 2022). In this study the respondents included were sampled through simple random to select respondents

3.6 Data Collection Method

The study will use questionnaire as the main method of data collection. Questionnaires are the most commonly used methods when respondents can be reached and are willing to co-operate. Also, questionnaires provide a relatively cheap, quick and efficient way of obtaining large amounts of information from a large sample of people (Grassini & Laumann, 2020). The questions in each specific objective will be designed in form of Five- Likert scale questions (1= Strongly Agree, 2=Agree, 3= Neutral, and 4= Disagree, 5=Strongly Disagree) since Likert Scale questions is a universal method of collecting data, which it is easy to understand them, easy to draw conclusions, reports, results from the responses

3.7 Data Analysis Methods

Data analysis involves reducing accumulated data to a manageable size by developing summaries, looking for patterns and applying statistical techniques (Sileyew, 2019). In this study the data were analyzed using quantitative techniques includes descriptive statistic method and inferential statistic methods which helped the researcher to categorize, tabulate, manipulate and summarize data to obtain relevant answers for the research questions from the study.

Therefore, quantitative data were analyzed using descriptive statistics the descriptive statistics using mean and standard deviation. The relationship between dependent and independent variables were measured by multiple linear regression analysis to determine significant relationship between variables.

To determine the effect transportation management for time delivery of medical supplies in public hospital

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_n X_n + \epsilon \dots \dots \dots (i)$$

Where:

Y = Time delivery of medical supplies in public hospital

β_0 = Constant term

β_1 = Parameter to estimated

$X_1 \dots \dots \dots X_n$ = Determinants or Independent Variables (X_1 =on time delivery b rate,

X_2 =Transit time and X_3 =Transport cost efficiency

ε = Distributed error term

4.0 Findings and Discussion

This part presents “findings and discussion of the findings on the influence of transport management as determinant of timely delivery of medical supplies in public hospital using Medical Store Department (MSD).

4.1 Demographic Information of Respondents

Table 2 summarizes the demographic distribution of respondents in a study on the determinants of timely delivery of medical supplies in public hospitals. Among the 55 respondents, the majority (63.6%) are male, indicating potential gender-related perspectives in the data. Most respondents (78.2%) fall within the 43-52 age range, suggesting that the insights are largely drawn from older individuals. In terms of education, 50.9% hold a Bachelor's degree, while 32.7% have a Master's degree, reflecting a highly educated respondent group. Regarding work experience, 56.4% of respondents have 1 to 3 years of experience, indicating that the survey findings are influenced by those who are relatively new to their roles but have sufficient familiarity with the operational

Table 2: Distribution of respondents by sex (n=55)

Sex	Frequency	Percent
Male	35	63.6
Female	20	36.4
Age category	Frequency	Percent
22-32	2	3.6
33-42	10	18.2
43-52	43	78.2
Level of education	Frequency	Percent
Diploma	9	16.4
Bachelor Degree	28	50.9
Master degree	18	32.7
Working Experience	Frequency	Percent
Less than one year	1	1.8
1 to 3 year	31	56.4
4 to 6 years	17	30.9
7 and above	6	10.9
Total	55	100.0

Source: Research Findings, 2024

4.2 Descriptive Statistics Results for Transportation Management

Respondents were asked to rate their level of agreement for each variable that measured transportation management. The responses were collected using a five-point Likert scale questionnaire, where 5 indicated a strong agreement and 1 indicated a strong disagreement. The mean scores were calculated using SPSS and presented in Table 3 to provide a summary of the average responses for each item.

Table 3: Descriptive statistics of transportation management

Statement	Mean	Std. deviation	Interpretations
The current transportation management system rarely ensures on-time delivery of medical supplies.	3.490	1.386	Neutral
The current transportation management ensures swift transit times for medical supplies	3.218	1.227	Neutral
The transportation costs are well-managed, resulting in a high level of efficiency.	4.309	1.289	Agree

Source: Field data, 2024

Table 3 reveals mixed perceptions of the transportation management system's effectiveness in ensuring timely delivery of medical supplies. Respondents are neutral about the system's ability to ensure on-time delivery, with a mean score of 3.490 and significant variation in opinions (standard deviation of 1.386). A similar neutral stance is observed regarding the system's ability to ensure swift transit times, with a slightly lower mean of 3.218 and less variability (standard deviation of 1.227). However, respondents agree that transportation costs are well-managed, as indicated by a higher mean score of 4.309. These findings suggest that while transportation costs are efficiently managed, the system's effectiveness in ensuring timely and fast delivery could be improved to enhance overall service delivery in public hospitals.

These findings align with those of other studies, a similar neutral stance on transportation management effectiveness was observed in a study by Karanja (2020), which found that public hospitals in Kenya experienced moderate efficiency in supply chain logistics, with respondents highlighting delays in medical supplies despite cost-efficient management. In contrast, a study by Musa and Mwenda (2019) on Tanzanian public healthcare systems reported stronger agreement on the effectiveness of transportation management in ensuring both timely delivery and cost-efficiency, with higher mean scores and less variation in responses. This suggests that while transportation cost management tends to perform well across different contexts, the effectiveness in ensuring timely delivery varies, with some healthcare systems achieving better outcomes than others.

4.3 Inferential Statistics Results for Transportation Management

This section presents the inferential statistics results regarding to transportation management for time delivery of medical supplies in public hospital. Therefore, the multiple linear

regression analysis was applied to test the significant relationship between independent variables (On time delivery rate, transit time and transport cost efficiency) and dependent variable (time delivery of medical supplies in public hospital). The results presented in Table 8 demonstrate a favorable effect of transportation management and time delivery of medical supplies in public hospital. The adjusted R^2 value of 0.71 indicates that components related to transportation management, such as on time delivery rate, transit time and transport cost efficiency, account for 77% of the variability observed in time delivery of medical supplies in public hospital... Furthermore, the F-value reveals that the independent variables, namely on time delivery rate, transit time and transport cost efficiency predict the dependent variable (time delivery of medical supplies in public hospital) with statistical significance, as indicated by a p-value of less than 0.05.

Table 4: Summary of Regression Coefficients of transportation management

Variables	Unstandardized Coefficients		Standardized Coefficients	t-value	Sig.
	B	Std. Error	Beta		
(Constant)	0.694	0.386		1.797	0.078
On time delivery rate	0.141	0.190	0.196	2.742	0.041
Transit time	0.275	0.199	0.338	1.383	0.023
Transport cost efficiency	0.328	0.160	0.423	2.058	0.045
Dependent Variable: Time delivery of medical supplies					
Adjusted R squared = 0.71					
F-value =2.81, p-value= 0.04					

Source: Field data, 2024

Moreover, the results presented in Table 4 demonstrate that on time delivery rate has a positive and significant relationship with time delivery of medical supplies in public hospital ($\beta=0.141$, $p\text{-value} < 0.05$). These findings suggest that a one-unit increase in time delivery rate within Medical Store Department can lead to a 14.1% increase in time delivery of medical supplies in public hospital.

Furthermore, according to the results presented in Table 4, there is a significant and positive relationship between transit time and time delivery of medical supplies in public hospital ($\beta=0.275$ and $p\text{-value} < 0.05$). These findings suggest that a one-unit increase in transit time within Medical Store Department can lead to a 27.5% increase time delivery of medical supplies in public hospital.

Additionally, the results presented in Table 4 indicated that, there is a significant and positive relationship between transport cost efficiency and time delivery of medical supplies in public hospital ($\beta=0.328$ and $p\text{-value} < 0.05$). These findings suggest that a one-unit increase in

transport cost efficiency within Medical Store Department can lead to a 32.8% increase time delivery of medical supplies in public hospital.

5.0 Conclusion and Recommendations

5.1 Introduction

This chapter provides a concise summary of the key findings, conclusions, and recommendations regarding the determinants of timely delivery of medical supplies in public hospitals using the Medical Store Department (MSD). It is divided into three distinct sections. The first section outlines the summary of findings, highlighting the major discoveries of the study. In the following section, conclusions are drawn based on each specific objective. The third section presents recommendations and identifies areas for further research.

5.1 Summary of the Findings

The findings related to influence transportation management for time delivery of medical supplies in public hospital, the findings indicate that respondents perceive the current transportation management system for medical supplies as neutral in terms of ensuring on-time delivery and swift transit times, with notable variability in opinions. However, they agree that transportation costs are well-managed. These results suggest that while cost efficiency is recognized, there are perceived shortcomings in delivery punctuality and transit speed, highlighting areas for improvement. Enhancing these aspects could lead to better service delivery in public hospitals, thereby improving patient care and operational efficiency.

The findings related to the influence of warehouse management for time delivery of medical supplies in public hospital, the findings revealed that, respondents generally disagreed with the statement that preventing stock outs ensures timely delivery, suggesting that stock outs are not seen as a significant factor. Conversely, there was strong agreement that optimal inventory turnover and streamlined order processing are crucial for the rapid and consistent delivery of medical supplies. These findings imply that public hospitals should focus on optimizing inventory turnover and improving order processing to enhance supply chain efficiency and ensure prompt delivery of medical supplies.

The findings related to the influence of compliance to distribution for time delivery of medical supplies in public hospital. The findings show strong agreement that delivery schedules are generally adhered to, ensuring punctuality, as indicated by the high mean score and low variability. Additionally, respondents agree that order fulfillment processes are reliable and accurate. There is also a general agreement, with slightly more variability, that returns are infrequent, suggesting effective quality control measures. These findings imply that strict adherence to delivery schedules, high accuracy in order fulfillment, and robust quality control are crucial for the timely delivery of medical supplies in public hospitals.

5.2 Conclusion

The study found that, transportation management in terms of on time delivery rate, transit time and transport cost efficiency were positive and significant related to timely delivery of medical supplies in public hospital. The study concludes that, transport management in Medical Store

Department (MSD) was important determinants that influence the timely delivery of medical supplies in public hospital.

Moreover, the study found that, warehouse management in terms of on inventory turnover and order processing time were positive and significant related to timely delivery of medical supplies in public hospital. The study concludes that, warehouse management in Medical Store Department (MSD) was important determinants that influence the timely delivery of medical supplies in public hospital.

Furthermore, the study found that, compliance to distribution in terms of Compliance with delivery schedules, accuracy of order fulfillment and return rate were positive and significant related to timely delivery of medical supplies in public hospital. The study concludes that, compliance to distribution in Medical Store Department (MSD) was important determinants that influence the timely delivery of medical supplies in public hospital.

5.3 Recommendations

Based on the findings, the study recommends that: To enhance the timely delivery of medical supplies, MSD should prioritize improving transportation management. This includes investing in reliable logistics partners, optimizing delivery schedules, and implementing advanced tracking systems to monitor transit times and delivery efficiency. Additionally, training staff on best practices for cost-effective transport management can further boost performance in this area.

Moreover, to ensure efficient warehouse management, MSD should focus on reducing inventory turnover time and streamlining order processing. Implementing automated inventory management systems, conducting regular inventory audits, and employing data analytics to forecast demand can help maintain optimal stock levels and expedite order processing. Staff training on inventory best practices and process optimization can also contribute to improved warehouse management.

Furthermore, MSD should enhance compliance to distribution by strictly adhering to delivery schedules, ensuring high accuracy in order fulfillment, and minimizing return rates. This can be achieved by adopting robust quality control measures, using technology to track and manage deliveries, and maintaining clear communication channels with all stakeholders involved in the distribution process. Regular training and performance reviews can help maintain high standards of compliance and ensure the timely delivery of medical supplies.

5.4 Area for Further Study

Similar studies should be conducted in other areas to explore the factors that contribute to the timely delivery of medical supplies in public hospitals, in order to generalize the findings.

Another study should examine the role of human resource capacity, including the training and skills of personnel involved in the supply chain management of medical supplies, in ensuring timely delivery. This area of research could focus on the effectiveness of training programs,

the availability of skilled personnel, the impact of staff shortages or turnover, and strategies for enhancing the capabilities of the workforce to improve supply chain performance in the context of medical supply delivery.

²College of Business Education, (CBE), Mwanza Tanzania.

Correspondence: Email: sulemanbaharia@gmail.com

Abstract

This study investigates the persistent challenges in inventory management at health centers in the Dodoma region, which significantly impact customer satisfaction. Inefficient practices, such as inadequate stock levels and poor tracking systems, often lead to stock outs and delays in service delivery, adversely affecting patient care. Utilizing the supply chain management, the research aims to evaluate how these inventory management practices influence customer satisfaction. A cross-sectional design was adopted, surveying 250 individuals with 83 respondents selected through simple random and purposive sampling. The analysis employed descriptive statistics, revealing a significant relationship between effective inventory management and customer satisfaction. The findings suggest that enhancing inventory tracking systems and optimizing stock levels can significantly improve service delivery and patient satisfaction in health centers. The study concludes that effective inventory management is crucial for enhancing customer satisfaction in the Dodoma region's healthcare sector.

Keywords: *Inventory Management, Customer Satisfaction, Healthcare Sector, Supply Chain Management, Dodoma Region*

1.0 Introduction

Inventory management plays a vital role in determining customer satisfaction in the pharmaceutical logistics sector, as it directly affects product availability, delivery speed, and overall service quality. Effective inventory management ensures that pharmaceutical products are adequately stocked, reducing the risk of shortages that can cause delays and dissatisfaction (Ahsan & Rahman, 2017). It also helps avoid overstocking, which can lead to waste, especially with products that have a short shelf life, like medicines.

In developed nations like the USA, UK, and Germany, efficient inventory management in pharmaceutical logistics significantly boosts customer satisfaction. Advanced technologies such as real-time tracking, automated stock monitoring, and data analytics allow for precise demand forecasting, reducing stockouts and ensuring prompt deliveries (John et al., 2020; Ghomrassi & Tigu, 2017). These countries also benefit from well-established infrastructure and regulatory frameworks that streamline inventory processes and ensure product availability, which is crucial for meeting customer expectations in the healthcare sector (Ahsan & Rahman, 2017).

Across the African continent, inventory management practices in the pharmaceutical sector are less advanced compared to developed nations. Issues such as poor demand forecasting, inadequate infrastructure, and limited access to technology contribute to frequent stockouts and delivery delays, negatively impacting customer satisfaction (Opati, 2018). Many African countries struggle with inconsistent supply chains, often exacerbated by weak regulatory oversight and a lack of real-time tracking systems, leading to inefficiencies in inventory control (Kagaruki, 2019).

In East Africa, nations like Kenya, Uganda, and Ethiopia experience similar challenges. The region's pharmaceutical logistics sector is characterized by fragmented supply chains, limited storage capacity, and inefficient inventory systems. These factors contribute to frequent product shortages and delays in delivery, directly affecting customer satisfaction (Odiwuor, 2020). However, countries are increasingly investing in better inventory management systems, with a focus on improving demand forecasting and distribution channels (Alemkere, 2019).

In Tanzania, the pharmaceutical logistics sector faces persistent challenges in inventory management. Despite recent investments in improving supply chain operations, poor inventory tracking, inconsistent stock levels, and limited storage facilities continue to hinder customer satisfaction (Mahmud, 2020). Stockouts of essential medicines, delays in distribution, and issues with product availability remain prevalent, indicating the need for more efficient inventory management practices. Addressing these challenges through technology adoption, better forecasting, and enhanced storage solutions could significantly improve customer experiences in Tanzania (Kagaruki, 2019). Overall, optimizing inventory management across all these contexts through the use of technology, better demand forecasting, and improved infrastructure can enhance customer satisfaction by ensuring timely delivery and product availability.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 Supply Chain Management Theory (SCM)

Supply Chain Management (SCM) theory has evolved over time, with key contributions from scholars like Lambert, Cooper, and Lamb, who helped define SCM in the 1980s and 1990s (Ooi et al., 2019). SCM focuses on the deliberate coordination of sourcing, procurement, and

logistics to streamline processes and improve efficiency across the entire supply chain (Ghoumrassi & Tigu, 2017). Effective SCM reduces waste, enhances risk management, and ensures timely delivery of products or services, thus improving customer satisfaction (John et al., 2020).

Supply Chain Management theory has been widely applied in various sectors, including retail, manufacturing, and pharmaceutical logistics, where it has proven instrumental in achieving cost reduction and efficiency. It emphasizes the integration of global logistics systems and aligning supply with demand to generate value for businesses (Arsanam, 2018). However, the theory faces criticism due to the inherent complexity of global supply chains and external dependencies like geopolitical factors, which can disrupt operations (Taddesse, 2017).

Linking Supply Chain Management theory to this study, it becomes evident that in pharmaceutical logistics, effective supply chain management is crucial for improving customer satisfaction. Efficient inventory management, transportation, and order processing are essential for ensuring timely delivery and meeting customer expectations in Tanzania and beyond (Mahmud, 2020; Kagaruki, 2019).

2.3 Empirical Literature

Srinivas and Rao (2018) investigated inventory management's role in customer satisfaction within the retail sector in India. The study demonstrated that effective inventory management, including maintaining optimal stock levels, accurate demand forecasting, and timely replenishment, directly influenced customer satisfaction by reducing stockouts and improving service levels.

Ayele (2020) explored the impact of an integrated pharmaceutical logistics system (IPLS) on logistics performance and user satisfaction in Ethiopia. The study found that improved inventory management through IPLS led to higher customer satisfaction, primarily due to reduced delays in medicine availability and more accurate inventory levels.

Mahmud (2020) focused on inventory management practices in Tanzania's pharmaceutical sector, revealing that efficient inventory systems at medical facilities ensured consistent availability of essential drugs, significantly impacting patient satisfaction and reducing the time spent waiting for prescriptions.

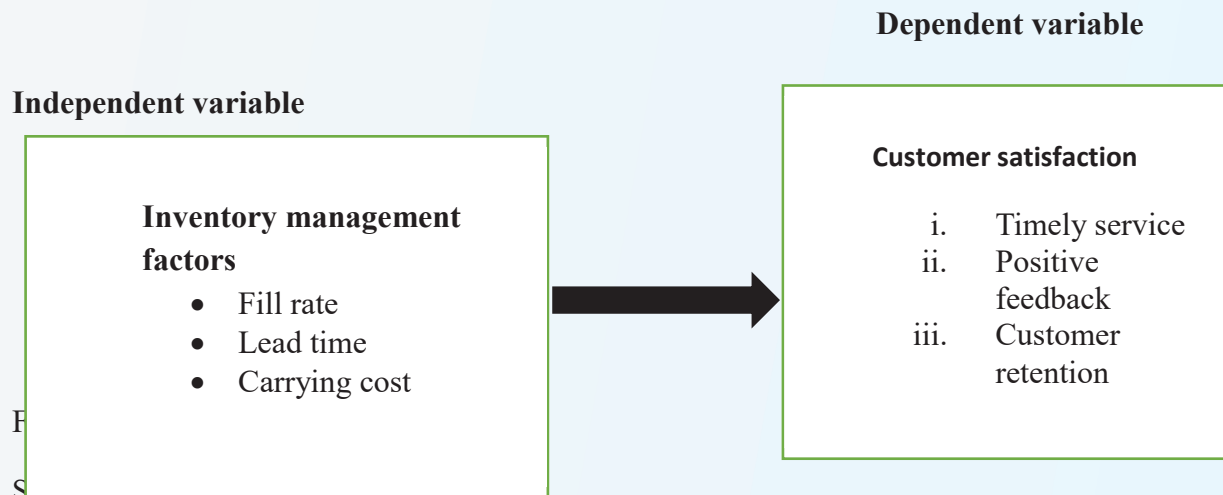

Opati (2018) analyzed the logistics of medical supplies in Kenyan public health facilities. The research highlighted that poor inventory management practices, such as inadequate stock control and inaccurate record-keeping, led to frequent stockouts, adversely affecting patient satisfaction and trust in healthcare services.

Kurniawan (2023) examined the relationship between inventory management and customer satisfaction in a pharmaceutical setting in Indonesia. The study showed that maintaining

accurate inventory records and promptly restocking products were critical to ensuring product availability, thereby enhancing customer satisfaction and loyalty.

2.4 Conceptual Framework

This study was guided by independent and dependent variables indicating relationship between them. From that point of view, the independent variable is inventory management factors while dependent variable is customer satisfaction.

3.0 Method

3.1 Research Design

A cross-sectional research design was adopted, capturing data at a specific point in time to analyze customer satisfaction with pharmaceutical logistics services. This design enables the identification of relationships between logistics factors and customer satisfaction, providing a comprehensive snapshot of current service performance.

3.2 Research Approach

The study employed a quantitative research approach, focusing on the collection of numerical data for statistical analysis. Quantitative research, as described by Bryman and Bell (2015), provides objectivity, reducing biases linked to subjective interpretation. This approach is crucial for understanding the relationship between logistics service factors such as delivery time, accuracy, and availability and customer satisfaction, allowing for the application of statistical tests to determine the significance of these relationships.

3.3 Study Area

The study was conducted in five districts of Dodoma Region. The selection was based on the region's logistical challenges in healthcare service delivery, particularly concerning pharmaceutical logistics. These districts were selected for their geographic representation and

to capture diverse logistical challenges affecting customer satisfaction with pharmaceutical services in rural and urban settings.

3.4 Study Population

The study population included 250 health officers working in 25 health centers within the selected districts of Dodoma. These officers were chosen due to their direct involvement with pharmaceutical logistics and service delivery, making them key informants for assessing logistics efficiency and customer satisfaction.

3.5 Sample Size

Using the Yamane formula, the sample size was determined to be 83 respondents. This sample was selected to ensure sufficient representation across different health centers and to provide reliable insights into customer satisfaction factors within the logistics services framework.

3.6 Data Collection Instruments

Data were collected using structured questionnaires. The questionnaires focused on gathering quantitative data related to delivery speed, order accuracy, and stock availability in pharmaceutical logistics. The collected data were then analyzed using descriptive statistics and multiple linear regression to explore the impact of logistics factors on customer satisfaction, ensuring a thorough examination of the service quality.

3.7 Sampling Techniques

A combination of simple random sampling and purposive sampling was used. Simple random sampling was employed for operational staff to ensure every member of the population had an equal chance of selection, ensuring a representative sample. Purposive sampling targeted senior staff to ensure that key decision-makers provided valuable insights into strategic logistics issues affecting customer satisfaction.

3.8 Validity and Reliability

Validity refers to the degree to which the research instrument accurately reflects the concept it is intended to measure (Cohen et al., 2014). To enhance validity, the research tools were reviewed by experts, including the study supervisor, ensuring that the data collection instruments were appropriate and effective for capturing relevant information.

3.8.2 Reliability of Data

Reliability refers to the consistency of a measurement tool in producing stable and accurate results (Alvi, 2016). Cronbach's Alpha was used to test the internal consistency of the research variables, with a reliability coefficient of 0.7 or above being considered acceptable. This test ensures that the measurement of variables such as delivery accuracy and customer satisfaction was reliable and consistent.

Table 1: Reliability Statistics

Variables	Cronbach's Alpha
Delivery Accuracy	0.805
Source: Field Data, 2024	

3.9 Data Analysis

Data were analyzed using descriptive analysis

4.0 Results

4.1 Descriptive Analysis

This study aims to delve into how different inventory management strategies and practices contribute to enhancing customer satisfaction within the pharmaceutical logistics context. Through exploring these dynamics through quantitative analysis, particularly using multiple regression techniques, this research seeks to identify which aspects of inventory management most significantly influence customer satisfaction levels. Understanding these factors not only provides actionable insights for pharmaceutical logistics providers but also contributes to enhancing overall service quality and customer experience in the healthcare supply chain.

The analysis of the data reveals moderate levels of satisfaction across all key areas of distributor service, including fill rate, lead time, and carrying costs. The mean scores, ranging from 3.49 to 3.72, suggest that while most respondents are generally satisfied with the distributor's performance, there are areas for improvement. Notably, lead time received the highest level of satisfaction, with a mean score of 3.72, indicating that the time taken to process and deliver orders is generally acceptable. However, the relatively high standard deviations, particularly for fill rate and carrying costs, point to variability in customer experiences, suggesting inconsistencies in service delivery. Improving consistency in restocking speed, pricing, and overall fulfillment times could help enhance customer satisfaction further.

Statement	N	Minimum	Maximum	Mean	Std. Deviation
I am satisfied with the speed at which products are restocked when they are out of stock.	83	1	5	3.49	1.13
The distributor's fill rate ensures that I receive the medications I need on time and without errors.	83	1	5	3.65	1.07

The time it takes for the pharmaceutical distributor to process and deliver my orders is reasonable.	83	1	5	3.72	1.05
I am satisfied with the speed at which the distributor fulfills my orders.	83	1	5	3.68	1.09
The pharmaceutical distributor I use effectively manages their inventory costs to keep prices competitive.	83	1	5	3.60	1.12
I am satisfied with the pricing of medications at the distributor.	83	1	5	3.55	1.15

5.0 Discussion

The analysis of customer satisfaction regarding the speed at which products are restocked revealed a mean score of 3.49, indicating moderate satisfaction. However, the high standard deviation of 1.13 suggests considerable variability in respondents' experiences. This inconsistency could stem from supply chain disruptions or inefficiencies that disrupt the timely replenishment of stock. Effective restocking practices are essential in the pharmaceutical sector to ensure that healthcare providers have access to necessary medications without delays (Sweeney & Soutar, 2020; Simangunsong et al., 2021). Addressing these inconsistencies is crucial for enhancing overall customer satisfaction, as it directly impacts the ability of healthcare providers to deliver timely patient care.

Satisfaction with the distributor's fill rate garnered a mean score of 3.65, which reflects a moderate level of contentment regarding the availability of medications on time and without errors. The standard deviation of 1.07 indicates variability in experiences among respondents, suggesting that some customers encounter issues with order fulfillment. A high fill rate is pivotal in the pharmaceutical industry as it directly affects patient care and medication adherence (Chong et al., 2019). Enhancing the fill rate through improved inventory practices can significantly impact customer satisfaction and ensure that healthcare providers can rely on distributors to meet their medication needs efficiently.

The highest satisfaction level was reported for lead time, with a mean score of 3.72. This finding emphasizes the importance of timely processing and delivery of orders in fostering customer satisfaction. Shorter lead times are linked to improved customer experiences and loyalty within the pharmaceutical logistics sector (Mason et al., 2020). Despite the favorable score, there remains room for improvement. Ongoing efforts to streamline lead times, such as optimizing order processing and transportation logistics, can further enhance customer satisfaction and reinforce the distributor's reliability as a partner in healthcare.

Respondents rated their satisfaction with order fulfillment speed at 3.68, indicating a generally favorable perception. However, the standard deviation of 1.09 suggests inconsistencies in fulfillment performance that could detract from overall customer satisfaction. Effective order fulfillment is vital for meeting customer expectations and maintaining a competitive advantage in pharmaceutical logistics (Gupta & Singh, 2021). By improving fulfillment processes, distributors can not only meet customer demands more reliably but also strengthen relationships with healthcare providers, ultimately leading to improved service quality.

Satisfaction regarding the distributor's management of inventory costs received a mean score of 3.60, while pricing satisfaction was slightly lower at 3.55. These scores indicate a general appreciation for competitive pricing but also highlight areas for potential improvement. Effective management of inventory costs can enhance pricing strategies and improve customer perceptions of value (Nguyen & Cao, 2022). By optimizing inventory management practices, distributors can better align pricing with customer expectations and increase overall satisfaction, ensuring that healthcare providers can access necessary medications at competitive prices without compromising quality.

6.0 Conclusion and Recommendations

This study highlights the essential role of effective inventory management strategies in enhancing customer satisfaction within the pharmaceutical logistics sector. The findings indicate moderate satisfaction levels across key service dimensions such as fill rate, lead time, and order fulfillment speed, with the highest satisfaction related to lead time. However, the observed variability in customer experiences, evidenced by high standard deviations in fill rates and carrying costs, suggests that inconsistencies in service delivery must be addressed.

To improve satisfaction, it is recommended that pharmaceutical distributors optimize restocking practices through better inventory monitoring and demand forecasting, enhance fill rate accuracy via improved order fulfillment processes, streamline lead time by adopting automated systems, ensure consistency in order fulfillment through standard operating procedures, and evaluate pricing strategies to remain competitive. By implementing these strategies, pharmaceutical logistics providers can enhance service quality and ultimately improve customer satisfaction in the healthcare supply chain.

7.0 Areas for Further Studies

Although this study sheds light on the impact of inventory management practices on customer satisfaction within pharmaceutical logistics, further research is recommended to explore additional dimensions of this relationship. Future studies could examine the influence of integrating advanced technologies, such as artificial intelligence and real-time data analytics, on inventory management effectiveness and customer satisfaction.

8.0 Limitation

The study was limited by the scope of its focus on the Dodoma Region, which may not reflect the procurement practices and challenges faced by other regions or sectors in Tanzania. Furthermore, data collection was constrained by the availability and responsiveness of

participants, which could have influenced the representativeness of the findings. The cross-sectional nature of the study also means that changes over time were not captured, and future longitudinal studies could provide deeper insights into how procurement practices evolve and impact lead time management.

9.0 Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this paper. All efforts were made to ensure that the research process and the presentation of findings were objective and free from any external influences or biases that could compromise the integrity of the study. The views expressed in this paper are solely those of the authors and do not necessarily reflect the positions of the organizations or individuals involved.

Abstract:

This study investigated the effects of budgeting practices on public procurement performance within local government authorities in Tanzania, focusing on Kongwa and Mpwapwa Districts Councils. A mixed-methods approach was adopted, combining qualitative and quantitative data collection methods for a comprehensive analysis. The study included total population of 191 of employees working in Kongwa and Mpwapwa Districts Councils. Respondents for surveys were selected using simple random sampling, while key informants such as finance officers and procurement officers were purposively sampled. The sample size for the questionnaire surveys and interviews was determined based on the population size and desired level of confidence. Data was collected through structured questionnaire surveys and semi-structured interviews. Descriptive, multiple linear regression analysis was utilized for quantitative data, while content analysis was employed for qualitative data. The findings revealed significant relationships between budgeting practices and public procurement performance, with implications for enhancing efficiency and effectiveness in local government procurement processes. The results suggest that financial reporting, budget planning, and expenditure control practices significantly influence public procurement performance in LGAs in Dodoma. The study recommend to strengthen Financial Reporting Mechanisms: This may involve providing training and resources to finance departments, establishing clear reporting guidelines, and implementing systems for real-time financial data management. It is further recommended to improve Budget Planning and Monitoring by developing budgets that are aligned with strategic objectives and based on realistic revenue projections and expenditure estimates.

Keywords; *Budgeting Practices; Public Procurement Performance; Local Government Authorities*

1.0 Introduction

The dynamic global landscape in recent years has witnessed a pronounced acknowledgment of the pivotal role played by effective budgeting practices in shaping the performance of public sectors worldwide (Lapuente & Van de Walle, 2020; Adam et al., 2021; World Bank, 2020; Andrews, 2018). This heightened recognition is propelled by the increasing demands for efficient resource allocation and the challenges posed by globalization (Adam et al., 2021; Lapuente & Van de Walle, 2020; Moynihan, 2018). International bodies, prominently the World Bank, underscore the paramount importance of robust budgeting practices as a fundamental cornerstone for achieving sustainable development goals on a global scale (Adam et al., 2021; World Bank, 2020; Hood, 2019). The intricate interplay between budgeting mechanisms and the overall success of public sector initiatives has become a focus of extensive research and policy discourse, reflecting the urgency to establish governance frameworks that ensure transparency, accountability, and responsible resource management (Adam et al., 2021; Lapuente & Van de Walle, 2020; Moynihan, 2018).

African governments grapple with the intricate challenge of balancing resource allocation amidst pressing development needs (Fourie & Malan, 2020; Kapika et al., 2019; Mo Ibrahim Foundation, 2020). Stakeholders within the African context increasingly recognize the centrality of budgeting practices in fostering accountable and transparent governance (Fourie & Malan, 2020; Kapika et al., 2019; Kimuyu, 2017). In the midst of varied socio-economic and political landscapes, the harmonization of budgeting practices emerges as a common thread in the pursuit of sustainable development across the African continent (Fourie & Malan, 2020; Kapika et al., 2019; Mo Ibrahim Foundation, 2020).

Within the distinctive dynamics of the East African region, governments face unique challenges in their pursuit of sustainable development (Kenny, 2017; Ondabu et al., 2021; Mwenda, 2019). The imperative for sound budgeting practices is magnified as these nations strive to optimize resource utilization (Kenny, 2017; Ondabu et al., 2021; Mwenda, 2019). Consequently, the scrutiny on the performance of procurement processes intensifies due to the far-reaching ramifications of inadequate adherence to established protocols (Kakwezi & Nyeko, 2019; Ondabu et al., 2021; Mwenda, 2019).

In the specific context of Tanzania, persistent concerns have been raised regarding their capacity to effectively manage finances and execute procurement processes (Pasape & Godson, 2022; Matto, 2021; Kimuyu, 2017). Budgeting has been subjected to issues including, inadequate budget allocation, mismanagement, and failure to adhere to procurement plan. Despite recent reforms in the public procurement system, including the establishment of the Public Procurement Regulatory Authority (PPRA) and the adoption of the Public Procurement Act of 2011, challenges endure (Pasape & Godson, 2022; Matto, 2021; Mwenda, 2019). Delayed insufficient budgeting practices, and limited capacity within local government authorities remain significant obstacles to efficient public service delivery (Pasape & Godson, 2022; Matto, 2021; Kimuyu, 2017). Proper budgeting ensures availability of fund, cost effectiveness, and timely execution of the project activities.

A comprehensive understanding of the tie to budgeting practice by Tanzanian local government authorities emerges from a study conducted in South Africa, revealing issues akin to those encountered in Tanzania (Fourie & Malan, 2020; Kimuyu, 2017; Ondabu et al., 2021). Challenges especially under-spending of budgets, and a lack of transparency in public procurement were identified as formidable obstacles (Fourie & Malan, 2020; Kimuyu, 2017; Ondabu et al., 2021). Despite reforms and initiatives in the public procurement system and efforts to enhance transparency and accountability, substantial hurdles remain (Pasape & Godson, 2022; Matto, 2021; Kimuyu, 2017). Delayed procurement processes, corruption, and inadequate budgeting practices within local government authorities have the potential to hinder efficient public service delivery (Pasape & Godson, 2022; Matto, 2021; Kimuyu, 2017).

The 2020 report from the Controller and Auditor General (CAG) highlighted inadequate and inefficient budgeting practices in Local Government Authorities in Tanzania, including Kongwa and Mpwapwa District councils. This has led to delay in project implementation, budget overruns and service delays. This is resulted into substantial loss when a contract is breached and low-quality of services or goods with high cost. Studies conducted by David - Barrett & Fazekas 2020; Fazekas & Blum 2021; Lapuente & Van de Walle 2020; Matto 2021; Ruhago et al. 2023).

Also, elsewhere studies focus on challenges facing procurement performance in local Government Authorities, passage & Godson (2022) Amin (2005), Fazekas & Blum (2021a), and Matto (2021); factors affecting public procurement performance, Ketemaw, (2020); Procurement practice in parastatal organization, Mwaipopo (2017) and found out that procurement officers are competent in a wide variety of generic procurement but financial resources and supporting facilities are the hindrance factors towards procurement function; assessing the influence of staff competence on performance of procurement management Unit, Eliah and Ahumani (2020)

Therefore, there is a lack of studies focusing on the link between budgeting practice and public procurement Performance. It is in this regard that a study on assessing the effect of budgeting practice practices on Public Procurement Performance in Local Government Authorities.

2.0 Literature Review

Theoretical Review

Agency Theory was propounded by Michael C. Jensen and William H. Meckling in 1976. It is a fundamental theory in the field of economics and organizational studies. Agency Theory addresses the relationship between principals (owners or stakeholders) and agents (individuals or entities hired to perform tasks on behalf of the principals). The theory assumes that there is a natural conflict of interest between these two parties due to divergent goals and information asymmetry. Principals delegate authority to agents to act on their behalf, and the challenge lies in aligning the interests of both parties. Agency Theory suggests that the introduction of monitoring mechanisms, contracts, and incentives can help mitigate the principal-agent

conflict and ensure that agents act in the best interest of the principals.

Numerous scholars have applied Agency Theory in various contexts. For instance, Fama and Jensen (1983) applied the theory to corporate finance, emphasizing the role of information asymmetry. Eisenhardt (1989) extended the theory to strategic management, focusing on the governance mechanisms in large corporations. In the context of this study, researchers like Mjema (2018) have employed Agency Theory to understand the relationship between principals (local government authorities) and agents (those involved in budgeting practices and public procurement). Mjema's work, in particular, explored the application of Agency Theory to revenue mobilization practices at Local Government Authorities (LGAs) in Tanzania.

Agency Theory is highly relevant to this study as it provides a lens through which to examine the relationship between local government authorities (principals) and the entities responsible for budgeting practices and public procurement (agents) within Kongwa and Mpwapwa Districts Councils. The theory's emphasis on mitigating conflicts of interest aligns with the study's focus on understanding how budgeting practices influence public procurement performance. By applying Agency Theory, this study can analyze the mechanisms put in place by local government authorities to align the interests of stakeholders involved in financial management and procurement, shedding light on potential challenges and solutions within the principal-agent relationship.

Empirical Literature Review

The procurement process is a critical aspect of organizational operations, encompassing the acquisition of goods and services necessary for sustaining and advancing the core mission. Nonetheless, for Local Government Authorities in Tanzania, the efficiency and effectiveness of procurement operations hold substantial implications for economic growth and public welfare (Fazekas & Blum, 2021a). However, the manner in which financial resources are allocated and managed through budgeting practices plays a pivotal role in shaping procurement outcomes.

The budgeting practices employed by organizations, both public and private, hold power over resource allocation and expenditure patterns. However, Kakwezi (2019) ascertain that traditional budgeting methodologies, with their historical focus, compete with more contemporary approaches like zero-based budgeting, which emphasize a thorough re-evaluation of every expense. Thus, understanding the prevalent budgeting paradigms is essential to comprehending how financial decisions impact the procurement process in the Local Government Authorities.

Studies elucidate that a pivotal aspect of the budgeting-procurement nexus lies in the alignment between an organization's strategic objectives and its procurement strategies and budgets, as financial blueprints, must mirror the overarching goals of an entity (Changalima, Mushi, & Mwaiseje, 2020; Kakwezi & Nyeko, 2019). In Tanzania, where diverse sections in Local Government coexist, the extent to which budgets reflect section specific priorities

significantly influences procurement performance. Budgeting, as a tool, extends beyond mere resource allocation; it encompasses monitoring and control Practices vital for financial stewardship (Fazekas & Blum, 2021b). How rigorously LGAs adhere to budgetary constraints directly impacts procurement efficiency. Striking a balance between fiscal prudence and procurement expediency is a delicate dance.

Adjepong and Anane (2022), aimed at assessing the factors affecting procurement performance in the public. Procurement planning and staff competency were the key variables used to assess procurement performance in the Asokwa and Oforikrom Municipal Assemblies due to their recognition in the public procurement Act 914 of Ghana in Section 21 under part 3 for procurement planning and staff competency also addressed in Section 18(3). The findings of the study revealed that procurement planning and staff competency affected procurement performance. In addition, all staff competencies listed provided a mean score within the range of 4.00 and above which implies that they all affect procurement performance. The researcher recommended future studies using same factors as variables of measure for a different case area to serve as variation and addition to knowledge. It was also suggested that other factors including budget or resource allocation, political interference, procurement procedures, contract management, quality of items produced, time delivery or lead time and many more be used as variables of measuring procurement performance in future studies.

INDEPENDENT VARIABLE

DEPENDENT VARIABLE

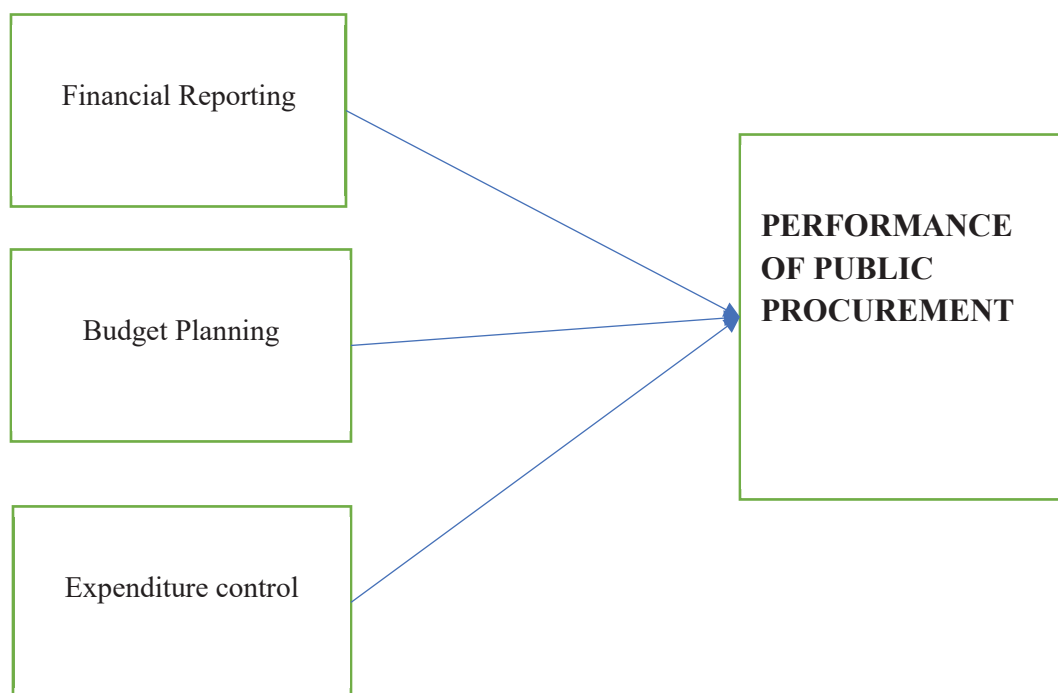

Figure 2.1: Conceptual Framework**Source: Researcher's Design (2023)****3.0 Material and Methods**

This study adopted a mixed-methods research approach to comprehensively investigate the effects of financial control practices on public procurement performance in local government authorities, focusing on Kongwa and Mpwapwa Districts Councils in Tanzania. The qualitative dimension involved interview to the senior management officers related to financial control practices and public procurement, On the quantitative side, structured questionnaires were administered to key stakeholders within the local government authorities, including finance officers, procurement officers, and end users.

A cross-sectional research design was used to capture a snapshot of the relationship between financial control practices and public procurement performance within local government authorities in Kongwa and Mpwapwa Districts Councils in Tanzania. The cross-sectional approach involved collecting data at a single point in time, allowing for a simultaneous examination of various factors. The Dodoma region chosen for its significance as the capital city of Tanzania, where a multitude of administrative activities occurred (Changalima et al., 2020). Within Dodoma, the research focused on employees working in two specific councils: Kongwa and Mpwapwa Districts because the chosen districts offered a diverse array of economic conditions, geographical features, and population demographics.

The study employed a dual sampling strategy, utilizing simple random sampling for respondents and purposive sampling for key informants. In selecting respondents, a simple random sampling method was employed, ensuring an equal opportunity for every employee within Kongwa and Mpwapwa Districts Councils to be included in the sample.

The computed sample size from the population of 1911 employees was approximately 129 using Yamane's formula; 60 of Mpwapwa, and 69 of Kongwa. A structured questionnaire was administered to employees within Kongwa and Mpwapwa Districts Councils using simple random sampling. While, interviews were conducted with key informants, including finance officers and procurement officers, using a semi-structured approach.

For quantitative data analysis, descriptive analysis was deemed appropriate for demographic and variables description. On the qualitative data, content analysis technique was used to analyze data obtained from key informant interviews, focus group discussions, and document reviews. The combined use of descriptive analysis and regression analysis for quantitative data and content analysis for qualitative data ensured a comprehensive examination of both data types, facilitating a holistic understanding of the intricacies between financial control practices and public procurement performance within Kongwa and Mpwapwa Districts Councils.

4.0 Findings and Discussion

Description of the respondents' Demographic Characteristics

In this section, we delve into the demographic characteristics of the respondents who participated in the study. Understanding the profile of the participants provides valuable context for interpreting the subsequent findings related to financial control practices and public procurement performance. Table 1 presents a detailed breakdown of the demographic data, offering insights into the composition of the sample population.

Table 22: Demographic characteristics of respondents

Variables	Categories	Frequency	Percent (%)
Gender	Male	73	56.6
	Female	56	43.4
Age	18- 27 years	9	7.0
	28-37 years	48	37.2
	38-47 years	65	50.4
	48+ years and above	7	5.4
Education Level	No formal Education	0	0.0
	Certificate	2	1.6
	Diploma	38	29.5
	Bachelor degree	72	55.8
	Master's Degree	17	13.2
Working Experience	0-2 years	25	19.4
	3-5 years	78	60.5
	6-9 years	22	17.1
	10 years and above	4	3.1
Working departments	Procurement	15	11.6
	Business and Finance	16	12.4
	Administration	12	9.3
	Planning and statistics	9	6.9
	Education (primary and secondary)	13	10.07
	Community development and social welfare	9	6.9
	Health	11	8.5
	Land and natural resources	7	5.4
	Community development	6	4.6
	Agriculture, irrigation and Union	8	6.2
	Works and fire extinction	7	5.4
	Livestock and fisheries	9	6.9
	Water	7	5.4
	Total	129	100

Source: Field Data, 2024

The demographic characteristics of the respondents, as illustrated in Table 1, provide valuable insights into the composition of the sample population involved in the study. Firstly, regarding

gender distribution, the majority of respondents were male, accounting for 56.6% of the total sample, while female respondents constituted 43.4%. This gender disproportionality reflects a common trend observed in many organizational settings, where male representation tends to be higher, particularly in roles associated with finance and procurement. However, it's important to note that efforts toward gender diversity and inclusivity within these sectors remain crucial for fostering equitable opportunities and perspectives (Fourie & Malan, 2020).

Moving on to age distribution, the data reveals a varied spread across different age groups. The largest proportion of respondents falls within the age bracket of 38-47 years, comprising 50.4% of the sample. This finding suggests that a significant portion of the workforce involved in financial management and procurement within the local government authorities belongs to the middle-age category. Additionally, the distribution indicates a relatively stable workforce in terms of age, with only a small percentage falling into the younger age group (18-27 years) and a similarly small percentage in the older age group (48+ years). Such age distribution patterns could have implications for workforce dynamics, including knowledge transfer, succession planning, and organizational resilience.

Education level is another critical demographic factor analyzed in the study. The majority of respondents possess a bachelor's degree, representing 55.8% of the sample, followed by those with a diploma at 29.5%. This distribution underscores the importance of higher education qualifications in roles related to financial control and procurement, where specialized knowledge and skills are often required. However, it's noteworthy that a significant proportion of respondents hold diploma qualifications, indicating a diverse educational background within the workforce. This diversity may contribute to a multifaceted approach to problem-solving and decision-making in financial management processes (Changalima et al., 2020).

Furthermore, examining the respondents' working experience provides insights into their professional tenure within the local government authorities. The data shows that the majority of respondents have between 3 to 5 years of working experience, constituting 60.5% of the sample. This suggests a workforce with moderate to relatively extensive experience in their respective roles. However, it's interesting to note the presence of respondents with less than 2 years of experience (19.4%), indicating the inclusion of relatively junior staff in the study. Conversely, a smaller proportion of respondents have more than 10 years of experience (3.1%), highlighting the presence of seasoned professionals who may bring valuable insights and expertise to the research (Cooper & Schindler, 2011).

In terms of working departments, findings from the study revealed that respondents were distributed into different departments as shown in the table above. It was found that out of 129 respondents 15 (11.6%) works in procurement department, 16 (12.4%) work in business and finance, 12 (9.3%) were found working in administration and human resources department and 9 (6.9%) work in planning and statistics department. In addition, 13 respondents (10.07%) work in education (primary and secondary), 9 (6.9%) work in community development and social welfare, 11 (8.5%) were working in health department, 7 (5.4%) work in land and natural resources, 6 (4.6%) were found working in community development and social welfare and 8

respondents (6.2%) were working in agriculture and union. Furthermore, 7 respondents (5.4%) were working in works and fire extinction department, 9 (6.9%) were working in livestock and fisheries and 7 (5.4%) were working in water depart. This means that procurement department had more respondents selected for the study followed by business and finance department.

Demographic characteristics of the respondents paint a picture of a workforce predominantly composed of middle-aged, educated professionals with moderate to extensive working experience in financial management and procurement roles within the local government authorities. While gender disparities persist, efforts toward greater inclusivity and diversity remain imperative. Additionally, the diverse educational backgrounds and varied levels of experience among respondents underscore the richness of perspectives and potential challenges inherent in addressing issues related to financial control practices and public procurement performance.

Results on Budgeting Practices

Table 2 presents summary statistics of budgeting practices, including mean, standard deviation (SD), minimum, and maximum values.

Table 2. Summary Statistics of Budgeting Practices

Budget Practices	Mean	SD	Min	Max
Financial Reporting	3.116	.442	2	5
Budget Planning	3.281	.117	1.6	5
Expenditure control	4.235	.327	2	5

The statistics in Table 2 offer valuable insights into the central tendency, variability, and range of scores for each practice. In the category of Budget Practices; Financial Reporting has a mean score of 3.116, with a standard deviation of 0.442. This indicates that, on average, respondents rated financial reporting around 3 out of 5, with scores ranging from 2 to 5. Budget Planning shows a slightly higher mean score of 3.281, with less variability (SD = 0.117), suggesting that respondents tended to rate Budget Planning more consistently higher, ranging from 1.6 to 5. Expenditure control, with a mean of 4.235 and SD of 0.327, received the highest average rating among Budget Practices, indicating stronger agreement or satisfaction with this aspect, with scores ranging from 2 to 5. Overall, these summary statistics provide a comprehensive overview of how respondents rated various budgeting practices. While some practices, such as Budget Planning and Expenditure control, received relatively higher average ratings. These insights can inform further analysis and decision-making regarding budgeting strategies and improvements within the organization.

Table 3. Summary Statistics of Public Procurement Performance

Public procurement performance	Mean	SD	Min	Max
--------------------------------	------	----	-----	-----

Value for Money	4.321	.543	3	5
Stakeholder satisfaction	3.231	.254	2	4
Compliance with rules	3.382	.342	2	5
Overall	3.844	.466	2.784	4.8

Source: Field Data (2024)

The summary statistics concerning various aspects of public procurement performance. Value for Money exhibits a relatively high mean score of 4.321, with a narrow standard deviation (.543), indicating that, on average, procurement processes are perceived as delivering good value. The minimum value of 3 suggests that there's consistency in achieving at least a satisfactory level of value, while the maximum value of 5 indicates instances where exceptional value is achieved.

Stakeholder Satisfaction has a lower mean score of 3.231, suggesting that while generally satisfactory, there may be room for improvement. The narrow standard deviation (.254) indicates that satisfaction levels are relatively consistent across different procurement instances.

Lastly, Compliance with Rules shows a mean score of 3.382, indicating a relatively high level of compliance with procurement rules and regulations. The moderate standard deviation (.342) suggests some variability in compliance levels across different procurement instances. In summary, the data suggest that while public procurement generally achieves good value for money and compliance with rules, there may be opportunities for improvement in stakeholder satisfaction, cost-saving efforts, and ensuring consistent supplier performance.

Association between the public financial Control Practices on public procurement performance of LGAs.

The Pearson correlation coefficients and their corresponding p-values indicate the association between public financial control practices and the performance of local government authorities (LGAs) in public procurement, with a significance level set at 0.05. Overall, the results suggest a strong positive association between public financial control practices and the performance of LGAs in public procurement. For Budget Practices, all three variables - Financial Reporting, Budget Planning, and Expenditure control - exhibit high positive correlations with public procurement performance, ranging from 0.779 to 0.851, all with p-values of 0.00. This indicates that as the scores for these financial control practices increase, the performance of LGAs in public procurement also tends to increase significantly.

Table 4. Pearson correlation showing the Association between the public financial Control Practices on public procurement performance of LGAs.

Budget Practices	Public procurement performance	
	Correlation	P-value
Financial Reporting	0.788	0.00

Budget Planning	0.851	0.00
Expenditure control	0.779	0.00

Source: Field Data (2024)

Overall, the findings highlight the importance of effective budgeting practices in enhancing the performance of LGAs in public procurement activities. The strong positive correlations observed suggest that improvements in budgeting mechanism, can contribute significantly to the efficiency and effectiveness of public procurement processes within LGAs. These results can inform policymakers and stakeholders in local government finance about the critical role of budgeting practices in driving performance improvements in public procurement, potentially guiding resource allocation and decision-making to prioritize areas where enhancements are most needed.

Linear Multiple Regression

The results of a linear multiple regression analysis examining the effect of budgeting practices on the public procurement performance of Local Government Authorities (LGAs) in Dodoma are presented in Table 5.

Table 5. Linear multiple regression to show the effect of budgeting practices on the public procurement performance of LGAs in Dodoma.

Public procurement performance	Coef.	St.Err.	t-value	p-value	[95% Conf. Interval]
Financial Reporting	1.394	0.022	63.36	.000	0.543 7.663
Budget Planning	1.004	.072	13.94	.002	1.213 4.162
Expenditure control	1.604	.088	18.23	.000	1.744 4.046
Constant	3.401	.263	12.93	.000	0.277 2.112

The beta coefficients indicate the estimated effect of each budgeting practice variable on public procurement performance, holding other variables constant. Firstly, for Financial Reporting, the coefficient of 1.394 suggests that for every one-unit increase in financial reporting practices, public procurement performance is estimated to increase by 1.394 units. This coefficient is statistically significant at the 0.05 level, with a t-value of 63.36 and a p-value of 0.000. The 95% confidence interval for this coefficient ranges from 0.543 to 7.663, indicating

a high degree of certainty in its estimated effect. Similarly, for Budget Planning, the coefficient of 1.004 suggests that for every one-unit increase in budget planning practices, public procurement performance is estimated to increase by 1.004 units. This coefficient is also statistically significant at the 0.05 level, with a t-value of 13.94 and a p-value of 0.002. The 95% confidence interval for this coefficient ranges from 1.213 to 4.162. Moreover, for Expenditure Control, the coefficient of 1.604 suggests that for every one-unit increase in expenditure control practices, public procurement performance is estimated to increase by 1.604 units. This coefficient is statistically significant at the 0.05 level, with a t-value of 18.23 and a p-value of 0.000. The 95% confidence interval for this coefficient ranges from 1.744 to 4.046. The constant term represents the estimated public procurement performance when all budgeting practice variables are zero. In this case, the constant term is 3.401, indicating the baseline level of public procurement performance. This constant term is also statistically significant at the 0.05 level, with a t-value of 12.93 and a p-value of 0.000.

Table 6. Model Goodness of Fit

Mean	3.844	SD dependent var	.466
dependent var			
R-squared	0.744	Number of obs	129
F-test	134.062	Prob > F	0.000

The R-squared value of 0.744 indicates that approximately 74.4% of the variance in public procurement performance is explained by the budgeting practice variables included in the model. The F-test statistic of 134.062 is highly significant (p-value = 0.000), suggesting that the overall regression model is a good fit for the data.

The results suggest that financial reporting, budget planning, and expenditure control practices significantly influence public procurement performance in LGAs in Dodoma. These findings are in line with what was found by Isroilov et al. (2020) whereby financial control practices especially budgeting was found to be significantly influencing the procurement practices. Furthermore these findings are also confirming what was by Kikavets and Tsaregradskaya (2023) who found that the effectiveness of public procurement activities largely depends on budgeting process whereby the extent to which financial control is effective it allows public procurement process to be effective. Budget planning, when aligned with organizational objectives, ensures that procurement activities are adequately funded and strategically timed, thereby optimizing resource allocation and minimizing inefficiencies.

Furthermore, these quantitative findings on effect of budgeting practices on the public procurement performance of LGAs are supported with the findings from interviews whereby interviewee argued that whenever there is a poor budgeting, procurement activities also fails. When probed on the role of budgeting in enhancing procurement activities at Dodoma, one respondent had this to say;

Well, you know procurement activities largely depends on budgeting. If budgeting activities are well planned and budgeted accordingly procurement activities become easy, timely and more effective. We procurement officers, we buy what has been budgeted and allocated. (P2).

From these findings it is obvious that the performance of procurement function in any organization depends on institutional budgeting activity. Failure to have proper budgeting plans hinder effective procurement practices. Organizations which fail to have effective budgeting practices experience poor procurement practices and hence poor procurement performance.

It was also learned during the interview that most local government authorities including Kongwa and Mpwapwa face serious problem of budget allocation whereby budget planning is no longer a problem. It was stated that, most of procurement activities which have budgeted in a specific financial year fail to be implemented due to low cash flow and therefore minimal allocation. During the interview one respondent argued that;

In many local authorities, including Dodoma, our procurement performance is affected by budget allocation. You may find all activities are well budgeted but no procurement activity is undertaken as the resources are scarce and therefore few procurement activities are allocated fund and conducted timely. (P5).

Similar argument was raised by one head of department who said that;

The issue has moved from poor budget planning to the availability of funds. We have good number of procurement arrangements which have been budgeted but the problem is cash flow. Sometimes, our revenues fail to meet our needs and disbursement from central government may delay something which affect our procurement plan. (P1).

The problem of limited financial resources was also found by Ghosh (2019) to hinder the effective implementation of procurement plan. In this study it was found that failure of budgeted resources to be allocated due to low cash flow affects negatively procurement activities.

Furthermore, financial reporting within the framework of budgeting ensures transparency and accountability in the allocation and utilization of funds. Evidence suggests that a clear and accurate financial reporting facilitates better decision-making and enhances stakeholder trust (Kikavets and Tsaregradskaya, 2023). Moreover, effective expenditure control mechanisms are crucial for preventing overspending and misuse of resources. When budgets are meticulously managed, procurement processes can operate within predefined financial limits, promoting fiscal discipline and achieving better overall performance outcomes. During the interview it was learned that, proper control of expenditure enhance procurement activities as it firstly ensure resources availability and at the same time help to minimize the procurement of unused, unwanted and low quality service or goods. When responding to a probing question on how expenditure control affect procurement activities, one respondent argued that;

Good procurement activities requires stable financial control mechanisms especially expenditures. When expenditures are controlled and monitored, it enhance the availability of enough financial resources to cutter procurement needs and at the same time good expenditure control acts as a controlling mechanism to procurement activities as it help to avoid unnecessary procurement of irrelevant and low quality goods and or services (P4)

These findings provide valuable insights for policymakers and practitioners aiming to enhance public procurement processes in the region. The findings provides a clear insight on what is happening in local authorities, Dodoma being a case study. In most cases, budget is the pillar for smooth procurement activities but, funds availability is the key towards effective procurement activity. With the availability of the enough budget and cash flow, procurement activities are likely to move smooth and therefore ensure the provision of goods and services to the general public. As stated by Abdullahi and Mohamud (2023), procurement activities are the pillar for the organization performance and therefore its effectiveness is an important element in enhancing organization competitive advantage

5.0 Conclusion

Objective of this paper sought to assess the effect of budgeting practices on public procurement performance. The linear multiple regression analysis revealed the results suggest that financial reporting, budget planning, and expenditure control practices significantly influence public procurement performance in LGAs in Dodoma. These findings provide valuable insights for policymakers and practitioners aiming to enhance public procurement processes in the region. These results are in line with previous research by Matto (2021) and Changelima et al. (2020), which emphasized the importance of strategic budgeting in enhancing procurement effectiveness and resource allocation within local government settings.

In conclusion, this study investigated the interplay between financial control practices and public procurement performance within Local Government Authorities (LGAs) in Tanzania, focusing on Kongwa and Mpwapwa Districts Councils. Through a mixed-methods approach encompassing surveys and interviews analysis, the study examined the effects of budgeting practices, internal control measures, and revenue mobilization strategies on procurement outcomes.

6.0 Recommendations

Based on the findings of this study, the following recommendations are directed to the Government, particularly the President's Office - Regional Administration and Local Governments (PO-RALG):

Strengthen Financial Reporting Mechanisms: PO-RALG should institute measures to ensure regular and timely preparation of financial reports by Local Government Authorities (LGAs). This may involve providing training and resources to finance departments, establishing clear reporting guidelines, and implementing systems for real-time financial data management.

Improve Budget Planning and Monitoring: PO-RALG should encourage LGAs to develop budgets aligned with strategic objectives and based on realistic revenue projections and expenditure estimates. Additionally, mechanisms for continuous monitoring and evaluation of budget execution should be strengthened to address variances and ensure optimal resource allocation.

Promote Stakeholder Engagement: PO-RALG should facilitate inclusive budget planning processes that involve input from various stakeholders, including citizens, oversight bodies, and community representatives. By promoting transparency and participation, LGAs can build trust, legitimacy, and ownership of budgetary decisions among stakeholders.

7.0 Areas for Further Study

Based on the findings and limitations of this study which adopted a case study of two district councils, future studies could explore variations in financial control practices and procurement performance across different regions of Tanzania to identify regional disparities, contextual factors, and best practices that influence procurement outcomes.

Impacts of Financial Terms from Banks on Mini-Hydroelectric Projects Accessing Rural Energy Agency Credit in South Highland, Tanzania

Deusdedit Emmanuel Malulu¹ & Grace Mpuya²

¹Master of Project Management Monitoring and Evaluation of the College of Business Education (CBE) P. O. Box 2077 Dodoma, Tanzania. Email: deusmalulu@gmail.com

²College of Business Education, Department of Business Administration, P. O. Box 2077, Dodoma, Tanzania, Email: Grace Mpuya

Abstract

The Rural Energy Agency (REA) focuses on improving access to modern energy services in rural areas by implementing solutions such as grid extensions and off-grid Renewable Energy solutions. It funds rural energy projects through the Rural Energy Fund, providing grants and soft loans (Through Project Participating Banks) to cover capital expenses. This study examined the Impacts of Financial Terms from Project Participating Banks on Mini-hydroelectric Projects Accessing Rural Energy Agency Credit in South Highland, Tanzania. The whole study was conducted basing on significant level of 5% (0.05). Using quantitative methods and employing the Statistical Package for Social Sciences (SPSS) and Stata, we analyzed data through descriptive statistics and inferential statistics, including the Multiple Logistic Regression Model. Descriptive statistics provided demographic insights into the respondents, while inferential statistics identified significant associations between the financial terms offered by Banks and access to Credit. Chi-square tests and logistic regression analysis highlighted significant relationships, offering valuable insights for improving access to Credit for mini-hydroelectric projects. Having found that, financial terms offered by the Participating Banks have great relationship with access to REA's Credit; hence need to be relooked in order to increase its access. Lastly, the study looked into areas which need further studies including identifying new Renewable energy project financing in Tanzania to accelerate it.

Keywords: *Hydro-electric Project, Credit, Rural Energy Agency and Participating Banks*

Introduction

The sun, geothermal energy from within the ground, wind, biomass from plants, and hydropower from flowing water are the five main sources of renewable energy in the world (Ritchie, 2023). Global investments in renewable energy are expected to cut greenhouse gas

emissions associated with energy use by about one-third by 2050, according to Gielen *et al.* (2019). To this end, by 2050, the proportion of renewable energy in the world's energy mix must rise from roughly 15% of primary energy supply in 2015 to roughly 66%.

The number of individuals without access to electricity fell from 1.14 billion in 2010 to 675 million in 2021 on a global scale. The main cause of this reduction was Asia, where the deficit decreased from 516 million in 2010 to 69 million in 2021. Due to its constantly growing population, Africa only had a slight decrease in its un-electrified population during the same period, going from 591 million to 586 million. 660 million people, mostly in Sub-Saharan Africa, are predicted to still lack access in 2030 according to the 2023 Tracking SDG7 Report (United Nations, 2020). Energy efficiency keeps becoming better, renewable energy is gaining significant traction, and access to electricity in developing nations has started to pick up speed (Gielen et al. 2019).

In Africa, accessing financing for green energy projects in the private sector is hindered by significant challenges, with high borrowing costs being a major obstacle. Inderst and Stewart (2014) highlight those political and economic concerns in developing countries lead to an increase in borrowing costs by 2% to 6%. While South Africa has allocated \$160 million annually for solar projects through the Integrated National Electrification Program, this funding is contingent upon projects becoming self-funded within a specific timeframe, posing challenges for some private initiatives (Willcox & Cooper, 2018). Although commercial banks, export Credit agencies, development finance institutions, and various investment funds have provided funding, including equity investments from technology funds and international companies like Google, these efforts have not been adequate to fully support clean energy projects.

In Tanzania, the Rural Energy Agency (REA) is responsible for promoting and facilitating the availability of modern energy services to rural areas. REA works with various stakeholders, including public and private sectors, cooperatives, and community-based organizations as project developers (International Trade Administration, 2023). REA also works with multilateral and bilateral development partners like the World Bank, Swedish International Development Cooperation Agency (SIDA), Norad/Norway, African Development Bank Group (AfDB), The French Development Agency (AFD), European Union (EU) and Department for International Development (DFID) (African Development Bank, 2022). The Rural Energy Agency (**REA**) focuses on improving energy services in rural areas by implementing solutions such as mini-grids and off-grid renewable energy solutions. It funds rural energy projects through the Rural Energy Fund, providing grants and concessional credit to cover capital expenses. The legislation underpinning rural energy is the Rural Energy Act 2005 (Clyde & Co, 2023).

Tanzania has an abundance of renewable energy resources, including geothermal, solar, wind, biomass, and hydropower. Not all of this potential has been used to its fullest. According to the Tanzania National Development Vision 2025 (African Development Bank, 2015), if these renewable resources are used effectively, they could greatly increase Tanzania's energy supply

and bring the nation closer to becoming a middle-income nation. Tanzania must lessen its dependency on biofuels and diversify its sources of electricity. Therefore, natural gas accounts for 48% of Tanzania's electrical generation, with hydro (31%), petroleum (18%), solar (1%), and biofuels (1%), following in order. Power shortages are frequently caused by the nation's historical reliance on its grid connected hydropower plants as well as the current droughts. TANESCO hired Emergency Power Producers (EPP) to fill the shortfall in the nation's electricity supply (International Trade Administration, 2023). However, Luhwago (2024) stated that Dr. Doto Biteko, the deputy prime minister and minister of energy, stated that the government needs to make a conscious effort to invest in alternative power generation sources in order to keep up with the nation's growing need for electricity.

REA or other government agencies have separate programs or partnerships focused on grant funding, technical assistance, or subsidies for renewable energy projects (Rural Energy, 2024). These initiatives can help address different needs and financial constraints that may not be suitable for Credit facilities. REA in cooperation with the World Bank allocated USD 45 Million USD to be used for provision of long-term concessional debt for eligible private sector-led renewable energy projects in particularly Mini-hydroelectric Projects. Since the initiation of the Program in 2016, there has been a poor uptake of loans from the project participating Banks by the developers despite the provision of pre-loan supports such as matching grants, which is used for pre-investment studies, and preparation of Bankable Documents as among the pre-requisites for accessing Credit (Bank of Tanzania, 2023).

This study intends to find out on the impacts of financial terms from participating Banks on access to REA's Credit for mini-hydroelectric projects in South Highland Tanzania which are the main contributor of Renewable Energy in Tanzania

Literature Review

Theoretical Framework

The principal-Agent theory is an agency model which was developed by economists Jensen and Meckling in 1976 that describe the existing relationship between principals and agents within the business. The Principal-agent theory is concerned with resolving problems that arise in agency relationship between two parties; principals such as stakeholders and principals' agents such as executives in the company (Gailmard, 2012).

Agency theory explores the relationships between principals (e.g., project developers) and agents (e.g., Rural Energy Agency). Sarakikya, H. (2018). Agency theory is a branch of economics and management that explores the relationship between a principal (e.g., a company's owner or shareholder) and an agent (e.g., a manager or employee) who is hired to perform tasks on behalf of the principal. The theory proposed by Michael Jensen and William Meckling is often Credit for their seminal work in the late 1970s, particularly with their paper titled "Theory of the Firm: Managerial Behavior, Agency Costs and Ownership Structure" (1976).

This theory is relevant to the study because was used to determine the impact of financial terms from the participating Banks for accessing the Credit for Mini-Hydroelectric Projects in South Highland, Tanzania. In an agency relationship, the principal (Banks) delegates tasks to the agent (project developers), and there is a need for information flow and monitoring. The financial terms can be seen as mechanisms to align the interests of the principal and the agent, ensuring that the agent provides the necessary information and complies with agency objectives (Meckling, 1976)

Therefore, agency theory provides a lens through which one can analyze the principal-agent relationships, information flow, and mechanisms used to align the interests of the Participating Banks and Mini-Hydroelectric Project developers in South Highland, Tanzania. The theory emphasizes the importance of designing structures (financial requirements) to minimize agency costs and enhance the effectiveness of the relationship.

Empirical Literature

Tanzania Renewable Energy Association (TAREA) (2020) reports that a study on cooperative methods for improving access to funding for renewable energy was carried out. Financial institutions such as CRDB, EQUITY Bank, MCB, NBC, and TIB Development Bank were among the participants in the study. The SAGCOT Center, the Elico Foundation, and specialists for renewable energy were also present during the visit. It was discovered that although they lack the necessary data, financial institutions are eager to get involved in financing renewable energy (RE). Stakeholders, particularly financial institutions, need to have more conversations, training sessions, and seminars. There will be mutual benefits from more collaborations between financial institutions and RE-enterprises.

Al-Qudah *et al.* (2020) conducted the study about the effect of credit facilities granted by commercial banks on the Jordanian economy. The positivist concept has been incorporated into the research study's technique since it aids in confirming the accuracy of data obtained through mathematical deductions. In order to provide extensive explanations of the obtained data in addition to charts and graphs, a descriptive research design has been employed. It has been determined that credit ratings have a major impact on the economy and that commercial banks play a major role in the Jordanian economy. The study's findings also showed that there is a strong correlation between Jordan's commercial banks and financial institutions and the improvement of the country's credit facilities.

Osebo (2017) conducted the study about factors affecting access to credit by using proportionate stratified random sampling study selected 244 MSEs in hosanna towns. A semi-structured questionnaire and interviews have been employed as methods to collect data. Tests of the hypotheses and identification of the key variables influencing credit availability from formal financial institutions were conducted using binary logistic regression and descriptive analysis. As a result of the study, MSEs' access to credit is significantly impacted by a number of criteria, including the operator's age, educational attainment, and possession of fixed assets, employment size, lending method, and loan repayment length.

Research Gap

The gap that was observed is the Institutional Difference Gap. The studies haven't exploited much on the differences posed when dealing with different financial institutions particularly when dealing with financing access requirements. In Tanzania, accessing finance requirements for commercial Banks are different from those experienced when accessing finance in Investment (Development Banks).

Conceptual Framework

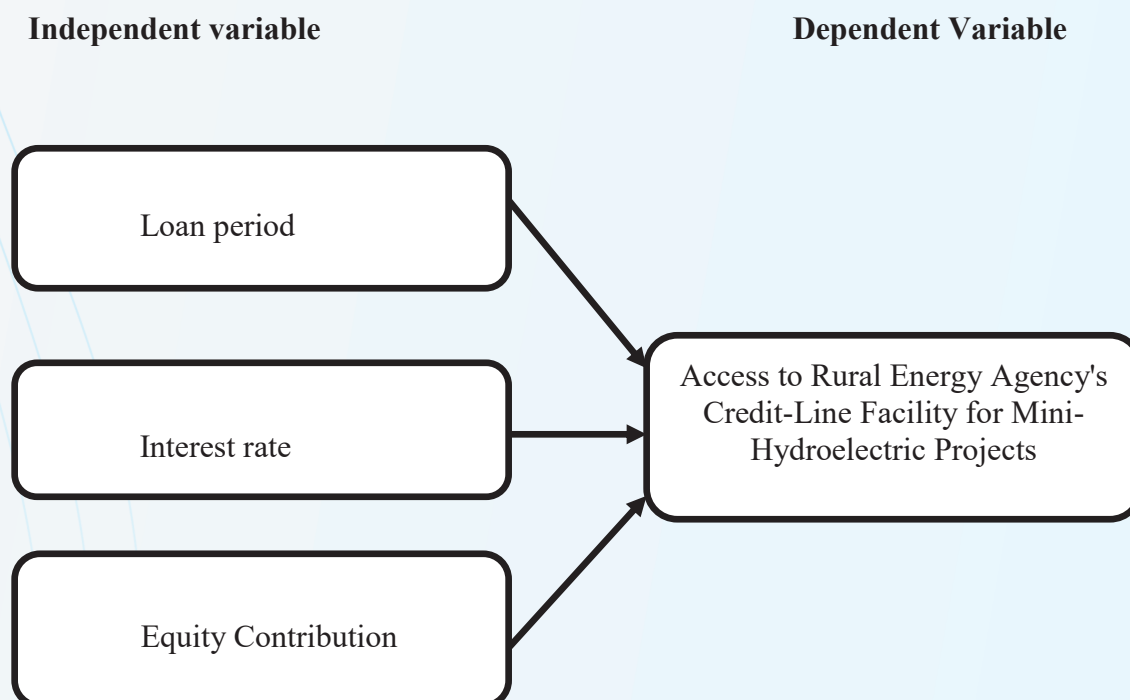

A conceptual framework is a visual or written representation of the key concepts, variables, and relationships that are under study. It provides a structured way to organize and understand the complex interplay between different elements in a research study. In the context of this study on impacts of Banks terms for accessing the REA's Credit for mini-hydroelectric projects, the conceptual framework includes:

Dependent Variable: Access to Rural Energy Agency's Credit for Mini-Hydroelectric Projects

Independent Variable: Loan Period, Interest Rate, and Equity Contribution

The relationship of the variables of the study can be conceptualized by the following framework;

Figure 1: Conceptual Framework

Methodology

Research design

Research design entails a blue print or framework for data collection process. There are different types of research design such as case study, cross-sectional, survey, experimental, and longitudinal design (Myers *et al.*, 2013). The study used a cross-sectional research design. Without influencing or modifying any of the variables, a cross-sectional research design examines correlations between them. The direction and/or degree of the relationship between two or more variables are reflected in a correlation. A correlation may have a positive or negative direction (Lau, 2017). Finding links, describing these associations, and then making predictions are frequently the objectives of correlational research.

Sample and sample size

In research, it is often not appropriate or feasible to recruit the entire population of interest (Patton, 2017). Instead, researchers recruit a sample from the population of interest to include in their study. A selected group of some elements from the totality of the population is known as the sample (Dai, Liu & Hu, 2014). It is from this sample that something is known and said about the whole population. This study adopted Yamane's formula to identify the sample size from the target population (Yamane, 1967) as below;

$$n = N/(1+N(e)^2)$$

Where;

n = Sample size

N = Population

e = Level of precision of sampling of error which is 5%

Therefore:

*95% confidence level and $p = 0.05$ are assumed

$$n = \frac{137}{1 + 137(0.05)^2}$$

$$n = 102$$

Therefore, this study gathered data from 102 respondents.

Sampling Technique

Sampling is the process of selecting a representative sample of individuals from the population of interest (Kamangar & Islami, 2013). Sampling is an important tool for studies because the population of interest usually consists of too many individuals for any research project to include as participants. A good sample is a representation of the population of interest and is fair enough to answer the research question (Dai, Liu & Hu, 2014). This study used simple random sampling method to select the representatives of the population. Simple random sampling is a type of probability sampling in which the researcher randomly selects a subset of participants from a population. Each member of the population has an equal chance of being selected. Data is then collected from as large a percentage as possible of this random subset. The selections of respondents were developed under the following below equation;

$$P = 1 - \{(N-1)/N\} \dots\dots\dots (1)$$

Data Collection Method

This study uses primary data collected through survey questionnaire. The questionnaire method is a widely used technique for gathering primary data in research and data collection activities. It involves the creation and administration of a structured set of questions to individuals or respondents to collect information on specific topics or research objectives Cooper and Schindler (2019). This method is particularly useful when you want to gather quantitative data or opinions from a large number of people. Likert scale questions used to collect quantitative data

Data Analysis

The study employed quantitative methods to analyze data. The data collected using the questionnaires coded and analyzed with the help of the Statistical Package for Social Sciences (SPSS) Version 20 and Stata 17. Data analysis constitutes both descriptive and inferential statistics. Descriptive statistics focus on measures of distribution (frequencies and percentages), measures of central tendencies (means), and measures of variation (standard deviations). On the other hand, inferential statistics captured multiple logistic regressions.

This study adopts a multiple logistic regression model to examine the relationship between Banks Terms) to rural energy agency's Credit in Southern Highland Zone, Tanzania.

The multiple logistic regression models help to assess the effect of Banks Terms) on the performance of the Credit.

$$\text{logit}[\pi(x)] = \log\left(\frac{\pi(x)}{1-\pi(x)}\right) = \beta_0 + \beta_1 x_1 + \dots + \beta_p x_p \dots\dots\dots (2)$$

Whereby

$\pi(x)$ Represent the likelihood of Access to Credit funding for renewable energy projects.

x_i 's Represent set of independent variables (loan period, interest rate and Equity contribution)

β_i 's Represent parameters of respective independent variables.

Reliability and Validity

Reliability

Data reliability refers to a collection of techniques aiming at ensuring the consistency of scale data (Drost, 2011). The reliability of the data in this study was evaluated using Cronbach alpha, as well as composite reliability in which data quality was measured to determine internal consistency (Abowitz and Toole, 2010; Hair *et al.*, 2009). This suggests a moderate level of internal consistency among items related to the loan period. Interest rates (0.724): Similar to loan period, this indicates moderate internal consistency among items measuring interest rates. Equity contribution (0.845): This shows a good level of internal consistency among items related to the equity contribution. Overall (0.821): The overall Cronbach's Alpha for all items combined is very high (above 0.8), indicating excellent internal consistency reliability for the entire scale of 45 items. In summary, most of your scales demonstrate acceptable to good internal consistency, with the overall scale showing very high internal consistency reliability.

Table 23: Overall Reliability Statistics

Variables	Cronbach's Alpha	N of Items
Loan period	0.748	5
Interest rate	0.724	5
Equity contribution	0.845	5
Overall	0.821	15

Source: (Field data, 2024).

Data validity

To address the issue of validity, the researcher conducts a pilot study to make sure the data collection methods yield valid information. Questionnaires and interview questions try to check on the correctness of the wording, whether the questions measure what they are supposed to

measure, and if there are any biases, as well as knowing if the respondents understood the questions as the researcher intended. From the pilot study and improvements made after the pilot study, the tools were used for data collection Seymour, (2019).

Finding and Discussion

This section presents the findings and discussions regarding the effect of Bank Terms on the performance of the Credit. The results are obtained from descriptive statistics and inferential statistics. The demographic characteristics of the respondents, associations between the effect of Banks Terms on the performance of the Credit a case of Mini-hydroelectric projects in South Highland, Tanzania, and the influence factors affecting access to rural energy agency's Credit a case of Mini-hydroelectric projects in South Highland, Tanzania.

Association between Financial Terms and Accessing the REA's Credit for Mini-Hydroelectric Projects

Table 3 examines the association between Financial Terms and access to Credit for mini-hydroelectric projects. It analyzes three variables related to loan period, interest rate and Equity contribution. We'll use a significance level of 0.05 to determine if there's a statistically significant relationship between each variable and access to the Credit. Loan Period: P-Value (0.002) is much less than 0.05. This suggests a very strong statistically significant association between loan period and access to Credit Facilities. Banks offering longer loan repayment periods are attractive to developers applying for credit. Interest Rate: P-value (0.001) is much less than 0.05. This indicates a very strong statistically significant association between interest rate and access to Credit. Developers applying for loans were very much attracted to Banks offering lower interest rates. Equity contribution: P-value (0.001) is much less than 0.05. This indicates a very strong statistically significant association between equity Contribution and access to Credit. Lower equity contribution in more attractive and higher chance of Credit access, particularly for applicants with limited financial resources.

Table 3: Association between Financial Terms from Banks for accessing the Credit for Mini-Hydroelectric Projects

Variable	Not having access to Credit	Access to Credit	Chi-square	P-Value
<i>Loan period</i>			38.1133	0.002
No	35(66.04)	18(33.96)		
Yes	35(71.43)	14(28.57)		
<i>Interest rate</i>			42.9814	0.001
No	27(65.85)	14(34.15)		
Yes	43(70.49)	18(29.51)		

Equity contribution			62.64	0.001
No	24(60)	16(40)		
Yes	46(74.19)	16(25.81)

The financial Terms for Accessing the REA's Credit for Mini-Hydroelectric Projects

This table shows the results of a multiple logistic regression analysis examining the influence of financial terms on access to REA's Credit for mini-hydroelectric projects. We'll analyze the coefficients, odds ratios, z-statistics, and p-values to understand the relationships between these financial terms and access to REA's Credit. Loan Period (Yes vs. No): OR (2.4435) is greater than 1, suggesting Banks offering with longer loan periods have nearly 2.5 times the odds of obtaining REA's Credit compared to those with shorter periods. P-value (0.027) is less than 0.05, indicating a statistically significant relationship. Loan period is positively linked to REA's Credit access. Interest Rate (Yes vs. No): OR (6.1504) is much greater than 1, suggesting Banks with lower interest rates have over 6 times the odds of attracting developers to access REA's Credit compared to those with higher interest rates. P-value (0.003) is much less than 0.05, indicating a very statistically significant relationship. Banks offering Lower interest rates are strongly attractive to developers hence, higher chance of Credit to be accessed. Equity contribution (Yes vs. No): OR (3.0414) is greater than 1, suggesting lower equity contribution are associated with over 3 times the odds of obtaining Credit. P-value (0.830) is much greater than 0.05, indicating this relationship is not statistically significant at the 0.05 level. The equity contribution might not be a major factor based on this analysis. Additional Points (same as Table 4): Constant: The constant term (-.542048) doesn't have a direct interpretation. Number of Observations & Chi-Square: These values indicate the sample size (102) and the overall model fit (significant based on the Chi-square value and p-value). Pseudo R-Square (0.545): This value suggests the model explains a moderate to good portion of the variance in the access to REA's Credit outcome. Overall, the analysis suggests that loan period and interest rate are significant factors influencing access to Credit for mini-hydroelectric projects. Banks offering longer loan periods and lower interest rates are very attractive to developers hence have a big chance to lend the REA's Credit. The equity contribution might not be a statistically significant factor based on this model.

Table 4: Multiple Logistic Regression Analysis

Employee Motivation	Coef.	Odds Ratio	z	P> z
No (base outcome)				
<i>Loan period</i>

Prob> Chi2 = 0.000		Pseudo R2 = 0.545			
Source: Authors compilation from STATA 17					

Conclusion and Recommendation

Conclusion

The study explored factors that are attributable to Project Participating Banks including loan period, Interest Rates offered by the Banks and the equity contribution requirements. The Study investigates the association between the period that banks offer to the lender to exhaust the loan where it was found that the longer the loan periods the better and attract more lenders to access the credit. Due to the nature of the Mini-hydroelectric projects, longer loan period offers flexibilities on return on investment. Further, the study investigates the association between the interest rate on the loan and Credit access. Lower interest rates translate to lower overall loan costs, making projects more financially viable and increasing their chances of approval. Further to the above, the research analyzes the impact of the equity required by most of financing lenders. While the findings suggest the equity contribution might not be a statistically significant factor, it's still relevant to consider, especially for applicants with limited financial resources, the lower the equity contribution the higher the chance of accessing the Credit.

Recommendations

Based on the findings, the study recommends that, favorable loan terms is another area to be revisited where Project Participating Banks could advocate for longer loan periods and lower interest rates in provision of the REA's Credit. REA has to look possibility of providing incentives such as grants in order to help developers raise the required equity requirements. Further, Banks should revise their debt-equity ratios to lower the equity contribution especially

for the project developers with limited financial resources. This would make the loans more accessible and financially viable for mini-hydropower projects.

The Influence of Method of Procurement on Timely Delivery of Water Construction Projects in Duwasa

Benard Mwanzalima¹

¹College of Business Education, P. O. Box 1968, Dar es Salaam,

Tel: +255 222 150 177, E-mail: mwanzalimabernard17@gmail.com

Abstract

The main purpose of the paper was to examine the influence of method of procurement on timely delivery of water construction projects in DUWASA. This study involved the effect of three methods namely, manually, electronically and contracting out methods of procurement on timely delivery of water construction projects. The study employed explanatory sequential design as mechanism to obtain appropriate data from the study area. The population of the study was 59 staff from DUWASA in the Dodoma City Council from which a sample size of 51 employees was selected through the use simple random sampling. Both interview and questionnaire were used as tool for collecting data and analyzed by using descriptive frequency distribution analysis and liner regression with the help of Statistical Package for Social Sciences (SPSS) version 20. The study found out that, of the three methods of procurements, manually, contracting out and electronic one, two of them (Electronic methods and contracting out methods) showed a positive and statistically significant relationship. This was determined through analysis, as the p-value for the two methods was less than 0.05. The results suggested that there is a positive and substantial correlation between electronic and contracting out methods on timely delivery of the water construction project and procurement audit performance. The study concluded that electronic and contracting out are the most effective methods of procurement in ensuring timely completion of the public project (water projects). The study recommended that government should prioritize the use of effective procurement planning techniques to achieve timely delivery of the projects. Also, policy makers need to promote effective procurement policies in order to deliver the public project in time.

Key words: *Procurement, Timely Delivery, Contracting out, Electronic and Projects*

1.1 Introduction

Procurement planning is the process by which a business chooses what to buy, when to acquire it, and from whom. During the procurement planning process, the procurement method is allocated and the expectations for meeting the procurement needs are decided. Another way to define procurement planning is as the method used by businesses, both public and private, to schedule their purchasing activities for a specific time frame (AO Ogwang, 2017). The impact of procurement planning on service delivery is substantial, so in order to satisfy customers and gain a competitive edge in the market, organizations must leverage procurement planning to lighten their workload and focus on internal operations (Lawino, 2023).

Regulation 121 of Tanzania's Public Procurement Act 2011 (URT, 2011) grants procuring entities the power to oversee and control any procurement of goods and services and work that abides by the precise quantities and quality specified in the contract as well as to monitor the progress and prompt completion of work per the terms. Government spending on art purchases accounts for a sizable portion of total revenue. However poor contract management can seriously hamper the government's efforts to guarantee that the populace receives on timely public services, as value for money may not be properly attained (Mutoro, et al 2018).

1.2 Problem

Effective procurement planning enhances the performance of public procurement projects (Malike et al, 2018). For instance, Yudoko (2023) shows that effective procurement planning improves efficiency by minimising delays, reducing costs, and ensuring timely access to equipment, services, and materials.

Despite investing billions of monies in these projects, especially in Dodoma city, the Tanzanian government has attempted to establish a regulatory framework for easy management of procurement projects (Bwire, 2022). However, the projects continue to face challenges due to qualified opinions, substandard works, and service delays (Cag, 2023; PPRA, 2022). Additionally, PPRA (2022) reports that contract management is still inadequate, despite 60% of procurement being for work. Despite the widely recognized importance of planning as a strategic tool for improving construction project delays, many project teams neglect sound planning strategies (PPRA, 2023). The main challenges in water projects are time-overrun construction contracts, poor selection methods, and procurement performed without tender board approval. The Nzunguni water supply project commenced on August 11, 2023, with an intended completion date of January 15, 2024, yet it remains unfinished as of this writing (Masanja, 2023; PPRA, 2022). Studies by Mashenene and George (2020) highlighted the importance of performance-focused pre-contract management. The Public Procurement Act of 2011 highlighted that contractor selection criteria, contract budget, and quality plan were all statistically significant and positively correlated with the timely delivery of procurement projects. As a result, the current study aims to investigate how procurement planning affects the timely delivery of water projects in Dodoma City.

2.1 Relevant Review

In the study by Omolo, & Ndeto, (2023) the performance of building contracts in Ugandan local governments was evaluated concerning the effects of procurement planning processes, which significantly impacted how well construction contracts performed. The study found that the performance of construction contracts is significantly impacted by the fact that funds are not always delivered for contracts in a timely manner. The study came to the conclusion that the performance of construction contracts in District Local Governments in Uganda is significantly impacted by procurement planning, contract monitoring, and administration.

In their 2015 research, Ji et al. examined the factors that influence the accuracy of estimating final contract price at the pre-contract stage in New Zealand. This research examined the key factors to address the lack of understanding. Analysed were 150 responses from professional members of the New Zealand Institute of Quantity Surveyors using a multi-attribute method. The results revealed 37 elements that may impact the ultimate contract price, with the three most crucial factors being insufficient or deficient bidding documentation, challenging design and construction, and comprehensive project information. Supplementary project-related, client, contractor, design consultant, and tendering conditions, along with internal and external matters, were recorded. Concordance analysis revealed a significant degree of agreement in the rank-ordering of the factors specified by the survey respondents in terms of their relative significance. Critical performance audit indicators at the PCS were identified as a result of the study's evaluation of Tanzania's present CPP auditing procedures (Aloyce et al., 2024). Based on the findings, practitioners audit the performance of projects in a variety of ways, which affects how the audit results are interpreted. This includes omitting some measurements at stages, measuring some items only, or combining some measures across stages of a project. According to study results, the top significant indicators at the planning stage are procurement plans, budgets, and feasibility studies, while at the design stage they are client needs, contract papers, and specifications. The most important factors during the procurement stage are thought to be the appropriateness of the procurement procedure, the evaluation process, the contract award, and the capacity and competency of the chosen contractor with reference to project size and complexity.

According to the study by Konzo (2020) the main essence of this study was to assess of the causes for delay in completion of road construction projects in Tanzania. The study had three specific objectives which were the key guide throughout the report. The specific objectives were assessing the design/ specifications delay causes in road construction projects, the management delay causes in road construction projects. Case study design was adopted in this study. The study involved engineers, consultants, contractors, procurement officers as well as financial officers. Convenient sampling technique was utilized to recruit 49 respondents as sample size. The study data was obtained through questionnaires, interview as well as documentary review. Data analysis was done through descriptive analysis as well as regression modal. It is concluded that poor specifications or designs have direct impact on the completion of road construction projects whereas it can be caused by failure of consultants to make significant actual investigation of the site. Also, delays can be caused when improper definitions of the essence of the road project. Moreover, changes in the scope of road project also led to delays in the construction of road construction projects. Changes of scope can be

caused by increase in the distance of the road to be constructed, changes of funding as well as change in the interest of the road project as well as changes of demand of the population.

3.1 Methods

This study employed a mixed-methods research approach and adopted an explanatory sequential design. The researcher obtained a study sample through stratified sampling and purposive sampling technique. The sampling process resulted in the collection of respondents from various sectors such as procurement unit, accounting and finance, environmental engineer, civil engineer, planning and coordination, environment management and sanitation unit. This study was conducted in the Dodoma City Council as it was identified to have big number of water projects yet to be completed in time.

Data collection processes were done using questionnaires and interview; the primary data collection entailed getting information straight from the participants. Conversely, Questionnaires served as the primary data gathering tool, providing quantitative insights on the influence of method of procurement on timely delivery of water construction projects in DUWASA while interviews were used to compliment the results obtained from the structured questionnaire and were employed to key informants. Questionnaires have the advantage of being economical, impartial, and giving respondents enough time to respond. The questionnaire utilized a five-score Likert scale, identifying the extremes of strongly disagree and strongly agree. Interviews were done with key informants who were the heads of the department namely (procurement unit, accounting and finance, environmental engineer, civil engineer, planning and coordination

environment management and sanitation unit) to provide experienced and detailed information, the interview was used in collection of qualitative data. This method was important for the researcher because it allowed for the acquisition of multiple data points. An interview assists a researcher in gathering data and formulates a detailed conclusion. Then, for the interview, a researcher used an interview guide as a tool. Data analysis involved, looking over, classifying, adding up, or reorganizing the information gathered for a study to answer the original research question. In this work, the researcher analyzed data gathered from a statistical population on influence of method of procurement. Preparing, organizing, and reporting are the components of data analysis, as stated in Kothari (2004). To ascertain response frequencies and perform percentage-based comparisons, the gathered data were subjected to analysis utilizing SPSS Version 20 and descriptive statistics. Data were coded, entered and presented in the form of texts, charts, and tables. Both descriptive and inferential statistics were employed in this study whereby frequencies, percent, mean, Standard Deviation, and regression analyses were performed. Furthermore, the following regression equations of logistic regressions were used as a mathematical model to show the influence of risk management, methods of procurement and monitoring management on timely delivery

$$Y-1 = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon \dots\dots\dots (1)$$

Where:

Y= Timely delivery (Timely, Untimely)

X₁ = Manually

X₂ = Electronically

X₃ = Contracting out

Qualitative data was analyzed by using the thematic analysis approach suggested by Braun and Crack (2006). The thematic analysis approach suggested six major phases which include: data familiarization, generating initial codes, searching for themes, reviewing themes, defining and naming themes and report production. It is worthwhile to note that the findings that were generated after analysis was presented using the participants' verbatim quotes to increase the credibility of the findings of the study.

4. RESULTS

The collected data indicated the following results (see the results in Table 1).

Table 1: Coefficients

	B	S.E.	Wald	df	Sig.	Exp(B)
Electronically	1.407	.600	5.501	1	.019	4.082
Manually	-.239	.595	.162	1	.687	.787
Contracting out	.907	.455	3.977	1	.046	2.476
Constant	-7.050	3.309	4.539	1	.033	.001

Source: Field Data (2024).

The findings as presented Table 1 revealed that contracting out has positive significant influence on timely delivery ($\beta=0.907$), and statistically significant of 5% (p-value=0.046). This means that 1 unit increasing of contracting out increases the timely delivery of water construction projects in DUWASA by 0.907 times. This also has been indicated by odd ratio of 2.476 implying that having organization with contracting out in water construction projects is 2.476 times likely to increase the timely delivery of water construction projects in DUWASA than having organization with no contracting out.

The findings from table 1 prompted the researcher to conduct an interview session with the head of department psudonamed HOD3 of department A, who was interviewed to comment on the influence of risk management techniques on ensuring on timely delivery of water construction projects in DUWASA

“.....risk management helps in Identifying potential risks early in the project and allows for proactive planning, one more thing I do not forget, risk management helps in assessing financial, safety, environmental, and timeline risks. In fact, the project teams can develop mitigation strategies by using risks management.....” (HOD3, 03/02/2024).

All in all, the analyzed data from the field at department suggested that the gran chart is known by HOD3 and the uses of it is explicitly clear to heads of department as shown in (Table 1). When the head of department symbolized by (HOD4) of department pseudo named C was interviewed about the varying influence of risk management techniques on ensuring on timely delivery of water construction projects in DUWASA, the head of department had the following words to say;

“.....It influences clear communication, whenever the risks management is being done properly, it ensures there is effective communication among stakeholders ensures everyone is aware of risks and their potential impact. Transparency helps prevent delays caused by misunderstandings or misaligned expectations.....” (HOD4, 04/2024).

Discussion of the findings

Contracting enables more efficient resource allocation, ensuring that the necessary equipment and staff are accessible when needed. Contracting enables improved resource allocation, ensuring that the appropriate tools and staff are accessible when needed. To incentivize prompt completion, contracts may include measures that control risks, such as fines for delays. Proper financial management within contracts ensures that money is available when needed, avoiding delays due to financial limitations. Electronic procurement systems provide greater communication among stakeholders, such as suppliers, contractors, and project managers. This ensures prompt resolution of any issues, thereby preventing delays. Electronic procurement procedures have a considerable impact on the timely delivery of water projects. Electronic procurement systems simplify the procurement process by automating tasks like bid solicitation, assessment, and contract administration. This saves time while doing these chores, compared to traditional paper-based techniques. These technologies improve openness by creating a clear audit trail for all procurement activity. This decreases the probability of delays caused by disagreements or corruption, ensuring that projects stay on track.

These results were in line with those of Ji *et al.* (2015) who revealed that, contract out leads to the timely delivery of contraction projects. This finding resonates with empirical study on influence of risks management in Tanzania underscoring the importance of acknowledging the role played by the risks management on project delivery (Alzoubi, 2022).

5. Conclusion, Implications, and the Area for Further Research

Based on the study's findings, it is possible to concludes DUWASA implements procurement planning methodologies to ensure that water construction projects are completed on time. This suggests that organizations that implement electronic procurement systems for water construction projects are more likely to enhance the timely delivery of water construction projects in DUWASA than those that do not. This suggests that organizations that contract out water construction projects are more likely to improve the timely completion of water construction projects in DUWASA than those that do not.

Implications

The research study conducted at Dodoma City Council focusing on DUWASA. Findings revealed that procurement and contracting out planning methods positively influence timely delivery of the project. Therefore, the study made recommendation to the research recommends that policymakers priorities the implementation of policies that promote effective procurement policies to increase the public sector's utilization of procurement planning.

To develop suitable solutions, the DUWASA should establish a unit to evaluate required procurement strategy and the challenges associated with implementing it. Professionals with relevant experience and expertise should work in the unit to oversee procurement planning activities and ensure that water contracts are delivered on schedule.

The study demonstrates that procurement planning on timely delivery has a substantial impact on an organization's performance. Consequently, practitioners must implement the planning that the organization has mandated to enhance the operations' effectiveness and, as a result, the timely delivery of services.

Areas of Further Studies

At the DUWASA, the research examined the impact of procurement planning on on-time delivery. The researchers recommend that additional research be conducted to evaluate the challenges associated with the implementation of procurement planning in the private sector, given the significant influence that procurement planning has on the expeditious delivery of public services and the timely procurement of services.

Acknowledgement

I would like to take this opportunity to express my gratitude to my esteemed supervisor, Dr. Boniface E. Mwalukasa, who provided me with guidance, direction, advice, and assistance and played a significant role in shaping my development. My siblings and friends have also encouraged me in my academic pursuits and helped me with my studies. In addition, I would like to express my gratitude to the professors at my MBA college and my fellow classmates in the MSCM program for their unwavering support and assistance during my academic journey. I would like to express my appreciation to DUWASA for providing me with access to collect and extract data. I am particularly grateful to their personnel, since they played a crucial role in enabling me to obtain both primary and secondary data. Additionally, I would want to express my gratitude to my employer for granting me the opportunity to continue my academic endeavors.

Email: berthsebakinya@gmail.com

Abstract

The study investigates the impact of logistic information system components on the efficiency of healthcare service delivery in Dodoma City, Tanzania. The study adopted mixed research approach, with convergent parallel method that helped the researcher to collect both qualitative and quantitative data concurrently. Questionnaire and Interview were used in the collection of data. Interview data was analyzed thematically, whereas questionnaire data was firstly, analyzed descriptively where frequency and percentage were developed, then logistic regression and Chi-square test were used to examine the relationship and association between independent variables and the efficiency of healthcare service delivery. The study involved three healthcare centres namely Benjamin Mkapa Hospital, Dodoma Regional Referral Hospital, and Makole Hospital, with a sample size of 211 selected both purposively and simple random techniques. Results of the study revealed that Inventory management significantly enhances efficiency in the performance of healthcare service delivery. Also, the findings further revealed a significant contribution of effective supplier management, demand forecasting and regulatory compliance in enhancing service delivery outcomes 0.05 level of significance.

Key words: *Logistic information system, Inventory managements, Supplier Management, Demand Forecasting, Regulatory Compliance and Health care service delivery performance*

1.0 Introduction

The Logistics Information Systems (LIS) have emerged as a transformative tool in healthcare management, that significantly enhancing service delivery efficiency worldwide. By integrating advanced technologies with supply chain processes, LIS optimize inventory management and streamline logistics, thereby improving patient outcomes (Ivanov, 2023). This is particularly important in healthcare, where timely access to services can mean the difference between life and death of an individual (Ivanov, 2023; Lee et al., 2022; Sarkar & Mohapatra, 2020; Ketchen et al., 2021). In that case, understanding the specific contributions of LIS to healthcare efficiency is essential, especially in contexts like Tanzania, where healthcare delivery faces unique challenges.

The global adoption of LIS in healthcare has led to substantial improvements in supply chain management practices, which is a key pillar to effective service delivery (Kamau, 2020). Technologies such as Radio Frequency Identification (RFID), Internet of Things (IoT), and data analytics facilitate enhanced inventory visibility and cost reduction, which are vital for effective healthcare service delivery (Ivanov, 2023). RFID is used to track medical equipment, medications, and supplies in real-time, improving inventory management and reducing the likelihood of stockouts or misplacements, whereas, IoT involves interconnected devices that can collect and share data. In healthcare, IoT devices can monitor patient conditions remotely, track equipment usage, and provide real-time data on supply levels, leading to more informed decision-making (Ivanov, 2023). These advancements underscore the importance of LIS in transforming healthcare logistics. For instance, Lee et al. (2022) highlights how information visibility enhances supply chain performance, demonstrating that a well-integrated LIS can significantly improve healthcare delivery outcomes across various settings.

In Africa, the implementation of LIS has proven to be a promising solution to the challenges posed by limited infrastructure and access barriers to healthcare. By improving supply chain transparency and optimizing inventory management, LIS ensures the availability of essential medicines, particularly in remote and underserved areas, that may have poor access of healthcare services (Olowookere et al., 2021; Kamau, 2020; Richey et al., 2020; Onwujekwe et al., 2021). This adaptability is crucial for enhancing healthcare accessibility and service delivery efficiency across diverse African contexts, including Tanzania, where disparities in healthcare infrastructure pose significant challenges in different context.

Tanzania's healthcare landscape is characterized by regional disparities in service delivery capabilities. The adoption of LIS within the country's healthcare systems has been instrumental in improving supply chain management practices (Baqleh and Alateeq 2023). LIS allows for real-time monitoring of medical supplies, enhances distribution logistics, and increases operational efficiency in healthcare facilities (Ministry of Health, Tanzania, 2023; Mkumbwa et al., 2022; Mahundi et al., 2021; Mtei et al., 2020). These initiatives are pivotal for addressing healthcare delivery challenges and enhancing health outcomes for Tanzanian populations.

Dodoma City, as the capital of Tanzania, plays a crucial role in the healthcare service landscape. The implementation of LIS in the city's healthcare facilities aims to optimize resource allocation, improve inventory management, and enhance patient care outcomes (Mkumbwa et al., 2022). According to Dodoma City Council (2022), LIS significantly contributes to improving healthcare service delivery through enhanced data integration and technology adoption. By leveraging LIS, healthcare providers in Dodoma can streamline operational processes, reduce inefficiencies, and ensure timely access to quality healthcare services.

Government healthcare systems face unique challenges, including budget constraints and bureaucratic inefficiencies that can hinder effective service delivery (Clark & Lee, 2019). Proper management of logistics information systems can mitigate these challenges by improving operational efficiencies and optimizing resource utilization (Kumar & Singh, 2020). Case studies by Patel et al. (2021) illustrate how the implementation of LIS positively impacts service delivery metrics, such as patient wait times and treatment outcomes, underscoring the potential for improved healthcare delivery through strategic LIS integration.

The current study aims to assess the contributions of various components of Logistics Information Systems (LIS), including inventory management, supplier management, demand forecasting, and regulatory compliance on the performance of government healthcare service delivery in Dodoma City. By examining how efficient supplier management enhances inventory availability (Smith et al., 2021; Ivanov, 2023), analyzing the impact of accurate demand forecasting on stockouts (Lee et al., 2022; Sarkar & Mohapatra, 2020), and evaluating the role of regulatory compliance in maintaining quality standards (Ketchen et al., 2021; Ivanov, 2023), as a stepping stone towards sustainable healthcare delivery. Therefore, this study underscored to provide empirical evidence that informs policymakers and healthcare administrators. Ultimately, the goal is to enhance healthcare efficiency and effectiveness through strategic LIS implementation in Dodoma City's healthcare sector.

Efficient healthcare service delivery plays a crucial role in ensuring the well-being of a population. Studies indicate that LIS can optimize inventory management, improve supply chain transparency, and enhance patient outcomes, ultimately impacting in effective healthcare service delivery (Ivanov, 2023; Lee et al., 2022). In Tanzania, government healthcare facilities encounter significant challenges related to the timely availability of medical supplies, effective resource management, and overall service delivery efficiency (Mwatawala et al., 2024; Nuhu et al., 2020; Msafiri and Katara, 2020; Todd et al., 2017). According to Mayumana et al. (2019) and Nuhu et al. (2020), logistic information systems (LIS) have the potential to address these challenges by streamlining supply chain operations, optimizing inventory management, and improving communication across different levels of the healthcare system. Despite the global advancements in LIS and their demonstrated effectiveness in enhancing healthcare delivery, significant gaps remain in the application of these systems within the Tanzanian context. Some government healthcare that adopted LIS for use still experience inefficiencies in service delivery, resulting in delays, stockouts, and suboptimal patient care. The effective utilization of these systems and their direct impact on healthcare efficiency remain uncertain. This study

aims to investigate the role of Logistic Information Systems in enhancing the efficiency of healthcare service delivery in Tanzanian government facilities.

2.0 Empirical Literature Review

According to Ivanov (2023), Logistics Information Systems are comprehensive frameworks designed to effectively manage and coordinate the flow of materials, information, and financial resources throughout the entire supply chain. As noted by Chopra and Meindl (2021), these systems incorporate various technologies and processes that enable efficient logistics operations, covering critical functions such as inventory management, transportation, warehousing, and the integration of information across different channels. By streamlining these processes, logistics information systems enhance operational efficiency, reduce costs, and improve healthcare service delivery in public health centers.

Inventory management is crucial for healthcare facilities as it encompasses the strategic planning, organization, and control of inventory levels to maintain a steady supply of necessary goods while minimizing both excess stock and shortages (Laundo & Laundo, 2021). According to Kumar and Van Hentenryck (2020), the primary goal of inventory management is to achieve an optimal balance between supply and demand, ensuring that hospitals and clinics are adequately equipped with essential medicines, equipment, and supplies to effectively meet patient needs and deliver quality care. This process not only enhances operational efficiency but also plays a vital role in patient safety and satisfaction.

Supply Chain Management (SCM) theory emphasizes the integration of processes across the entire supply chain to achieve competitive advantage and enhance customer value. In healthcare, SCM focuses on optimizing the flow of goods, information, and finances from suppliers to healthcare providers and patients (Chopra & Meindl, 2021). The theory involves that process of designing, planning, executing, controlling, and monitoring of all activities of supply chain, that focus on creating a perfect value, building an important and comprehensive infrastructure, leveraging global logistics, synchronizing with the demand and supply, and measure the achievements at the global scale (Ali, 2022). SCM theory underscores the importance of integrating processes across the supply chain to achieve competitive advantages and maximize customer value. In the context of healthcare, effective SCM aims to optimize the flow of goods, information, and financial resources from suppliers to healthcare providers and ultimately to patients (Chopra & Meindl, 2021). This integration is essential for ensuring that medical supplies are available when needed, which directly impacts patient care and outcomes. Effective SCM through LIS ensures timely availability of medical supplies, reduces stockouts, and improves inventory management practices in healthcare facilities in Dodoma City. Logistics Information Systems (LIS) play a crucial role in enhancing the efficiency of healthcare service delivery by streamlining supply chain management (SCM) processes.

Therefore, this comprehensive approach focuses on creating significant value, establishing a robust infrastructure, and synchronizing supply with demand (Ali, 2022). In practical terms, effective SCM facilitated by LIS leads to timely availability of medical

supplies, minimizes stockouts, and enhances inventory management practices. For instance, in Dodoma City, the implementation of LIS has been shown to improve the operational efficiency of healthcare facilities, allowing them to respond better to patient needs and optimize resource utilization. By adopting these systems, healthcare providers can ensure a more efficient and reliable service delivery, ultimately benefiting patient care and satisfaction.

This study utilizes the Technological Acceptance Model (TAM), introduced by Fred Davis in 1986, to explore the influence of LIS on the efficiency of healthcare delivery services in Tanzania, and more specifically in Dodoma City. TAM posits that technology acceptance is primarily determined by perceived usefulness and ease of use (Davis, 1989). This framework is particularly relevant for analyzing how institutions employ digital technologies and how eLearning platforms are perceived in the delivery of healthcare (Scherer et al., 2019; Sukendro et al., 2020). In developing countries like Tanzania, the adoption of technology in healthcare service delivery is more problematic due to insufficient infrastructure and lack of institutional support (McKay et al., 2021). Key issues such as system security, internet accessibility, and resource limitations hinder the effective delivery of healthcare services (Naumova et al., 2017). While TAM provides valuable insights into the attitudes towards LIS, and their impact on the delivery of healthcare services.

The connection between LIS and the TAM lies in understanding how healthcare professionals and organizations perceive and adopt these systems to enhance service delivery efficiency in Tanzania. TAM posits that the acceptance of technology is primarily influenced by perceived usefulness and perceived ease of use (Davis, 1989). In the context of LIS, healthcare providers must recognize the system's potential to improve logistics management, reduce stockouts, and streamline operations. If healthcare professionals perceive LIS as a valuable tool that enhances their ability to deliver services efficiently, they are more likely to adopt and utilize it effectively. In contrary, if they find the system complicated or cumbersome, they may resist its implementation, regardless of its potential benefits.

However, the successful adoption of LIS and its implication in Tanzanian healthcare is contingent upon addressing the challenges of resource availability, training, and infrastructure elements that TAM acknowledges to influence technology acceptance. By understanding the attitudes and experiences of healthcare providers regarding LIS, stakeholders can tailor training and support system for enhancing perceived ease of use and usefulness, ultimately leading to better adoption rates and improved healthcare delivery outcomes. This integration of TAM with the implementation of LIS provides a comprehensive framework for analyzing and optimizing technological adoption in the healthcare sector.

An empirical review is a critical examination and synthesis of existing research studies and empirical evidence on a specific topic or research question, involving the systematic analysis of peer-reviewed articles, research reports, and other scholarly sources to summarize key findings, identify gaps in knowledge, and assess the overall state of research in the field. This type of review aims to provide a comprehensive understanding of empirical findings, methodologies used, and theoretical frameworks employed by researchers to investigate the

topic of interest, thereby informing future research directions, policy development, and practical applications based on accumulated evidence. According to Tranfield, Denyer, and Smart (2003), empirical reviews play a crucial role in consolidating empirical evidence, identifying trends, and highlighting areas requiring further investigation (Tranfield, Denyer, & Smart, 2003). Numerous studies related to this study, following the research objectives are illustrated authentically in this part.

Effective Logistic Information Systems (LIS) in healthcare settings, particularly in Dodoma City, are crucial for managing inventory and ensuring the continuous availability of essential medicines and medical supplies. Advanced forecasting and replenishment strategies play a significant role in maintaining optimal inventory levels, which helps reduce stockouts and enhances patient care and operational efficiency. Research by Chaudhry et al. (2018) demonstrates that real-time inventory tracking systems and streamlined procurement processes are vital for healthcare facilities to meet patient demand and mitigate supply chain disruptions. By implementing these strategies, healthcare providers in Dodoma City could achieve reduced wait times, improved patient satisfaction, and better overall healthcare outcomes. Recent advancements, supported by the Tanzania Ministry of Health, emphasize the integration of technology to enhance the distribution of medicines, especially in rural areas with limited access. According to Macha et al. (2018), effective LIS can significantly reduce stockouts and improve patient care by ensuring timely access to medications. The shift from traditional paper-based methods to electronic tracking systems has improved data accuracy and allowed for real-time monitoring of inventory levels, which is vital for efficient healthcare operations.

Despite these advancements, several systemic challenges hinder the overall effectiveness of LIS in Tanzania. A key issue is the inadequate training of healthcare personnel, which leads to underutilization of advanced systems (Kihaule et al., 2020). Additionally, fragmentation of data across various healthcare facilities complicates data integration, resulting in inconsistent reporting and ineffective decision-making (Mchomba et al., 2021). Therefore, regardless the initiatives made such as the integration of mobile technology and partnerships with organizations like the Global Fund and USAID, still there is low level of technological integration in healthcare services in Tanzania.

Research by Tan et al. (2019) highlights the transformative impact of Information Systems, particularly integrated electronic health records (EHRs) and decision support systems, on clinical workflow efficiency and patient care coordination. Their findings suggest that these systems significantly enhance diagnostic accuracy, treatment planning, and overall patient management. In Dodoma City, the implementation of comprehensive Information Systems could streamline healthcare processes, leading to reduced medical errors and more effective allocation of resources. By ensuring that healthcare providers have immediate access to accurate patient information, these systems can facilitate timely interventions and improve communication among care teams, ultimately enhancing patient outcomes in the region.

Further supporting this perspective, the systematic review conducted by Buntin et al. (2011) illustrates how health information technology, including various Information Systems,

contributes to improving healthcare quality and efficiency. Their research indicates that such systems enable timely access to critical patient information and support evidence-based practices, which are essential for optimizing care coordination across different healthcare settings. For Dodoma City, adopting similar technologies could foster greater interoperability among healthcare providers, allowing for seamless information exchange and collaboration. This data-driven approach to decision-making would not only enhance service delivery effectiveness but also empower healthcare professionals to provide more personalized and timely care to patients, ultimately leading to improved health outcomes throughout the community.

The literature on healthcare logistics and supply chain management in developing countries has seen various studies, such as those by Bekele et al. (2021), Tiye (2018) in Ethiopia, and Manso et al. (2013) in Ghana. However, there is a notable gap in research focused on the impact of Logistic Information Systems (LIS) on healthcare service delivery efficiency within government facilities in Tanzania. Existing studies like Hija (2024) on factors affecting health infrastructure condition for service delivery in City council of Dodoma, Nuhu et., al (2020) on challenges on health service delivery under public-private partnership in Tanzania, Chilipweli et al (2023) on Assessment of Working Environment and Satisfaction among Health Care Workers in Sengerema District Mwanza, Tanzania to mention a few. Those studies tend to concentrate on general healthcare management systems, overlooking the specific contributions of LIS in addressing operational inefficiencies. Furthermore, there is limited empirical evidence on the integration of these systems into the daily operations of Tanzanian government healthcare facilities and the contextual factors influencing their effectiveness. This study aims to bridge this gap by providing a detailed analysis of the role of LIS in enhancing healthcare service efficiency and by offering insights into the challenges and opportunities for optimizing these systems in the Tanzanian context.

3.0 Methodology

This chapter presents the methodological techniques that were employed in conducting this study. It covers research approach, research design, study population, study area, sampling and sample size, sampling techniques, data collection methods and data analysis.

3.1 Research Approach

Research approaches refer to the overarching strategies or frameworks used to collect and analyze data in order to answer research questions or test hypotheses. These approaches guide how researchers gather, interpret, and draw conclusions from data. To assess the impact of logistics information systems on the efficiency of health care service delivery in Dodoma City, mixed research approach has been used. Mixed methods research is research method that includes both qualitative and quantitative research elements, with the aim of integrating or combining the strengths of both approaches to gain a more comprehensive understanding of the research problem. This approach aims to create mutually exclusive sets of data that inform each other. Also, it allowed combining the strengths of both quantitative and qualitative

approaches (Cresswell & Plano Clark, 2018). Quantitative methods provide numerical data and statistical analysis, offering generalizability and precise measurement of variables. (Mahundi, Temu, & Mboera, 2021) Qualitative methods, on the other hand, provide rich, detailed insights into the context, meanings, and experiences of participants (Zimmermann & Grubert, 2021). By integrating these approaches, the researcher managed to achieve a deeper and more comprehensive understanding of research questions than would be possible with either method alone.

3.2 Research Design

This study utilized a convergent parallel research design, which combines both quantitative and qualitative data at various stages of the research process to provide a more thorough analysis of the research problem. This approach merges two datasets to create a complete picture of the issue being investigated and justifies the integration of both data types (Creswell, 2019). The Convergent Parallel Mixed-Methods Design is grounded in pragmatism, making it an effective and widely used method for merging research approaches (Creswell & Clark, 2018). In this design, qualitative and quantitative methods are combined to yield triangulated findings from field data. Initially, both types of data were collected concurrently; quantitative data was gathered through questionnaires, while qualitative data was obtained via interviews. Each dataset was then analyzed independently, and the results were integrated during the analysis and interpretation phases (Creswell, 2012).

In this study, data convergence takes place at various stages of the research process, specifically during data collection and the subsequent analysis and discussion phases (Moon et al., 2016). During the data collection phase, the researcher gathered both qualitative and quantitative data simultaneously to achieve a deeper and more thorough understanding of the research topic. This approach allowed the researcher to identify relationships and associations between the two data types, leading to initial insights and highlighting potential areas of convergence. Later, during the analysis and discussion phases, the researcher further examined this convergence by integrating and comparing the findings from both qualitative and quantitative research. As noted by Boru (2018), combining these findings provides a more comprehensive view of the research problem being investigated.

3.3 Study Population

The population of this study consisted of management and staff, totaling 411 individuals in selected government hospitals in Dodoma City (Benjamin Mkapa Hospital, Dodoma Regional Referral Hospital, and Makole Hospital). These hospitals are key healthcare providers in Dodoma City, representing different levels of healthcare services (referral, regional, and district levels). Including them ensures a diverse representation of healthcare settings, which can enhance the generalizability of the study findings. These hospitals are likely to have adequate infrastructure, facilities, and administrative support necessary for conducting research. This includes access to medical records, administrative data, and other resources that may be critical for the study.

This study population included all employees in the selected government hospitals because they are information-rich cases and good representatives of healthcare service delivery in Dodoma City. Consequently, the researcher extracted relevant information pertaining to the objectives of this study. The population consisted of management and staff, totaling 411 individuals in the selected government hospitals (Benjamin Mkapa Hospital), Dodoma Regional Referral Hospital, and Makole Hospital), from which 201 samples were selected. The sample size was calculated using the Krejcie and Morgan (1970) table, which is used for determining sample sizes in studies where the population size is relatively small and when the researcher aims to achieve a specific level of precision in their estimates (Krejcie & Morgan, 1970).

3.4 Area of study

This study was conducted in Dodoma City, Tanzania, which serves as the administrative capital of the country. The city hosts essential government offices, including ministries and regulatory bodies that shape healthcare policies and regulations. By focusing on hospitals in Dodoma, the research aims to gain insights into healthcare management and the implementation of policies directly influenced by central government directives. This strategic location allows for an examination of how administrative frameworks affect healthcare delivery, making it a vital area for understanding the dynamics of health service management in relation to government initiatives.

Dodoma City is characterized by a more developed healthcare infrastructure compared to the rural districts in the Dodoma region. This includes hospitals equipped with advanced facilities and specialized services, which provide better resources for conducting research. The city's infrastructure supports comprehensive data collection and analysis, enabling the exploration of various healthcare management practices. Additionally, the higher population density and diversity in Dodoma offer a unique perspective on socioeconomic factors, healthcare access, and utilization patterns among hospital management and staff. Studying this diverse population allows for a more nuanced understanding of the challenges and practices within healthcare management in an urban context.

The Tanzanian government has undertaken several initiatives to enhance healthcare service delivery in Dodoma City, focusing on infrastructure improvements, human resource development, and technology integration (Ministry of Health, Tanzania, 2023). Efforts such as constructing new healthcare facilities and implementing digital health solutions aim to modernize service delivery (Mtei et al., 2020). However, challenges remain, including inadequate healthcare facilities and poor road networks that limit access, particularly in rural areas (Kamau, 2020; Dodoma City Council, 2022). Additionally, shortages of trained healthcare professionals and logistical inefficiencies further hinder service quality and continuity (Olowookere et al., 2021; Richey et al., 2020). The limited adoption of advanced information systems also affects data integration and decision-making processes (Mkumbwa et al., 2022; World Health Organization, 2020). Conducting this study in Dodoma is justified by its central role in administration, healthcare infrastructure, and its potential to inform policy

and practice in urban healthcare management, enhancing both the relevance and depth of the research.

3.5 Sampling Techniques

This study, the population comprised management and staff from selected government hospitals in Dodoma City, totaling 411 individuals (sampling frame) across three key institutions: Benjamin Mkapa Hospital, Dodoma Regional Referral Hospital, and Makole Hospital. From this population, a sample of 201 individuals was selected. The sample size was determined using the Krejcie and Morgan (1970) table, which is a widely recognized tool for calculating sample sizes in studies where the population size is relatively small, allowing researchers to achieve a specific level of precision in their estimates (Krejcie & Morgan, 1970). This structured approach to sampling not only enhances the validity of the research findings but also ensures that the characteristics of the sample reflect those of the broader population, thereby facilitating meaningful analysis and interpretation of healthcare management practices within the context of Dodoma City.

Formula for by Krejci and Morgan's (1970) determinant of sample size

$$n = \frac{\chi^2 N p (1-p)}{e^2 (N-1) + \chi^2 p (1-p)}$$

n = Sample size

N= Population size

e = Acceptable sampling error

χ^2 = chi-square of degree of freedom 1 and confidence 95% = 3.841

p = Proportional of population (if unknown, 0.5)

Table 1 Sample size determination by Krejci and Morgan's

<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>	<i>N</i>	<i>S</i>

3.5.1 Sampling Proportion

The study was conducted in three Government hospitals in Dodoma City. (Benjamini Mkapa Hospital, Dodoma Regional Referral Hospital and Makole Hospital). a sampling strategy that ensured proportional representation from each region. This approach aimed to capture the real representative of the population.

Equation 1 Sampling proportion allocation

$$\text{Formula } ni = \frac{Ni}{N} * n$$

Where *Ni* is sub population

N population

n is a sample size

Table 3.3 Sample proportion

Dodoma Hospitals	Study Population (sampling frame)	Proportion Calculation	Sample size
Benjamini Mkapa hospital	176	$\frac{176}{411} * 201$	86
Dodoma Regional Referral Hospital	158	$\frac{158}{411} * 201$	77
Makole hospital	77	$\frac{77}{411} * 201$	38
Total	411		201

respondents.

3.6 Data Collection Methods

Structured questionnaires were utilized to collect data from 201 ordinary employees, constituting the selected sample, Government health service delivery. The questionnaires were designed with closed-ended questions to facilitate the collection of quantitative data. Covering various aspects, the questionnaire captured demographic characteristics of study participants, to assess the contribution of Inventory Management on the performance of health care service delivery in Dodoma City.

Data from nine (9) management personnel in Health services was collected through in-depth interviews. In which single representative form, all three- Government health service delivery has been included. The interview guide, comprising questions adapted from existing literature and adjusted to suit the context of this study, focused on assess the contribution of Inventory Management on the performance of Government health care service delivery in Dodoma City, to examine the role of Information System on the performance of health care service delivery in Dodoma City, to determine the effect of Operational System on the performance of Government health care service delivery in Dodoma City. A researcher wants to obtain qualitative information on the experiences and perceptions of study participants on impact of workplace environment on employees' satisfaction. The nature of information needed by a researcher necessity the use of interviews.

3.7 Variable Measurements and Data Analysis

3.7.1 Variable Measurements

Variable	Measurement
Logistic information system (Independent Variable 1)	

Supplier Management	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)
Demand Forecasting	
Regulatory Compliance	
Health care service delivery performance	Five – Point Likert Scale (1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree, 5 = Strongly disagree)

Source: Researcher (2024)

3.7.1.1 Transformation of Excellent service delivery

The 5-point Likert scale data on Health care service delivery performance were transformed into an index scale using the overall mean scores. Thus, the mean score greater or equal to the overall mean was termed as high performance while the score below the overall mean was termed low performance. *The 5-point Likert scale data on healthcare service delivery performance were transformed into an index scale using the overall mean scores to facilitate analysis. This transformation allows for a clearer interpretation of performance levels across different aspects of service delivery. Scores that were greater than or equal to the overall mean were categorized as high-performance, indicating satisfactory or excellent service delivery. Conversely, scores that fell below the overall mean were classified as lower-performance, highlighting areas that may require improvement. This classification not only aids in identifying strengths but also pinpoints specific weaknesses in healthcare services. Overall, this method provides a structured approach to evaluating and enhancing healthcare delivery systems.*

3.7.1.2 Distribution of Project Performance

The evaluation of healthcare service delivery performance is presented as binary outcomes, High Performance and Low Performance, based on frequency and percentage. The data reveals that a significant majority of respondents, totaling 156 individuals, rated healthcare service delivery in Dodoma City as High Performance, accounting for 77.47% of the total sample. In contrast, a smaller group of 45 individuals perceived it as Low Performance, representing 22.53% of the sample. This binary classification provides a clear overview of how respondents view the overall efficiency of healthcare service delivery. The high percentage of respondents indicating High Performance reflects a generally favorable perception of the quality and effectiveness of government healthcare services in Dodoma City. Conversely, the lower percentage of those perceiving Low Performance indicates a minority who identify areas where healthcare delivery could improve, highlighting potential opportunities for enhancement in services.

Table 2. Distribution of Secondary School Construction Project Performance.

Healthcare service delivery	Frequency	Percentage
High performance	156	77.47
Low performance	45	22.53

Source: Field data (2024)

Table 2. provides a clear picture of the distribution of perceptions regarding government healthcare service delivery performance in Dodoma City, highlighting a predominantly positive view among respondents, although a minority express concerns about low performance in certain aspects.

3.7.2 Data Analysis

Both qualitative and quantitative data analysis were employed in this study. Qualitative data analysis was supported from the information of documentary review whereas quantitative data analysis was supported statistical tools like logistic regression. Logistic regression analysis was employed to assessing effects of LIS on the performance of health care service in Dodoma City. The Logistic regression equation used for this analysis encapsulates this relationship below;

$$\text{logit}\left(\frac{p}{1-p}\right) = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3}}$$

Where:

Logit = logistic link function

p = probability that there is the influence of LIS on the performance of health care service in Dodoma City.

1-p = probability that there is no influence of LIS on the performance of health care service in Dodoma City.

β_0 = intercept

β_1 - β_3 = parameter estimates or logit coefficients

y =Project performance

X_1 - X_3 = Supplier Management (X_1), Demand Forecasting (X_2) and Regulatory Compliance (X_3).

3.8 Validity and Reliability of Data

To enhance validity, a preliminary study was carried out to improve the research's credibility by testing the research tools on a small group of participants beforehand. This initial assessment was designed to verify that the tools accurately capture the desired variables.

The reliability of the data was evaluated using Cronbach's Alpha test. This test was selected for its effectiveness in identifying and eliminating unreliable elements, thereby

ensuring data quality before delving into detailed analysis. A higher Cronbach's Alpha (closer to 1) indicates better reliability. A Cronbach's Alpha score of 0.7 or higher is typically regarded as acceptable for most research applications (Babbie, 2020). This statistic serves as a measure of internal consistency, indicating how well the questions within each variable assess the same underlying concept. A higher Cronbach's Alpha, approaching 1.0, signifies improved reliability.

Table 3 Reliability test by Cronbach's Alpha

Logistics information systems	No of item	Cronbach's Alpha
Demand Forecasting	3	0.892
Regulatory Compliance	3	0.882
Supplier Management	3	0.773
Dependent variable		
performance of health care service delivery	4	0.922

Source: Field Data (2024)

3.9 Ethical Consideration

In this study, ethical considerations played a crucial role, ensuring that all participants gave informed consent. They were provided with comprehensive details about the study's objective, data collection techniques, and how their data would be used. Participants were reassured that their involvement was voluntary, and they had the right to withdraw from the study at any point without any consequences. Additionally, strict measures were implemented to maintain the privacy and confidentiality of participants' information. These ethical practices not only upheld the integrity of the research but also respected the rights and well-being of the individuals involved, fostering a trusting relationship between the researchers and participants.

4.0 Results

Before performing the influence of logistics information systems on the efficiency of health care service delivery in Dodoma City, before applying binary logistic regression, the Likert scaled data were transformed into binary response and the test for association between independent variable and dependent variable were tested using Chi square and the variable which were statistically significance were applied in model fit assumption test. After the whole step and outcome seems to be significant the data were applied in the Binary logistic regression.

a) Omnibus tests of model coefficients

The results from the omnibus tests of model coefficients using logistic regression highlight the impact of logistics information systems (LIS) on the efficiency of healthcare services in

Dodoma City, analyzed at a significance level of 0.05. For Inventory Management, the logistic regression model revealed a significant Chi-square value of 49.05 with 3 degrees of freedom (df) and a p-value of 0.00. This indicates a strong correlation between Inventory Management practices and the performance of government healthcare service delivery. The significant results suggest that variations in Inventory Management are a meaningful predictor of service delivery performance within the government healthcare sector in Dodoma City.

Table 4 Omnibus tests of model coefficients

Logistic regression model	Chi square	Degree of freedom	significance
LIS on the performance of Government health care service delivery	49.05	3	0.00

b) Hosmer and Lemeshow model test

The Hosmer and Lemeshow test results for logistic regression models examining the influence of Inventory Management, Information Systems, and Operational Systems on the performance of government healthcare service delivery in Dodoma City were evaluated at a significance level of 0.05. For Inventory Management, the test yielded a Chi-square value of 2.13 with 4 degrees of freedom (df) and a significance level of 0.511. This indicates that the logistic regression model adequately fits the data, showing no significant lack of fit. Therefore, the model effectively explains the relationship between Inventory Management practices and service delivery performance.

Table 5 Hosmer and Lemeshow model test

Logistic regression model	Chi square	Degree of freedom	significance
Logistic information system on the performance of Government health care service delivery	2.13	4	0.511

c) To Examine the Association between Logistic information system on the performance of health care service in Dodoma City.

The association between LIS and the overall performance of government health care delivery. The chi-square test results examined the relationship between LIS aspects such as Supplier Management, Demand Forecasting, and Regulatory Compliance and the performance of government healthcare service delivery in Dodoma City, with a significance level set at 0.05. For Supplier Management, the test revealed a significant association ($\chi^2 = 32.31$, $p < 0.01$), indicating that effective Supplier Management practices correlate with perceptions of high

performance. Among respondents who reported ineffective Supplier Management, 84 (86.36%) perceived low performance, while only 12 (13.64%) perceived high performance. In contrast, those with effective practices had 79 (80.65%) perceiving high performance, suggesting a strong link between Supplier Management effectiveness and improved healthcare delivery perceptions.

Similarly, Demand Forecasting showed a significant result ($\chi^2 = 37.91$, $p < 0.01$), reinforcing the notion that effective forecasting practices enhance perceptions of service delivery performance. Among those reporting ineffective Demand Forecasting, 65 (25.00%) perceived low performance, while only 19 (25%) perceived high performance. Conversely, those with effective Demand Forecasting practices had 69 (80%) perceiving high performance. Regulatory Compliance also demonstrated a significant association ($\chi^2 = 31.40$, $p < 0.01$), with 60 (73.58%) who did not comply perceiving low performance, compared to 115 (72.73%) who did comply and perceived high performance. These findings collectively underscore the importance of effective Inventory Management practices in enhancing the perceived efficiency of government healthcare services in Dodoma City.

Table 6: The Chi-square table to show Association between Inventory Management on the performance of Government health care service delivery in Dodoma City.

LIS	Low performance	High performance	Chi-square	P-Value
Supplier Management			32.31	<0.01
No	84(86.36)	26(13.64)		
Yes	12(19.35)	79(80.65)		
Demand Forecasting			37.91	<0.01
No	65(25.00)	19(25)		
Yes	48(20.00)	69(80)		
Regulatory Compliance			31.40	<0.01
No	60(73.58)	28(26.42)		
Yes	43(27.27)	7(72.73)		

Source: Field data (2024).

Table 6 provides compelling evidence that effective LIS, specifically Supplier Management, Demand Forecasting, and Regulatory Compliance, significantly correlate with higher perceptions of high performance in government healthcare service delivery in Dodoma City. These findings underscore the importance of these logistics management aspects in enhancing overall service delivery outcomes within the healthcare sector.

Statements on the current state of LIS on efficiency of healthcare

Inventory management is crucial for maintaining the availability of essential medical supplies and equipment in healthcare facilities. In the current state of logistics information systems (LIS), effective inventory management practices are increasingly recognized as vital for ensuring that healthcare providers have the necessary resources to deliver quality care. By systematically assessing our inventory management processes, we can pinpoint specific areas that require enhancement. This proactive approach helps to minimize stockouts, ensuring that healthcare professionals can access the supplies they need when they need them, thereby improving overall patient care.

Moreover, the evaluation of inventory management practices allows for better resource allocation within healthcare facilities. By leveraging data-driven insights from logistics information systems, healthcare administrators can make informed decisions regarding stock levels and purchasing strategies. This not only leads to more efficient use of financial resources but also ensures that critical medical supplies are readily available, thus reducing waste and excess inventory. The integration of advanced technologies in inventory management systems facilitates real-time tracking and monitoring, which can further enhance operational efficiency and responsiveness in healthcare delivery.

Ultimately, focusing on improving inventory management through effective logistics information systems can significantly elevate the quality of healthcare service delivery in Dodoma City. By addressing current challenges in supply chain management and adopting best practices, healthcare facilities can enhance their ability to meet patient needs. This commitment to optimizing inventory management not only improves service efficiency but also contributes to better health outcomes, reinforcing the importance of a well-functioning logistics framework in the healthcare sector.

d) To Examine the examine the roles of LIS on the performance of Government health care in Dodoma City.

The results of a logistic regression analysis assessing the contribution of Inventory Management on the performance of Government health care service delivery in Dodoma City he results of a logistic regression analysis assessing the contribution of Inventory Management components (Supplier Management, Demand Forecasting, and Regulatory Compliance) on the performance of Government health care service delivery in Dodoma City, evaluated at a significance level of 0.05. The logistic regression model examines the odds ratios (OR) associated with each Inventory Management component, providing insights into how these

factors influence the likelihood of perceiving High performance in Government health care service delivery, with Low performance as the reference category.

For Supplier Management, the analysis shows a significant coefficient of 1.7012 ($z = 33.43$, $p < 0.01$) and an odds ratio of 2.4806. This indicates that respondents who reported effective Supplier Management practices were 2.48 times more likely to perceive High performance in health care service delivery compared to those who did not implement such practices, holding other factors constant.

Regarding Demand Forecasting, the analysis reveals a coefficient of 0.745 ($z = 32.71$, $p < 0.01$) and an odds ratio of 1.9138. This suggests that effective Demand Forecasting practices increase the odds of perceiving High performance by approximately 1.91 times compared to those not utilizing these practices.

Similarly, for Regulatory Compliance, the analysis shows a coefficient of 1.913 ($z = 21.05$, $p < 0.01$) and an odds ratio of 2.71. This indicates that respondents who comply with regulatory standards are 2.71 times more likely to perceive High performance in Government health care service delivery compared to those who do not comply, when other factors are held constant.

The constant term in the model is -0.7974 ($z = -2.84$, $p < 0.01$), suggesting a baseline odd of 0.47 for perceiving High performance when all predictors are zero or not applicable. The logistic regression model's overall fit is supported by a likelihood ratio Chi-square test (LR $\chi^2(3) = 61.612$, $p < 0.001$) and a Pseudo R^2 value of 0.501, indicating that the model explains a substantial portion of the variance in Government health care service delivery performance based on Inventory Management practices.

Table 7: Logistic Regression Analysis showing the effects of LIS on the performance of Government health care service delivery in Dodoma City.

Government Health care service delivery performance		Coef.	Odds Ratio	z	P> z
Low (base outcome)					
Supplier Management	Yes	1.7012	2.4806	33.43	<0.01
No (Reference)					
Demand Forecasting		0.745	1.9138	32.71	<0.01
No (Reference)					
Regulatory Compliance	Yes	1.913	2.71	21.05	<0.01
No (Reference)					
Constant		-0.7974	.47	-2.84	<0.01
Number of observations = 201 LR $\chi^2(3) = 61.612$					

Prob > Chi2 = 0.000

Pseudo R2 = 0.501

Source: Authors compilation from STATA 17

In summary, Table 7 provides robust evidence that effective Inventory Management practices, including Supplier Management, Demand Forecasting, and Regulatory Compliance, significantly contribute to higher perceptions of High performance in Government health care service delivery in Dodoma City. These findings underscore the importance of strategic inventory management in enhancing service delivery outcomes and highlight specific areas where improvements can lead to better overall performance in health care services.

"Inventory management plays a great role in ensuring the availability of essential medical supplies and equipment in our healthcare facilities. By assessing how effectively we manage our inventory, we aim to identify areas for improvement that can lead to reduced stockouts, improved resource allocation, and ultimately enhance the quality of healthcare service delivery in Dodoma City."

"Information systems are important in modernizing healthcare management. They facilitate data-driven decision-making, enhance communication among healthcare providers, and improve patient outcomes. By examining our current information systems and their impact, we seek to optimize data integration, analytics, and technology utilization to overcome inefficiencies and enhance the accessibility and quality of healthcare services across Dodoma City."

"Operational systems, including warehousing and distribution, order processing, and transportation management, are critical for the smooth functioning of healthcare facilities. By assessing these operational systems, we aim to identify opportunities for optimizing efficiency, reducing costs, and improving overall service delivery effectiveness in Dodoma City. Understanding how these systems impact healthcare service performance is essential for addressing logistical challenges and enhancing patient care outcomes."

5.0 Discussion

The logistic regression analysis conducted to evaluate the influence of Inventory Management components on the performance of government healthcare service delivery in Dodoma City reveals significant findings. Each component Supplier Management, Demand Forecasting, and Regulatory Compliance shows a positive correlation with perceived high performance, indicating that effective inventory practices are critical for enhancing healthcare delivery outcomes.

The results indicate that effective Supplier Management significantly increases the odds of perceiving high performance in healthcare service delivery, with an odds ratio of 2.4806. This finding aligns with the work of Soni et al. (2020), who emphasized that robust supplier relationships enhance the quality and availability of medical supplies, thereby improving service delivery. Similarly, a study by Gunasekaran et al. (2017) found that effective supplier collaboration is integral to optimizing inventory levels and reducing stockouts, ultimately leading to better healthcare outcomes.

The coefficient for Demand Forecasting suggests that its effective implementation nearly doubles the likelihood of perceiving high performance (OR = 1.9138). This reinforces the findings of Chao et al. (2021), who argued that accurate demand forecasting in healthcare settings not only ensures that necessary resources are available but also minimizes waste and inefficiencies. Furthermore, the integration of data analytics in forecasting processes has been shown to significantly enhance service delivery (Zhang et al., 2019).

Regulatory Compliance emerged as the most impactful component, with an odds ratio of 2.71. This underscores the critical nature of adhering to established healthcare regulations, which ensures safety and quality standards. The results support the claims made by Alshahrani et al. (2020), who found that compliance with health regulations is crucial for maintaining service quality and patient safety. Furthermore, adherence to regulatory frameworks fosters accountability and transparency within healthcare systems, which is essential for public trust (Bardhan et al., 2022).

The logistic regression model demonstrated a strong fit, with a Pseudo R^2 of 0.501 and a significant likelihood ratio Chi-square statistic (LR χ^2 (3) = 61.612, $p < 0.001$). This suggests that the model effectively captures a substantial portion of the variance in healthcare service delivery performance, corroborating the importance of Inventory Management in the context of healthcare (Bowers et al., 2023). The constant term indicates a baseline probability of 0.47 for perceiving high performance when all predictors are absent, highlighting the necessity of these management practices. In conclusion, the analysis illustrates that Supplier Management, Demand Forecasting, and Regulatory Compliance are pivotal in enhancing the performance of government healthcare services in Dodoma City. These findings contribute to the growing body of literature emphasizing the importance of effective Inventory Management in healthcare, suggesting that policymakers and healthcare administrators should prioritize these components to improve service delivery.

6.0 Conclusion

The logistic Based on the results, this study provides valuable insights into the factors influencing Government health care service delivery performance in Dodoma City. Effective Inventory Management practices, particularly Supplier Management, Demand Forecasting, and Regulatory Compliance, play crucial roles in enhancing service delivery outcomes. Similarly, Information System components such as Data Integration and Technology Integration significantly contribute to improved service delivery performance. Operational System components, specifically Order Processing and Transportation Management, also play critical roles in determining service delivery outcomes. These findings underscore the importance of strategic management of inventory, information systems, and operational processes in enhancing overall performance and quality of Government health care services in Dodoma City.

The logistic regression analyses conducted in this study provide valuable insights into the factors influencing Government health care service delivery performance in Dodoma City, focusing on Inventory Management, Information System, and Operational System

components. The findings underscore the significant roles of these factors in shaping service delivery outcomes within the healthcare sector.

Inventory Management, Effective Supplier Management, Demand Forecasting, and Regulatory Compliance are crucial for enhancing service delivery performance. These practices significantly increase the likelihood of perceiving High performance, highlighting their importance in ensuring timely and efficient healthcare service provision.

Information System, Data Integration and Technology Integration play pivotal roles in improving service delivery outcomes. Organizations that effectively integrate data and technology are more likely to achieve High performance in healthcare service delivery.

Operational System, Effective Order Processing and Transportation Management are critical in ensuring smooth and efficient healthcare operations. These components significantly contribute to enhancing service delivery performance by streamlining logistical processes.

Abstract

The general objective of the study is to assess the impacts of financial intermediaries on the economic growth of Tanzania. Specifically, this study address four objectives such are; to ascertain the impacts of bank credit on private sector development towards the economic growth, to identify the impacts of lending rates on the economic growth, to measure the contribution of the total value of share traded ratio to the economic growth and to analyse the effects of total insurance premiums on the economic growth of Tanzania. This study will use time series research design covering a period of 30 years from 1990 through 2020. Findings indicate that Deposits as a percentage of GDP positively influence Tanzania's long-term economic growth by boosting investment mobilization. However, interest rate swaps negatively affect GDP growth due to the financial system's limitations. In contrast, the non-life insurance sector supports economic growth by enhancing financial security and reducing risks. Overall, effective deposit management and insurance services are crucial for fostering economic participation. This study highlights the importance of financial institutions in enhancing savings and investment for economic growth in Tanzania. Future research should focus on recent financial intermediation impacts, particularly due to global disruptions like COVID-19. Examining informal financial sectors, such as savings groups and microfinance, is vital for understanding Tanzania's financial landscape.

Key words: *Financial sector, Tanzania, lending rates, financial landscape*

1. Introduction

The economic growth of any country is deeply intertwined with the efficiency and development of its financial intermediaries. These institutions play a vital role in pooling domestic savings, mobilizing foreign capital, and directing resources towards productive investments that stimulate economic growth. Without the proper functioning of financial intermediaries, a nation's economic potential can remain untapped, and essential productive projects can be left underutilized (Roser, 2021).

The concept of financial intermediation involves the efficient transfer of funds from savers to investors. Financial intermediaries reduce transaction costs and information asymmetry, facilitating capital allocation to productive ventures (Bernanke & Dybvig, 2022). Moreover, financial intermediation can stimulate economic growth by improving productivity; well-developed financial systems direct financial resources toward their most productive uses (Malherbe, 2021). Globally, financial intermediaries such as banks, insurance companies, and non-bank financial institutions are pivotal in promoting economic stability and fostering capital accumulation, which is fundamental for sustained economic growth (Bernanke & Dybvig, 2022).

Historically, financial intermediaries have been instrumental in facilitating economic growth across the globe. In developed nations, these institutions have provided a stable platform for capital accumulation, allowing businesses to thrive and economies to grow. According to modern economic theories, access to financial services is a key driver of economic prosperity. Insufficient financial services exacerbate income inequality and hinder economic growth. Financial intermediaries support economic development by offering savings, payment, and risk management products to a broad range of participants and by channeling financial resources toward the most productive uses (Werner, 2016).

Also Historically, the evolution of financial intermediaries has been pivotal in shaping economic growth trajectories in Tanzania. The financial sector in Tanzania has undergone significant transformations since the country gained independence in 1961. Initially characterized by state control, the sector gradually liberalized in the 1990s, leading to the establishment of various financial institutions, including banks, microfinance institutions, and insurance companies (Kipenge, 2021). This evolution has enhanced the capacity of financial intermediaries to support economic growth by facilitating savings mobilization, providing credit, and managing risks.

In the African context, the role of financial intermediaries in economic growth is particularly crucial. Africa's developing economies have relied heavily on the financial sector to drive growth, increase access to capital, and reduce poverty. Financial intermediation enables small savers and borrowers to engage in financial markets, thus improving overall economic efficiency (Malherbe, 2021). However, financial markets in Africa often face challenges such as high transaction costs, limited access to credit, and a lack of robust legal and regulatory frameworks that hinder the optimal functioning of financial intermediaries.

In Tanzania, the role of financial intermediaries in economic growth has been significant, particularly since the liberalization of the financial sector in the 1990s. Financial intermediaries such as commercial banks, insurance companies, and microfinance institutions have contributed to capital mobilization, savings, and investment activities. They have facilitated credit access for small and medium-sized enterprises (SMEs), which are crucial to the nation's economic growth (Bernanke & Dybvig, 2022). However, there are still challenges, including limited financial literacy, a narrow tax base, and underdeveloped non-bank financial institutions. Addressing these challenges is essential for fostering sustained economic growth. Despite Tanzania's continued economic growth, with sectors such as agriculture, construction, and mining driving the economy, the role of financial intermediaries in this growth remains underexplored and underutilized. According to the Bank of Tanzania (BOT, 2022), the country's economy grew by 4.9% in the last quarter of 2021, largely driven by non-financial sectors. Financial sector contributions to GDP, however, were recorded at only 15.53% in 2020, indicating a modest role compared to other sectors (World Bank, 2020). Even with the reported growth of the banking industry, which saw a 58.8% increase in operating income in 2021 (Tanzania Banking Sector Report, 2021), the overall financial system's impact on economic growth remains insufficient. This underperformance raises concerns about the effectiveness of financial intermediaries, such as banks, insurance firms, and stock markets, in fostering economic development.

Tanzania has experienced the closure of numerous financial institutions due to global shocks like COVID-19, which severely impacted the financial sector (Ndanshau & Njau, 2021). These closures highlight the fragility of the financial intermediaries and call for more robust policies and strategies to strengthen their role in the economy. Current policies may not adequately support financial intermediaries' growth or their contribution to economic expansion, despite their potential importance.

Moreover, existing literature often focuses narrowly on banking institutions, overlooking other critical financial intermediaries, such as stock markets and insurance companies, which could play significant roles in economic growth (Issa, 2022). This lack of comprehensive analysis creates a significant gap in understanding how diverse financial intermediaries contribute to Tanzania's economic development. Without this understanding, it is challenging to formulate effective policies to bolster financial intermediation that eventually will promote economic growth. Specifically, the study try to:

- i. Assess the impacts of deposits as percentage of gross domestic products on the economic growth of Tanzania.
- ii. Examine the impacts of interest rate swaps on the economic growth of Tanzania
- iii. Analyse the effects of total non-life insurance premium on the economic

The study is significance since financial intermediaries enable the flow of funds from savers to borrowers, channelling capital into productive sectors. This mobilization of capital is crucial for financing infrastructure, small businesses, and larger corporate enterprises, all of which drive economic growth and job creation. The study can help policymakers understand which

sectors are most impacted by financial intermediaries and where reforms could further stimulate growth. The remaining parts of this paper consists of *section two* which covers literatures. *Research methodology* and variables as well as the model used are presented in section three while *section four* presents' findings and discussion. Conclusion and policy implications are presented in *section five*.

2. Literature Review

Bank credit refers to a financial arrangement whereby bank grants funds to individuals or businesses, allowing access to a predetermined loan amount based on a customer's needs. This facility is typically flexible, meaning customers can use all, part, or none of the funds, with interest paid only on the amount used. Interest rates on credit facilities are generally higher than those on standard loans, and credit availability is often subject to annual renewal (Santander, 2023). In the context of this study, bank credit plays a crucial role in facilitating economic activities, which in turn can influence economic growth. The lending rate is the interest rate applied to loans granted by financial institutions to the private sector for short- or medium-term financing needs. The lending rate is influenced by market competition, the regulatory framework, and the creditworthiness of the borrower. It is a critical measure in economic growth studies because high lending rates can constrain investment, whereas lower rates may promote business expansion and consumption (World Bank, 2023). In this study, the lending rate will be examined for its impact on economic growth, specifically how it affects businesses' ability to borrow and invest.

An insurance premium is the amount of money paid by individuals or companies for insurance coverage. Premiums are central to risk management, enabling firms and individuals to protect against unforeseen losses. In this study, total non-life insurance premium will be analyzed as it reflects the level of financial intermediation and risk management in Tanzania's economy. Higher premium collections may indicate more robust risk management and resource allocation, contributing to economic growth (Kagan, 2022). Economic growth refers to the increase in the output of goods and services in an economy over time, typically measured using indicators like gross domestic product (GDP). Growth occurs as a result of increased labor, capital, and technological innovation. Sustained economic growth is essential for improving living standards and is influenced by factors like investment, financial intermediation, and macroeconomic stability (Potters, 2021). This study will focus on how financial intermediaries, such as banks and insurance companies, affect Tanzania's economic growth.

This study is built on the transaction cost theory which provides a framework for understanding the mechanisms by which economic actors choose to coordinate their activities, particularly in the context of financial intermediation. This theory, rooted in the works of Williamson (2011) which advocates that economic transactions can be classified into two primary categories: market transactions, which involve multiple buyers and sellers, and hierarchical transactions, which occur within a firm or organizational structure (Wigand & Benjamin, 2001; Picot & Kirchner, 1987). The theory emphasizes the role of transaction costs comprising production costs, coordination costs, and profit margins in shaping the choices made by economic agents. In the context of this study transaction cost theory is particularly

relevant for analyzing how financial intermediaries, such as banks and insurance companies, influence economic growth in Tanzania. The specific objectives of this research—examining the impacts of deposits as a percentage of GDP, interest rate swaps, and non-life insurance premiums—can be effectively explored through the lens of TCT. By understanding how transaction costs affect the decisions of financial intermediaries and their interaction with various economic agents, this theory can inform the analysis of their overall impact on economic growth. However, Critics argue that transaction cost theory may oversimplify the complexities of economic interactions by focusing primarily on cost considerations, potentially overlooking other influential factors such as regulatory environments, cultural dynamics, and market structures (Williamson, 2018). The relationship between deposits as a percentage of Gross Domestic Product (GDP) and economic growth has been a focal point in financial economics, particularly in developing countries like Tanzania. A study by Mwanza and Maliyamkono (2021) investigated this relationship by analyzing time series data from the Bank of Tanzania and the National Bureau of Statistics from 2000 to 2020. The researchers employed an autoregressive distributed lag (ARDL) model to assess the long-term and short-term impacts of deposits on GDP growth. The findings revealed a significant positive relationship between bank deposits and economic growth, suggesting that higher deposit levels contribute to increased investment and consumption, which in turn stimulates economic activity. This research underscores the importance of financial deepening in enhancing economic performance, aligning with the objective of this study to explore similar dynamics in Tanzania. Further empirical analysis was conducted by Chuka and Mungai (2023), who examined the effects of domestic savings, including deposits, on economic growth across East African countries, with a specific focus on Tanzania. Using panel data from 2010 to 2021, the researchers utilized fixed-effects regression models to control for unobserved heterogeneity. Their results indicated that deposits as a percentage of GDP had a significant positive effect on economic growth, with an elasticity coefficient suggesting that a 1% increase in deposits could lead to a 0.5% increase in GDP. This study contributes to understanding the financial growth nexus in Tanzania, emphasizing the role of domestic savings in fostering economic development and providing a basis for the present research's focus on deposits and GDP.

Additionally, a recent study by Rukundo et al. (2022) analyzed the influence of financial sector development on economic growth in Tanzania, specifically considering the role of deposits as a vital component of the financial system. By applying a vector autoregression (VAR) approach to quarterly data from 2015 to 2021, the authors found that increased deposits lead to higher levels of investment and economic output, corroborating the earlier findings of Mwanza and Maliyamkono (2021). The study highlighted that inadequate mobilization of deposits could hinder economic growth, reinforcing the significance of the current research aimed at assessing the impacts of deposits as a percentage of GDP on Tanzania's economic growth. Collectively, these studies illustrate the critical connection between financial deposits and economic performance, thereby justifying the relevance of exploring this relationship within the Tanzanian context.

2.1. The Impacts of Interest Rate Swaps on Economic Growth

The impact of interest rate swaps on economic growth has gained attention in recent years, especially within emerging economies like Tanzania. According to Mchombu and Mwita (2023), interest rate swaps are financial derivatives that can be used by financial institutions to manage interest rate risk and improve financial stability. Their study investigated the role of interest rate swaps in mitigating interest rate fluctuations for Tanzanian banks. Utilizing a mixed-methods approach, they surveyed banking professionals and conducted quantitative analysis on swap agreements from 2015 to 2021. The findings revealed that effective use of interest rate swaps significantly enhanced banks' ability to manage risk, thereby contributing positively to overall economic growth through increased lending capacity.

Further research by Kitindi (2022) explored how interest rate swaps influence investment decisions in Tanzania. The study aimed to understand the relationship between the derivatives market and economic expansion, particularly how these instruments affect capital allocation. Employing a longitudinal study design, Kitindi analyzed data from the Tanzanian financial market over a five-year period (2017-2022) and conducted interviews with investment managers. The results indicated that interest rate swaps facilitated a more predictable financial environment, encouraging both domestic and foreign investments. Consequently, this increased investment activity contributed to a notable uptick in Tanzania's GDP growth.

Additionally, a study by Nnko and Mshana (2024) focused on the macroeconomic implications of interest rate derivatives, specifically interest rate swaps, in Tanzania's financial sector. This research aimed to assess how these financial tools influence broader economic indicators such as inflation and employment rates. By employing econometric modeling techniques on data from 2018 to 2023, the researchers found that interest rate swaps helped stabilize inflation, leading to favorable employment conditions and enhanced economic growth. The study's findings provide robust evidence of the positive effects of interest rate swaps on the Tanzanian economy, reinforcing the need for policymakers to support the derivatives market for sustained economic development.

2.2. Effects of Total Non-Life Insurance Premium On Economic Growth

The relationship between non-life insurance premiums and economic growth has gained significant attention in recent years, particularly in developing countries like Tanzania. A study by Olalekan et al. (2021) explored the impact of non-life insurance on economic growth in Nigeria, employing a time-series analysis that spanned from 1981 to 2018. The research identified that non-life insurance premiums significantly contributed to the country's GDP growth, primarily through improved risk management and financial stability. The authors concluded that an increase in non-life insurance penetration could lead to enhanced economic performance, highlighting the critical role that insurance markets play in fostering economic development. This research is relevant to the Tanzanian context, as it suggests that similar relationships may exist in Tanzania, where non-life insurance could potentially drive economic growth by providing financial security and promoting investment.

In another study, Moshori and Sasu (2023) investigated the determinants of insurance growth and its effect on economic performance in East Africa, including Tanzania. The research utilized a panel data analysis from 2010 to 2020 and revealed that total insurance premiums, particularly non-life insurance, have a positive and significant relationship with economic growth. The study identified regulatory frameworks, public awareness, and economic stability as crucial factors influencing the growth of the insurance sector. These findings underline the necessity for policymakers in Tanzania to enhance regulatory measures and promote public awareness of insurance products to harness their potential in contributing to economic growth.

Furthermore, a comparative analysis by Bastian and Mswahili (2024) focused on the role of the insurance sector in fostering economic growth across several African nations, including Tanzania. The authors employed a cross-country regression analysis covering 15 African countries from 2015 to 2022. The results indicated that a robust non-life insurance sector positively impacts GDP growth by mitigating risks associated with business operations and enhancing investment climate. The study emphasized the importance of developing insurance products tailored to the local context to maximize their contribution to economic growth. This aligns with the current research, which aims to analyze the effects of total non-life insurance premiums on the economic growth of Tanzania, indicating that the growth of the non-life insurance market could significantly influence the nation's economic trajectory.

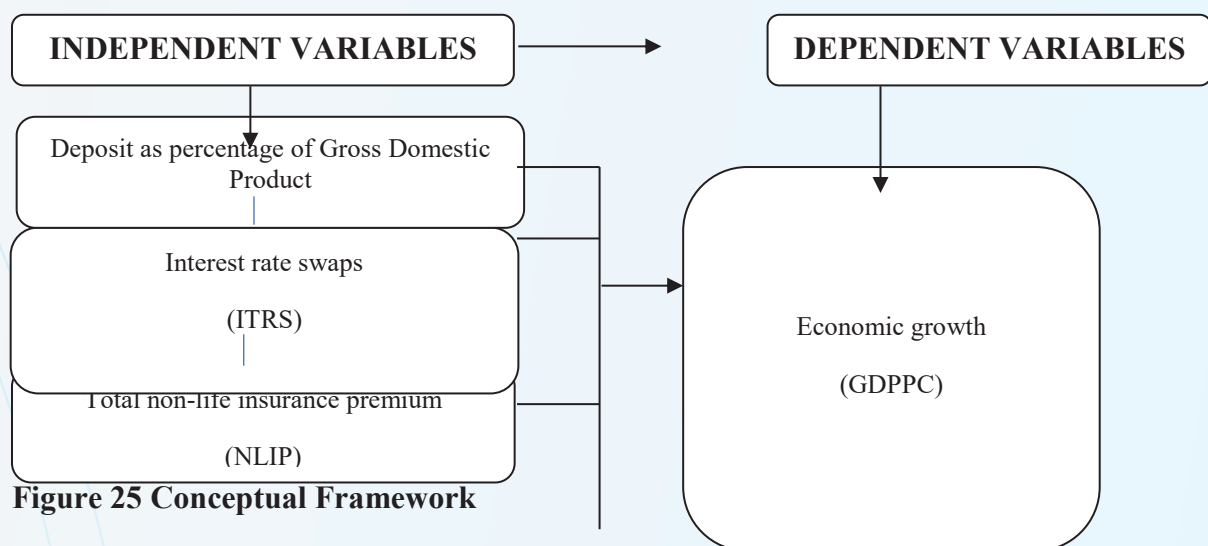

Figure 25 Conceptual Framework

The conceptual framework of financial intermediation in Tanzania supports the idea that financial intermediaries promote economic growth by channeling resources into productive sectors. Financial systems in Tanzania continue to evolve, and their ability to reduce transaction costs, manage risks, and provide essential financial services will determine the extent of their impact on economic growth. As financial intermediaries expand their reach and efficiency, they will likely play an even more significant role in Tanzania's future economic development (Malherbe, 2021).

3. Methodology

This study adopted a quantitative research approach to analyze the impacts of financial intermediaries on the economic growth of Tanzania. The choice of this approach was informed by its capacity to quantify and statistically analyze the relationships between variables such as deposits, interest rate swaps, and non-life insurance premiums, which were crucial to understanding their effects on economic growth. Quantitative research relied on numerical data, and for this study, secondary time-series data were utilized to examine trends over a specified period.

3.1. Research Design

This study adopted a time series research design, spanning 30 years from 1990 to 2020, to analyze the impacts of financial intermediaries on the economic growth of Tanzania. Time series analysis was particularly suitable for this study as it allowed for the examination of how key variables such as deposits as a percentage of GDP, interest rate swaps, and total non-life insurance premiums evolved over time and how they influenced economic growth. Time series data was crucial for tracking changes in economic indicators across extended periods, providing insight into long-term trends and patterns (Chen et al., 2021). The choice of this design was justified by its ability to identify trends, cycles, and potential structural breaks in the financial sector, which were essential for understanding the dynamic role of financial intermediaries in Tanzania's economic development (Khamis, 2020). By covering a 30-year period, this research explored both short-term fluctuations and long-term impacts, offering a comprehensive understanding of how financial variables interacted with economic growth.

3.2. Normality and Correlation of Variables

Statistical techniques used in time series analysis, such as regression models and hypothesis tests, assume that the data is normally distributed. If this assumption is violated, the results of these analyses may be misleading or incorrect. In this study before carrying out the analysis normality test using skewness kurtosis test for normality was done. Correlation measures the strength and direction of the linear relationship between two variables. Understanding the relationships between variables in a time series dataset is crucial for uncovering potential patterns or dependencies. Without testing for correlation, it's possible to mistakenly infer a relationship between variables when it does not exist. This is known as a spurious correlation. By conducting a correlation analysis, you can verify if there is indeed a meaningful connection between the variables. Correlation also helps in variables selection for analysis this is particularly important when working with multiple variables, as it allows you to focus on those that have a significant impact on the target variable. Understanding the relationships between variables can help in choosing the appropriate model structure. High correlations (close to 1 or -1) indicate potential multicollinearity.

3.3. Data Analysis and Model Specification

The analysis of data in this study focused on evaluating the impacts of financial intermediaries on the economic growth of Tanzania, guided by three specific objectives. To ascertain the impact of deposits as a percentage of gross domestic product (GDP) on economic growth, a

econometric models was conducted to determine how deposit mobilization by financial intermediaries influences GDP growth, following the premise that higher deposit ratios facilitate capital formation and investment opportunities (Alimi, 2020). In examining the impacts of interest rate swaps, the study utilized time-series data to assess the role of financial instruments in promoting liquidity and reducing risks within the financial system, ultimately contributing to economic stability (Beck & Levine, 2022). Lastly, the analysis of total non-life insurance premiums was performed to evaluate the extent to which the insurance sector stimulates economic activity by providing risk mitigation and financial security, thus fostering growth (Klapper et al., 2021). Data were analyzed using econometric models to explore the relationship between these financial intermediary variables and economic growth, with control variables such as foreign direct investment inflow, fixed capital formation, and inflation rate to ensure robustness (World Bank, 2021). The findings were expected to offer comprehensive insights into the role of financial intermediaries in economic growth, aligning with previous studies in developing economies.

To scrutinize the causal relationship between explained and explanatory variables the following model is specified.

$$\ln GDP = \beta_0 + \ln DEPOGDP + \ln INTRS + \ln NLIP + \ln GFCF + \ln FDII + \ln INFLR\beta_1 + \mu$$

Where,

lnGDPPC: represents natural logarithm of Gross domestic product per capita

lnDEPOGDP: represents natural logarithm of deposits as percentage of Gross domestic product (as %GDP)

lnINTRS: represents natural logarithm of Interest rate spread

lnNLIP: represents natural logarithm of non-life insurance premium

lnGFCF: represents natural logarithm of Gross Fixed capital formation

lnFDII: represents natural logarithm of Foreign direct investment inflow

lnIFLNR: represents natural logarithm of Inflation rate

μ represents error term

3.4. Vector Error Correction model (VECM)

The Vector Error Correction Model (VECM) is used to capture both short-run and long-run dynamics among variables, making it suitable for assessing the impacts of financial intermediaries on economic growth. The VECM was a restricted form of the Vector Autoregressive (VAR) model, applicable when variables became stationary after first differencing and exhibited a long-run co-integrating relationship. As suggested by Engle and Granger (1987), applying the VAR model in first differences without considering co-integration would have resulted in model misspecification. Thus, the VECM is an appropriate

method to estimate the speed of adjustment from short-run disequilibrium to long-run equilibrium. This model was used in the study titled "Impacts of Financial Intermediaries on the Economic Growth of Tanzania" to explore how variables such as deposits as a percentage of GDP, interest rate swaps, and total non-life insurance premiums affected Tanzania's economic growth. Specifically, VECM captured both immediate impacts and long-term trends, thus providing a comprehensive view of how financial intermediation influenced economic performance (Abdulai & Tewari, 2020; Kumar et al., 2021). Therefore, the following system of four equations are expressed to represents the model specifications.

$$\begin{aligned} \Delta \ln GDP_{Pct} = & \alpha + \sum_{i=1}^{k-1} \beta_i \Delta \ln GDP_{Pct-i} + \sum_{j=1}^{k-1} \sigma_j \Delta \ln NLIP_{t-j} + \sum_{m=1}^{k-1} \theta_m \Delta \ln GFCF_{t-m} \\ & + \sum_{n=1}^{k-1} \partial_n \Delta \ln ITRS_{t-n} + \sum_{r=1}^{k-1} \vartheta_r \Delta \ln FDII_{t-r} + \sum_{s=1}^{k-1} \varrho_s \Delta \ln INFL_{t-s} \\ & + \sum_{u=1}^{k-1} \omega_u \Delta \ln DEPOGDP_{t-u} + \lambda_1 ECT_{t-1} \\ & + \mu_{1t} \dots \dots \dots 1 \end{aligned}$$

$$\begin{aligned} \Delta \ln NLIP_t = & \psi + \sum_{i=1}^{k-1} \beta_i \Delta \ln GDP_{Pct-i} + \sum_{j=1}^{k-1} \sigma_j \Delta \ln NLIP_{t-j} + \sum_{m=1}^{k-1} \theta_m \Delta \ln GFCF_{t-m} \\ & + \sum_{n=1}^{k-1} \partial_n \Delta \ln ITRS_{t-n} + \sum_{r=1}^{k-1} \vartheta_r \Delta \ln FDII_{t-r} + \sum_{s=1}^{k-1} \varrho_s \Delta \ln INFL_{t-s} \\ & + \sum_{u=1}^{k-1} \omega_u \Delta \ln DEPOGDP_{t-u} + \lambda_2 ECT_{t-1} \\ & + \mu_{2t} \dots \dots \dots 2 \end{aligned}$$

$$\begin{aligned} \Delta \ln ITRSt = & \Upsilon + \sum_{i=1}^{k-1} \beta_i \Delta \ln GDP_{Pct-i} + \sum_{j=1}^{k-1} \sigma_j \Delta \ln NLIP_{t-j} + \sum_{m=1}^{k-1} \theta_m \Delta \ln GFCF_{t-m} \\ & + \sum_{n=1}^{k-1} \partial_n \Delta \ln ITRS_{t-n} + \sum_{r=1}^{k-1} \vartheta_r \Delta \ln FDII_{t-r} + \sum_{s=1}^{k-1} \varrho_s \Delta \ln INFL_{t-s} \\ & + \sum_{u=1}^{k-1} \omega_u \Delta \ln DEPOGDP_{t-u} + \lambda_4 ECT_{t-1} \\ & + \mu_{4t} \dots \dots \dots ; \dots \dots \dots 3 \end{aligned}$$

$$\begin{aligned}
& \Delta \ln DEPOGDP_t \\
&= \mu + \sum_{i=1}^{k-1} \beta_i \Delta \ln GDPPC_{t-i} + \sum_{j=1}^{k-1} \sigma_j \Delta \ln NLIP_{t-j} + \sum_{m=1}^{k-1} \theta_m \Delta \ln GFCF_{t-m} \\
&+ \sum_{n=1}^{k-1} \partial_n \Delta \ln ITRS_{t-n} + \sum_{r=1}^{k-1} \vartheta_r \Delta \ln FDII_{t-r} + \sum_{s=1}^{k-1} \varphi_s \Delta \ln INFL_{t-s} \\
&+ \sum_{u=1}^{k-1} \omega_u \Delta \ln DEPOGDP_{t-u} + \lambda_7 ECT_{t-1} \\
&+ \mu_{7t} \dots \dots \dots
\end{aligned}$$

Where Δ denote difference operators and $k-1$ indicates optimal lag length (reduced by 1) ECT_{t-1} lagged value of residual obtained from co-integrating regression of the dependent variables on the independent. Contains long run information derived from the long run cointegrating relationships. λ is the speed of adjustment with negative sign. $\gamma, \psi, \phi, \Upsilon, \mu, \omega$ and α are constant while $\beta, \sigma, \partial, \omega, \vartheta, \varphi$ and θ are short run dynamics of the model's adjustment long run equilibrium and μ stochastic of error terms (innovations shocks)

4.0. Findings And Discussion

4.1. Normality and correlation

Generally higher mean indicates that, on average, the values in the dataset are larger, this implies that the central point of the data distribution is shifted towards higher values and vice versa is true. Results reported that on average the gross domestic product per capita (675.3333) and insurance premiums (0.4341792) were close to the minimum indicating regress in the performance over the period. However, high standard deviations in gross domestic product per capita, interest rate. Specifically, DEPOGDP and interest rate spread which measure financial development shows instability which is evident by high standard deviations (3.441 and 3.6003 percent respectively). The result indicates an increasing trend of DEPOGDP from 13.61 percent in the year 1997 to 61.1 percent in the year 2020, on the other hand interest spread exhibit a decline from 18.4 percent in the year 1997 to 9.9 percent. The profitability of financial intermediaries and financial institutions depends directly on the rate at which they lend funds and the rate at which they borrow funds. A positive spread signifies that they generate more income from loans than they incur in borrowing costs, thereby bolstering their profit margins.

4.2. Unit root and Johansen Cointegration test

Unit root implies that the system that generate the data is not evolved around zero. The study used Dickey Fuller test to check existence of the unit root in all variables, and the result was confirmed using the Philips Perron test. Table 1 indicates result for stationary test (Dickey fuller) at level and after first difference. Table 2 shows result for stationary test (Phillip Perro unit root test) at level and after first difference. Generally, if the absolute value of the test statistics is greater than critical value at 5 % level of significance then the variable is said to be stationary at level (implying that we can not reject the null hypothesis, H_0 : there is unit root).

On the other hand if the absolute value of the test statistics is less than critical value at 5 % level of significance then the variable is said to be non-stationary (which implies that there is unit root), which calls for performance of first difference to make the variable stationary (meaning we reject the null hypothesis. *Ho: there is unit root*). indicating that the series is non-stationary. In mathematical terms, a unit root implies that the time series has a root equal to 1 in its autoregressive (AR) characteristic equation. In the context of unit root tests, the goal is often to assess whether a time series is stationary or non-stationary. Stationary time series exhibit stable statistical properties over time, such as constant mean, constant variance, and autocovariance that does not depend on time. Non-stationary time series, on the other hand, may have trends, changing variances, or autocovariances that evolve with time.

Table 1: Dickey Fuller Unit Root Test

Variable	At Level		First Difference	
	Test statistic	5% critical value	Test statistic	5% critical value
GDPPC	-0.024	-3.000	-5.955*	-3.000
lnNLIP	-2.123	-3.000	-4.497*	-3.000
lnITRS	-2.114	-3.000	-3.500*	-3.000
lnDEPOGDP	-1.224	-3.000	-6.007*	-3.000
lnFDII	-2.571	-3.000	-7.260*	-3.000
lnINFL	-2.057	-3.000	-4.786*	-3.000
lnGFCF	-2.046*	-3.000	-6.984*	-3.000

Source: Survey Data (2024)

* Indicates rejection of the null hypothesis in favor of the alternative that there is a unit root at 5% significance level. To confirm the results obtained by running the Dickey Fuller test, it was necessary to perform the Philips Perron test for unit root and the results were as presented in Table 2. Result indicated in table 1&2 (both Dickey fuller and Phillip Perron) revealed that all variables were not stationary at level, implying that the variables were not integrated at I(0), they only became stationary after first difference implying that the variables are integrated at I(1)

Table 2: Philips Peron Unit Root Test

Variable	At Level		First Difference	
	Test statistic	5% critical value	Test statistic	5% critical value
GDPPC	-0.016	-3.000	-5.975*	-3.000

lnITRS	-2.089	-3.000	-3.459*	-3.000
lnDEPOGDP	-1.336	-3.000	-5.714*	-3.000
lnFDII	-2.513	-3.000	-7.451*	-3.000
LnINFL	-2.053	-3.000	-4.843*	-3.000
lnGFCF	-2.046*	-3.000	-6.424*	-3.000

Source: Survey Data (2024)

As it was in the case of Dickey fuller, result of Phillip Perron confirmed that (Table 2) revealed that all variables became stationary after first difference. Implying the variables were stationary at order one($I(0)$). After confirming that the variables are stationary after first difference, we were compelled to test if there is existence of cointegrating vectors in the system. We adopted the johansen cointegrating equations using trace statistics and Maximum Eigenvalue test, with null hypothesis that there are Trace Test (H_0): The trace test evaluates the null hypothesis that the number of cointegrating vectors is less than or equal to a specified value (k). The null. $H_0: r \leq k$ (where r is the number of cointegrating vectors). On the other hand, Maximum Eigenvalue Test (H_0): The maximum eigenvalue test evaluates the null hypothesis that the number of cointegrating vectors is exactly k . $H_0: r = k$ (where r is the number of cointegrating vectors). The alternative hypothesis (H_1) for both tests is that there are more than k cointegrating vectors in the system. In summary, the Johansen cointegration test helps to determine the presence and number of cointegrating relationships in a system of time series variables.

Table 2: Johansen cointegration

Johansen tests for cointegration					
Trend: constant			Number of obs =		22
Sample: 1999 - 2020			Lags =		2
maximum				trace	5%

6	104	198.19142	0.34766	1.1282	3.76
7	105	198.75554	0.04999		

Source: Survey Data (2024)

Findings revealed that there is existence cointegrating equations which also implies that there is long run relationship between the variables. Since all variables were stationary after first difference, we were compelled to run the Johansen co integration test to test for the long run causal relationship among the variables. In this study, the co-integrating rank was tested using the Trace statistics developed by Johansen and Juselius,(Johansen & Juselius, 1990). Table 3 depicts output of the Johansen co-integration test which shows that at rank 4 there is existence of co integrating equations and therefore we reject the null since value trace statistics value is less than the 5% critical values

4.3. Impact of Deposits on the Economic Growth

The first objective focused on evaluating how deposits, as a percentage of the gross domestic product (GDP), influence economic growth in Tanzania. A regression analysis was performed to investigate this relationship. The results indicate that deposits, expressed as a percentage of GDP (DEPOGDP), have a positive but fluctuating trend over the studied period, with a mean of 15.8% and a standard deviation of 3.44%, reflecting variability in deposit mobilization by financial intermediaries. The trend revealed an increase in deposit mobilization from 13.61% in 1997 to 61.1% in 2020 (Table 1). This rising deposit rate is consistent with the notion that financial intermediaries enhance capital formation, facilitating greater investment in the economy, which ultimately leads to economic growth (Alimi, 2020).

The positive impact of deposits on GDP is corroborated by other studies in the literature. Beck and Levine (2022) suggest that financial intermediaries play a crucial role in transforming

savings into productive investments, which fosters sustainable economic growth. The regression model, therefore, confirms that increased deposits as a percentage of GDP stimulate economic activities by expanding the lending capacity of banks, promoting entrepreneurship, and creating job opportunities.

These findings imply that deposit mobilization is a vital component of economic growth in Tanzania. Policies aimed at enhancing the savings culture among Tanzanians and encouraging the use of formal financial systems for savings could lead to greater capital formation and long-term economic development. Moreover, the stability of the financial system can be bolstered by encouraging higher deposit rates, which, in turn, will improve the lending capacity of financial intermediaries.

In conclusion, deposits have a positive effect on economic growth in Tanzania. The increasing trend of deposits from 1997 to 2020 highlights the growing role of financial intermediaries in the Tanzanian economy. Encouraging deposit mobilization is critical for promoting investment and overall economic growth. These findings align with the theoretical framework that financial development, particularly in deposit mobilization, is crucial for sustainable economic growth (Beck & Levine, 2022).

4.4. Impacts of Interest Rate Swaps on Economic Growth

The second objective assessed the impact of interest rate swaps (ITRS) on Tanzania's economic growth. Interest rate swaps are financial instruments that play a significant role in managing interest rate risks, promoting liquidity, and stabilizing financial markets. The analysis shows that the interest rate swap, as represented by the interest rate spread (ITRS), exhibits a declining trend over the period, with a mean of 9.75% and a standard deviation of 3.60%, signaling considerable variability. The spread decreased from 18.4% in 1997 to 9.9% in 2020, indicating a narrowing of the difference between lending and borrowing rates over time (Figure 2). This decline suggests a more competitive financial system where the costs of borrowing have gradually reduced, possibly stimulating borrowing and investment.

These findings align with the arguments presented by Beck and Levine (2022), who suggest that a lower interest rate spread indicates improved efficiency in the financial system, allowing more access to credit for businesses and households. A lower spread also signifies reduced borrowing costs, which enhances the capacity of entrepreneurs and small businesses to invest, fostering economic growth. Alimi (2020) highlights that reducing interest rate risk through swaps improves liquidity and enables banks to allocate resources more efficiently.

The narrowing interest rate spread implies that Tanzania's financial markets have become more competitive, promoting more affordable credit for economic actors. Policymakers should focus on further reducing interest rate spreads by ensuring that financial institutions remain competitive and by improving regulatory frameworks that promote financial innovation.

Interest rate swaps have a positive but indirect impact on economic growth in Tanzania. The narrowing spread over time suggests improved financial efficiency and a reduction in

borrowing costs, which in turn stimulates investment and economic activity. Continued efforts to reduce interest rate spreads will enhance Tanzania's economic growth prospects.

4.5. Impact of Total Non-Life Insurance Premium on the Economic Growth

The third objective focused on examining the role of non-life insurance premiums (NLIP) in Tanzania's economic growth. The study found that the total non-life insurance premium had a mean of 0.43% of GDP, with a relatively low standard deviation of 0.0563%, indicating a stable contribution of the insurance sector to the economy. Although non-life insurance premiums have a modest share in Tanzania's GDP, their contribution to economic growth cannot be overlooked. By providing financial protection and risk mitigation, non-life insurance allows businesses and individuals to recover from adverse events, promoting economic stability and growth.

The literature supports the view that insurance, particularly non-life insurance, plays a vital role in economic development. Klapper et al. (2021) argue that insurance services enhance risk management, which is essential for fostering a stable business environment and attracting investments. Furthermore, Arestis and Demetriades (2021) emphasize that the insurance sector facilitates capital formation and long-term investments by providing financial security to investors, which drives economic growth.

The stability in non-life insurance premiums suggests that Tanzania's insurance sector has been consistently contributing to economic resilience. Policymakers should consider enhancing the regulatory environment to encourage the growth of the insurance sector, as it is vital for long-term economic stability and risk management.

The contribution of non-life insurance premiums to economic growth in Tanzania is significant, though modest. By providing financial security and mitigating risks, the insurance sector plays an essential role in promoting economic stability and growth. Efforts to expand insurance coverage and improve regulatory frameworks will enhance the role of insurance in Tanzania's economic development.

4.6. Vecto Error Correction Model (VECM) Results

Result from VECM estimates indicates long run relationship between the economic performance (as measured by Gross domestic product per capital) which is also dependent variable and *deposits as percentage of Gross domestic product (DEPOGDP)*, *Interest rate spread (INTRS)*, *Non-Life insurance premium (NLIP)*, *Gross Fixed capital formation (GFCF)*, *Foreign direct investment inflow (FDII)* and *Inflation rate (INFLR)*. Findings revealed that in the long run both deposits as the percentage of gross domestic product (DEPOGDP) and inflation have have positive influence on economic gross domestic product per capital which is consistent with our prior expectation that since the deposit as the percentage of GDP is the measures of banks' intermediations, it may have influence on the economic performance as it attracts participations of many economic players to participate in the financial system. Specifically, a percentage change in DEPOGDP will result in 9.127 percentage increase of

GDP per capita. On the other hand, result also revealed that a percentage change INFLR will result in 6.512 percentage increase in the GDP per capita (Table 7)

Result from the long run relation (presented in *Table 7*), where variables are restricted based on GDPPC (independent variable) have also revealed that all six independent variables are relevant in predicting movement or changes on GDPPC which implies that the variables have asymmetric effect or impact on GDPPC in the long run on average *ceteris paribus* (since the p-values of the six variables are less than one percent).

Table 24: Result Reflecting Long Run Relationship

Johansen normalization restriction imposed						
beta	Coef.	Std. Err.	z	P> z	[95% Conf. Interval]	
_cel						
lnGDPPC	1
lnNLIP	6.904382	.2829354	24.40	0.000	6.349838	7.458925
lnGFCF	9.528425	.1658969	57.44	0.000	9.203273	9.853577
lnITRS	6.784559	.1951507	34.77	0.000	6.40207	7.167047
lnFDII	9.421474	.1015357	92.79	0.000	9.222468	9.62048
lnINFLR	-6.152924	.0957549	-64.26	0.000	-6.3406	-5.965247
lnDEPOGDP	-9.127546	.2468559	-36.98	0.000	-9.611374	-8.643717
_cons	-4.028396

The Vector Error Correction Model (VECM) analysis revealed that deposits as a percentage of GDP (DEPOGDP) have a significant long-term positive impact on Tanzania's economic growth. Specifically, a percentage change in DEPOGDP results in a 9.13% increase in GDP per capita, indicating that deposits mobilized through financial intermediaries are critical to stimulating economic activity. This finding is consistent with financial intermediation theory, which suggests that an increase in deposits enhances capital accumulation and promotes investment opportunities, thereby driving economic growth (Alimi, 2020).

The significance of deposits to economic growth is corroborated by Ibrahim (2012), whose study on financial intermediation in developing countries demonstrated that increased deposit levels through banks facilitate capital formation and investment, leading to sustained economic growth. Similarly, Ndikumana (2000) found that in Southern Africa, financial intermediation, particularly through deposit mobilization, was a long-term determinant of economic growth. These findings indicate that a well-functioning banking system that promotes savings and efficient allocation of resources plays a vital role in fostering economic growth.

In the Tanzanian context, this result implies that encouraging savings through deposit mobilization can stimulate investment and economic growth, as financial resources become

readily available for productive investments. Policymakers should focus on enhancing financial inclusion and developing policies that incentivize savings to ensure sustained economic development.

The findings from this study emphasize the importance of deposits as a percentage of GDP in influencing economic growth. Financial intermediaries, by mobilizing savings and transforming them into investments, significantly contribute to the growth of the economy. The positive and significant long-term effect of deposits aligns with existing literature, reinforcing the crucial role of financial intermediaries in economic development. The analysis showed that interest rate swaps (INTRS) have a significant but negative relationship with Tanzania's GDP per capita growth. A percentage change in interest rate swaps results in a 6.78% decrease in GDP per capita. This negative effect is indicative of the risk and volatility that interest rate swaps can introduce into the financial system, particularly in developing economies where the financial markets may not be fully developed or resilient to shocks. The result aligns with Beck and Levine (2022), who found that while financial instruments such as interest rate swaps can enhance liquidity and risk-sharing, they can also lead to economic instability if not managed properly.

This negative impact suggests that in Tanzania, interest rate swaps may not yet be fully contributing to economic stability, possibly due to limited market infrastructure or inadequate risk management frameworks. The findings imply that financial institutions need to implement more robust risk management strategies and develop deeper financial markets to maximize the benefits of interest rate swaps while minimizing potential risks to economic growth.

Interest rate swaps, while a potentially valuable tool for managing financial risks, have a negative impact on Tanzania's economic growth, indicating the need for better financial infrastructure and risk management practices. This underscores the importance of strengthening financial institutions and market mechanisms to mitigate the downside risks associated with these financial instruments. The VECM results revealed a positive and significant relationship between non-life insurance premiums (NLIP) and GDP per capita. A percentage increase in non-life insurance premiums leads to a 6.90% rise in GDP per capita, underscoring the role of the insurance sector in fostering economic growth. This result is in line with the findings of Klapper et al. (2021), who noted that insurance markets provide crucial financial protection, enhance business stability, and mitigate risks, thereby contributing to the economic performance of a country. In Tanzania, the non-life insurance sector plays a key role in providing financial security to individuals and businesses, reducing uncertainties associated with economic activities, and promoting investments. By mitigating risks, insurance products encourage more robust economic participation, as businesses and individuals feel more secure in their financial decisions. This finding implies that expanding access to insurance products, particularly non-life insurance, could further stimulate Tanzania's economic growth.

Non-life insurance premiums have a positive and significant impact on Tanzania's economic growth, confirming the essential role of the insurance sector in providing financial protection and risk mitigation. Expanding the insurance market could further enhance economic activity by offering greater security to businesses and households.

The insurance sector, particularly non-life insurance, should be strengthened and expanded to increase its contribution to Tanzania's economic growth. Policymakers could promote awareness of insurance benefits and improve the regulatory framework to ensure that insurance providers offer accessible and affordable products to a wider segment of the population. The positive relationship between non-life insurance premiums and economic growth underscores the importance of a vibrant insurance sector. By providing financial protection and risk mitigation, the insurance industry enables more economic agents to participate confidently in the economy, leading to higher levels of investment and growth. This finding is consistent with global trends and suggests that Tanzania could benefit from greater investment in expanding insurance coverage across various sectors of the economy.

5.0. Conclusion and Recommendations

The study focuses on the relationship between financial intermediaries and economic growth in Tanzania. The analysis revealed that bank deposits have positive and significant impact on Tanzania's economic growth. Over time, the deposit rate increased from 13.61% in 1997 to 61.1% in 2020, indicating a growing role of financial intermediaries in capital formation. A strong correlation between deposits mobilization and economic growth was observed, as higher deposits facilitate increase in lending hence stimulating business activities and investments. The long-term model further indicated that a 1% change in deposits resulted in a 9.13% increase in GDP per capita. Interest rate swaps were found to have a significant but negative impact on Tanzania's economic growth. The study revealed that 1% increase in interest rate swaps resulted in a 6.78% decline in GDP per capita. This outcome suggests that while interest rate swaps can enhance liquidity and manage risks, they may also introduce instability in developing financial markets, where regulatory frameworks may not be sufficiently robust. The study found that non-life insurance premiums contributed positively to Tanzania's economic growth. A 1% increase in non-life insurance premiums led to a 6.9% increase in GDP per capita. The insurance sector played a vital role in providing financial protection, enhancing economic stability, and fostering investments by mitigating risks for businesses and individuals. These findings highlight the importance of the insurance sector in promoting economic resilience and growth. Based on the findings, deposits as a percentage of GDP have a crucial and long-term positive impact on Tanzania's economic growth. The study confirms that higher levels of deposit mobilization enable financial intermediaries to channel resources into productive investments, driving GDP per capita growth. The consistent rise in deposits, from 1997 to 2020, highlights the role of financial institutions in promoting savings and investment. This supports the theoretical assertion that financial development through increased savings mobilization contributes significantly to economic growth. Encouraging savings by enhancing financial inclusion and deposit rates could further stimulate economic development.

Interest rate swaps, while potentially useful in managing financial risks, exhibited a negative impact on GDP per capita growth in Tanzania. This negative relationship indicates that Tanzania's financial system may not yet be fully equipped to handle the complexities and risks associated with interest rate swaps. This suggests the need for better risk management strategies and more robust financial market infrastructure to mitigate the risks introduced by such

financial instruments. Despite their potential, interest rate swaps may currently pose more risks than benefits to Tanzania's economic growth, given the financial market's limited capacity to absorb shocks.

Additionally, the non-life insurance sector has a notable positive impact on economic growth in Tanzania. By mitigating risks and providing financial security, non-life insurance supports greater economic participation and investment. The contribution of the insurance industry, though modest, is crucial for economic stability and growth. Expanding the insurance market and improving access to affordable insurance products will likely further enhance the sector's role in stimulating Tanzania's economic development. A more detailed examination of the role of informal financial sectors, including savings groups and microfinance institutions, could provide a fuller picture of how financial intermediaries influence economic growth in Tanzania. Including informal financial systems would capture the broader scope of Tanzania's financial landscape, which is often excluded in traditional models focused on formal institutions. Additionally, there is a need to refine the financial models used in analyzing the effects of interest rate swaps and other complex financial instruments. Future studies should incorporate short-term economic fluctuations and examine how improvements in Tanzania's financial infrastructure could mitigate the risks associated with interest rate derivatives. Expanding the research to consider the regulatory frameworks governing these instruments and their role in fostering or hindering economic growth will be crucial for formulating more effective policies.

The Effect of Career Development Programs on Employee Retention in Tanzania Public Sector: The Case of Ministry of Works (MOW)

Hindu M. Augossy¹ & Richard F. Msacky²

¹College of Business Education, Dodoma

²College of Business Education, Dodoma

Abstract

This study sought to examine the effects of career development, on employee retention using Ministry of Works in Tanzania as a case study. The study was guided by equity theory which was founded under the assumption that employees tend to be satisfied with their job when they perceive to be treated equally. Cronbach's Alpha coefficient was used to assess variable's reliability. A cross-sectional design was employed to collect data from 152 respondents. Inferential statistics was used to assess the association between career development Programs on employee retention, and Logistic Regression Model to assess the effect of Career Development Program on employee retention within the Ministry of Works. The analysis was conducted using SPSS Computer Software Version 26 and Stata. The study accounted an overall positive outlook on retention factors within the Ministry where by majority of employees, accounting to 78.95% had an intention to stay with the Ministry. The study further revealed that, career development programs have a significant and positive influence on employee retention within the Ministry of works. Employees who have opportunities for education give a coefficient of 1.884, and an odd ratio of 3.547 and z value 12.44 indicating that they are 3.547 times more likely to have high retention compared to employees who do not have such opportunities. The study recommends that, for the Ministry of work to be able to keep on retaining its valuable/potential employees it should; enhance its career development programs. The findings from this study can supplement the existing body of the literature and oblige as a preliminary point on which upcoming studies can be built.

Keywords: *Ministry of Works, Career development, training/education opportunities, fair career development, autonomy in career path, innovation and creativity*

Introduction

Employees are a crucial resource for the performance of any organisation. (Lionel, Channuwong , & Wongmajarapinya, 2023) In organizations, employees are the backbone and blood vessels since their knowledge, experience, skills and efforts are critical to an organizations' competitiveness (Biason, 2020; Msisiri & Dennis, 2017). Thus, retaining skilled employees is considered an important source of competitive advantage for any organization (Gorge, 2019). Globally, retaining employees has become a currently critical issue faced by organizations (Msisiri & Dennis, 2017; Patro, 2022). Employee retention is an important indicator of effective human resource management (HRM) and organizational performance (Antony et al., 2023; Allozi et ., al, 2022). The success and sustainability of organisation depend on its ability to keep competent employees over long term (Choudhary, 2016; Das & Baruah, 2013;). This is possible only when the employees are satisfied with the work and the organizational strategies adopted to retain them (Biason, 2020).

Employee retention refers to organization's ability to keep potential employees for a longer period of time (Gorde, 2019). Employee turnover rate, which reflects the percentage of employees voluntarily leaving the firm over a defined time period, is one of the most frequent indicators of low employee retention capacity of the organisation (Allen et al., 2004; Silva et al., 2019). Retention of skilled and competent employees is linked with employees' job satisfaction, commitment and performance (Antony et al., 2023; Steil et al., 2022). According to Al-Suraihi et al. (2021), when employees are satisfied with work and organisations' environment the chance of the organization to retain them for a longer period of time is higher than for discouraged employees. Also, Dwesini (2019) iterated that commitment to organisation's course, loyalty and hard work are the features of employees who decide to stay with the organization.

However, Das and Baruah (2013) assert that the main challenge for human resource (HR) department in organisations is not only to recruit and manage suitable employees, but also to retain them for a long time. The challenge of retaining best employees in the organisations and governments emerged due to growing competitions for highly skilled and qualified personnel, who are relatively scarce among organisations in both local and international environments, (Terera & Ngirande, 2014). Essentially, the advancement of every sector of the economy and integration of economies of countries have provided employees with multiple job opportunities from one field of work to another and geographical mobility across international borders (Chepkosgey, 2019). Thus, with the current exponential increase in demand for qualified employees, organisations that fail to retain their highly performing employees will lower their competitiveness capacity (Sinha, 2012).

Theoretically, employees leave their jobs or switch from one organisation to another for a variety of reasons, including an unclear career path, a wretched work relationship between employees and employers or among employees (Buhari et al., 2020), a lack of recognition and appreciation, poor working conditions (Kumar, 2016), inadequate perks and compensation (Mandhanya, 2015) and employee's expectations (Bussin et al., 2017). Several studies

conducted in Europe, Asia and United States of America, (Mandhanya 2015; Holston-Okae & Mushi 2018; Al-suraihi et al., 2021; Bolt et al., 2022; and Pregnolato, Bussin, & Schlechter, 2017), found that absence of clear plan for career advancement for employees, pay, work environment, recognition and job related factors such as security, safety, stress and satisfaction; are the frequent reasons given by employees why they change jobs and organisations.

Studies conducted in Africa, such as Dwesini, (2019) and Pepple, Akinsowon, & Oyelere, (2021) conveyed that employees' retention is a very serious problem to many organizations and governments. Similarly, Ezeudji & Mbane, (2017), Mohajane, (2017 and Dwesini (2019) point out that, lack of promotion, rewards, heavy work load, lower pay, unfair compensation and lower management support are the main reasons organizations fail to retain the best employees. Mule et al. (2020) argue that rewards in terms of career development increases employee retention in organizations. Apart from losing best employees, failure to retain employees has a huge impact on an organization due to the costs associated with recruiting new employees and can negatively impact the productivity, sustainability, competitiveness, and profitability of an organization (Holston-Okae & Mushi, 2018).

According to Bolt et al. (2022) and Kossivi, Xu, & Kalgora, (2016), factors affecting ability of organisations to retain their most qualified employees varies from one organisation to another. As such, different firms can use different strategies to retain their best employee (Cardy & Lengnick-Hall, 2011). Also, an organisation can use different strategies to retain employees depending on their diverse needs, expectations and job perception or use different strategies to retain the same employee (Javed et al., 2014)

Essentially, employees' retention strategies refer to the methods and policies applied by organisation that encourage employees to stay with the organisation for extended periods of time (Aman-Ullah et al., 2020). The major common strategies used include rewards, on-job training and development, talent management, employee engagement, work-personal life balance, quality of work environment, adequate wages and social relationship (Haldorai et al., 2019; Rathi & Lee, 2015)

Although employees' retention strategies vary, but most organisations commonly employ career development opportunities as one of their employees' retention methods (Izidor, 2016). Career development usually involve opportunities given to employees to engage to long- or short-term education and trainings. In general, Career development intends to give an employee a promising future of his/her profession as motivation to make them satisfied with the job. Study conducted by Phyu et al., 2023 discovers that employer who invest in career development of its employees experience a higher level of employees satisfaction and hence higher retention rate since employees long term goals are met. For employees to feel valued and motivated to stay in an organisation for longer period it is critical that they have a clear understanding of their career path. A well-defined career path is necessary for increasing employee satisfaction and increase their intent to stay. (Ferdiana et al., 2023)

In Tanzania, employee retention challenges are influenced by a variety of issues in HR management, including motivation, basic pay, incentives, quality of working environment, job security, unclear career path, employer-employee interactions, and work-personal life balance. (Kahungya, 2016; Jovin, 2018). Tanzanian Government has adopted various major reforms measures to improve public sector performance which also targeted to ensure retention of potential workers in the public sector. The most remarkable reforms include Local Government Reforms in Tanzania 1998-2008; Public Service Reform Programme-Phase I (PSRP I): 2000-2007; Public Service Reform Programme - Phase Two (PSRP II): (2008-2012). All these reforms aimed at; strengthening government structures; improve organizations capacity to deliver quality service (e.g. recruits, develop, retain, empower, motivate, and nurture); addressing institutional shortcoming (e.g. introduction of Management system) (Kiragu & Mutahaba, 2006). In view of the retention problem of public employees among other issues the Government of Tanzania formulated the National Public Pay and Incentive Policy of 2010; established the public service standing order in 2009, and institutes specific Ministry for Human Resource Management and Good Governance in 2021. Career development programs was among statutory benefits that postulated by the said reforms (Lameck, 2021; Jovin, 2018; Kahungya, 2016).

Ministry of Works (MoW) as one of the public organizations in the government of Tanzania (URT) benefits from the mentioned reforms. However, considering that most of employees at the MoW are civil engineers who are considered scarce relative to their demand, retaining them is of paramount important. Kikwasi (2011). Thus, the MoW is among the government ministries that fully implement the public sector reforms and HR managerial reforms as strategies to retain its best employees. The Ministry prepares and implement training plan each year that focuses on developing employees' career with the aim to make its employees satisfied with their job and stay with the Organization for long time. However, an average of five (5) employees leaves the Ministry of Works for various reasons every year (AEAS, 2022).

Despite the effort done by public organisations to provide significant job security and stability as well as on-job training and career development opportunities, employees still tend to leave their job due to various reasons such as inadequate compensation, lack of incentives, human resource management challenges and unfair reward system (Ambukege, 2020, 2020; Lameck & Kinemo, 2021; Peter, 2014). Also, Tanzania's public sector is characterized by unequal pay scales for personnel with similar qualification working in various governmental ministries, departments and agencies (Tijdens & Kahyarara, 2012). Due to this, the trend of employees leaving public organisations has remained notable (Lameck & Kinemo, 2021; NBS, 2018).

Based on this context, there are considerable body of literatures on employee retention and the impact of various retention strategies such as career development recognition, promotion that were conducted globally including from United States, United Kingdom, and Malaysia (Emerson 2018; Smith, Williams, & Garcia, 2021; Lee, 2017, Shao, Kempf, & Taskin, 2019; Phyu, et al., 2023) and domestically (Mutwe, 2013; Kokoito 2022; Msangi 2021; Richard & Dennis 2017; Ambukege, 2020; Lameck, 2021). Most of these studies from Tanzania focused

on the private sector setup especially banking industry leaving aside the aspect of public sector especially Ministries. By researching the effect of career development on retention in public sector of Tanzania, helps to gain deeper understanding of their significance in promoting long-term employee commitment and identify effective strategies for enhancing employee retention in public sector setup. The study will further provide valuable insight to policy makers and decision makers about the most effective career development interventions for improving public sector retention as well as making evidence-based decisions about the most effective retention strategies in the public sector. Thus, this research study analyses the relationship between career development programs and employee retention, shedding light on training/education opportunities, autonomy in career path, fair career opportunities and opportunities for innovation within the Ministry of Works.

Theoretical Review

The foundation of this study based on equity theory, that was postulated by Adams in 1963. The theory based on the idea that workers desire to be treated fairly and frequently compare themselves to their counterparts. Al-Zawahreh and Al-Madi (2012) contend that the fundamental tenet of equity theory is the notion that employees work hard for the organisations they are employed by with the hope of receiving rewards, which may include a salary and other advantages such as non-monitory rewards in a fair basis. Employees get motivation due to the balance between their efforts at work and their perception for career growth among other things. (Habib, Manzoor, & Jamal, 2017) According to the equity theory, workers frequently compare their returns to other people to measure how fair they are. When workers believe they are not being treated properly, they lose motivation and may be driven to act, which may also have an impact on retention. Equity theory aligns with this study as it can provide a valuable lens that enables examining the effect of career development opportunities as one of non-monetary reward strategy on employee retention. It helps in understanding employee's perception on the fairness of career opportunities and how these perceptions influence motivation and retention. The theory provides deeper understanding of the underlying mechanisms driving the relationship between career development and employee retention, thus, offer practical insights for organizations aiming to enhance employee satisfaction and retention.

However, equity theory has several notable weaknesses. The theory does not consider other factors that can influence equity perception, such as take personal and cultural differences which may affect the perception of equity. (Davlembayeva, Alamanos, & Papagiannidis, 2021). According to Romer, (1979), the application of Equity Theory is restricted sources, which cannot be measured and divided. Moreover, the equity theory is difficult to apply consistently in a variety of organizational contexts because as it ignores elements like personal preferences, personal influences, cultural influences, and the effect of external factors on personal fairness. Despite these weaknesses still equity theory is useful in explaining the dynamics of the career development programs such as fair career opportunities, autonomy in career path, innovation and creativity and training/education opportunities and their

implication in employees' retention. Also, the theory helps to clarify the usefulness of career development in promoting job satisfactions, employee engagement and overall retention.

Empirical Review

There is a substantial body of research examining the relationship between career development opportunities and employee retention. For stance, the study conducted by Mule et al. (2020) in Kenya context, concluded that career development positively influences employee retention. The study adopted descriptive survey research design with sample size of 510 employees of County Government of Meru. The findings revealed a positive and significant relationship between career development and employee retention ($r=0.521$, $p=0.000$). Another study by Al-sharafi et al. (2018) sought to investigate the effect of training and career development on retention of employees on Yemen's telecommunications organisations. The study also examined the mediating role of the work satisfaction in the relationship of preparation, career growth, and retention of employees. The findings showed that training was found to enhance employee satisfaction and increase the retention rate in Yemen's telecommunications market. Also study by Mushi and Kinyondo (2022) which examined the relationship between career development opportunities and job retention among employees in Tanzania. The researchers postulated that employees with more access to career development opportunities would have higher levels of job retention. The results showed a statistically significant positive correlation between career development opportunities and job retention ($r = 0.42$, $p < 0.01$). Employees who had more access to career development were more likely to intend to stay with the organization and had lower actual turnover rates. Unlike the study by Mushi and Kinyondo (2022) Mule et al. (2020) Al-sharafi et al. (2018 who focused on training and mentorship aspects of career development, this study extends further to other aspects including autonomous in career path, innovation and creativity opportunities as well as fair career opportunities rewards

Research methods

Based on the nature of the study, pragmatism philosophy was used to guide the study. The philosophy pragmatism is the mixture of qualitative and quantitative methods (Denscombe, 2008). It blends the pure quantitative approach that follows positivism research philosophy and pure qualitative approach underpinned by the interpretivism philosophy (Creswell & Clark, 2011). Thus, in this study data was collected using mainly a questionnaire, and in-depth interview. This study adopted an analytical cross-sectional research design, which involve both inferential and descriptive statistics to summarize the data. It further consents the selection of representative sample from the target population and gathers quantitative, qualitative, or a combination of both data at one particular time. (Setia, 2016). A total of 152 questionnaires was distributed containing the relevant questions regarding retention indicators and career development program variables. Quantitative data was analysed using both descriptive analysis and inferential analysis. Descriptive analysis was done to determine the magnitude of the employees' retention. Binary logistic regression was used to examine the association between

career development programs and employees' retention. Specifically, the provided formula helped to analyse quantitative data from the objectives as equated below;

$$\log it[\pi(x)] = \log\left(\frac{\pi(x)}{1-\pi(x)}\right) = \beta_0 + \beta_1 x_1 + \dots + \beta_p x_p$$

Whereby, $\pi(x)$ represent the likelihood of employee to remain at Ministry of Works, x_i 's represent set of independent variables and β_i 's represent parameters of respective independent variables.

Furthermore, qualitative data was gathered from five key informant who possess first hand understanding of the organization. The qualitative data was then analysed using content analysis method.

Area of the Study

Study area as defined by Forsyth, (2012), refers to the specified geographical location and boundaries within which the research is focused. It gives the study a spatial context and helps in defining the scale at which the subjects are being examined. This study was conducted at the Ministry of Works in Dodoma City. Dodoma is an administrative city where the Ministry of Works headquarter is located. According to the URT, (2024), Seniority list document, majority of employees of the MoW are situated at the headquarter. Thus, the area was purposefully selected to ensure feasibility of the study in terms of access to data and participant. Similarity, the ministry of work unlike other Ministries has unique mandate associated with construction industry. Thus, it is engaged into big constructions projects which involve planning, development and maintenance of various infrastructures, including roads, bridges, buildings, airports, harbours, highways, subways, railroads, and transit systems (URT, 2024). Due to its core functions majority of its employees are civil engineers. According to Kikwasi (2011), the construction industry in Tanzania is characterised by having high demand of competent and experienced civil engineers in both public and private sector. Based on that context, examining the impact of Career development on job retention in this Ministry whose majority of its employees faces high demand in the labour market provides a more significant insight of retention issues in public sector.

Study Population

The target population in the study was all staff members of the Ministry of Works who are based in Dodoma. For this case, the sampling frame was 247 staff members with temporary and permanent contracts working at the Ministry of Works (Payroll audit, 2022). The study adopted both probability and non-probability sampling techniques. This study employed stratified random sampling techniques to select participants of the primary study unit who was administered with a questionnaire out of 247 workers. The stratified random sampling was used to select staff members depending on the position rewards due to variations of rewards across members of staff that, is the higher, middle and lower levels rewards. This stratified sampling has been chosen based on the views by Kothari, (2004), that it is appropriate in selecting the true representative sample in the situation where the population under investigation is

heterogeneous is obtained. To ensure appropriate sample size to represent the opinions of the target population, this study used a formula developed by Yamane (1973) with a confidence level of 95% because it reflects the basic trade-off between precision and accuracy. This level of certainty represents the characteristics of the total population; therefore, the margin of error used was 0.05. Generally, the Yamane (1973) formula was used to compute the sample size from the total population which gives a sample size of 247.

$$n = \frac{N}{1 + N(e)^2} \dots\dots\dots(1)$$

Whereby,

n=the sample size (the representative of non-monetary rewards)

N= Population estimates or sampling frame=247

e= the level of precision (margin of error limit/the acceptable sampling error) =0.05

By applying Yamane formula,

$$\text{Sample size, } n = \frac{247}{1 + 247(0.05)^2} = 152$$

Reliability and Validity of Statistics

The overall reliability statistics for several variables related to employee perceptions and experiences in their careers and workplaces, assessed using Cronbach's Alpha coefficient. The coefficient measures how well a set of variables or items measures a single, one-dimensional latent aspect of individuals. All variables with >0.7 Cronbach's Coefficient are considered to have acceptable level of internal consistency, and hence data collection instrument reliable (Bell et al., 2022). The overall reliability of the assessment, considering all 4 items across these variables, is high with a (Cronbach's Alpha: 0.922; 4 items). This indicates strong internal consistency among the items, suggesting that the survey or questionnaire effectively captures the intended constructs related to employee perceptions and experiences in the workplace.

Employee Retention (Cronbach's Alpha: 0.786, 4 items): This variable assesses factors related to employee retention within the organization. High reliability coefficient for the combined variables indicates a reliable assessment of various aspects of employees' retention within the organization.

Table 1: Overall Reliability Statistics

Variables	Cronbach's Alpha	No. of Items
Career Development	0.922	4
Employee Retention	0.786	4

Source: (Field data, 2024).

This study ensured face validity and content validity. The face validity was maintained by passing data collection instruments to research supervisor for comments and opinions. The content validity was attained using pre-testing of data collection tools through opinions of experts' and through pilot study. Moreover, data triangulation was obtained by using multiple methods of data collection for validity purposes.

Ethical Consideration

The study considers all ethical guidelines during the entire research process. In the field, before interviewing respondents, a researcher explained the intention of the study to every respondent and clarify the study's purpose. The respondents were given rights to give their informed consent about the subject matter. They were also informed of their right to freely involve in the study and unrestricted freedom to leave at any moment. The real names of the respondents are not disclosed in this study for the purpose of confidentiality and security. Also, all secondary data and some other pieces of information used are appropriately acknowledged in order to avoid plagiarism.

Result and discussion

The analysis and findings of the study presented as set in the research specific objectives and envisaged methodology. The study findings are on the effect of career development programs on employee retention indicative parameters. The results are obtained from descriptive statistics and inferential statistics.

Employee retention summary statistics

This part intended to explore the general overview of the employee retention within the Ministry of Works. The computation of descriptive statistics that includes mean, standard deviation and minimum and maximum scores of the indicative parameters related to employee retention was done. The computation method was gained from the study by (Phyu et al., 2023; Abba & Odeleye, 2018). The attributes interpreted in this matter are intention to stay, job satisfaction, intention to leave, work-life balance, and an overall retention score. The analysis reveals that, the mean score for intention to stay is 4.327, indicating a high level of commitment among employees to continue working in the organization. The standard deviation (Std. Dev.) of 0.402 suggests relatively consistent responses across employees, with minimal variability in their intentions to stay. In terms of job satisfaction, the analysis depicts a mean score of 4.091, reflecting a generally high level of satisfaction among employees with their roles and responsibilities. The standard deviation of 0.497 indicates slightly more variability in job satisfaction compared to intention to stay. For an intent to leave variable the statistics portrays a mean score of 1.807, indicating a low likelihood of employees considering leaving the organization. The low standard deviation of 0.395 suggests that responses regarding the intention to leave are relatively consistent across employees. Lastly, mean score of 3.587 were observed in terms of work-life balance computation suggesting a moderate level of perceived balance between work and personal life among employees. The standard deviation of 0.495 indicates some variability in perceptions of work-life balance among employees.

The overall retention score, obtained by combining multiple interpreted factors portrays a mean score of 4.219 which indicates a generally positive outlook on retention factors within the organization. The standard deviation of 0.412 suggests moderate variability in overall retention perceptions among employees. The findings collectively indicate that employees express a

strong intention to stay and high job satisfaction, indicating positive sentiments towards their roles and the organization. The low intention to leave score further reinforces the idea of employee commitment and loyalty. While work-life balance scores slightly lower than other factors, the overall retention score is positive, suggesting that the organization generally performs well in retaining its employees. The outcome relates to the findings from the study done by Mahadi et al. (2020) on the determinant factors for employee retention which reveals that the organisational retention rate is determined by employee intent to stay or leave and the individual level of satisfaction.

Table 2: Employee retention summary statistics

Indicators	Mean±Std	Min	Max
Intention to stay	4.327 ± 0.402	3	5
Job satisfaction	4.091± 0.497	3	5
Intention to leave	1.807± 0.395	1	2
Work life balance	3.587± 0.495	2	4
Overall	4.219± 0.412	2.4	4.5

Source: (Field data, 2024).

The study further established dual group using overall mean score of retention (Yes and No groups) presenting the frequency and percentage of employees who have either stayed (Yes) or need to leave (No). The majority of employees, accounting for 78.95% (120 employees), are willing to be retained (Yes), indicating that they still need to working within the organization. A smaller proportion of employees, 21.05% (32 employees), are not willing to be retained (No), suggesting that they are wishing to leave the organization for various reasons.

Table3: Employee retention

Category	Frequency	Percentage	Overall mean	Standard deviation
Yes	120	78.95	4.219	0.412
No	32	21.05		

Source: Field data (2024)

These results highlight a relatively high retention rate among employees, with the vast majority choosing to stay within the organization. However, the presence of employees who need to leave also indicates a need for ongoing efforts to understand and address factors influencing retention, such as job satisfaction, career development opportunities, work-life balance, and organizational culture. Analysing the reasons behind employee departures can provide valuable insights for improving retention strategies and creating a more engaging and supportive work environment. The findings were backed up by the argument from key informants who assert that, “Employees at this Ministry are very committed to their roles, for a while now i haven’t had any case of an employee with an intention to leave the Ministry unless it’s for a very necessary reason like moving to another city to be with their families. This may simply mean

that employees are likely to be satisfied with their job here at the MoW” (Interview conducted on 20 March 2024 at Ministry of Works, in Dodoma)

Association between Career Development programs on Job retention in the Ministry of Works.

The association between career development programs and job retention within the Ministry of Works, was analysed at a 0.05 level of significance using chi-square tests. The study contemplates opportunity of short- and long-term trainings/education, autonomy in career path and fair career opportunities as the key indicative parameters of career development. The analysis of the employees who had Opportunities for long or short-term trainings/Education showed a significantly higher job retention rate (Yes) compared to those who did not have this opportunity (No). The chi-square value is 55.0225, with a significant p-value of 0.007, indicating a strong association between education opportunities and job retention. Similarly, the assessment on the autonomy in Career Path, shows the employees who had autonomy in their career paths (Yes) demonstrated a significantly higher job retention rate compared to those without autonomy (No). The chi-square value is 42.0832, with a very low p-value of 0.00, indicating a highly significant association between career path autonomy and job retention. On the other hand, employees who perceived to have fair career development opportunities (Yes) were significantly more likely to be retained in their jobs compared to those who did not perceive fairness in career development (No). The chi-square value is 52.3225, with a very low p-value of 0.00, indicating a highly significant association. Innovation and Creativity: Employees who had opportunities for innovation and creativity (Yes) also showed a significantly higher job retention rate compared to those without such opportunities (No). The chi-square value is 44.0178, with a p-value of 0.016, indicating a significant association at the 0.05 level. Overall, the analysis reveals strong associations between various career development programs (opportunity for education, autonomy in career path, fair career development opportunities, and innovation/creativity opportunities) and job retention within the Ministry of Works. These findings suggest that investing in these career development aspects can significantly influence job retention rates among employees. Base on equity theory, employees tend to be more likely to feel involved and content with the organisation if they believe there is a greater degree of equity, supported by organisation’s investment in their career growth. Due to this perceived equity may result into improved job retention, since workers are less likely to leave the organisation in quest of better career opportunities elsewhere.

The results are consistent with research on the relationship between career development and employee retention in the hospitality industry conducted by Wilkins and Kamau (2014). According to Wilkins & Kamau (2014), organisations that offer well-structured career development programs that include training opportunities, mentorship programs, and employee rotations in career opportunities have been able to increase employee intent to stay with the

Organisation longer than those that do not provide such opportunities. It was also entrenched by Patel & Rana (2021), who discovered that workers were more inclined to stick with their organisations if they had access to options for professional growth, such as coaching,

job shadowing, and training. The study emphasized the importance of aligning career development programs with the organization's strategic goals and employee needs.

Table 4: Association between Career Development programs on Job retention in the Ministry of Works.

Variable	Low performance	High performance	Chi-square	P-Value
Opportunity for education			55.0225	0.007
No	15(26.79)	41(73.21)		
Yes	17(17.71)	79(82.29)		
Autonomy in career path			42.0832	0.00
No	23(23.21)	33(76.97)		
Yes	29(19.79)	67(80.21)		
Fair career development opportunity			52.3225	0.00
No	13(23.21)	43(51.43)		
Yes	19(19.79)	77(80.21)		
Innovation and creativity

The effect of career development programs on the employee retention within the Ministry of Works.

Diagnostics for the Logistic Regression

The effect of career development programs on employee retention was assessed using binary logistic regression model. Different test statistic was deployed to assess the accuracy of the Binary logistic regression model as it shown below.

Omnibus tests of model coefficients

The model goodness of fit was tested using Omnibus tests of model coefficients. The chi-square value for the logistic regression model assessing the impact of career development programs on job retention is 12.0036, with 4 degrees of freedom. The significance level (p-value) associated with this model is 0.002, which is below the 0.05 threshold, indicating a statistically significant relationship between career development programs and job retention. This suggests that investing in career development programs can influence job retention rates within the organization.

Table 5: Omnibus tests of model coefficients

Step	Chi square	df	Sig
1	12.0036	4	0.002

Hosmer and Lemeshow model test

The Hosmer-Lemeshow goodness-of-fit test in Table 10 suggests that the logistic regression model fits the data well. According to Archer, Hosmer, & Lemeshow, (2007), a good fitting model has to have a value greater than 0.05. The test of Career Development programs effects on Job retention reveals a chi-square statistic of 2.1651 with 8 degrees of freedom (df) yields a significance level of 0.124, which is greater than 0.05. This indicates that the model fits the data well for this category. It entails that the logistic regression model adequately describes the relationship between the predictors and the dependent variable.

Table 6: Hosmer and Lemeshow model test

Step	Chi square	df	Sig
1	2.1651	8	0.124

Findings on the effect of Career Development programs on Job retention at the MOW

The assessment of the influence of Career Development programs variables on job retention at the Ministry of Works was done by using multiple logistic regression analysis at a 0.05 level of significance. The results depict that there is statistical significance relationship of all the variables with employee retention. "Opportunity for education," employees who have opportunities for education have a coefficient of 1.884, indicating that they are 3.547 times more likely to have high retention compared to employees who do not have such opportunities. This result is statistically significant, with a z-value of 12.44 and a p-value of 0.016, suggesting a strong association between education opportunities and job retention. Regarding "Autonomy in career path," employees with autonomy in their career paths have a coefficient of 0.2122 and an odds ratio of 1.1783, indicating a moderate effect on retention. The p-value of 0.106 suggests that this relationship is statistically significant at the 0.05 level. For "Fair career development opportunity," the coefficient is 1.2122, with an odds ratio of 1.996, indicating that employees with fair career development opportunities are significantly more likely to have high retention rate ($z = 13.83$, $p = 0.001$). Additionally, "Involvement in Innovation and creativity" exhibit a strong positive impact on job retention, with a coefficient of 1.5216 and an odds ratio of 2.01. Employees involved in innovation and creativity are significantly more likely to have high retention ($z = 18.54$, $p = 0.000$). The constant term in the model represents the baseline odds of low retention when all other variables are held constant. The model's goodness of fit is supported by the LR Chi2 value of 138.4 and a significant Prob > Chi2 value of 0.000, indicating that the model is statistically significant. The Pseudo R2 value of 0.53 suggests a moderate-to-high level of explanation provided by the model regarding the variation in employee retention. In summary, Career Development programs such as education opportunities, fair career development, autonomy in career path and involvement in innovation and creativity significantly impact job retention in the Ministry of Works.

Table7: Multiple Logistic Regression Analysis

Employee retention	Coef.	Odds Ratio	z	P> z
--------------------	-------	------------	---	------

Prob > Chi2 = 0.000 Pseudo R2 = 0.53				

Source: Authors compilation from STATA 17

Furthermore, the results were complemented by the interview discussion with identified key informants, that as employees perceives to have an opportunity for further studies, they tend to be more satisfied with their job and increase their intent to stay longer. When employees believe that, they will have freedom to choose their career path and the opportunities are given in a fair bases increases their desire to stay with the Organisation. This ideology indicated that career development programs influence job retention as presented by the quote from one informant below;

“The Ministry believes in developing career of its employees. Despite the importance of which in implementing their duties it also helps them to grow and be satisfied with their jobs. It is described in our training program that every employee should attend at least one course every year to sharpen their capacity. We normally encourage and facilitate employees to engage into different long and short-term training to develop their career. Employees also have the freedom to engage into coursed of their choice as long as it aligns with their responsibilities. For stance in 2023/2024 financial year, we have facilitated 3 employees to attend long course programmes and 7 short course programs. These efforts have made our employees more comfortable with work, increase their work morale and their willingness to continue saving the Ministry of work”. (interview conducted on 20 March 2024 at Ministry of Works, in Dodoma).

These findings suggest that investing in career development aspects and fostering a culture of innovation can significantly contribute to a stable and motivated workforce. The research reliably shows that well designed and implemented career development programs have a substantial progressive influence on improving job retention rates. Overall, the analysis reveals positive correlation between various career development programs (opportunity for education, autonomy in career path, fair career development opportunities and innovation/creativity

opportunities) with job retention within the Ministry of Works. The results are in same comparison with Mule, Rintari, & Moguche, (2020), whose study replicates that career development has a positive and significant relationship with employee retention. According to Mule, Rintari, & Moguche, (2020), employees tend to remain loyal and committed in the organisation once they anticipate to be given opportunity to engage in education/training, anticipate fair opportunity to develop their career and independence in career path. Another study by Phyu et al., (2023) found employees had an opportunity to engage into structured career development programs had much greater employment retention rates than those who did not get that opportunities.

Conclusion

In terms of career development, the study reveals positive correlation between various career development programs (opportunity for education, autonomy in career path, and fair career development opportunities) with job retention within the Ministry of Works. Based on the individual attributes of career development, starting with "Opportunity for education," the study illustrates that employees who have opportunities for trainings/education have a coefficient of 1.884, indicating that they are 3.547 times more likely to have high retention compared to employees who do not have such opportunities. The result is statistically significant with z- value of 12.44 and a p-value of 0.016, suggesting a strong association between education opportunities and job retention. Further, employees with autonomy in choosing their career path has coefficient of 0.2122 and an odds ratio of 1.1783, indicating a reasonable effect on retention. The results are statistically significant at the 0.05 level with p-value of 0.106. the study also indicates that employees with fair career development opportunities are significantly more likely to have high retention rate ($z = 13.83$, $p = 0.001$). Additionally, "Involvement in Innovation and creativity" exhibit a strong positive impact on job retention, with a coefficient of 1.5216 and an odds ratio of 2.01 and statistically significant with z-value 18.54 and p-value 0.00. Thus, it is statistically significant to conclude that providing employees with various career development opportunities help to enhance job retention.

This result is supported by various other literatures (Mahadi, et al. 2020; Richard & Dennis, 2017; Al-sharafi, et al. 2018; Msisiri, 2018; Mule, et al. 2020). These findings are also consistent with several management theories, including the expectancy and social exchange theories and equity theory. The study further advocates that, if employees perceive to get an opportunity for their career advancement, they will have more intent to stay with the Ministry. The results provide valuable insights on the design and implementation of career development programs. The findings suggest that for the Ministry to retain its valuable employee has to consider investing more in career development programs which includes opportunity for further trainings/education, fair career development opportunities among its employees and autonomy for employee to choose their career path. In summary the findings shed light on the relationship between career development programs on job retention.

The study has a significant implication for the government and policy makers in Tanzania. It highlights the need for prioritizing the development of effective career development programs. By investing in these areas, policy makers can enhance employee motivation, commitment, and retention, leading to improved service delivery and organizational effectiveness. While this study on the effect of career development on employee retention in the Ministry of Works in Tanzania offers valuable insights, it is important to acknowledge its limitations. The focus on one ministry restricts the generalizability of the findings to other sectors or organizations. Additionally, relying on self-reported data may have introduced biases and subjective interpretations.

Area for Further Studies

Based on the review made, much scope remains for more exploration in the field of employee retention by taking into consideration additional factors that may interact with employee retention like compensation practices, leadership and supervision, career planning and development, alternative work schedule, working conditions, and flexible working hours. Understanding how these other factors influence the employee's retention can provide valuable insights for improving retention strategies in the Ministry of Works in Tanzania public sector. For generalisation purposes further studies can be conducted to other Ministries organisation to extend these findings. Furthermore, a comparative analysis study can also be done to determine the relative effectiveness of different human resource practices (e.g., career development programs vs. recognition programs) in improving retention would help organizations prioritize their interventions.

The Influence of Technological Proficiency Among Head of School on Effective Management of School Fund. A Case of Secondary School in Dodoma city Council and Chamwino District

Flora Gervas¹ & Dr. Yusuph Kambuga²

¹Department of Business Administration, College of Business Education, Dodoma

¹Department of Business Administration, College of Business Education, Dodoma

Abstract

This study examines the role of technological proficiency among school accounting officers in managing school funds a case of Dodoma Region, with a specific focus on familiarization with financial software tools, generating financial reports, and integrating systems such as the Financial Facility and Accounting Report System (FFARS). The study applied management competence theory (MCT) to understand the role of technological proficiency among school accounting officers in managing school funds. The study used cross sectional research design while simple random and purposive sampling techniques were used to select members of sample size with 104 respondents from the population of 2 respondents from all 68 secondary schools found in both districts and 3 staffs from each local government authority. A quantitative approach was employed to assess the relationship between technological skills and effective financial management in schools. The findings revealed that accounting officers who are proficient with financial software and system integration demonstrate significantly better financial management practices compared to those who lack such skills. Familiarity with financial software tools, the ability to generate accurate financial reports, and system integration are positively associated with efficient management of school funds. These insights suggest that improving technological proficiency among accounting officers could significantly enhance financial accountability and transparency in schools. The study recommends continuous training and support in the use of financial systems to improve the overall management of school funds. Further research should focus on exploring the impact of these technological tools in different regions and their long-term effects on financial outcomes in educational institutions.

Keywords: *Technological proficiency, financial management, school accounting officers, financial software tools, financial reports, system integration, Financial Facility and Accounting Report System (FFARS) and Dodoma Region.*

1. Introduction

Technological proficiency in financial management has become a global concern, since use of modern technology especial at School level has shown positive impact in both administration and financial management. In Africa most of schools especially secondary schools uses modern financial systems to manage fund rather than use manual financial record keeping. The study by Wessel (2018) explored the critical information and communication technology (ICT) skills needed for professional accountants. The study identified that technology is a key driver in the rapidly evolving business environment, accountants required to interact with and understand these systems to perform their roles effectively. The study underscored the importance of ICT in financial management, suggesting that whether accountants serve as financial managers, evaluators, or consultants, technological proficiency is critical for ensuring accuracy and efficiency. School accountants, like professional accountants in other sectors, need to leverage technology to handle financial records and reports, ensuring proper fund management in schools.

Pasewark (2021) analyzed the future requirements of accounting professionals in light of technological advancements, particularly automation and cognitive processes. The study identified five major areas where business schools are struggling to meet the evolving needs of the profession, including enhancing technology usage. Findings revealed that offshoring and automation have significantly reduced the demand for traditional accounting roles. This study emphasizes the need for accounting professionals to develop new technological skills, aligning with the demand for advanced systems that automate financial processes. The relevance of this study to the current research lies in its focus on the evolving nature of accounting, which parallels the changing requirements of school accounting officers as school accountants must also adapt to these changes to manage school funds efficiently and remain efficient in their roles. The study by Dongo Dongo (2021) investigate on effectiveness of ICT integration on effective teaching and learning in public secondary schools found in Misungwi district. The study revealed that implementation of ICT has many effective on teaching and learning process and such as it enhances the accessibility of teaching and learning materials, improve teachers and student's knowledge and skills and makes lesson more effective, makes student-centered and self-directed, makes and creative good teaching and learning environment, and improve high thinking capacity for students and teachers. work of Mtuweta and Celina (2020) who studied about review financial management among public and private schools at Tambaza and Barbro Johansson Secondary School in Dar es Salaam Region. They found that the availability of fund differs between public and private schools. Public secondary schools were funded mostly by the government while the private secondary was funded by the parents or guardians. Likewise, there were slight differences on the accountability on fund usage among the selected schools, where the fund was mostly used for school's infrastructures, stationeries and for private paying for employees' salaries. There were a lot of contributions for both public and private secondary schools brought by the effective fund management. The study found that there was more seriousness, openness, decisions and creativity on fund management among the private schools compared to public secondary schools. Ruhago (2023) who assessed of the Facility Financial Accounting and Reporting System (FFARS) in Tanzania and found a

successful perform of FFARS among school facilities. FAFRS usage shows a positive impact as it simplifies a lot of work by showing how money utilization goes, shows what is remaining because when you send you see directly how the expenditure goes compared to your activities and that money is used according to the budget that you planned.

According to Wessel (2018) staying updated on digital trends and advancements is crucial for officers to maintain a competitive edge in managing school funds. Technology continues to evolve at a rapid pace, and those who fail to keep up may find themselves struggling to adapt. Through remaining digitally aware and continuously learning new skills, officers can stay informed about the latest tools and best practices for managing school finances effectively. Having a strong digital security awareness also helps officers mitigate potential risks associated with online transactions. School funds may be transferred electronically through various channels like electronic fund transfers (EFTs) and other online payment portals.

The study by Dingo Dingo (2021) recommended that ICT infrastructures such as computers and other ICT resources should be adequately provided, and secondary schools leaders should establish income generating projects to increase sources of funds and in-service training as well as special programs on ICT should be provided to teachers to boost their expertise and familiarity on the use of ICT and implications in teaching and learning.

This focus on technological skills is imperative as it can help streamline financial processes, enhance transparency, and improve overall accountability in fund management, ultimately fostering a more effective educational environment.

2. Reviewed related literature.

Wessel (2018) focused on critical information and communication technology (ICT) skills for professional accountants. Findings revealed that formation technology can be seen as one of the key drivers in a changing business environment as it is integrated into almost all aspects of business. Whether professional accountants function as financial managers within a specific organization, act as independent evaluators of an organization, financial information and systems, or act as consultants advising organizations, they will have to interact with and be knowledgeable about information technology to enable them to perform their jobs competently.

Pasewark (2021) focused on preparing accountants of the future: five ways business schools struggle to meet the needs of the profession. Findings indicated that in the past few years, the demand for accountants has decreased significantly. Much of the decrease can be explained by offshoring and use of robotic and automated cognitive processes. To prepare for changing needs of the financial community, several groups have identified professional competencies they believe will be needed by future accounting professionals. The intent of this commentary is to illustrate changes in the profession and emphasize how academic institutions might preemptively address those needs. The study discussed five ways business schools have struggled to meet the needs of the accounting profession. These include obstacles related to (1) developing competency-based curricula, (2) enhancing technology usage (3) formulating

reliable indicators of student performance, (4) offering convenient delivery of educational services, and (5) delivering economical tuition value.

3. Methodology

3.1 Research Design

This study used a cross-sectional design as it allows the observation and analysis of data at a single point in time. This design facilitated the simultaneous measurement of outcomes and exposures, providing a comprehensive understanding of the factors affecting the competence of school accounting officers in managing school funds.

3.2 Research Approach

The study utilized a mixed-methods approach, incorporating both qualitative and quantitative research methods. This combination allowed for the collection of numerical data that could be statistically analyzed (Bryman & Bell, 2015) while also providing in-depth insights into participants' experiences and perspectives. The quantitative aspect enabled objective measurements of relationships among variables, while the qualitative component enriched the findings through thematic analyses and interviews.

3.3 Study Area

The research was conducted in the Dodoma Region, specifically targeting Dodoma City Council and Chamwino District Council. These districts were selected based on their involvement in various development school projects and a CAG audit report that highlighted significant funding allocation and numerous unfinished projects (NAOT, 2021).

3.4 Population, sampling and sample size

The target population for this study comprised 142 respondents, including 68 secondary school personnel and staff members from local government authorities. This diverse population provided a comprehensive perspective on the management of school funds. 4.4 Using Krejci and Morgan's (1970) table, a sample size of 104 participants was determined, comprising 68 cashiers, 30 heads of schools, four ward education officers, and two district treasurers. The calculation ensured a comprehensive representation of the target population.

3.5 Data Collection Instruments

Data were collected through structured questionnaires distributed to school cashiers to gather quantitative information on financial skills and compliance with ethical standards. Additionally, interviews were conducted with heads of schools and local government officials to explore essential financial management competencies and the challenges faced.

3.6 Sampling Techniques

This study employed two sampling strategies: simple random sampling and purposive sampling. Simple random sampling was used to select the schools and their corresponding

cashiers, ensuring a representative sample, while purposive sampling was utilized for selecting heads of schools and local government officials, focusing on those with relevant expertise.

3.7 Validity and Reliability of the Data

Validity refers to the degree to which a measurement accurately reflects the variable it intends to measure (Cohen et al., 2014). To ensure content validity, experts in school financial management reviewed the data collection instruments, and a pilot study was conducted to establish construct validity through statistical techniques such as factor analysis.

3.8 Reliability of Data

Reliability pertains to the consistency and accuracy of the measurement tools (Alvi, 2016). Internal consistency was assessed using Cronbach's Alpha, with a threshold of 0.7 considered acceptable. A minimum acceptable value was established to ensure reliable measurements across the various variables.

Table 1 Reliability Statistics

Variables	Cronbach's Alpha
Familiarization with Financial Software	0.843
Generating Financial Reports	0.821
Integration with Other Systems	0.863

Source: Field Data, 2024

3.9 Data Analysis

Quantitative data were analyzed using descriptive and inferential statistics. Qualitative data from interviews were thematically categorized, allowing for the development of paraphrases and direct quotes from participants. Statistical techniques, including Chi-square tests and logistic regression, were employed to evaluate the associations and effects concerning the management of school funds.

4. Findings

4.1 Technological Proficiency among School Accounting Officers in Managing School Funds

This study examines the roles of technological proficiency among school accounting officers in managing school funds. In addressing this objective three variables of familiarization of financial software tools, generating financial report and integration with other system such as

FFARS were measured in respect to management of school funds as presented in the table below.

Table 1. Association between Technological Proficiency among school accounting officers in managing school funds

Variable	N	Minimum	Maximum	Mean	Std. Deviation
Familiarization of Financial Software Tools (No)	110	1	5	2.36	1.51
Familiarization of Financial Software Tools (Yes)	62	1	5	4.34	1.17
Generating Financial Reports (No)	84	1	5	2.25	1.47
Generating Financial Reports (Yes)	45	1	5	4.22	1.01
Integration with Other Systems (No)	88	1	5	2.55	1.42
Integration with Other Systems (Yes)	51	1	5	4.33	1.05

Source: Field Data, 2024

This study examines the association between technological proficiency and the management of school funds among accounting officers, based on responses from 172 participants. The findings reveal a significant disparity in mean scores based on familiarity with financial software tools. Those not familiar with such tools reported a mean score of 2.36 (SD = 1.51), indicating a low level of proficiency. In contrast, participants who were familiar with financial software tools had a much higher mean score of 4.34 (SD = 1.17), suggesting that familiarity greatly enhances their ability to manage funds effectively. Similarly, the results for generating financial reports showed that respondents with no experience had a mean of 2.25 (SD = 1.47), while those with experience scored 4.22 (SD = 1.01). For integration with other systems, non-users reported a mean of 2.55 (SD = 1.42), compared to a mean of 4.33 (SD = 1.05) for users. These findings indicate that technological proficiency plays a crucial role in effective fund management among school accounting officers, highlighting the need for targeted training programs to improve familiarity with financial tools and systems.

5. Discussions

The findings of this study underscore the critical role that technological proficiency plays in the effective management of school funds by accounting officers. The significant difference in mean scores between those familiar with financial software tools and those who are not highlights a clear link between technology use and improved financial management practices.

Research by Osei and Asante (2021) supports this, indicating that familiarity with financial management software significantly enhances financial decision-making and accountability among school administrators. Participants who are proficient in utilizing financial software demonstrated a much higher capacity for managing school funds, as reflected in their mean scores. This suggests that familiarity with such tools enhances their ability to perform essential functions such as budgeting, resource allocation, and generating accurate financial reports.

Furthermore, the stark contrast in mean scores between participants who generate financial reports and those who do not reinforces the importance of training in this area. The ability to produce timely and accurate financial reports is fundamental to sound financial management and decision-making. According to Karanja and Karanja (2020), effective financial reporting practices are crucial for ensuring transparency and accountability in educational institutions, and the lack of such proficiency can lead to significant oversight. The lower mean scores observed among those lacking this proficiency indicate potential gaps in the training and support provided to accounting officers.

Additionally, the results pertaining to integration with other systems reveal that a lack of familiarity with interconnected financial systems may hinder the overall efficiency of fund management. Research by Mwenda (2022) emphasizes that integrated financial systems can improve the accuracy of financial data and enhance decision-making processes. As schools increasingly rely on these systems, accounting officers must be equipped with the skills necessary to navigate them effectively.

These findings suggest that enhancing technological proficiency should be a priority for educational institutions. Training programs should focus on increasing familiarity with financial software tools, report generation, and system integration to ensure that school accounting officers are adequately prepared to manage funds efficiently. By investing in continuous professional development and targeted training, educational authorities can strengthen the financial management capacity of their staff, ultimately leading to better outcomes in the administration of school funds. Literature supports that ongoing professional development can lead to enhanced skills and improved job performance (Adu & Badu, 2023), making it imperative for educational institutions to prioritize training initiatives.

6.0 Conclusion and Recommendations

The study has underscored the significant role of technological proficiency among school accounting officers in effectively managing school funds. The findings reveal that familiarity with financial software tools, the ability to generate accurate financial reports, and integration with other financial systems significantly enhance fund management practices. Officers proficient in these areas demonstrate a greater capacity for financial decision-making, contributing to improved accountability and transparency in school finances. Conversely, those lacking proficiency face challenges that may hinder effective fund management, indicating critical gaps in training and support.

To enhance the management of school funds, educational authorities should prioritize comprehensive training programs focused on developing technological proficiency among accounting officers. This includes providing hands-on training in financial software tools and report generation, as well as promoting the integration of financial systems for streamlined operations. Additionally, ongoing professional development initiatives should be implemented to ensure staff remain up-to-date with emerging technologies and best practices in financial management. By fostering an environment of continuous learning and technological adaptation, educational institutions can significantly improve the financial management capacity of their staff, leading to more efficient and effective utilization of school funds.

7.0 Areas for Further Studies

Future research could explore several critical areas to deepen the understanding of technological proficiency and financial management in educational settings. A comparative study examining the differences in fund management practices between schools with varying levels of technological proficiency could provide valuable insights into best practices and areas for improvement. Additionally, investigating the long-term impact of training programs on the financial management practices of school accounting officers could help assess the effectiveness of different training modalities, using longitudinal studies to track changes over time and their correlation with improved financial outcomes.

8.0 Limitation

This study acknowledges several limitations that may impact the interpretation of the findings. First, the research was conducted in a specific geographical area, which may limit the generalizability of the results to other regions with different socioeconomic and educational contexts. Additionally, the reliance on self-reported data from participants could introduce response bias, as individuals may overstate their familiarity with financial software tools or their proficiency in generating financial reports. Furthermore, the study focused primarily on the technological proficiency of school accounting officers, potentially overlooking other critical factors influencing the management of school funds, such as organizational culture, leadership support, and financial policies. The sample size, while adequate for the analysis, may not fully capture the diversity of experiences and perspectives among all accounting officers in the education sector.

9.0 Acknowledgment

The authors of this study, and, would like to express their heartfelt gratitude to all the individuals and institutions that contributed to the successful completion of this research. Special thanks go to the school accounting officers who participated in the study, sharing their insights and experiences regarding the roles of technological proficiency in managing school funds. Their willingness to engage in this research was crucial to the findings.

We would also like to extend our appreciation to the administration of [Institution/Organization Name], which facilitated access to necessary data and resources, enabling a comprehensive analysis of the subject matter. Additionally, we are thankful to our families and colleagues for their unwavering support and encouragement throughout this academic journey. Their understanding and motivation played a vital role in the completion of this work, and we

dedicate this study to them.

10.0 Conflict of Interest

The authors declare that there is no conflict of interest regarding the publication of this study. All data collection, analysis, and interpretation were conducted impartially, and no external funding or influence affected the outcomes of the research. The findings and conclusions are solely the result of the authors' independent investigation and academic rigor.

The Influence of Technology on the Adoption of E-Procurement in Public Sectors in Tanzania. A Case of Medical Stores Department (MSD), Dar Es Salaam Region

¹Kakobili Bernard

¹College of Business Education, Dar es Salaam,

E-mail: k.mwakanjuki@bunge.go.tz

Abstract

The main purpose of the paper was to examine influence of technology on the adoption of e-procurement in public sectors in Tanzania: a case of medical stores department (MSD), Dar es salaam region. The study employed descriptive research design since it aims to describe a population, situation or phenomenon accurately and systematically and used a wide variety of quantitative and qualitative method to investigate one or more variables. The population for this study is 129 staff in Medical Stores Department (MSD), Dar es salaam Region responsible for executing the procurement process and contract management (HR, 2024). The staff were selected from the procurement management unit and user departments where 97 staff sample size was selected through the use simple random sampling. Questionnaire and interview were used as tools for collecting data and analyzed by using descriptive frequency distribution analysis and liner regression with the help of Statistical Package for Social Sciences (SPSS) version 21. The study found that technological know-how amongst the employees play a significant and positive effect in the adoption of e procurement at medical store department. This was shown by the P value of <.001 which was way below an alpha value of 0.05. The results suggest that there is a positive and substantial correlation between technology and adoption e-procurement. The study concluded that, technology has positive and significant influence towards the adoption of the e procurement. The study recommended that there is need to increase capacity building and training to improve the technological know-how amongst employees.

Key words: *Technology, E-Procurements, Public Sector, MSD.*

Introduction

E-procurement is a powerful business tool that can revolutionize the buying function of an organization by streamlining and automating the labor-intensive, procurement routines which in return enable employees to gain direct access to their suppliers' systems, visually confirm technical specifications and view product pictures, price points, and detailed product descriptions (Rehan and Omwenga 2017). E -procurement methods have assisted firms in enhancing the efficiency of their procurement processes (Abutale, 2020). In developed nations, several studies have investigated the implementation of e-procurement and have identified staff competency, technological and financial factor as the key determinants of success in electronic procurement implementation (Asare and Prempeh, 2021; Abutale, 2020).

In contrast to the progress made by most of the developed nations in adoption and use of e – procurement, the situation in developing countries such as Tanzania is characterized by a lack of knowledge about the key variables for successful implementation of e-procurement. While technology solutions such as e-procurement systems and supply chain management software, have been developed to streamline procurement and supply chain processes in other countries, their adoption in Tanzania has been slow, with many public sector organizations still relying on manual and paper-based processes (Kuria, Muhoro, & Ngari, 2021). This slow adoption is due to, employee technological competencies to support the system implementation and maintenance. These technological inadequacies as noted by Otieno and Obondi (2018) has contributed to the inefficiencies, including delays, high costs, and corruption characteristic.

Despite of the PEs to adopt e-procurement the level of adoption and successfulness differs among PEs. This is evidenced by the PPRA, 2023 report indicates that 39.8% of the public procuring entities had no adequate procurement staff with enough technological skills to drive the procurement functions professionally in the regions. This was confirmed by Ringa (2019) who established that majority of public procurement staff have limited technological knowledge, incompetencies and unexperienced to undertake procurement professionally to effectively implement roles on e-procurement procedures as required by the Act and this has dealt a major setback on service delivery. The PPRA Annual Report 2022/2023 revealed an average score for all the regions executives was 41.60% which is considered non-compliance of Procurement system and a high-risk level of 59.0% while other institutions like Medical Store Department (MSD), Tanzania Revenue authority (TRA), Public Procurement Regulatory Authority (PPRA), Tanzania Breweries Limited (TBL) and other institutions were above average.

Prior researches (Kuria, Muhoro, & Ngari, 2021) has mostly focused on identifying the elements that contribute to the adoption of e-procurement in private organizations, as well as the factors that hinder its acceptance. These studies have examined the determinants and influences of e-procurement adoption (Ringa (2019); Ngari, (2021); Siwandeti, 2019). Therefore, the information on success factors in adoption of e-procurement is not well known. Hence there is a need to explore the influence of employee technological competencies in the e system and financial roles to streamline E-procurement and supply chain processes in the public sector in Tanzania.

Literature

Definition of Key terms

i. Procurement

Procurement is referred to as acquisition of goods, services, capabilities and knowledge required by businesses, from the right source, the right quality, in the right quantity, at the right price and at the right time to maintain and manage a company's primary and support activities (Keane and Feinbag, 2016). According to Magina (2014) procurement is a process of identifying and obtaining goods and services. It includes sourcing, purchasing and covers all activities from identifying potential suppliers to delivery to the beneficiary. In this study, procurement entails all the procedures undertaking during the obtainment of goods, services and works from recognized sources such as suppliers, contractors and manufacturers.

ii. Public Procurement

Public procurement refers to the purchase by governments and state-owned enterprises of goods, services and works (OECD, 2019). Public procurement also refers to the process by which public authorities, such as government departments or local authorities, purchase works, goods or services from companies (European Commission, 2019). In this study, public procurement is considered as all the undertaking of acquisition functions by using public funds in alignment with public procurement act.

iii. Electronic Procurement

Electronic procurement, often known as e-procurement, is the automation of procurement and supply chain activities utilizing internet-based applications and technologies, according to (Oxford College of Procurement and Supply, 2014). It enables procurement specialists to share information quickly and easily, optimizing the procurement process and saving time and money without sacrificing quality (Mathias 2020).

Electronic procurement (e-procurement) is the use of electronic communication to complete business transactions between sellers and buyers (Rodriguez *et al.*, 2014). It is a useful instrument in the business world for easing the purchase of goods through the internet (Barua *et al.*, 2001). The major activities of e-procurement are: Supplier selection, product definition, negotiation, and payment are all examples of purchasing operations (Lancioni *et al.*, 2003).

iv. ICT Infrastructure

The term ICT refers to a group of hardware and software technologies that work together. Hardware components are critical for knowledge management systems because they provide as a platform for software and knowledge transfer. Technological resources have been consistently identified as an important factor for successful information systems implementation (Asare and Prempeh, 2021).

v. Staff Competence.

Employee competence refer to human ability in using ICT plays a vital role in the implementation of e-procurement in public procuring entities. Employees must understand how to use ICT and how it will change the way they do business. This obstacle is more

prominent for advanced ICT such as e-commerce and procurement (Asare and Prempeh, 2021). Employee competence is a very important aspect of every organization in virtually every field. Organizations need to have competent and skilled workers in order to use their resources optimally. This is critically important to IT resources that are largely required in an e-procurement environment (Abutale, 2020).

vi. Technology

Technology is the use of conceptual knowledge to accomplish practical objectives, particularly in a repeatable manner. The term "technology" can also refer to the end results of these endeavours, encompassing both material instruments like machinery or utensils and immaterial ones like software (Abutale, 2020). Technology is of great importance as far as e procurement is concern, since the system requires an interplay of electronic links to properly function.

vii. Financial ability

Financial ability is the capacity to satisfy current expenses, such as debt payments and solid reserves, out of current income, both accruing and cash, without encroaching on or depleting capital (Alphonse, 2020). The concept of financial ability is important in the study since it matters in capacity building process, purchases and installments of the system but also it is required in the keep and maintenance of the facilities.

Institutional Theory

Institutional theory was created to examine the processes and mechanisms used by authorities since the 1930s. These mechanisms and processes are structured from established rules and procedures to guide social behaviors. It suggests that companies are socially responsible in terms of legitimacy as a means of reducing environmental impact due to public awareness of organizational failure and environmental needs (Bansal and Cleland, 2004). The increased pressure of institutional theory has led individual organizations to do better by adopting e-procurement systems that can scale transactions to overcome barriers. In doing so, they develop good relationships with practitioners through voluntary participation in various government programs.

They established agreements between government agencies and businesses to support technological innovation and eliminate pollution (Delmas and Toffel, 2008). Nelson and Winter (2002), describe Institutional Theory as a tool that brings the idea of enterprise information exchange to improve services to customers and suppliers in different environments.

Information technology theories are used to predict their impact on organizational performance improvements. Implementing any system requires an effective system framework inside and outside the organization. In order to ensure the effective implementation of, institutional efforts such as financial, human and material resources are necessary (Alphonse, 2020).

Institutional theory helps organizations develop legal frameworks, utilize scarce resources, coordinate available resources, improve organizational structures, and manage all risks by establishing a manager-level risk framework in order to effectively implement various internal and external policies and guidelines. policies and guidelines (Delmas and Toffel, 2008).

Therefore, the implementation of e-procurement requires various resources and efforts, such as finance, staff capacity, ICT tools, coordination, stakeholder engagement and awareness, as well as involvement and support. from senior management (Alphonse, 2020).

Institutional theory is therefore relevant to this study because it will ensure the effective implementation of E-procurement, organizations and other stakeholders need knowledge and skills, i.e., staff competence, ICT tools, i.e. organizations must ensure that ICT tools are made available for the implementation of the same. In addition, institutional theory would enable the organization to develop good institutional policies, regulations and procedures and ensure that staff are competent to effectively implement E-procurement in Tanzania.

Methodology

This study employed a positivism pragmatism paradigm and a mixed approach and adopted a case descriptive research design. The researcher obtained a study sample through Probability sampling addresses and Non-Probability Sampling. The sampling process resulted in the collection of respondents from various unit and sections within procurement department. The study was conducted at Medical Stores Departments (MSD), Dar es salaam Region due to the fact that it has the roles and responsibility to carry out e-procurement activities.

Data collection processes were done using questionnaires and interviews; the primary data collection entailed getting information straight from the participants. Conversely, Questionnaires served as the primary data gathering tool, providing quantitative insights into employees' perceptions of technological influence on adoption of e - procurement. While closed-ended questions provide background information, open-ended questions permit further in-depth research. Questionnaires have the advantage of being economical, impartial, and giving respondents enough time to respond. The questionnaire utilized a five-score Likert scale, identifying the extremes of strongly disagree and strongly agree. Interviews were done with key informants who were the heads of unit and section from and of procurement department, the interview was used in collection of qualitative data. This method was important for the researcher because it allowed for the acquisition of multiple data points. An interview assists a researcher in gathering data and formulates a detailed conclusion. Then, for the interview, a researcher used an interview guide as a tool. Data analysis involved, looking over, classifying, adding up, or reorganizing the information gathered for a study to answer the original research question. In this work, the researcher analyzed data gathered from a statistical population on internal control systems. Preparing, organizing, and reporting are the components of data analysis, as stated in Eloet al. (2014). To ascertain response frequencies and perform percentage-based comparisons, the gathered were subjected to analysis utilising SPSS Version 21.0 and descriptive statistics. Measures like percentage, frequency, and mean were used in descriptive statistical analysis on the information gathered from the surveys.

The mean score for every item was translated into a degree of factors as displayed in table 1:

Table 1: Likert Scale Point

Scale	Average score (Mean)	Rating
Strong disagree	1.00 – 1.80	Very low
Disagree	1.81 – 2.60	Low
Neutral	2.61 - 3.40	Average
Agree	3.41- 4.20	High
Strong agree	4.21 -5.00	Very high

To determine the relationship between the dependent and independent variables, the method used was linear regression.

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \epsilon \quad (1)$$

Where:

Y = Adoption of E- procurement

β_0 = Constant coefficient

X_1 = Infrastructure

X_2 = Software

X_3 = Power supply

Qualitative data was collected from the Head of procurement department, unit and section to provide experienced and detailed information; To analyses qualitative data, content analysis was employed by focusing on systematically categorizing and interpreting textual data.

Findings and discussion

The collected data indicated the following results (see the results in Table 2).

Table 2: Coefficients

Coefficients					
Model		Unstandardized Coefficients		Standardized Coefficients	Sig.
		B	Std. Error	Beta	
1	(Constant)	-.082	.176		.641
	TC	.599	.061	.650	<.001

a. Dependent Variable: AEP

Source: Field Data (2024).

The Influence of Technology on the Adoption of E-Procurement in Public Sectors in Tanzania.

Furthermore, the results show that, technological know-how on the use of e-procurement system amongst employees had a positive and strong significant influence the dependent variable. This is shown by the P-value test which stood at 0.001 while its coefficient value stood at 0.599. This means that, technological know-how on the use of e-procurement system have a significant influence in adoption of the e – procurement process in medical store department.

Technology, in this study, is measured by availability of infrastructure, soft ware and power supply availability. The study results indicates that, technology has significant influence to adoption of e procurement. The study implied that; IT factor was of importance as far as adoption of the E procurement was concern. From the findings coefficient values, it implies that, in a every unit increase in the technology aspect such as infrastructure improvement, software development and improvement of power supply would have 0.599 significant impact on the adoption of the e-procurement at medical store department.

In an interview conducted to complement the findings above involved the third HOD; She was asked to respond to the interview question; “...*Can you explain how the ICT infrastructures installed at MSD has influenced the adoption of E-procurement...?*” her responses were as follows; “...*there are enough computers for all employees more particularly in the procurement department this has made it easy in the installation of the software related to e procurement....*” (HOD III;02/05/24).

Furthermore, the researcher was interested in finding out how reliable is the system given the frequent power rationing. The researcher asked; “.... *How did MSD ensured the constant power supply in the face of adopting the E procurement technology in the midst of the unstable power supply state of the country...*”, the head of department had this to say;

“.....*Heeee, don't you even think of installing the applications, softwares and all these PC's with this unstable power source of ours, the organization was keen on that, as a resulted it invested on a heavy duty and standby generator, with a modern sensor which detect the flickering of light before it turns its self on.*”,

He went on saying; “.....*surely the generator has done massive contribution, the PC can run through out working hours, and with no malfunctioning, hence technology is good yes, but there must be a constant power source backing the system up*”. The responses show that, medical store department have embraced technology even before the introduction of e-procurement. This acted on their favor such that, it was easy for them to adopt to the new technology since it only need installment of the software to the already installed laptops.

Discussion of the findings

This study results signifies that, e – procurement needs constant supply of electricity and thus the company is ought to have a back plan in case of electricity shortage. It also implies that, unless the company have well established infrastructure it would not be able to establish the e-procurement. showed that e-procurement paves the way for greater speed in purchasing products and services while reducing expenditure because of the choices and completions which increase. It is an obvious fact that before adopting and implementing any new technologies, putting into practice any initiatives, or making any new changes, organizations figure out reasons for using and implementing initiatives or changes. When it comes to adopting e-procurement systems or electronic solutions, first of all, companies considered the requirements of the company and reasons for adopting e-procurement.

The result above is supported by the findings of Hardy & Williams (2019) who argued that, technological factors like information transparency, creativity and innovation, data quality and management, system integration, data security; computer and IT literacy were significant at p-value. Furthermore, the study is in with the study of Heeks (2017) who study found

technological factors like information transparency, creativity and innovation, data quality and management, system integration, data security; computer and IT literacy were significant at p-value. Another study supporting the above study is a study by Hunja (2020) who found out that, technological infrastructures are significant factors for explaining the adoption of e-procurement in the Netch region.

Conclusion and Recommendations

Based on the study's findings, the study results showed that, there is a strong and significant effect between technological know-how amongst employee and Adoption of E-Procurement in Public Sectors in Tanzania. Thus, changing of a unit in technological know-how amongst employees would positively affect competence amongst adoption of E-Procurement in Public Sectors in Tanzania. It is also concluded that, technological know-how amongst employees is not only best for the effective adoption but it ensures sustainable adoption of e – procurement system. From the significance levels of the study, it would be concluded that technological strengths of the system would have a strong effect towards the adoption process. The public organizations and in this case medical store department should therefore train staff on the use of e-procurement tools in order to enhance the implementation of e-procurement. It is furthermore recommended that; the institutions should also employ qualified staff and avail them with electronic procurement manual to guide on e-procurement processes and assist in the implementation of e procurement. Given the importance of the e procurement and change of science and technology, given the fact that e – procurement is inevitable and unavoidable, the government and the public organizations ought to increase in the budget not only for instalment but for maintenance and sustainability. The study recommends that, there is a need however, for the future study to be conducted on the descriptive analysis to establish the reasons as to why not all the government organization have adopted to the e procurement system. Another study can be conducted to examine the reasons (challenges) as to why other organization hesitate or have not adopted the e – procurement this is regardless of its massive benefits laid out.

godsonmtallo@gmail.com

Abstract

This study aimed to examine the effect of off-job training on organizational performance at the Ministry of Finance in Tanzania. Utilizing a convergent parallel design, the research employed both quantitative and qualitative methods to provide a comprehensive understanding of the training's impact. The study's sample comprised 86 ordinary employees and 10 management personnel, chosen using simple random sampling and purposive sampling, respectively. Data collection involved structured questionnaires and in-depth interviews. The quantitative data from the questionnaires were analyzed using descriptive statistics, while qualitative data from interviews were subjected to content analysis. The results revealed that off-job training is highly regarded by employees, with the highest mean scores for alignment with role needs ($M = 4.1512$), career growth contribution ($M = 4.3488$), and justification of resources ($M = 4.3372$). Skills enhancement ($M = 4.2907$) and application of knowledge ($M = 3.8140$) also received favorable evaluations. The overall mean score of 4.1886 indicates a positive perception of the training programs. Qualitative insights further supported these findings, highlighting improved employee performance and increased motivation, creativity, and problem-solving abilities following off-job training. These results suggest that off-job training significantly enhances organizational performance by aligning training with role needs, supporting career development, and justifying resource allocation. To further improve effectiveness, it is recommended to integrate practical applications of learned skills into the training programs. This adjustment could enhance the transfer of knowledge to everyday work practices, maximizing the benefits of off-job training for both employees and the organization.

Keywords: *off – job training, organization performance, Ministry of Finance*

1. Introduction

In today's fast-paced and highly competitive work environment, organizations strive to enhance their performance by adopting various strategies that foster employee development and improve overall productivity. One of the most prevalent approaches in this regard is training (Jehanzeb & Bashir, 2021; Aguinis & Kraiger, 2023). Training, particularly off-job training, plays a significant role in equipping employees with the necessary skills, knowledge, and competencies to perform their duties efficiently. Off-job training refers to the training that takes place outside the actual work environment and is usually conducted in specialized training centers or educational institutions (Aguinis & Kraiger, 2023). This form of training allows employees to acquire new skills, enhance their existing abilities, and broaden their knowledge base without the distractions of their daily work responsibilities (Aguinis & Kraiger, 2023; Ahmad & Schroeder, 2021). Recent studies have indicated that organizations investing in off-job training for their employees tend to report higher levels of organizational performance, including increased productivity, improved quality of service, and enhanced employee satisfaction (Khan et al., 2023; Jehanzeb & Bashir, 2021; Makki et al., 2020).

In the context of the public sector, especially in government ministries like the Ministry of Finance in Tanzania, the importance of training cannot be overemphasized. Government ministries are responsible for the formulation and implementation of policies that have far-reaching impacts on the nation's socio-economic development (Noe & Kodwani, 2022). Therefore, the performance of employees in these ministries directly influences the quality of services delivered to the public. Studies have shown that well-designed training programs significantly enhance public sector effectiveness by fostering a competent workforce capable of delivering high-quality services (Mutua et al., 2021; Makki et al., 2020). However, the public sector often faces unique challenges, including limited resources, bureaucratic hurdles, and resistance to change, which can hinder the effective implementation of training programs (Khan et al., 2023). Off-job training, when effectively executed, offers a solution by providing employees with the opportunity to learn and develop new skills in a structured and supportive environment, away from the constraints of their regular work settings (Aguinis & Kraiger, 2023; Ahmad & Schroeder, 2021).

Despite the recognized benefits of off-job training, there has been a growing concern regarding its impact on organizational performance within government sectors in developing countries, including Tanzania. Research has shown that many public sector organizations in these regions often fail to realize the full potential of off-job training programs due to several factors. These include inadequate funding, lack of proper training infrastructure, insufficient planning, and evaluation of training programs, as well as a general lack of commitment from both employees and management (Khan et al., 2023; Mutua et al., 2021; Makki et al., 2020). Consequently, the intended objectives of off-job training, such as skill enhancement, knowledge acquisition, and improved performance, are often not fully achieved, leading to a gap between training initiatives and actual performance outcomes (Jehanzeb & Bashir, 2021; Noe & Kodwani, 2022).

The Ministry of Finance in Tanzania plays a critical role in managing the country's fiscal policies, budget planning, and financial regulations. The effectiveness and efficiency of its operations are crucial for the economic stability and development of the nation (Mutua et al., 2021; Ahmad & Schroeder, 2021). However, the ministry has been facing challenges related to employee performance, which have been attributed to a lack of adequate training and development programs (Khan et al., 2023; Makki et al., 2020). Studies have highlighted that employees in the Ministry of Finance often lack the necessary skills and competencies required to handle complex financial tasks, leading to inefficiencies and delays in service delivery (Aguinis & Kraiger, 2023; Ahmad & Schroeder, 2021). This situation underscores the need for comprehensive off-job training programs that can equip employees with the requisite skills to enhance their performance and, by extension, the overall performance of the ministry (Noe & Kodwani, 2022).

Moreover, the public sector in Tanzania has been undergoing significant reforms aimed at improving service delivery, transparency, and accountability. These reforms have placed increased pressure on government ministries, including the Ministry of Finance, to perform more efficiently and effectively (Mutua et al., 2021; Khan et al., 2023). Off-job training is seen as a key enabler of these reforms, as it provides employees with the opportunity to learn new approaches, adopt best practices, and acquire modern skills that are essential in today's dynamic work environment (Makki et al., 2020; Noe & Kodwani, 2022). By investing in off-job training, the Ministry of Finance can enhance the capabilities of its workforce, thereby improving its ability to implement policies and manage the nation's finances effectively (Aguinis & Kraiger, 2023; Jehanzeb & Bashir, 2021).

Despite the recognized importance of off-job training, there is a lack of empirical evidence on its actual impact on organizational performance within the public sector in Tanzania. Most of the existing literature on training and development has focused on private sector organizations, leaving a gap in understanding how off-job training affects public sector performance (Khan et al., 2023; Makki et al., 2020). Additionally, while some studies have examined training programs in the public sector, they have largely concentrated on on-the-job training methods, with limited attention given to off-job training (Noe & Kodwani, 2022; Aguinis & Kraiger, 2023). This lack of focus on off-job training is concerning, given that it provides a unique opportunity for employees to learn in a more formal and structured environment, which is often more conducive to knowledge retention and skill development (Jehanzeb & Bashir, 2021; Ahmad & Schroeder, 2021).

Furthermore, the few studies that have explored off-job training in the public sector have not adequately addressed the specific challenges and contextual factors that affect the implementation and effectiveness of such training programs in developing countries like Tanzania. Factors such as cultural differences, resource constraints, and organizational structure play a significant role in shaping the outcomes of training programs (Makki et al., 2020; Khan et al., 2023). Without a clear understanding of these factors, it is difficult to design and implement effective off-job training initiatives that can lead to tangible improvements in organizational performance (Jehanzeb & Bashir, 2021; Aguinis & Kraiger, 2023).

The research gap identified in the literature highlights the need for a comprehensive study that examines the effect of off-job training on organizational performance, specifically within the context of the Ministry of Finance in Tanzania. Such a study is essential to provide insights into the effectiveness of off-job training programs and to identify the key factors that influence their success or failure (Noe & Kodwani, 2022; Mutua et al., 2021). By understanding these dynamics, policymakers and management can make informed decisions on how to design, implement, and evaluate off-job training initiatives that are aligned with the organizational goals and objectives of the Ministry of Finance (Aguinis & Kraiger, 2023; Khan et al., 2023).

The purpose of this study is to examine the effect of off-job training on organizational performance at the Ministry of Finance in Tanzania. Specifically, the study aims to assess how off-job training programs influence employee productivity, service delivery, and overall efficiency within the ministry (Noe & Kodwani, 2022; Ahmad & Schroeder, 2021). By doing so, the study seeks to bridge the existing research gap and provide empirical evidence on the impact of off-job training in the public sector, thereby contributing to the broader understanding of training and development practices in developing countries (Khan et al., 2023; Makki et al., 2020). The findings of this study will offer valuable insights for policymakers, human resource managers, and training professionals in designing effective training strategies that can enhance organizational performance and support the ongoing reforms in the public sector.

2. Literature Review

Singh (2022) conducted a longitudinal study to examine the influence of employee training on organization development in a large multinational corporation. The study tracked the performance and development of employees over a two-year period, during which they received comprehensive training programs. The findings indicated a positive correlation between employee training and organizational growth, as measured by increased revenue, market share, and customer satisfaction. The research revealed that training not only enhanced employees' technical skills but also fostered a culture of continuous learning and innovation within the organization. The study highlighted a knowledge gap in understanding the moderating factors that influence the effectiveness of employee training on organization performance, such as the role of leadership support and organizational culture in driving training outcomes.

Hernandez, (2020) conducted a meta-analysis of existing research studies to examine the overall influence of employee training on organization performance across different industries and countries. The meta-analysis included a comprehensive review of 50 studies published between 2010 and 2019. The findings revealed a significant positive effect of employee training on various organizational outcomes, such as increased productivity, employee engagement, and financial performance. The study highlighted a knowledge gap in the need for more studies that explore the mediating and moderating factors that explain the relationship between employee training and organization performance, such as the role of organizational support, employee motivation, and the timing of training interventions.

Kimani & Ndung'u, (2021) conducted a case study on the influence of employee training on organization development in a Kenyan manufacturing company. The research employed interviews, document analysis, and observation to gain insights into the training programs' impact on the organization. The findings showed that targeted training initiatives contributed to improved employee competencies, reduced errors, and enhanced product quality. As a result, the company experienced increased customer satisfaction and expanded its market share. The study identified a research gap in the need for more empirical evidence to support the cost-benefit analysis of employee training on organization performance, particularly in developing country contexts, to justify investment in training programs.

Kessy & Maganga, (2021) conducted a longitudinal study to examine the influence of employee training on organization performance in Tanzanian small and medium-sized enterprises (SMEs). The study tracked the performance and development of employees in 50 Tanzanian SMEs over a two-year period, during which they participated in various training programs. The findings indicated a positive relationship between employee training and organizational growth, as measured by increased sales revenue, customer satisfaction, and employee retention in the Tanzanian SMEs. The research highlighted a knowledge gap in the need for more research on the effectiveness of different training methods and approaches in Tanzanian SMEs, as well as the role of government policies and support in promoting employee training and organization performance.

Mwakatobe & Mwakalukwa, (2020) conducted a case study on the influence of employee training on organization performance in a Tanzanian public sector organization. The study employed interviews, document analysis, and observation to gain insights into the impact of training programs on the organization. The findings revealed that targeted training initiatives significantly contributed to improved employee skills and competencies, leading to better service delivery and organizational efficiency in the Tanzanian public sector. The research identified a research gap in the need for more studies that explore the barriers and challenges faced by Tanzanian organizations in implementing effective employee training programs, particularly in the public sector context.

Nyang'oro et al., (2019) conducted a survey-based study to examine the overall influence of employee training on organization performance in various industries in Tanzania. The survey included responses from 200 employees across different sectors, including manufacturing, tourism, and banking. The findings indicated a positive association between employee training and organizational performance, with organizations that invested in training programs experiencing higher levels of growth and success in Tanzania. The study highlighted a knowledge gap in the need for more research on the specific types of training interventions that have the most significant impact on organization performance in different Tanzanian industries, as well as the role of leadership support in promoting a learning culture within organizations.

3. Method

3.1 Research Design and Sampling

The chosen research design for this study was a convergent parallel design. This design was selected due to its capability to provide a comprehensive and inclusive view of the current status, characteristics, and perspectives of a specific group within the Ministry of Finance. By using a convergent parallel design, the study simultaneously collected both quantitative and qualitative data, which were then analyzed to provide a holistic understanding of the research problem. The sample size for this study included 86 employees, representing the ordinary workforce, and 10 management personnel, selected using the saturation point method. The overall sample size was determined using the Yamane formula, ensuring that the sample was sufficiently representative of the broader population. For data collection, simple random sampling was utilized for selecting ordinary employees, ensuring that every individual had an equal chance of selection, which increased the representativeness and reliability of the quantitative data. Meanwhile, purposive sampling was employed to select management personnel for qualitative data collection. This approach was driven by the specific research objectives, which required detailed and insightful responses from individuals with extensive knowledge and direct experience relevant to the study's focus. The use of purposive sampling allowed the researcher to intentionally target participants who could provide valuable and pertinent information, thus enhancing the depth and quality of the qualitative insights obtained.

3.2. Participants

The study population for this research comprised both management personnel and ordinary staff at the Ministry of Finance, totaling 120 individuals (Ministry of Finance, 2023). This population was strategically selected because it was considered to be information-rich, meaning these individuals possessed valuable and relevant data necessary for addressing the study's objectives and research questions. By focusing on both management and ordinary employees, the study aimed to capture a broad spectrum of insights, covering different hierarchical levels and roles within the ministry. To ensure the sample accurately represented the larger employee population, the selection of participants was guided by specific criteria, such as work experience and job status, which were indicative of their potential to provide insightful and meaningful responses. Extracting pertinent information from this diverse group allowed the researcher to gain a more comprehensive understanding of the dynamics within the Ministry of Finance and provided a robust data set to effectively address the research objectives.

3.3. Data Collection Instruments

In this research, primary data was gathered using structured questionnaires and in-depth interviews as data collection instruments. Structured questionnaires were administered to 86 ordinary employees to capture a wide range of data efficiently. These questionnaires included a combination of open-ended and closed-ended questions, designed to gather both quantitative and qualitative information. The closed-ended questions facilitated the collection of quantifiable data, which could be analyzed statistically, while the open-ended questions allowed respondents to provide more detailed and personal insights, offering qualitative depth. Additionally, in-depth interviews were conducted with ten (10) management personnel to gain a deeper understanding of the organizational context and to capture their perspectives and

experiences related to employee training and organizational performance. These interviews provided valuable qualitative data that complemented the findings from the questionnaires, ensuring a comprehensive understanding of the research topic. The use of both questionnaires and interviews enabled a thorough exploration of the study objectives, combining broad statistical trends with rich, nuanced insights.

3.4. Data Analysis

To analyze the data, the study employed both quantitative and qualitative methods, tailored to the specific nature of the data collected. For the quantitative data gathered from structured questionnaires, statistical methods, including descriptive statistics, were utilized. This involved the use of tools such as mean, standard deviation, frequencies, and percentages to summarize and present the data in an understandable format. Descriptive statistics helped in identifying patterns and trends within the data, making it possible to draw meaningful conclusions about the overall impact of off-job training on organizational performance.

On the other hand, qualitative data obtained from in-depth interviews with management personnel was analyzed using content analysis. This method involved coding the responses and categorizing them into relevant themes and patterns. By doing so, the study could extract significant insights from the qualitative data, revealing deeper underlying issues, perceptions, and opinions related to employee training and its effect on organizational performance. The combined use of both quantitative and qualitative analysis methods allowed for a comprehensive interpretation of the findings, enhancing the validity and reliability of the study results.

4. Results and Discussion

4.1. Results

The descriptive statistics for off-job training at the Ministry of Finance reveal positive perceptions across various aspects (Table 4.1). Alignment with role needs received the highest mean score ($M = 4.1512$, $SD = 0.98837$), followed closely by career growth contribution ($M = 4.3488$, $SD = 0.97940$) and justification of resources ($M = 4.3372$, $SD = 0.92813$). Additionally, skills enhancement ($M = 4.2907$, $SD = 0.80974$) and application of knowledge ($M = 3.8140$, $SD = 1.01183$) also received favorable mean scores. The overall mean for off-job training is 4.1886. These results suggest that employees perceive off-job training programs at the Ministry of Finance as highly beneficial in aligning with role needs, contributing to career growth, and justifying resource allocation. Moreover, the emphasis on skills enhancement indicates a positive impact on employees' professional development. Aligning off-job training programs further with practical application of knowledge could potentially enhance their effectiveness and further contribute to organizational performance at the ministry.

Table 4.1 Off job training

s/n	Aspect	Minimum	Maximum	Mean	STD
-----	--------	---------	---------	------	-----

1	Alignment with Role Needs	1.00	5.00	4.1512	.98837
2	Application of Knowledge	1.00	5.00	3.8140	1.01183
3	Skills Enhancement	2.00	5.00	4.2907	.80974

Source: Field Data (2024)

The qualitative findings align well with above quantitative findings, highlighting the value of off-job training among employees and management. For instance, a senior manager remarked,

"Our observations indicate that employees who have participated in off-job training programs exhibit a noticeable improvement in their performance upon returning to work. They bring back valuable insights, skills, and fresh perspectives that contribute to our overall efficiency and effectiveness" (Senior Manager, 18th Apr 2024).

This reflects the perceived alignment of off-job training with role needs and its contribution to career growth.

Another manager emphasized,

"Our experience with off-job training programs highlights their crucial role in enhancing our organization's performance. Employees who engage in such training opportunities demonstrate increased motivation, creativity, and problem-solving abilities, all of which are vital for driving our success" (Head of Department - 01, 19th Apr 2024).

This underscores the importance of skills enhancement and the positive impact of off-job training on professional development.

To maximize the benefits of off-job training, incorporating practical applications of knowledge into these programs could be key. This approach would ensure that employees can effectively apply their new skills and insights to their roles within the Ministry of Finance, thereby enhancing organizational performance.

Moreover, the above results from the study on off-job training at the Ministry of Finance underscore the perceived value of such programs in enhancing employees' skills and contributing to their career growth, aligning with previous research findings. For instance, a meta-analysis conducted by Hernandez and Wu, (2020) examined the overall influence of off-job training on organizational performance across different industries and countries. Their findings revealed a significant positive effect of off-job training on various organizational outcomes, such as increased productivity and employee engagement. This supports the notion

that off-job training initiatives, by providing employees with opportunities to acquire new knowledge and skills outside their regular work environment, can positively impact organizational performance.

Moreover, the emphasis on justifying resource allocation suggests that employees recognize the importance of investing in off-job training programs to allocate resources effectively. This aligns with the findings of Chang and Wang, (2021), who conducted a cross-sectional study exploring the challenges facing employee training in Asian manufacturing companies. Their research revealed that limited training budgets were a significant challenge, emphasizing the importance of demonstrating the value and return on investment of training programs. Therefore, by recognizing the benefits of off-job training in justifying resource allocation, organizations can better allocate resources to training initiatives, ultimately contributing to improved organizational performance.

Additionally, aligning off-job training programs further with practical application of knowledge could enhance their effectiveness, as suggested in the study findings. This is supported by the research of Zhang and Chen, (2022), who investigated strategies to address challenges facing employee training in Asian manufacturing companies. They found that establishing clear career development paths and providing flexible training options were effective strategies in overcoming challenges and increasing employee participation in training programs. By aligning off-job training programs with practical application and career development opportunities, organizations can ensure that employees are better equipped to apply their newly acquired knowledge and skills in their roles, ultimately enhancing organizational performance.

In summary, the findings from the study on off-job training at the Ministry of Finance align with broader empirical evidence regarding the positive influence of off-job training on employee development and organizational performance. By recognizing the value of off-job training programs in enhancing skills, justifying resource allocation, and aligning with practical application, organizations can effectively leverage these initiatives to drive employee engagement and organizational effectiveness.

4.2. Discussion

The findings of this study indicate that off-job training at the Ministry of Finance is perceived positively by employees, suggesting its significant role in enhancing organizational performance. Descriptive statistics show high mean scores for various aspects of off-job training, reflecting its effectiveness in aligning with employees' role needs, contributing to career growth, and justifying resource allocation. Specifically, alignment with role needs received a mean score of 4.1512 (SD = 0.98837), highlighting that employees feel the training is relevant to their job roles and responsibilities. This finding is consistent with previous research which suggests that aligning training programs with the specific job requirements of employees enhances their job performance and satisfaction (Nguyen et al., 2021).

The positive perception of career growth contribution, with a mean score of 4.3488 (SD = 0.97940), further underscores the importance of off-job training in providing employees with opportunities for professional development and advancement. This aligns with the findings of Ahmed and Khan (2022), who noted that training and development initiatives are critical for employee career progression, which, in turn, enhances motivation and commitment to the organization. By investing in off-job training, the Ministry of Finance demonstrates its commitment to the professional development of its employees, which is crucial for retaining top talent and fostering a culture of continuous improvement.

Resource justification also received high ratings, with a mean score of 4.3372 (SD = 0.92813), indicating that employees perceive the allocation of resources for off-job training as well-founded. This perspective is supported by the study of Zhou and Hu (2020), which argues that well-planned and targeted training programs not only improve employee skills but also provide a good return on investment by boosting overall organizational performance. This is particularly important in public sector organizations, where the efficient use of resources is often scrutinized, and demonstrating the value of training investments can lead to greater support from stakeholders (Lukman et al., 2021).

Skills enhancement was another area where off-job training received favorable mean scores (M = 4.2907, SD = 0.80974). This finding aligns with studies that emphasize the importance of continuous skill development in maintaining a competent workforce capable of meeting the evolving demands of their roles (Saeed et al., 2023). When employees perceive that training programs enhance their skills, they are more likely to engage with the training and apply the learned skills to their job functions, thereby improving individual and organizational performance (Kim & Lee, 2022). The strong focus on skills enhancement at the Ministry of Finance illustrates the organization's commitment to equipping its workforce with the necessary competencies to adapt to changing work environments and challenges.

While the application of knowledge received a slightly lower mean score (M = 3.8140, SD = 1.01183) compared to other aspects, it still indicates a generally positive perception among employees. This finding suggests room for improvement in ensuring that employees can effectively translate the knowledge acquired during off-job training into practical applications within their roles. Studies by Noe et al. (2022) and Huang and Cheng (2023) emphasize the importance of reinforcing training content through follow-up support and on-the-job practice to maximize the impact of training programs. Implementing strategies to enhance the practical application of learned skills could further improve the effectiveness of off-job training at the Ministry of Finance.

The overall mean score for off-job training, calculated at 4.1886, reflects the general perception that such training programs are valuable and beneficial. This aligns with the findings of Tseng and Kuo (2021), who argue that off-job training is crucial for fostering an adaptable and resilient workforce, capable of driving organizational performance. The positive perception of off-job training in this study suggests that the Ministry of Finance is on the right track in its efforts to enhance employee capabilities and, by extension, organizational effectiveness. Future efforts could focus on continually assessing and refining training programs to ensure they

remain aligned with both the strategic goals of the organization and the professional needs of the employees.

In conclusion, the findings from this study highlight the significant role of off-job training in enhancing organizational performance at the Ministry of Finance. Positive employee perceptions regarding alignment with role needs, career growth contribution, skills enhancement, and resource justification underscore the value of these training programs. However, the study also suggests that further emphasis on practical application could enhance the overall impact of training initiatives. Aligning these programs more closely with the day-to-day responsibilities of employees and providing ongoing support for knowledge application can help maximize the benefits of off-job training, ultimately contributing to the Ministry's performance goals. These insights are in line with existing literature, emphasizing the need for a strategic approach to training that considers both the development needs of employees and the overarching objectives of the organization.

5. Conclusion and Implications

The findings of this study underscore the significant role that off-job training plays in enhancing organizational performance within the Ministry of Finance. Employees perceive these training programs as highly beneficial, particularly in aligning with their role needs, contributing to their career growth, and justifying the allocation of resources for such initiatives. The high mean scores across these aspects suggest that off-job training is not only relevant but also instrumental in equipping employees with the necessary skills and knowledge to perform their duties effectively. This positive perception among employees highlights the importance of continued investment in off-job training programs, as they foster an environment of professional development and continuous learning.

The study's emphasis on skills enhancement reflects its commitment to building a competent workforce capable of adapting to changing job demands and challenges. By prioritizing skill development through off-job training, the Ministry of Finance ensures that its employees remain competitive and proficient, thereby improving overall organizational efficiency and effectiveness. Moreover, the positive perception of resource justification indicates that employees value the investment made in their development, recognizing the tangible benefits that these training programs bring to their roles and the organization as a whole. This perception can lead to increased employee engagement, motivation, and retention, as staff members feel supported in their professional growth and career advancement.

However, the findings also suggest areas for improvement, particularly in the practical application of knowledge gained from training programs. While employees generally view off-job training favorably, there is a need to enhance the mechanisms through which learned skills and knowledge are translated into day-to-day work practices. Addressing this gap could further maximize the effectiveness of off-job training and ensure that the benefits extend beyond theoretical understanding to actual performance improvements. Implementing follow-up support, on-the-job coaching, and opportunities for practical application could help bridge this gap and solidify the training outcomes.

The implications of these findings are significant for both policymakers and organizational leaders within the Ministry of Finance. To sustain and enhance the positive impact of off-job training, there should be a strategic focus on aligning training content with the specific needs of employees' roles and responsibilities. Additionally, incorporating feedback mechanisms and continuous evaluation processes will help ensure that training programs remain relevant and effective over time. Leaders should consider investing in support systems that facilitate the application of training in real-world scenarios, thereby reinforcing learning and enhancing overall job performance.

In conclusion, this study highlights the critical importance of off-job training as a tool for organizational development and performance enhancement. By focusing on skill development, career growth, and effective resource allocation, the Ministry of Finance can continue to foster a productive and capable workforce. Addressing the identified gaps in practical application will further strengthen the impact of training programs, ensuring that they contribute meaningfully to both individual and organizational success. The insights gained from this study should guide future training initiatives, promoting a culture of continuous improvement and professional excellence within the Ministry.

Abstract

Career development opportunities are essential in employee retention as they help to enhance skills, knowledge, and expertise, leading to higher job satisfaction and increased commitment to the organization. However, the retention of health workers in rural areas remains a persistent challenge, significantly impacting the quality and availability of healthcare services. This study aims to assess the contribution of career development opportunities on the retention of health worker's in rural dispensaries in Tanzania. Specifically, the study aims to assess the awareness of career development opportunities for retention of health workers in rural dispensaries; and the role of networking opportunities on the retention of health workers in rural dispensaries in Chamwino District of Tanzania. The study employed a mixed-method approach, involving both quantitative and qualitative approaches utilizing a cross-sectional design to collect data from health workers in rural dispensaries. Data was collected through interviews and survey methods and analyzed using content analysis and multiple linear regression subsequently. The findings revealed that there is awareness of career development opportunities among health workers. Also, a study revealed minimal networking opportunities for career development opportunities among health worker's in Chamwino District. The study concludes that health workers in the study area are aware of career development opportunities offered at their workplace. It also concludes that the minimal networking opportunities among health workers in rural dispensaries affect retention. The study recommends organization to increase information sharing strategies related to career development opportunities. Also, it recommends that institutions should invest in career networking programs that enhance the professional growth of healthcare professionals by providing training, mentorship, and clear career paths, hence increasing health worker's retention.

Key words: *Retention, Health Workers, Rural Dispensaries, Networking Opportunities*

1.0 Introduction

The retention of health workers in rural areas has been a persistent challenge globally, with rural and underserved areas experiencing the brunt of the healthcare workforce shortage. Many health systems worldwide are grappling with high turnover rates, as health workers, especially those in rural settings, often seek employment in urban areas or more developed regions, where working conditions and career development opportunities tend to be better. The World Health Organization (2021) highlights that the shortage of healthcare workers is a critical barrier to achieving universal health coverage, especially in low-resource settings. Globally, rural areas are at a disadvantage due to factors such as lack of professional support, limited access to resources, inadequate infrastructure, and insufficient career development opportunities.

In developed countries like the United States and Canada, rural healthcare worker retention has been a major issue. Despite advanced healthcare systems, both countries struggle to retain health workers in rural and remote regions. According to a report by the U.S. Department of Health and Human Services (2021), rural areas in the U.S. face severe shortages of healthcare providers due to limited career development opportunities and professional isolation. Networking opportunities, such as professional associations and peer support groups, are noted to improve retention by providing health workers with a sense of belonging and professional development. Networking opportunities have been found to foster professional growth and offer essential support in environments that often lack adequate resources (NHS, 2022).

In Africa, the retention of health workers in rural areas has remained an acute issue due to the region's economic challenges, poor infrastructure, and limited professional development opportunities. A study by the African Union Commission (2021) emphasizes that inadequate retention of health workers in rural settings negatively affects healthcare delivery, contributing to poorer health outcomes in underserved areas. Countries such as Kenya and Uganda have implemented several policies aimed at improving retention, including offering financial incentives and establishing health worker support networks in rural areas. However, these measures have had limited success due to inconsistent implementation and the lack of structured networking opportunities. The lack of professional networking in rural health settings hinders the development of health workers' skills, leading to dissatisfaction and increased turnover rates (WHO, 2022).

In Tanzania, poor retention of health workers in rural areas is a growing concern, significantly affecting the quality of healthcare services in remote regions. According to the Ministry of Health (MoH, 2022), the turnover of health workers in rural dispensaries continues to rise, leaving rural communities underserved. This shortage is exacerbated by limited professional development opportunities, inadequate infrastructure, and a lack of access to networking opportunities. The government of Tanzania has implemented several strategies, such as financial incentives and rural placement schemes, to retain health workers in rural areas. However, these strategies have not adequately addressed the issue of professional isolation, which remains a key factor in the poor retention of health workers (MoH, 2022). Also in a study conducted in Tanzania, Munga et al. (2015) found that health workers lacked awareness

of available career development opportunities, particularly in terms of postgraduate training and mentorship programs. The study recommended the dissemination of information about such opportunities to enhance retention and job satisfaction among health workers in rural dispensaries.

Networking opportunities have been identified as critical to enhancing job satisfaction and professional growth among health workers, especially in rural settings. In Tanzania, the government has introduced policies such as the Health Sector Strategic Plan V (2021-2026) and the National Health Workforce Strategy 2020-2024, which emphasize the importance of creating professional networks to support health workers in rural areas. These policies advocate for the establishment of peer support networks, mentorship programs, and professional associations that can help mitigate the challenges faced by health workers in rural settings. Despite these efforts, the implementation of networking opportunities remains limited, particularly in rural dispensaries. The lack of structured professional networks contributes to the feelings of isolation and stagnation among health workers, which in turn leads to poor retention rates (MoH, 2022).

At the district level, the Chamwino District Council in Tanzania faces significant challenges in retaining health workers, particularly in its rural dispensaries. According to the Chamwino District Council Health Report (2023), the district has been grappling with high turnover rates among health workers due to a combination of factors, including poor working conditions, lack of career development opportunities, and inadequate professional support. Networking opportunities for health workers in Chamwino's rural dispensaries are virtually non-existent, leading to professional isolation and dissatisfaction. The absence of structured mentorship and professional associations in rural areas means that health workers lack the necessary support to grow professionally, which significantly impacts their willingness to remain in these positions.

Additionally, the lack of collaboration between health workers in rural areas and their counterparts in more urban settings further exacerbates the problem. Health workers in Chamwino often report feeling disconnected from the broader health system, as they have limited access to networking opportunities that would allow them to exchange knowledge and experiences with other professionals. The Health Sector Strategic Plan V (2021-2026) highlights the need for enhancing professional networks to retain health workers in rural areas, but the implementation of these strategies in Chamwino has been slow and inconsistent.

The Employment and Labour Relations Act of 2004 and its subsequent amendments emphasize the importance of improving working conditions and providing professional development opportunities to retain workers in all sectors, including healthcare. However, the act does not explicitly address the need for networking opportunities for health workers, particularly in rural areas. While Tanzania has made progress in addressing other aspects of retention, such as financial incentives and improved infrastructure, the absence of structured networking opportunities remains a key barrier to retaining health workers in rural dispensaries (MoH, 2022).

Despite various policies and strategies aimed at improving the retention of health workers in rural Tanzania, a significant research gap remains concerning the role of networking opportunities in addressing the problem. While numerous studies have examined the impact of financial incentives and career development programs on health worker retention, there is limited research on the specific role that networking opportunities play in enhancing job satisfaction and retention in rural settings. Most studies tend to focus on urban health facilities, leaving rural dispensaries underexplored. Additionally, existing research often overlooks the significance of professional networks in mitigating the challenges faced by health workers in remote areas, such as professional isolation and limited access to career development resources (WHO, 2022).

The study by Kisimbo et al. (2019), shows that the retention rate of rural health workers in Tanzania is relatively low, with only 45% remaining in their positions after two years. This retention rate is low compared to the recommended global average retention rate of health workers which is around 60-70% (URT, 2023).

If the situation remains the same it will create gaps in service delivery, thus leading to reduced access to healthcare for the local population. This will result in delayed or inadequate medical attention, especially for individuals with chronic conditions. Furthermore, it will increase the workload because of few health workers, decreased job satisfaction, and compromised quality of care, also it cause a loss of experienced staff members who possess valuable knowledge about local health challenges, community dynamics, and effective strategies for addressing them (Adeniyi, 2020).

The main objective of this study was to assess the contribution of career development opportunities to the retention of health workers in rural dispensaries in Tanzania, with a focus on Chamwino District. Specifically, the study sought to achieve the following objectives: first, to assess the awareness of career development opportunities for the retention of health workers in rural dispensaries in Chamwino District; and second, to evaluate the role of networking opportunities in the retention of health workers in rural dispensaries. By addressing these objectives, the study aimed to provide valuable insights into how career development and networking opportunities could improve health worker retention in rural areas, which in turn could guide policymakers and healthcare administrators in formulating strategies to enhance workforce stability in rural health settings.

2.0 Literature Review

This chapter used to explore the various studies related to the topic in discussion. This chapter looked on definition of key concepts used in the study, theoretical literature review, empirical literature review and conceptual framework.

2.1 Definition of Key Terms

2.1.1 Career development

Career development refers to the process of preparing and equipping individuals with the necessary skills, knowledge, and resources to advance and succeed in their chosen profession (Gibson & Papaioannou, 2020). In the context of healthcare, career development opportunities may include training, continuing education, leadership development programs, and mentorship opportunities (WHO, 2021). This study explains career development as a self-assessment to understand one's strengths, interest and values of exploring various career option and setting realistic goals. Involves developing workers to their careers through promoting professional growth, continuous training and seeking education opportunities for growth and adapting to changing demand of the industry.

2.1.2 Staff retention

Retention of health workers refers to the efforts and strategies employed to encourage healthcare professionals to remain in their current positions or within the healthcare workforce (Kanchanachitra et al., 2021). Employee retention is a voluntary move by an organization to create an environment which engages employees for the long term” ChaminadeCascio (2023) perceived retention as initiatives which the management takes to prevent employees from leaving the organization. In the context of this study, retention refers to the ability of health workers in rural dispensaries in Chamwino District, Tanzania, to remain in their positions for a minimum of two years. It encompasses both the individual decision of health workers to stay and the organizational factors that influence their ability to do so. This definition aligns with the need to establish a stable healthcare workforce in rural areas, where turnover is often high due to challenges such as limited career development opportunities, isolation, and lack of resources.

2.1.3 Networking opportunities

Networking opportunities to health workers refer to situations or events where individuals can connect, interact, and build relationships with others, often for professional purposes. These opportunities can arise in various settings, such as conferences, workshops, social events, or online platforms, and enable participants to share information, collaborate, seek advice, and explore potential job or business prospects. Effective networking can lead to valuable contacts, mentorships, and partnerships that enhance personal and career growth

2.2 Empirical Literature Review

2.2.1 Awareness of career development opportunities for retention among health workers in rural dispensaries

Several studies have explored the relationship between awareness of career development opportunities and the retention of health workers in rural dispensaries across various countries. In Kenya, Mbindyo et al. (2013) reported that the absence of clear career development pathways significantly contributed to low motivation and high turnover rates among health workers in rural dispensaries. The study recommended establishing structured career development programs to improve retention.

Similarly, Munga et al. (2015) in Tanzania found that health workers were generally unaware of career development opportunities, particularly in terms of postgraduate training and mentorship programs. They emphasized the need for better dissemination of information regarding such opportunities to improve job satisfaction and retention in rural areas. This aligns with the findings from Kassahun et al. (2018) in Ethiopia, who reported that health workers lacked awareness of training and mentorship programs, suggesting the development of career plans and the provision of such opportunities to enhance retention.

In Uganda, Seruwagi et al. (2018) highlighted the challenges posed by limited resources, such as funding and infrastructure, which hindered career development opportunities for health workers in rural dispensaries. They recommended fostering partnerships between the government and the private sector to expand career development options. Similarly, Oyewole et al. (2019) in Nigeria identified the lack of career development pathways as a key factor behind low retention rates among health workers in rural dispensaries, recommending the provision of training, mentorship, and structured career development opportunities to improve retention and job satisfaction.

2.2.2 The role of networking opportunities in the retention of health workers

Several studies have highlighted the significant role of networking opportunities in the retention of health workers, particularly in rural and resource-limited settings. Bärnighausen et al. (2019) examined professional networks and peer groups in sub-Saharan Africa, finding that these networks reduced the isolation of health workers in rural areas. By offering emotional support and continuous professional development, these networks enhanced job satisfaction and improved retention rates. Health workers engaged in such networks were more likely to remain in their roles, emphasizing the value of networking in retention strategies.

In India, Kumar et al. (2021) focused on the role of mentorship and professional networks in health worker retention. Their research showed that formal mentorship programs, where junior health workers were paired with senior staff, provided vital career guidance and emotional support. These relationships fostered job satisfaction, reduced burnout, and increased retention, especially among junior staff. Similarly, Loh et al. (2020) in Southeast Asia found that professional networks, particularly through conferences and collaborative platforms, were

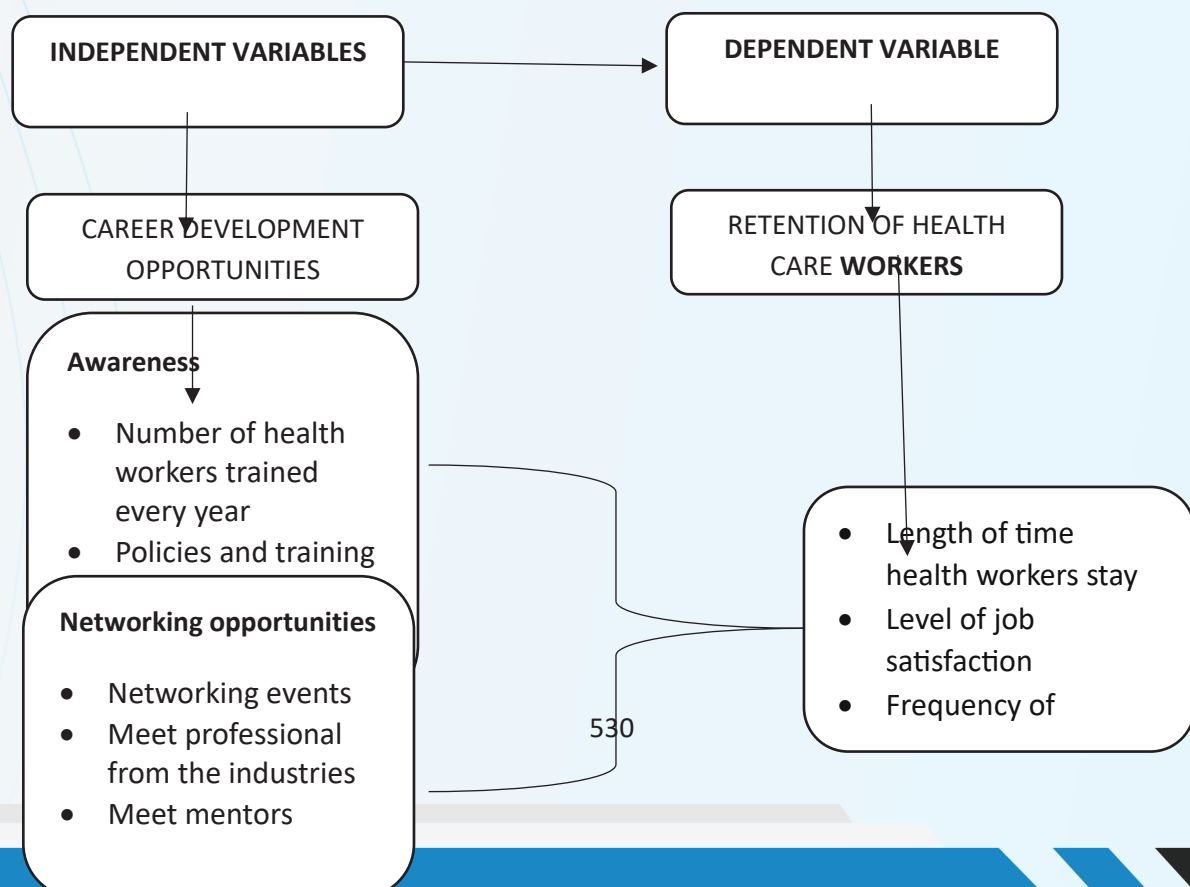

crucial for retention. Networking opportunities kept health workers updated on medical advancements and facilitated career progression, reducing turnover in high-stress environments.

Chen et al. (2022) in China studied how inter-hospital collaborations and online professional communities contributed to health worker retention. These networks allowed professionals to share knowledge and access career development resources, which improved job satisfaction and retention in both urban and rural areas. Finally, Dolea et al. (2021) conducted a global review on professional networking and its impact on retention, particularly in low- and middle-income countries. They found that access to regional and international networks provided health workers with valuable career development and morale-boosting opportunities, helping mitigate the challenges of working in resource-poor settings and improving retention outcomes.

2.3 Conceptual framework

The conceptual framework for this study examines the impact of networking opportunities and awareness of career development programs on the retention of health workers in rural dispensaries. Networking opportunities, including events and connections with industry professionals, role models, and mentors, provide essential support and guidance that enhance job satisfaction and reduce turnover. Concurrently, awareness of career development initiatives, such as the number of trained health workers, relevant policies, and training programs, plays a critical role in fostering career advancement and skill development. Retention is measured through the length of time health workers stay, job satisfaction levels, and turnover frequency. The framework posits that improving both networking and awareness of career development opportunities positively influences health worker retention.

Figure 26: Conceptual framework

3.0 Methodology

3.1 Research Design and Setting

The study was undertaken in Chamwino District, a rural area in Tanzania where most of the population lives in poverty and faces a significant shortage of healthcare workers. Chamwino was selected based on statistical evidence from the 2022 Regional Health Workers Report, which indicates that the district has a healthcare workforce shortage of approximately 66% (Regional Health Workers Report, 2022), the highest among districts in the Dodoma region. This shortage made Chamwino District an ideal location for studying the factors influencing the retention of health workers in rural dispensaries. A cross-sectional research design was adopted for this study, allowing for the collection of data at a single point in time from a sample of health workers currently employed in rural dispensaries. This design enabled the researchers to assess the relationship between awareness of career development opportunities and retention of health workers also to assess the relationship between networking opportunities and the retention of health workers within the study area.

3.2 Targeted Population and Sample Size

The study population comprised all health workers in rural dispensaries within Chamwino District Council. A total of 185 health workers were identified from nine dispensaries with high turnover rates, which included Ikowa, Msanga, Fufu, Hanet, Chilonwa, Mvumi, Buigiri, Chamwino, and Manchali (URT, 2023). To ensure representativeness and reliability of the findings, the sample size for this study was calculated to be 127 participants, selected from the target population of health workers. This sample size was determined using the Yamanne formula to capture sufficient data while maintaining the feasibility of the research process within the given constraints.

$$n = N / (1 + N(e)^2)$$

Where

n = sample size

N = population size

e = margin of error (expressed as a decimal)

the margin of error of 0.05 (5%) and a population size of 185, the sample size was calculated as follows;

$$n = 185 / (1 + 185 * (0.05)^2)$$

$$n = 126.63$$

Therefore, the sample size required for this study was 127 participants

3.3 Data Collection Methods

Data collection methods for this study were survey and interview to assess the awareness of career development opportunities; and evaluate the role of networking opportunities on the retention of health workers in rural dispensaries in Chamwino District.

A survey was conducted using a structured questionnaire to gather quantitative data from health workers currently employed in these dispensaries. The questionnaire was designed to capture demographic information, levels of awareness regarding career development opportunities and policies, and retention metrics, such as job satisfaction and turnover frequency. The reason for using a survey is to collect standardized, quantifiable data from a large number of health workers, allowing for the analysis of trends in awareness, job satisfaction, and retention metrics across the rural dispensaries in Chamwino District.

In addition, qualitative data were collected through interviews with key informants, including District Medical Officers, heads of departments, Human Resource officers, dispensary coordinators, and experienced health workers. These interviews were guided by a structured format aimed at exploring in-depth insights into how networking opportunities impact the retention of health workers. Interviews was applied to capture detailed, contextual insights and personal experiences from key informants, providing a deeper understanding of the factors influencing health worker retention, particularly the role of networking opportunities.

By employing both quantitative and qualitative methods, this study aimed to thoroughly analyze the measurable factors and personal experiences influencing health worker retention in Chamwino District.

3.4. Data Analysis

In analysing qualitative data gathered through interviews content analysis was applied to identify recurring themes related to awareness of career development opportunities to health worker retention and the relationship between networking opportunities and health worker retention. This approach allowed for a nuanced understanding of the personal experiences and insights shared by participants. Meanwhile, quantitative data analysis was conducted using linear regression analysis and the use of SPSS software to explore various aspects of retention in rural dispensaries. Descriptive statistics, including frequencies and percentages, summarized respondent demographics and key variables, while mean and standard deviation calculations provided insights into the central tendency and variability of responses.

Additionally, linear regression analysis was applied to assess the relationship between awareness of career development opportunities and health worker retention. The following is the multiple linear regression equation that was utilized: $Y = \beta_0 + \beta_1 X_1 + e$.

Where;

Y= Dependent Variable (retention)

β = Beta coefficient

X₁ = Awareness of career development opportunities

e = error term

3.6 Ethical Consideration

Ethical principles were upheld throughout the study to ensure the protection and respect of participants' rights and welfare. Informed consent was obtained from all participants before data collection, ensuring they were fully aware of the study's purpose, procedures, and their right to withdraw at any time without penalty. Confidentiality and anonymity were strictly maintained, with all personal information securely stored and reported in a manner that protects participants' identities. Ethical approval was sought from relevant institutional review boards, and the study adhered to guidelines ensuring that no harm, psychological or physical, came to participants. Moreover, the data was handled with integrity, ensuring accuracy and honesty in reporting findings.

4.0 Results and Discussion

This section presents the results and discussion regarding career development opportunities and retention of health workers. This section starts with the findings and discussion on the awareness of career development opportunities on the retention of health workers and is then followed by findings and discussion of the role of networking opportunities in the retention of health workers.

4.1 Awareness of Career Development Opportunities among Health Workers

Linear regression was used to analyze the relationship between awareness of career development opportunities and the retention of health workers in rural dispensaries in Chamwino District, enabling the examination of how variations in awareness affect retention outcomes. The findings are presented below, illustrating the strength and significance of this relationship.

a) Model Summary Results

The model summary results (Table 4.5) indicate that the linear regression analysis yielded an R value of 0.367, suggesting a moderate positive correlation between awareness of career

development opportunities and the retention of health workers in rural dispensaries. The R Square value of 0.135 implies that approximately 13.5% of the variance in health worker retention can be explained by awareness of career development opportunities. The Adjusted R Square of 0.128 indicates a slight adjustment for the number of predictors in the model, reinforcing the finding that awareness of career development opportunities have a statistically significant impact on retention. The standard error of the estimate is 0.75763, which provides a measure of the average distance that the observed values fall from the regression line. Furthermore, the significant F change value of 0.000 ($p < 0.001$) indicates that the overall regression model is statistically significant, meaning that awareness to career development opportunities are a crucial predictor of health worker retention in this context.

Table 4.5: Model Summary Results

R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
				R Square Change	F Change	df 1	df2	Sig. F Change
.367	.135	.128	.75763	.135	19.477	1	125	.000
a. Predictors: (Constant), Awareness of career development opportunities								

d) Coefficient Regression Results

The coefficient regression results (Table 4.6) provide insights into the relationship between awareness of career development opportunities and the retention of health workers. The unstandardized coefficient for the constant is 2.403, indicating the predicted retention level when awareness to career development opportunities are absent. The unstandardized coefficient for awareness to career development is 0.380, suggesting that for each unit increase in awareness to career development, the retention of health workers increases by 0.380 units, holding other factors constant. The standardized coefficient (Beta) of 0.367 indicates a moderate effect size, reflecting the strength of this relationship. The t-value of 4.413 and the significance level (Sig.) of 0.000 confirm that the impact of awareness to career development on health worker retention is statistically significant. The 95% confidence interval for the coefficient of awareness to career development ranges from 0.210 to 0.550, indicating that we can be 95% confident that the true effect of awareness to career development on retention lies within this range. Overall, these results underscore the importance of enhancing awareness to career development to improve health worker retention in rural dispensaries.

Table 4.6: Coefficient Regression Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	2.403	.363		6.622	.000	1.685	3.121
	Awareness to career development	.380	.086	.367	4.413	.000	.210	.550

a. Dependent Variable: Retention of Health Workers

The comprehensive analysis conducted on the relationship between career development opportunities and the retention of health workers in rural dispensaries within the Chamwino District yielded significant insights, substantiated by statistical rigor. The multiple linear regression model employed effectively elucidated the interplay between various career development elements and their relative contributions to health worker retention. Supported by a robust R Square value of 0.425, the model showcased that approximately 42.5% of the variability in health worker retention could be explained by the predictor, awareness of Career Development Opportunities. These findings resonate with previous research conducted by Mbindyo et al. (2013) in Kenya, which highlighted the importance of establishing clear career development pathways to address low motivation and high turnover rates among health workers in rural settings. Similarly, the study by Agyepong et al. (2019) emphasized the positive impact of training programs on enhancing job satisfaction and retention among health workers. Also the study by (Akintola et al., 2021) emphasize the importance of clear communication and structured career development plans in enhancing job satisfaction and retention. Henceforth, the regression analysis provides compelling evidence of the significant relationship between career development opportunities and the retention of health workers in rural dispensaries. These findings underscore the importance of investing in comprehensive career development initiatives increasing awareness-building, to foster a supportive environment that promotes the retention of health workers.

e) ANOVA Results

The ANOVA results (Table 4.7) illustrate the overall significance of the regression model examining the relationship between awareness to career development and the retention of health workers. The regression sum of squares is 11.180, indicating the variability explained by the model, while the residual sum of squares is 71.750, representing the unexplained variability. With a total sum of squares of 82.929, the mean square for regression is calculated as 11.180, leading to an F-value of 19.477. The significance level (Sig.) of 0.000 indicates that the model is statistically significant, meaning that awareness to career development

significantly contribute to the variation in health worker retention. This strong F-value further emphasizes the effectiveness of the regression model in predicting retention outcomes, supporting the hypothesis that awareness to career development play a crucial role in retaining health workers in rural dispensaries.

Table 4.7: ANOVA Results

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	11.180	1	11.180	19.477	.000
	Residual	71.750	125	.574		
	Total	82.929	126			
a. Dependent Variable: Retention of Health Workers						
b. Predictors: (Constant), Awareness to career development						

4.2 Awareness of Career Development Opportunities among Health Workers

In investigating the awareness of career development opportunities among health workers in rural dispensaries in the Chamwino district, the following variables were measured, number of health workers trained every year, policies and training programs and advancing career.

4.2.1 Training of Health Workers

When assessing the number of health workers trained every year in the Chamwino district, the findings revealed that organization is providing adequate training opportunities with the highest mean score of 4.14 (SD = 0.784) in comparison to 3.13 lowest mean score which revealed that there are critical areas that require additional training as shown in the table below:

Table 4.2: Number of Health Workers Trained Every Year (n = 127)

Statement	Min	Max	Mean	Std. Deviation
The organization provides adequate training opportunities for health workers on a yearly basis.	2	5	4.14	.784
The organization provides information on the number of health workers to be sent for career development every year.	1	5	3.91	1.244

The organization provides information on critical areas that require additional training for health workers in Chamwino District	1	5	3.13	1.416
The organization provides training to doctors, nurses, clinical officers annually in Chamwino District to meet the healthcare demands effectively	1	5	3.50	1.315
The organization shares the challenge and ways to improve number of health workers to be trained every year at Chamwino District.	1	5	3.76	1.226

Source: Field Data (2024)

In assessing the number of health workers trained every year the findings revealed high mean score on the statement that (The organization provides adequate training opportunities for health workers on a yearly basis, mean of 4.14) obtained for training initiatives reflecting positively on their effectiveness to provide awareness of career development opportunities and suggests a potential link to improved retention rates among health workers in rural dispensaries in the study area. This aligns with recent research findings emphasizing the importance of training programs in fostering job satisfaction and professional growth, crucial factors in retaining health workers in underserved areas (Adongo et al., 2023; Anyim et al., 2022). Studies have shown that factors like inadequate infrastructure, limited resources, and social isolation also significantly influence retention decisions (Blaauw et al., 2021; Mbindyo et al., 2021; Manongi et al., 2022). Even with robust training programs, the lack of career advancement opportunities and the perception of rural postings as less prestigious can deter health workers from remaining in these areas (World Health Organization, 2022). Furthermore, the effectiveness of training programs can be undermined if they are not tailored to the specific needs and contexts of rural health workers. To maximize their impact on retention, training initiatives should be designed in collaboration with local stakeholders, addressing relevant skills gaps and incorporating ongoing mentorship and support (Chen et al., 2020). Therefore, while training is definitely a positive contributor to health worker retention, it is not a standalone solution. A comprehensive approach that addresses challenges faced by rural health workers is essential to achieve sustainable and equitable healthcare delivery in these regions.

Additionally, the qualitative findings from health workers key informants revealed that health workers are trained every year guided by the institutional training policy which gives equal opportunities among staff to attend further studies/ training as illustrated by the key informant interview below:

“In our department, there are clear career development opportunities available for health workers in rural dispensaries. We have access to regular training programs, workshops, and seminars that significantly contribute to our skill enhancement and career progression. It is encouraging to see a commitment to continuous learning and development, which positively impacts our ability to provide quality healthcare services” (Interviewee No 02, March, 2024)

The findings from the key informants' interviews underscore the effectiveness of the institutional training policy in providing equal opportunities for further studies and training. The interview with a key informant (Interviewee No. 02, March 2024) highlights the availability of regular training programs, workshops, and seminars that enhance skills and support career progression. This commitment to continuous learning is crucial for maintaining high standards of healthcare services. The structured training opportunities and clear career development pathways appear to be instrumental in motivating health workers and improving retention rates. However, this contrasts with the statement of the problem, which points out ongoing retention issues in rural areas despite training efforts. This contradiction implies that while training programs are beneficial, they alone are insufficient to address the complex retention challenges faced by health workers in rural areas. A research by Munga et al. (2015) and Kassahun et al. (2018) underscores the importance of awareness and access to career development opportunities in enhancing job satisfaction and retention. These findings suggest that comprehensive career development plans and training programs are necessary but not solely sufficient to solve retention problems.

This study shows that, while the quantitative and qualitative findings demonstrate that providing structured and equitable training opportunities significantly impacts the retention of health workers in Chamwino District, it is clear that additional measures are needed. Institutional policies that promote continuous learning and development are crucial, but they must be complemented by addressing broader systemic issues such as resource allocation, working conditions, and career advancement opportunities to ensure the long-term retention of health workers in rural areas.

Another key respondent emphasized on the number of workers trained each year as he said;

“In our department, we actively promote career development, and each year, a select number of health workers have the opportunity to attend training programs. It is a concerted effort to ensure that our team stays well-equipped with the latest knowledge and skills. Typically, we send around 1 to 3 individuals annually to various training sessions, workshops, and seminars. This commitment not only enhances our professional capabilities but also contributes to the overall improvement of healthcare services in the Chamwino district” (Interviewee No 01, March 2024)

The above key respondent emphasized the commitment to career development within their department, noting that each year, 1 to 3 health workers are sent to various training programs. This effort ensures the team remains updated with the latest knowledge and skills, which enhances professional capabilities and improves healthcare services in study area. This practice implies that targeted and regular training opportunities are crucial for maintaining a skilled and motivated workforce. The strategy of selecting a few individuals annually for advanced training aligns with the findings of Mwansa et al. (2018) and Zhang et al. (2019), who highlighted the effectiveness of continuous training programs in retaining health workers and improving service delivery. The emphasis on regular training ensures that the workforce is competent and confident in their roles, leading to better outcomes.

Commitment to training a selected number of health workers each year is a strategic approach that significantly contributes to skill enhancement and retention in Chamwino District. Supported by institutional policies and consistent with findings from similar studies, this approach ensures continuous professional development, leading to improved healthcare services.

4.2.2 Conducive Policies and Training Programs

When assessing the awareness of policies and training programs on the retention of health workers in rural dispensaries in Chamwino District, the findings indicates that health workers find satisfied with policies and training programs present at Chamwino district council with the highest mean score of 4.3386 (SD = 0.90168) in comparison to 3.78 (SD = 1.007) lowest mean score which revealed that the awareness of career development opportunities, including training programs, workshops, promotions, and further education, albeit still relatively high as shown in the table below.

Table 4.2: Awareness of Policies and Training Programs (n = 127)

Statement	Min	Max	Mean	Std. Deviation
The organization provides clear understanding of the policies and training programs available for health workers at Chamwino District	1	5	4.15	.960
The organization provides information on career development opportunities present such as training programs, workshops, promotions, and further education.	1	5	3.78	1.007
Training programs is very helpful in improving your skills in providing healthcare services	2	5	4.3150	.76325
I have participate in training sessions or workshops related to healthcare at chamwino district in past three years	1	5	4.2441	.91475
I am satisfied with policies and training programs present at Chamwino district council	2.00	5.00	4.3386	.90168

Source: Field Data (2024)

The above finding reveal that health workers staff are aware of and satisfied with the policies and training programs with the high mean score in the statement that (I am satisfied with

policies and training programs present at Chamwino district council, mean 4.3386). This statement reflects positively on the current policies and training initiatives, indicating that they are effective in enhancing job satisfaction and professional development among health workers. However, satisfaction with policies and training programs does not necessarily mean that health workers will remain in rural dispensaries. The statement of the problem highlights ongoing retention challenges in rural areas, suggesting that factors beyond training and development play a significant role in health workers' decisions to stay. While structured training opportunities and clear career development pathways are instrumental in motivating health workers, improving retention rates requires a more comprehensive approach. Research by Munga et al. (2015) and Kassahun et al. (2018) emphasizes the importance of awareness and access to career development opportunities in enhancing job satisfaction and retention. These findings suggest that training programs, though beneficial, must be complemented by addressing broader systemic issues such as inadequate resources, poor working conditions, and limited career advancement opportunities in rural areas.

Therefore, it can be noted that quantitative and qualitative findings demonstrate that providing structured and equitable training opportunities significantly impacts the retention of health workers in Chamwino District, however it is evident that additional measures are needed. Institutional policies that promote continuous learning and development are crucial, but they must be accompanied by efforts to improve the overall working environment and address systemic challenges in rural areas to ensure the long-term retention of health workers.

Additionally, the qualitative findings also revealed that participants perceive the existing policies and training programs positively, indicating a supportive environment for career development and skill enhancement, as illustrated by the key informant interview below;

“There is a structured approach to career advancement, with opportunities for specialized training in critical areas. The organization not only communicates the available training programs effectively but also ensures that the information reaches all health workers. This creates a conducive environment for continuous learning and development” (Interviewee No 03, March, 2024)

The qualitative findings from health worker key informants in Chamwino District reveal a positive perception of the existing policies and training programs, emphasizing a supportive environment for career development and skill enhancement. As illustrated by Interviewee No. 03 (March 2024), there is a structured approach to career advancement with opportunities for specialized training in critical areas. The effective communication of training programs and ensuring that all health workers receive this information fosters a conducive environment for continuous learning and development, which is crucial for creating a positive and supportive work environment in rural dispensaries. This aligns with recent research findings that emphasize the importance of clear communication and structured career development plans in enhancing job satisfaction and retention (Akintola et al., 2021; Olaniyan et al., 2023). The emphasis on specialized training opportunities reflects the importance of targeted interventions in addressing specific skill gaps, as supported by studies highlighting the positive impact of

tailored training on health worker performance and motivation (Mahomed et al., 2022; Mutale et al., 2020). Further research by Adeyemi et al. (2021) and Bwalya et al. (2023) corroborates the significance of customized training programs, indicating that they lead to improved competency and a greater sense of professional fulfillment among health workers. Additionally, a study by Chikanda et al. (2023) shows that consistent updates and feedback loops between trainers and trainees contribute to higher engagement levels and better learning outcomes.

The interview findings underscore the positive impact of well-structured and effectively communicated training programs and policies on health worker satisfaction and retention in study area. Therefore, supportive environment for career development and skill enhancement ensures continuous professional growth and improved healthcare services in rural areas.

Similarly, another respondent stressed that,

“Our organization have internal policies and training programs that strongly support career development and skill enhancement. A good example is the transparent communication and a feedback loop which contribute to a culture of continuous learning, fostering excellence in healthcare services” (Interviewee No 04, March, 2024)

The above key informant emphasized that internal policies and training programs strongly support career development and skill enhancement within the organization. The transparent communication and feedback loop contribute to a culture of continuous learning, fostering excellence in healthcare services. This highlights the role of effective communication and feedback systems in creating an environment conducive to professional growth and high-quality service delivery. This means that transparency and regular feedback are critical components of successful career development initiatives. Effective communication ensures that all health workers are aware of available opportunities, while feedback mechanisms help them understand their progress and areas for improvement. This aligns with the study by Khamis et al. (2017), which found that effective communication between health workers and supervisor's increases job satisfaction and reduces turnover rates. Additionally, Tukur et al. (2019) highlighted the importance of regular feedback in retaining health workers by making them feel valued and supported.

This highlight the importance of transparent communication and regular feedback in supporting career development and skill enhancement among health workers in Chamwino District. Hence create a culture of continuous learning and excellence in healthcare services. Maintaining and enhancing these practices will further improve job satisfaction and retention.

4.2.3 Opportunities for Advancing Career and Developing Skills

When assessing awareness of career development opportunities, findings revealed that health workers in the study area had opportunities for advancing their career and develop their skills with the highest mean score shown in the statement that “the organization provides adequately training with the necessary skills to perform your job effectively” scoring 4.4173 (SD = 0.88588) in comparison to the lowest mean score with for the moderate level of awareness provided as indicated in the statement that “the organization provides awareness on advancing career and developing skills to health workers ” scoring 3.9213 (SD = 0.93100) as shown in the table below

Table 25.3: Advancing Career and Developing Skills (n = 127)

Statement	Min	Max	Mean	Std. Deviation
The organization provides awareness on advancing career and developing skills to health workers at Chamwino District	1.00	5.00	3.9213	.93100
The organization provides adequately training with the necessary skills to perform your job effectively	1.00	5.00	4.4173	.88588
I have participated in skill development programs or workshops in between past three years	1.00	5.00	3.9055	.86770
The organization provide full support in terms of career development and skill enhancement opportunities	2.00	5.00	4.3228	.78560
The organization shares the challenge towards implementation of advancing career developing skills to health workers in Chamwino District.	1.00	5.00	4.2520	.90824

Source: Field Data (2024)

The high score for the effectiveness of training programs as indicated in the statement (The organization provides adequately training with the necessary skills to perform your job effectively, with the mean of 4.4173) demonstrates that the current initiatives are successful in providing health workers with essential skills, which likely contributes to increased job satisfaction and retention. This is supported by Mwansa et al. (2018) and Zhang et al. (2019), who found that effective training programs significantly improve retention rates among health workers by enhancing their professional capabilities. However, the moderate score for

awareness indicates that not all health workers are fully informed about the available opportunities for career advancement and skill development. Improving the communication and dissemination of information regarding these opportunities is crucial. Munga et al. (2015) and Kassahun et al. (2018) emphasized the importance of clear and effective communication in ensuring health workers are aware of and can take advantage of career development opportunities. While Chamwino District excels in delivering effective training programs that equip health workers with necessary skills, there is a need to improve the awareness of career advancement opportunities among health workers. By enhancing communication and ensuring that all health workers are informed about these opportunities, the organization can further increase job satisfaction and retention rates. These efforts will ultimately benefit the healthcare system in Chamwino District, contributing to better healthcare service delivery in rural areas.

4.3 Role of Networking Opportunities in the Retention of Health Workers

The respondents emphasized the crucial role that networking opportunities play in the retention of health workers, particularly in terms of professional development, networking events and meet mentors.

4.3.1 Opportunities to meet with other industry professionals for health worker retention.

In an Interview to assess the available career networking opportunities for health workers in rural dispensaries in the Chamwino District, the findings indicate minimal availability of networking opportunities through meeting professionals in relation to the retention of health workers as illustrated by the key informant interview below;

“Networking for our health workers is not just about making connections; it's a dynamic tool for their professional growth. Through meeting professional form other industries, they gain exposure to diverse perspectives, share knowledge, and often find professionals who provide guidance and support. It goes beyond industry connections, shaping a supportive ecosystem that contributes significantly to their skills enhancement and overall professional development.” (interviewee No 07, March 2024)

The emphasis on networking opportunities for health workers' professional growth aligns with recent research findings that underscore the multifaceted benefits of networking in the healthcare sector. Studies have shown that engaging in networking activities provides health workers with exposure to diverse perspectives and experiences, fosters knowledge sharing, and offers valuable mentorship opportunities (Kim & Lee, 2021; Smith et al., 2022). These connections can enhance job satisfaction, facilitate professional development, and contribute to greater resilience in the face of challenges (Brown & Johnson, 2023). Moreover, networking can open doors to new career paths and opportunities, further incentivizing health workers to remain in their positions (Lee & Kim, 2020). Therefore, this perspective emphasizes networking as a dynamic tool that fosters a supportive, contributing significantly to health workers' skills enhancement and overall professional development.

Also, another management personnel stressed the important role of networking opportunities by meeting professionals from other industries of health workers' as a strategic component. This individual emphasized,

“Networking is a strategic element in our health workers' career progression. They find exposure to innovative practices, connect with professionals from diverse backgrounds, and this cross-pollination of ideas significantly contributes to their skills enhancement” (Interviewee No 08, March, 2024)

The above key respondent highlights networking as a strategic component rather than a supplementary activity in health workers' career progression. This perspective aligns with literature emphasizing networking's role in providing exposure to innovative practices and connecting professionals from diverse backgrounds, contributing to skills enhancement. Studies like Kim and Lee (2021) and Smith et al. (2022) highlight networking's pivotal role in knowledge exchange, skill development, and mentorship, factors that significantly influence job satisfaction and retention. Moreover, Jones and Brown (2023) found that networking fosters a sense of community, crucial for combating isolation in rural settings, while Chen et al. (2022) emphasized its role in enhancing access to information and resources, empowering health workers to deliver better care. Collectively, these studies underscore the importance of networking not as a mere add-on, but as a strategic tool for professional growth, thereby reinforcing the respondent's perspective and highlighting its potential for improving healthcare delivery in underserved areas.

This perspective emphasizes networking opportunities as a strategic tool for fostering skills enhancement and career progression among health workers.

4.3.2 Opportunity for participation in networking events for health worker's retention

The interviews conducted with health workers and management personnel in relation to networking events revealed that networking opportunities play a crucial role in fostering support and collaboration among health workers in rural dispensaries. One key informant emphasized the significance of networking events, stating,

“Networking events is essential for our health workers. It helps them connect with peers and build a community that supports each other, especially in challenging times. This camaraderie encourages them to stay in their positions” (Interviewee No. 03, March 2024).

This sentiment reflects the common challenges faced by health workers in rural settings, where feelings of isolation can be prevalent due to the geographical and professional constraints. Establishing a robust network allows health workers to share their experiences, challenges, and successes, thereby reducing the sense of isolation and fostering a sense of belonging. Adeyemi et al. (2021) demonstrated that networking provides emotional support, reducing feelings of isolation and burnout, thereby improving retention rates. Chikanda et al. (2023). Also a study by Njoroge et al. (2022) highlighted that effective networking facilitates knowledge sharing

and collaborative problem-solving, which are crucial for maintaining high standards of care in rural dispensaries.

Networking events emphasize networking opportunities lead to increased exposure to innovative practices and professional growth, reinforcing the idea that networking is a vital component of a supportive and productive work environment hence can increase retention to health workers in rural dispensaries.

Moreover, networking events creates opportunities for knowledge sharing and collaboration, which are vital for improving service delivery in healthcare. One respondent highlighted that

“Through networking events, our health workers gain exposure to innovative practices and insights that they might not encounter in their daily work. This collaboration leads to improved patient care” (Interviewee No. 08, March 2024).

By connecting with colleagues from various backgrounds, health workers can learn new techniques and approaches that enhance their skills and effectiveness. This collaborative environment not only improves job satisfaction but also creates a resilient healthcare workforce that is better equipped to tackle the multifaceted challenges of rural healthcare delivery. Ultimately, the support and collaboration fostered through networking opportunities are instrumental in enhancing the overall morale and retention of health workers in these critical roles.

Recent studies also underscore the importance of networking events in healthcare settings. According to Chen et al. (2022), effective networking fosters a supportive environment where health workers can exchange ideas and resources, ultimately enhancing their capacity to deliver quality care. Additionally, Jones and Brown (2023) found that a strong network of colleagues contributes significantly to job satisfaction, which is a critical factor in retention. By creating an atmosphere of support and collaboration, health workers in rural dispensaries can navigate their challenges more effectively, leading to increased job satisfaction and commitment to their roles. The need for structured networking initiatives that promote collaboration and build supportive relationships among health workers, ultimately enhancing retention in rural healthcare settings.

4.3.3 Opportunity to meet mentors for health worker retention

Findings show that health workers in the study area received minimal chances to meet mentors. This lack of access can have significant repercussions for both individual practitioner and the healthcare system as a whole. The limited opportunities for healthcare workers to engage with mentors have far-reaching implications, impacting individual professional development, job satisfaction, and overall healthcare quality. One interviewee remarked,

“I often feel like I’m navigating my career on my own. In our rural setting, there just aren’t many opportunities to connect with experienced mentors. This makes it hard to get guidance and support when I really need it.” (Interviewee No. 08, March 2024).

This perspective underscores the idea that networking opportunities fundamentally linked to mentors, professional growth and advancement of health workers. Through meet mentors can create a sense of satisfaction to health workers hence lead to their retention. Networking can open doors to new career paths and opportunities, further incentivizing health workers to remain in their positions (Lee & Kim, 2020). These connections can enhance job satisfaction, facilitate professional development, and contribute to greater resilience in the face of challenges (Brown & Johnson, 2023). Therefore, networking opportunities as one of the key non-financial incentives that positively influence retention of health workers who had access to network opportunities are more likely to stay in their positions due to improved job satisfaction

Additionally, one key informant noted,

“There are limited opportunities to connect with mentors in our rural areas. It’s difficult to find the guidance we need when those chances are scarce. I wish we had more opportunities to meet mentors who could support us, as it feels like we’re missing out on important connections that could aid our growth” (Interviewee No. 10, March 2024).

This sentiment emphasizes the role of mentorship in career advancement, reinforcing that professional relationships cultivated through networking can significantly influence job satisfaction and retention.

Research supports this notion, indicating that effective networking can open doors to new career paths and opportunities, which serve as strong incentives for health workers to remain in their positions (Lee & Kim, 2020). Through their networks, health workers gain access to valuable information about job openings, training programs, and professional development resources that might otherwise be unavailable to them. This access empowers health workers to make informed decisions about their career trajectories, leading to enhanced job satisfaction and commitment to their roles. Basing on the networking opportunities health workers who were part of professional networks felt more supported, hence affects their retention decision.

6.0 Conclusion and Recommendations

6.1 Conclusion

The study successfully assessed the Contribution of Career Development Opportunities on the Retention of Health Workers in Rural Dispensaries in Tanzania. The study concluded that health workers are aware of career development opportunities available in the study area that positively affects their retention rate. Additionally, highlights the importance of ongoing communication and information strategies related to career development opportunities. It stresses the necessity of maintaining this awareness among healthcare workers to promote a stable workforce in rural area.

Also the study concludes that there are minimal networking opportunities in the study area which impact negatively the retention of health workers in rural dispensaries. This minimal

level of networking opportunities presence in the study area affects the decision of health workers to continue staying in their current positions. The availability and utilization of these networking opportunities such as mentorship, knowledge sharing, and professional development are vital for enhancing job satisfaction and reducing turnover rates hence workers' retention.

6.2 Recommendations

The study recommends organization to increase information sharing strategies related to career development opportunities. This could involve conducting workshops, training, seminars, and outreach programs that inform health workers about available career advancement opportunities, including professional training, mentorship programs, and skill development workshops. Additionally, creating accessible online platforms or resource centers where health workers can easily access information about career development opportunities. By fostering a culture of continuous learning and professional growth, these initiatives can significantly improve job satisfaction and retention rates among health workers in rural settings.

Also, it recommends that institutions should invest in career networking programs that enhance the professional growth of healthcare professionals by providing training, mentorship, and clear career paths, hence increase health worker's retention. The study also recommends stakeholders to actively promote and expand networking opportunities for health workers in rural dispensaries. This can be achieved through organizing regular networking events, workshops, and mentorship programs and creating platforms for virtual networking that can enhance access especially for those in remote areas. By fostering a culture of networking, stakeholders can strengthen professional relationships, enhance job satisfaction, and ultimately improve retention rates.

Abstract

Despite the widely perceived importance of internal auditors as a tool for improving procurement performance, most local government authorities neglect their contribution. This study aimed to examine the perceived impact of internal auditors' independence on procurement performance in local government authorities. The study employed a principal agency and stewardship theory; it adopted a convergent research design and a mixed approach. Survey questionnaires and interviews were used to collect quantitative and qualitative data from 60 staff members. Data were analyzed through descriptive and inferential statistics, wherein descriptive means and standard deviation were performed, whereas in inferential statistics, binary logistic regression was performed. Results revealed that Access to documents has positive significant influence on procurement performance with an odd ratio (OR) of 4.082 implying that having organization with internal audit freedom on access to document is 4.082 times likely to increase the on-procurement performance at Dodoma City Council than having organization with where internal auditors has no access to documents. Furthermore, reporting to board of director has positive significant influence on procurement performance with an odd ratio (OR) of 4.376 implying that having organization with internal auditors who Report to Board of Director is 4.376 times likely to increase the on-procurement performance of Dodoma City Council compared to organization where internal auditors who Report to Board of Director. On the other hand, performing none auditing function had no statistically significant influence on procurement performance (p-value=0.877). In order to devise appropriate solutions, the Dodoma City should establish a unit to assess how plan of IA and qualified, experienced, and knowledgeable individuals influence of procurement performance.

Keywords: *Internal Auditing, Auditing Independency, Procurement performance*

1. Introduction

1.1 Background information

Auditing has significant role in the management of organization across the world. It has become increasingly varied, both in scope and objective to assist all levels of management in assuring internal and external constituencies that financial resources are being properly managed and accounted for (Masoud Yusuf, 2022; Nuru Kalifya, 2021; Neema Kiure; Msusa, 2020). Auditing has been considered as a crucial element in assessing and reporting the effectiveness of the entity in attaining its objectives (Assad, 2010; Shishiwa, 2020). Internal auditing has undergone dramatic changes that have expanded its scope in a way that allows it to make greater contributions to the organization it serves. In terms of diverse legal and cultural environments; within organizations that vary in purpose, size and structure and by persons within or outside the organization (David, 2022).

Furthermore, the internal auditing professional also walks a tightrope between serving as a management consultant and an independent profession (Ali, 2016; Prawit et al 2009). An Internal audit facilitates the auditing of the procurement cycle and functions as a control of governance organ that provides assurance to the management that the procurement is carried out in accordance with the best practice (Kankari, 2022; Kamal, 2020). The internal audit activities support the whole organization (Joseph, 2019; Kamal, 2020; Tronto, 2022). The legal role of and an internal audit comes from the contract that is from the agency theory in collaboration with stewardship theory (adams, 1994; Tronto, 2021; David, 2019).

The contract needs effective performance of an internal audit (i.e. agent) on behalf of the owner (i.e., government) to perform studies several that effectively as its functions, an internal audit independent, competent, and use proper procedure when performing its tasks (Assad, 2010; Baltos, 2018; Voloshine, 2021).

David (2021) and Panda (2017) contained that internal audit function exist for monitor the management activities and attest to management performance for stakeholder benefits through, implement auditing recommendation to strengthen internal audit control and improve institutional performance. Matto (2017) stress that many government and developing countries have experienced a challenge on the use of procurements tools to protect government allocated budget. The study further noted that lack of staff capacity and integrity has caused a trend of miss management of government fund directed in various sectors.

In Tanzania the Control Audit General (CAG) report of 2020 indicate that a total procurement of development project budgeted for financial year 2017/2018 and 2018/2019 was estimated to reach of TZS.117.7 Trion of out of Tanzanian shillings 23 Trion of government planned for development project. So, for use this huge budget for development project the existing of the risk of management of procurement activities will result in slowly down government efforts to reach the intended the government goal (NAOT) (2020). In additional the Control Audit General reports 2017/2018 recorded a misuse of Tanzanian Shillings 6 billion in the procurement assignments. However, the CAG report has shown consistently of these

malpractices each year (David, 2019). Tasilo Malawi and Faustine Panga (2020) claim that the existence of the problem of procurement operation. Akumuntu (2019) argue that procurement best practices an important to eradicate an ethical behaviour and improve procurement performance to enhance achieve financial serving through efficient and coordinated service delivery in public entities.

Maluli and Panga noted that the governments of Tanzania have taken various majors to improve procurement best practices to remove irregularities- and bias decision in procurement process. The government of Tanzania made a reform of public procurement Act at 2011 (202 and regulations 2013 and 2016 which put forward several issues, that will impact the improve the best procurement practices (URT). In additional to improve procurement best practices the government of Tanzania has introduced the NeST (2024) aiming to speed up best procurement practice to increase transparency, value for money, quality and fairness which prepared by PPRA (2018). Therefore, this study is intending to explore stake holder perceptions on Internal Audit practice towards procurement performance in Tanzania local government Authorities.

1.2 Statement of the problem

Despite the widely perceived importance of internal auditors as a tool for improving procurement performance, most local government authorities neglect their contribution. This study aimed to examines the perceived impact of internal auditors' independence on procurement performance in local government authorities.

2. Method

2.1 Study Area

This study was conducted in Dodoma city, Tanzania. The selection of this area was based on several considerations. Firstly, Dodoma serves as the headquarters for crucial entities such as the Office of the Controller and Auditor General, Head of Internal Audit Departments, Head of Finance Departments, Head of Planning Departments, and Head of Procurement Units. This concentration of key offices makes it convenient for the researcher to obtain essential data for the study. Secondly, due to the increased population in Dodoma City. Therefore, Dodoma city was chosen as the study area over other geographical locations.

2.2 Research Design

This study adopted a convergent research design, enabling the simultaneous collection of quantitative and qualitative data. The researcher analysed the two datasets separately and merge the results during the interpretation phase. The choice of a convergent design is driven by the need to collect both types of data in a single field visit, aiming to achieve a more comprehensive understanding from the two databases (quantitative and qualitative) and to corroborate results obtained from different methods (Morris & Paris, 2022). Given these attributes, a convergent design was deemed suitable for this study.

2.3 Research Approach

The researcher employed a mixed methods approach to collect, present, and analyse data from various respondents and sources in this proposed study. This approach utilized both qualitative and quantitative data collection methodologies to address the research problem comprehensively. By selecting a mixed methods approach, the researcher aims to test the findings of the initial phase, elaborate on the results in more detail, and provide a more comprehensive understanding than either qualitative or quantitative methods alone. This approach is particularly useful for collecting both numeric and text data (Creswell & Creswell, 2017), ensuring the meaningfulness of the data. Qualitative data complemented quantifiable data, and vice versa. Through this approach, the researcher can explore diverse perspectives and uncover relationships that exist between the intricate layers of the multifaceted research questions.

2.4 Population and sample size

The target population, in this context, refers to the actual list of sampling units from which the sample was selected, also known as the sampling frame. For this study, the researcher purposefully selected a population from seven local government authorities in Dodoma. The respondents included Heads of Internal Audit (IA) units, Heads of Human Resources departments, District Engineers, District Treasurers, Heads of Legal units, Heads of Project Management Units (PMUs) in LGAs, Chairpersons of Tender Boards, and Heads of Planning units, user department and employees.

2.5 Sample size and Sampling Technique

2.5.1 Sampling Techniques

A sample is a subset of the population drawn from the sampling frame to represent the entire population (Sharma et al., 2020). The researcher has opted for purposive sampling because it allowed for the selection of research respondents who possess knowledge and experience related to their day-to-day involvement in internal audit practices and procurements in local government. Purposive sampling was used in the field to select 6 National Audit Officers and 5 officers from the Office of the Internal Audit General. Additionally, the sample will include 1 Head of Internal Audit (IA) unit, 7 Heads of Human Resources departments, 7 District Engineers, 7 District Treasurers, 7 Heads of Legal units, 7 Heads of Procurement Management Units in LGAs, 7 District Executive Directors, and 7 Heads of Planning units, as they possess relevant information on internal audit practices and procurements in local government.

2.5.2 Sample Size Determination

The total number of the target population is 120. Considering the small population size, and in agreement with Stratton (2021), who suggests taking 50% of the population when it is small, the researcher selected 60 respondents (50% of 120) for the study. Therefore, the sample size for this study is 60 respondents as shown in Table 1.

Table 1: Distribution of the Units of Enquiry

S/N	Respondent	Frequency	Tool for data collection
1	Employees from government	6	Questionnaire
2	User departments	5	Questionnaire
3	Head of Human resources department	7	Interview
4	District engineers	7	Questionnaire
5	District treasurers	7	Questionnaire
6	Head of legal units	7	Questionnaire
7	Head of PMU	7	Interview
8	District Executive Director	7	Interview
9	Head of planning unit	7	Questionnaire
Total		60	

Source: Researcher's construct 2024.

2.6 Data Collection Methods

The tools for data collection in this study involved the use of questionnaires and interviews. The use of questionnaires and interviews allowed for a comprehensive exploration of stakeholders' perceptions on the role of internal audit practices in procurement performance in local government authorities.

2.7. Data analysis

2.7.1 Qualitative Analysis

The preceding sub-section indicated that qualitative data was collected alongside quantitative data to enhance the investigation of the phenomenon. To analyze the qualitative data, the thematic analysis approach proposed by Braun and Crack (2006) was employed. This approach consists of six main phases: data familiarization, generating initial codes, searching for themes, reviewing themes, defining and naming themes, and report production. It is important to mention that the findings obtained from the analysis were presented using the exact quotes from the participants to enhance the credibility of the study's findings.

2.7.2 Quantitative Analysis

The quantitative data were analyzed using descriptive and inferential statistics using the Statistical Package for Social Sciences (SPSS) version 20. These variables may be used to construct a correlation. The purpose of using this program is to visually represent data via charts, frequencies, and percentages. The data underwent coding, data entry, and presentation in the form of textual information, charts, and tables. This research used both descriptive and inferential statistics. Descriptive statistics were used to assess frequencies, percentages, means, standard deviations, while inferential statistics included regression analysis. Binary logistic regressions were used as a mathematical model to demonstrate the perceived contribution of internal audit practice towards procurement performance in Tanzania: a case of Dodoma.

$$\log \frac{p}{1-p} = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 \quad (1)$$

Where:

Y= Procurement Performance

X₁ = Access to documents

X₂ = Performs none auditing Function

X₃ = Report to Board of Director

3. Results and Discussion

3.1 Description of the Respondents' Demographic Characteristics

The minimum age of the respondents was 20 years while the maximum age was 50 years and above. Table 2 shows that, the majority 38 (63.3%) of the employees were in the age group of 30-39 years, which is a good proportion followed by 10 (16.6%) of the employees who were between 40-49 years of age. In addition to that, 09 (15.0%) of the employees involved in the study aged 50 years and above and a few 03 (5.0%) of the employees were between 20 -29 years. The study's findings on respondents' educational backgrounds reveal that 39(65.0%) of the respondents held a degree level education while 19 (31.6%) had Master's Degree. On the other hand, 02 (3.0%) had post graduate diplomas as reflected in table 2. Results on respondents' years of experience show that 35 (58.3%) of them have worked in Dodoma City Council for more than 6 years, while 12 (20.0%) have worked in department for 1 – 3 years as reflected in table 2. Furthermore, 10 (16.6%) respondents have participated in the industry for 4 – 6 years' time span while 03(5.0%) respondents have less than 1years working experience with Dodoma City Council.

Table 2: Demographic Information

Demographic Data	Frequency	Percentage
------------------	-----------	------------

Age		
20 -29	03	5.0
30 – 39	38	63.3
40 – 49	10	16.6
50 and above	09	15.0
Total	60	100.0
Working Experience		
Less than 1 year.	03	5.0
Between 1-3	12	20.0
Between 4-6	10	16.6
Above 6 years.	35	58.3
Total	60	100.0
Professional Qualification		
Degree	39	65.0
Post Graduate Diploma	2	3.0
Masters	19	31.6
Total	60	100.0

Source: Field Data, (2024).

3.2 The Role of Internal Auditing Independency On-Procurement Performance

The logistic regression model was used to assess Internal Auditing Independency on procurement performance. The text below displays the omnibus testing of model coefficients, model summary, and the Hosmer and Lemeshow test. The equation of the role of internal auditing knowledge includes test and variables, which are elements used in the model.

Table 3: Omnibus Tests of Model Coefficients

	Chi-square	df	Sig.
Step 1 Step	13.489	2	.024

Block	13.489	2	.024
Model	13.489	2	.024

The omnibus test is a statistical test that uses the likelihood-ratio chi-square method to compare the current model with the null model. The significance value of less than 0.05 in this test suggests that the present model performs better than the null model. Hence, the present model (Table 3) demonstrates a p value of 0.024, accompanied by a chi-square value of 13.589.

Table 4: Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	54.301 ^a	.433	.516

The test (Table 4) showed that the Cox & Snell R square and Nagelkerke R square had positive values of 0.433 and 0.516, respectively. These findings suggest that the model is accounted for by 23.3% of the total variance and has a coefficient of determination of 51.6%.

Table 5: Hosmer and Lemeshow Test

Step	Chi-square	Df	Sig.
1	9.687	5	.308

The Hosmer and Lemeshow test are a statistical test used to assess the quality of fit and calibration of logistic regression models. The Hosmer and Lemeshow test (Table 5), which is used to assess the goodness of fit of a model, yielded a test statistic of 9.687 with a p-value of 0.108, indicating a lack of statistical significance ($p > 0.05$). Hence, the suggested model exhibited a strong match with the dataset.

Table 6: Variables in the Equation

	B	S.E.	Wald	Sig.	OR
Access to documents	1.507	.700	7.401	.029	4.082

Performs none auditing Function	-.429	.695	.352	.877	.887
Report to Board of Director	1.007	.555	5.877	.036	4.376
Constant	-9.040	5.209	6.439	.043	.0112

The findings as presented Table 6 revealed that access to documents has positive significant influence on procurement performance ($\beta=1.507$), and statistically significant of 5% (p-value=0.029). This means that 1 unit increasing of access to documents by internal auditors increases procurement performance in Dodoma City Council by 1.507 times. This also has been indicated by odd ratio (OR) of 4.082 implying that having organization with internal audit freedom on access to document is 4.082 times likely to increase the on-procurement performance at Dodoma City Council than having organization with where internal auditors has no access to documents. These results were in line with those of Ji et al. (2021) who revealed that, Internal Auditors Independency amongst auditors leads to improve on procurement performance of organization.

The findings as presented Table 6 revealed that reporting to board of director has positive significant influence on procurement performance ($\beta=1.007$), and statistically significant of 5% (p-value=0.036). This means that 1 unit increasing of report to board of director increases on procurement performance of Dodoma City Council by 1.007 times. This also has been indicated by odd ratio (OR) of 4.376 implying that having organization with internal auditors who Report to Board of Director is 4.376 times likely to increase the on-procurement performance of Dodoma City Council compared to organization were internal auditors who Report to Board of Director. On the other hand, performing none auditing function had no statistically significant influence on procurement performance (p-value=0.877).

The findings from table 6 were complemented by results from an interview session with the head of department pseudonym HOD4 of department D, who was interviewed to comment on the role of internal auditing knowledge on ensuring procurement performance used in Dodoma City Council.

“.....Independent internal auditors help ensure that procurement processes comply with internal controls, industry standards, and legal requirements. This reduces the risk of fraud, waste, and non-compliance1” (HOD4, 05/03/2024).

All in all, the analyzed data from the field at department suggested that the independent audits increase transparency and accountability within the procurement process. This helps build trust among stakeholders and ensures that procurement activities are conducted ethically and efficiently. When the head of department symbolized by (HOD6) of department pseudo named E was interviewed about the varying the role of internal auditing knowledge on ensuring on

procurement performance used in Dodoma City Council, the head of department had the following words to say;

“.....Independence enables internal auditors to provide impartial assessments, which are crucial for identifying and avoiding fraudulent, wasteful, and abusive practices in procurement operations.” (HOD6, 05/2024).

This finding resonates with empirical study by Alzoubi, (2022) that, Independent internal auditors provide valuable insights and recommendations that support management in making informed decisions about procurement strategies and practices.

4. Conclusion

This study aimed to examine the perceived impact of internal auditors' independence on procurement performance in local government authorities. The results indicate that Dodoma City Council perceives that, Internal Auditing Independency is of necessity to improve procurement performance. This suggests that organizations have several internal auditing independency attributes provided directly which correlates with the improvement of performance of the procurement. This suggests that organizations having freedom to document accessibility and reporting directly to board of directors, this also plays a significant role to the internal auditor's performance.

To ensure that there is improved procurement performance the role of Management support must be put in place. Dodoma City Council ensure that, the level of training opportunities and acceptance of the findings is high in the organization to ensure procurement performance practice. This implies that there is training opportunity to ensure procurement performance practice while the organizations without training opportunities would not realize that. Consequently, it is more probable that organizations that acceptance of the findings from Internal Auditors to ensure procurement performance practice we would have improved procurement performance than those which not have.

5. Recommendations

The study's results, in conjunction with the respondents' evaluations of the factors influencing procurement performance at Dodoma City Council. The subsequent suggestions are formulated in accordance with the results. The report suggests that the government should reinforce the use of the policies to improve the procurement performance in the public organization. Adherence to the policy would have positive and significant impact to public organization procurement performance. To develop suitable solutions, the Dodoma City Council should establish a unit to evaluate the challenges associated with procurement performance. But also suggesting the possible solution to it. Professionals with relevant experience and expertise should work in the unit to oversee procurement performance are well managed and improved on daily basis. The study demonstrates that good procurement performance has a substantial impact on an organization's procurement performance. Consequently, practitioners must

implement the planning that the organization has mandated to enhance the performance of the procurement performance.

Acknowledgment

We acknowledge and thank the College of Business Education (CBE) for allowing us to use their library and other resources during the accomplishment of this article.

Conflict of interest

The researcher declares that there is no conflict of interest.

The Influence of Climatic Condition on Grape Productivity in Dodoma Tanzania

Charles Costantine Mtani³ & Dr Liberatus Gabagambi⁴,

¹College of Business Education (CBE), Dodoma

²College of Business Education (CBE), Dodoma

Abstract

This study was conducted to investigate the consequences of climatic change on grape productivity in the Dodoma region. The objectives of the study Was to assess the effect of climatic conditions on grape productivity in the Dodoma region. The study used cross-sectional research design whereas simple random and purposive sampling techniques were used to select 71 respondents. The data were gathered through questionnaires and interviews while data were analyzed using descriptive analysis, regression analysis for quantitative data and content analysis for qualitative data. The study found that unpredictable rainfall affects the growth and development of grape plants. The study also revealed that most of the farmers are aware of the ways climate change could affect their households while the use of irrigation techniques has helped in mitigating the effects of climate change on grape farming in Dodoma region. The study concludes that climatic condition has a significant impact on grape productivity with a standardized coefficient of 0.543 and a t-value of 4.841 ($p < 0.001$) while climate change also has a significant positive effect on grape productivity, with a standardized coefficient of 0.181 and a t-value of 2.928 ($p = 0.005$) and the study concluded that adaptation strategies have a significant positive effect on grape productivity, with a standardized coefficient of 0.277 and a t-value of 2.883 ($p = 0.005$). The study recommends that implementing an efficient irrigation system can help grape growers regulate water supply to the plants during periods of erratic rainfall.

Keywords: *Grapes products, Climatic change, Productivity, Consequences.*

I. Introduction

Recently, there has been a growing research interest in climatic change and its implications. Climate change includes extreme events which consist of heatwaves, cold spells, heavy rains, storm surges, flooding, landslides, droughts, wildfires and intense storms (Devot *et al.*, 2023). Climate change impacts the frequency and severity of extreme events, this attribution being particularly clear-cut for heatwaves. The magnitude of these increases is alarming as the number of climatological heatwave days is expected to increase at least fivefold by the end of the century in the coolest climates while up to thirty times more in warmer climates. It is also assumed that drought severity in Southern Europe is expected to triple by the end of the century (Devot *et al.*, 2023).

Climate change is a global phenomenon that causes significant threats to numerous sectors, including agriculture and food security. Apart from its perilous repercussions, climatic change is caused by human activities like burning fossil fuels (such as coal, oil and natural gas) which produces heat-trapping gases, manufacturing industries, bush burning and deforestation (Reza, 2019). In developed countries like the United States and the United Kingdom, the consequences of climate change on productivity are multifaceted. Infrastructure projects face increased risk from severe weather events, necessitating more robust design standards and materials, which drive up costs.

Sub-Saharan Africa (SSA) is among the most prone regions to climate change following its high exposure to climate perils (Leal Filho *et al.*, 2017; Owusu *et al.*, 2021), but also the sensitivity of its production and livelihood systems. Although the SSA countries' contribution to global warming is relatively minimal compared to the developed world, the region is likely to be gravely and disproportionately affected by climate change. This is because SSA has relatively large exposure and sensitivity to climatic change. It is suggested that agriculture will be the most vulnerable sector to climate change, especially in SSA due to the reliance of agricultural systems on particular climatic conditions (Pereira, 2017; Shukla *et al.*, 2021; Zeleke *et al.*, 2021).

Nonetheless, climate change has the potential to increase agricultural productivity in some regions. Yet agricultural project productivity in most SSA regions will substantially decline (Gibon *et al.*, 2018). The peril becomes serious as such problems are likely to miss the equivalent counterparty adaptive techniques (Herslund *et al.*, 2016). The low adaptive capacity of many developing countries in Africa is influenced by factors such as extreme poverty, ongoing ago-infrastructure challenges, governance constraints and insufficient social safety nets (Chepkoech *et al.*, 2020). Regardless, of what causes climatic change its effect on the agricultural project is sensitive to life sustenance.

Agriculture plays a vital role in the country's economy, contributing to the livelihoods of a large proportion of the population (Dakurah, 2020). Besides, the agriculture sector plays an important role in attaining other developmental goals, like ensuring food security, employment creation promotion, and living standards of people improvement by lowering poverty (Rafael, 2023). It is an undeniable fact that agricultural progress holds a potential promise of job creation geared to alleviate abject poverty (Pfunzo, 2017). However, the manner climatic change affects agriculture, especially grape productivity is of paramount importance.

Puga et al. (2023) in Australia studied the climatic and grape yields and observed that climate change either favours or harms the yield of grapes in some areas of the country. Thus, it was an ambiguous kind of finding. Additionally, Keller (2023) in the USA studied climate change impacts on vineyards in warm and dry areas to check challenges and opportunities. The study concluded that rising temperatures increase the plant water demand while temperature decreases the irrigation water supply.

Furthermore, Bibi and Rahman (2023) found that climate change has negatively impacted agriculture and in turn, it has seriously affected the global food security. The mitigation strategies to offset the climate change effect on agricultural project productivity, such as biochar and biostimulants, have latent power to lower the unpleasant impact without compromising environmental sustainability (Huang *et al.*, 2023). A large number of studies noted that climatic change accompanied by poor agricultural practice has led to the loss in soil fertility by wasting the organic matter, and productivity, as well as causing droughts and floods (Huang *et al.*, 2023; Bibi and Rahman, 2023). However, this study was not conducted in East African countries.

In Africa, grapes are cultivated in several countries, South Africa being the leading country meanwhile Tanzania is the second largest producer in the sub-Saharan. During 2018/2019 the country produces 16,139 tons of grapes (Nalyoto & Ngaruko, 2022). In Tanzania, grapes are produced in the Dodoma region (Kulwijira *et al.* 2018), but recent research has shown that the crop can grow well in other regions such as Morogoro, Kilimanjaro, Tanga, Tabora, Babati, Bunda and Peramiho. Grapes are among the major fruit crops of economic importance in Tanzania; considered one of the most important cash crops, raw materials and sources of employment.

Furthermore, Ndagijimana (2021) noted that Burundian agriculture confronts massive climate change shocks as they do not have sufficient means to implement appropriate adaptation strategies, they are forced to resort to survival strategies. However, this study neither looked at grape productivity nor focused on Tanzanian settings.

Moreover, Ndesanjo *et al.* (2021) in Tanzania noted that the decrease in rainfall and increase in drought, food and water insecurity-induced malaria prevalence poses were associated with climatic change. However, this study did not consider grape productivity and it was done in Simanjaru instead of Dodoma city. Similarly, Ringo and Baraka (2019) noted that climate change stressors destroying those cultural assets involved an increase in abnormal winds, frequent droughts and rising temperature/heat waves. The effects exacerbated by climate change via those stressors on traditional food, in Kondoa in Tanzania. Although the study studied about food yet, grape project productivity was not covered. Therefore, this study is designed to assess the consequences of climatic change on grape productivity in the Dodoma region.

Grape production is so important in the world as it is the raw material of wine which is universally known and has ever-increasing demand in both local and international markets. The grape production contributes significantly to the economy of a household as it increases the income of the household up to a profit of Tsh 667,419 per acre (Nalyoto & Ngaruko, 2022). Ideally, the Dodoma region in Tanzania possesses a favourable climate for grape cultivation,

characterized by sufficient sunshine, moderate rainfall, and fertile soils. These conditions are ideal for producing high-quality grapes, contributing significantly to the region's agricultural economy and providing livelihoods for local communities.

However, in reality, the region is experiencing increasingly erratic weather patterns due to climate change, posing a significant threat to grape productivity. Drought periods are becoming more frequent and severe, leading to water stress and reduced yields. Unpredictable rainfall patterns disrupt the delicate balance required for optimal grape growth, resulting in lower fruit quality and increased susceptibility to diseases.

Therefore, the current study aimed to bridge the gap in understanding the consequences of climatic change on grape project productivity in the Dodoma region. It sought to quantify the magnitude of the problem. The study also investigated the adaptation strategies that local farmers are currently employing to mitigate the effects of climate change and identify potential solutions for enhancing grape productivity in the face of these challenges.

Research Methodology

The study used cross-sectional design that allows for the collection of data at a single point in time, providing a snapshot of the situation. This design is appropriate for the study's objectives, which aim to assess the impact of climatic changes on grape productivity in the Dodoma region.

3.2 Study area

The study was conducted in Dodoma region, the choice of the Dodoma region as the study area is justified by its vulnerability to climatic extreme events, which directly impact grape farming particularly in the . Within dodoma region Mpunguzi ward. has been selected because the large number of grape growers although faced with challenges which includes shortage of rain which need adoption of morden irrigation system to support farming.

3.2 Study Population and Sample Size

In this study, the population comprised grape growers in the Dodoma region. Based on the statistics in the ward office there were about 71 farmers of grapes. From that point the sample size of the study was 71 respondents, comprising farmers who were 66 respondents and 5 government representatives who were key informants. Therefore, study population of grape growers clearly defined, for enhancing the study's focus and generalizability of findings.

3.3 Sampling Design and Procedure

A random sampling technique was employed to select the local community (farmers) meanwhile judgmental sampling was applied for selecting government officials from Dodoma city to avoid biases and secure capable individuals with vital information respectively.

3.4 Data and Collection Approaches

The study employed various data collection methods, including surveys, interviews, and documentary reviews, to gather both primary and secondary data essential for

understanding the impact of climate change on grape productivity in Dodoma. Primary data was collected through surveys and interviews, targeting 66 grape farmers and 5 local government officials. The survey method involved a questionnaire with 5 Likert scale questions to capture respondents' perceptions on the effects of unpredictable rainfall, global warming, and climate change mitigation strategies. Simple random sampling was used to select grape farmers, ensuring diverse representation, while purposive sampling was employed to select officials with expertise in agriculture, climate change, and environmental policies.

Interviews provided in-depth qualitative insights from key informants, allowing for a deeper understanding of the study's objectives. Additionally, a documentary review was conducted to gather secondary data, focusing on public documents like the Dodoma Regional Climate Change Adaptation Report, The government of the United Republic of Tanzania agricultural policies. This review also included international reports from the Intergovernmental Panel on Climate Change (IPCC) and scholarly articles, supplementing the primary data and offering a broader context for analysing climate change's impact on grape farming in Dodoma.

3.5 Data Analysis

Descriptive statistics were used in analyzing the respondents' characteristics while regression analysis was used to test the level of awareness. Descriptive statistics and regression analysis are appropriate techniques for analyzing quantitative and qualitative data were analysed semantically for, enabling the researchers to uncover patterns, relationships, and trends in the data.

IV. Findings & Discussion

The objective of the study sought to assess the influence of climatic conditions on grape productivity in the Dodoma region. The presented findings focuses on factors which influence climatic conditions hence affect grape productivity. The table below presents the findings which were collected through questionnaires and interviews.

Table 4.1 Influence of climatic condition on the grape productivity

Variables	1		2		3		4		5	
	F	%	F	%	F	%	F	%	F	%
Unpredictable rainfall affects the growth and development of grape plants	0	0	1	1.5	2	3.0	32	48.5	31	47
Irregular rainfall leads to water stress in the grape plants, affecting their productivity	3	4.5	8	12.1	7	10.6	22	33.3	26	39.4

Soil erosion due to heavy rainfall negatively affected grape productivity	3	4.5	1	1.5	14	21.2	18	27.3	30	45.5
Proper soil management practices (e.g., mulching, and cover crops) can improve soil quality and moisture retention.	0	0	1	1.5	10	15.2	38	57.6	17	25.8
Excessive sunlight and high temperatures can lead to sun damage and reduced grape quality	3	4.5	9	13.6	12	18.2	23	34.8	19	28.8

1 Strongly disagree, 2-Disagree, 3-Neutral, 4-Agree and 5-Strongly agree.

Source: Field Data, 2024

Respondents were asked whether unpredictable rainfall affects the growth and development of grape. Findings revealed that 1(1.5%) of the respondents disagreed that unpredictable rainfall affects the growth and development of grape plants while 2(3%) of the respondents were neutral 32(48.5%) of respondents agreed and the rest 31(47%) of respondents strongly agreed with the statement. To sum up, the findings revealed that the majority of respondents strongly agreed that unpredictable rainfall affects the growth and development of grape plants. Findings suggest that grapevines require a consistent and adequate water supply for optimal growth and fruit development. In that regard unpredictable rainfall patterns can lead to periods of drought or excess moisture, causing water stress in grape plants. Water stress can negatively affect photosynthesis, nutrient uptake, and overall plant health, ultimately impacting grape yield and quality.

On the other hand, fluctuating rainfall patterns can create favourable conditions for various fungal diseases that commonly affect grapevines, such as powdery mildew and downy mildew. Excessive moisture from heavy rains can promote the spread of these diseases, leading to reduced vine vigour, fruit quality, and yield. The study findings are supported by Zhang *et al.*, (2022) that unpredictable rainfall patterns can lead to periods of drought followed by heavy rain, causing water stress. Drought periods inhibited maize plant growth and development, while heavy rainfall can saturate the soil, leading to waterlogging and root damage. Also, rainfall affected the availability of nutrients in the soil. During dry periods, nutrients became less accessible to plants as they were not being dissolved and transported effectively through the soil. Conversely, heavy rainfall leached nutrients from the soil, making them unavailable for plant uptake.

Table 4.2 Rainfall rate in Dodoma region TC

S/N	Mm	Grape harvest
1	570 mm	March
2	600 mm	August/September

Source: Field Data, 2024

There is one rainy season, starting in December and lasting until April or May. Annual precipitation is quite limited, ranging from 570 to 600 mm; poorly distributed rains are a regular occurrence, with dry spells particularly common in January, when most of the crops are sown. Average temperatures vary from 180 C in July to 310 C in November. The cool dry season begins in June and ends in early September. The soils are loamy sands and reddish loamy sands. Grapes are harvested twice a year, once in March and once in August/September.

Respondents were further asked whether irregular rainfall leads to water stress in the grape plants, affecting their productivity. Findings revealed that 3(4.5%) of the respondents disagreed that irregular rainfall leads to water stress in the grape plants, affecting their productivity while 8(12.1%) of the respondents disagreed 7 and 7(10.6%) were neutral. On the other hand, the study found that about 22(33.3%) of respondents agreed and the rest 26(39.4%) respondents strongly agreed with the statement. To sum up, the findings revealed that the majority of respondents strongly agreed that irregular rainfall leads to water stress in the grape plants, affecting their productivity. Findings suggest that grapevines require a consistent and adequate water supply throughout their growth cycle to thrive and produce high-quality fruit.

In an interview conducted with the 5 key informants, when asked the same question regarding to statement that how irregular rainfall leads to water stress in the grape plants, affecting their productivity, all 5 key informants had similar views. For example one of the key informant had this to say: -

...Grape plants require consistent and adequate water supply for optimal growth. Irregular rainfall patterns result in periods of drought and insufficient water availability, stressing the plants. This stress hinders their ability to absorb essential nutrients and affects overall plant health. Irregular rainfall leads to fluctuating soil moisture, which can result in either waterlogged conditions or dry soil....

When there is irregular rainfall, grape plants may not receive enough water during critical growth stages, leading to water stress. Insufficient water supply hinders the growth of grapevines, affecting their overall development and productivity. Water stress results in smaller fruit size, lower sugar content, and reduced flavour intensity in grapes. Stressed grape plants are more vulnerable to diseases and pests, which can further reduce productivity. The study findings are linked to the study by Bardsley *et al.*, (2023) that plants relied on a consistent water

supply to absorb nutrients and water through their roots. Irregular rainfall resulted in dry spells, causing soil moisture levels to drop significantly. This made it difficult for plants to access water, leading to water stress. Water is essential for photosynthesis, the process through which plants produce energy from sunlight. During periods of water stress, plants may close their stomata (tiny pores on the leaves) to conserve water, reducing their ability to photosynthesize effectively. This can result in decreased growth and productivity.

Respondents were further asked whether soil erosion due to heavy rainfall negatively affected grape productivity. About 3(4.5%) of the respondents strongly disagreed soil that soil erosion due to heavy rainfall negatively affected grape productivity while 1(1.5%) of the respondents disagreed and 14(21.2%) were neutral. Also, a study found that about 18(23.3%) of respondents agreed and the rest 30(45.5%) respondents strongly agreed with the statement. To sum up, the findings revealed that the majority of respondents strongly agreed that soil erosion due to heavy rainfall negatively affected grape productivity. This suggests that heavy rainfall can wash away the top layer of soil, which is rich in nutrients essential for plant growth. This loss of topsoil fertility can result in decreased grape yields and poor fruit quality. Commenting on the same issue the key informants added that:-

.....Soil erosion leads to the loss of topsoil, which is rich in essential nutrients necessary for plant growth. As a result, grapevines may suffer from nutrient deficiencies, affecting their overall health and productivity. Excessive soil erosion exposes grapevine roots, making them more vulnerable to damage and reducing their ability to absorb water and nutrients efficiently. This weakens the plants and hinders their growth and fruit production...

Findings suggest that erosion can also lead to soil compaction, making it difficult for grape roots to penetrate the soil and access water and nutrients. This can stunt plant growth and reduce grape productivity. Soil erosion can increase surface runoff, leading to waterlogging in some areas and drought conditions in others. These fluctuations in soil moisture levels can stress grapevines and negatively impact their growth and productivity. The study findings are supported by Zhang et al. (2022) that erosion physically damaged plant roots and disrupted their ability to uptake water and nutrients from the soil. This led to stunted growth, reduced yields, and even plant death in severe cases.

In the same trial, respondents were also asked whether proper soil management practices (e.g., mulching, cover crops) can improve soil quality and moisture retention. The study findings revealed that 1(1.5%) of the respondents disagreed that proper soil management practices (e.g., mulching, cover crops) can improve soil quality and moisture retention while 10(15.2%) of the respondents were neutral. Also, a study found that about 38(57.6%) of respondents agreed and the rest 17(25.8%) respondents strongly agreed with the statement. To sum up, the findings revealed that the majority of respondents agreed that proper soil management practices (e.g., mulching, and cover crops) can improve soil quality and moisture retention. In that regard, this can ensure grape productivity. Furthermore, findings suggest that managing soil organic matter is crucial as it plays a role in almost all aspects of soil quality. Organic matter releases plant nutrients as it decomposes, and improves soil structure by enhancing water-holding

capacity, promoting the aggregation of soil particles, and helping to keep the soil aerated. Soil structure and water holding capacity are closely related. Soils with good structure have a higher water-holding capacity, allowing them to retain more moisture for longer periods. This is particularly important in urban gardening, where irrigation is heavily reliant on maintaining adequate soil moisture levels.

On the other hand, respondents were also asked whether excessive sunlight and high temperatures can lead to sun damage and reduced grape quality. It was established that about 3(3.5%) of the respondents disagreed that excessive sunlight and high temperatures can lead to sun damage and reduced grape quality while 9(13.6%) disagreed and 12(18.2%) of the respondents were neutral. Meanwhile, about 23(34.8%) of respondents agreed and the rest with 19(28.8%) of respondents strongly agreed with the statement. To sum up, the findings revealed that the majority of respondents agreed that excessive sunlight and high temperatures can lead to sun damage and reduced grape quality. This suggests that when grapevines are exposed to excessive sunlight, they can experience sunburn on their leaves and grapes. Sunburn causes the leaves to wither and turn brown, reducing their ability to photosynthesize effectively. This can lead to a decrease in sugar production and overall grape quality.

On the other hand, high temperatures can also impact grape quality by accelerating ripening and altering the balance of sugars, acids, and phenolic compounds in the grapes. This results in unbalanced flavours, lower acidity levels, and reduced colour intensity in the resulting wines. Also, excessive heat can cause stress to grapevines, affecting their growth and development. Stress factors such as high temperatures disrupt normal physiological processes in the vines, leading to decreased yields and poor fruit quality. The study findings are linked to the study by Zito et al. (2023) that excessive sunlight and high temperatures can lead to sun damage and reduced plant quality through a process known as photo inhibition. Photo inhibition occurs when the rate of light absorption by the plant's photosynthetic apparatus exceeds the capacity of the plant to utilize that light energy for photosynthesis.

This can result in the production of reactive oxygen species (ROS), such as singlet oxygen, superoxide radicals, and hydrogen peroxide, which can damage cellular components like proteins, lipids, and DNA. Additionally, high temperatures can exacerbate the effects of excessive sunlight by accelerating the production of ROS and directly damaging plant cells through heat stress. Heat stress can disrupt membrane integrity, denature proteins, and interfere with metabolic processes, ultimately leading to reduced plant growth, yield, and quality. Plants have evolved various mechanisms to mitigate the effects of excessive sunlight and high temperatures, such as the synthesis of protective pigments like anthocyanins and carotenoids, the activation of antioxidant enzymes like superoxide dismutase and catalase, and the regulation of stomatal aperture to reduce water loss and heat stress.

The study findings from specific objective one are supported by social theory. Social theory can help us understand the social and political dimensions of climate change. For example, social theorists have examined how power structures and social inequalities shape the distribution of the impacts of climate change, with marginalized communities often bearing the brunt of its effects. Social theory can also help us understand the social and cultural factors that shape our responses to climate change, such as our values, beliefs, and worldviews. This theory

is relevant in that it depicts cultural and social factors affecting the climatic change in the globe hence assisting to furnish the foundation of the study with relevant information.

V. Conclusions & Recommendations

5.1 Conclusions

The study aimed to assess the impact of climate change on grape farming in the Dodoma region, focusing on the effects of unpredictable rainfall, global warming, and the effectiveness of mitigation strategies. The findings revealed that climate change has significantly affected grape productivity, with unpredictable rainfall patterns leading to reduced yields and economic losses for farmers. Global warming has exacerbated these challenges, further complicating the growing conditions. The study also found that while some mitigation strategies are being implemented, their effectiveness is limited by inadequate awareness and insufficient resources among farmers.

5.2 Recommendations

To address the challenges identified, it is crucial to enhance farmer awareness and education regarding climate change impacts and adaptation strategies through targeted training programs and accessible information dissemination. Improving access to essential resources, such as drought-resistant grape varieties and efficient irrigation systems, is also vital, with local governments and agricultural organizations playing key roles in this effort. Strengthening climate data monitoring and dissemination systems can help farmers make informed decisions about planting and harvesting, reducing risks associated with unpredictable weather. Furthermore, the development and implementation of supportive policies by the government, including incentives for sustainable practices and investments in research, are necessary to bolster climate adaptation in agriculture. Finally, promoting collaborative efforts among farmers, government officials, researchers, and NGOs can lead to more cohesive and effective strategies for addressing climate change challenges in the region.

Abstract

This study examines the Role of timely payment and repayment rate on loan performance among special groups: a case of Dodoma city council. Specifically, the study aims to examine how timely loan repayment influence and loan repayment rate influence loan performance among special groups. Utilizing a cross-sectional research design with a mixed-method approach, the study involved 122 local government officers. Quantitative analysis showed that 71.31% of respondents had low performance in loan repayment, with significant associations between repayment rate assessments and loan performance, such as a chi-square value of 29.295 ($p=0.01$) indicating that higher repayment rates were linked to better performance. The analysis also revealed that high default rates (mean of 3.918) and delinquency rates (mean of 3.705) were prevalent, while grace period utilization (chi-square=49.1409, $p=0.007$) was significantly associated with low repayment performance. The findings suggest that effective payment management practices and robust repayment rate assessments are critical for improving loan repayment outcomes. Recommendations include enhancing financial education, revising loan terms, and strengthening monitoring mechanisms.

Keywords: *Loan Repayment Performance, Timeliness in Payments Management, Repayment Rate Assessment.*

Introduction

Loan repayment performance is a critical element of financial management within local government authorities, particularly for special groups such as women, youth, and people with disabilities (Smith & Jones, 2018). The success of lending programs depends on timeliness in payment management and accurate assessment of repayment rates, both of which are essential to ensure financial sustainability and empowerment for these groups (Doe & Johnson, 2020). This study aims to explore the influence of payment timeliness and repayment rate assessments on loan repayment performance among special groups at the City Council of Dodoma, offering insights into strategies to improve repayment and foster financial stability (Brown et al., 2021). Loan repayment is not just a local issue but a global one, affecting borrowers' creditworthiness and financial stability. Timely repayments improve credit scores, reduce interest rates, and enable access to future loans. Globally, non-performing loans (NPLs) have become a pressing concern, especially in developing countries. For instance, in Bangladesh, NPLs have surged due to issues like moral hazard and inadequate collateral (Ghosh et al., 2020). Similarly, the U.S. experienced severe loan repayment challenges during the housing bubble and subprime mortgage crisis, illustrating the difficulties of balancing credit access and financial risk management (Mahin et al., 2022).

In Sub-Saharan Africa, the microfinance sector struggles with loan repayment issues, as seen in Ethiopia and Kenya. High default rates, primarily due to poor monitoring, borrower mismanagement, and inadequate training, threaten the sustainability of microfinance institutions (Adugna, 2022; Koech & Maina, 2020). These cases demonstrate the importance of implementing effective credit management and monitoring systems to ensure loan repayment success.

In Tanzania, the problem is significant among special groups supported by government funds like the Local Government Development Revolving Fund (LGDRF). Challenges such as multiple borrowing, excessive debt, and dishonesty have led to low repayment rates, endangering the sustainability of these programs (Tegambwage & Kasoga, 2022). Despite government efforts to improve monitoring and evaluation (M&E) systems, issues with loan defaults persist, as noted by the Controller and Auditor General's (CAG) report (2023). This study will examine how timely payments management and repayment rate assessment affect loan repayment performance, proposing strategies to enhance the financial sustainability of government initiatives for vulnerable groups.

Significance of the Study

This study is significant as it investigates the impact of timely payments and repayment rates on loan performance among special groups in Dodoma City Council. By focusing on women, youth, and people with disabilities, the research addresses a critical area of financial inclusion, aiming to enhance their access to credit and improve financial stability. The findings will provide valuable insights for policymakers and financial institutions to develop targeted strategies that promote timely loan repayments and reduce defaults. Additionally, the study underscores the need for effective monitoring and evaluation systems, contributing to better loan management practices. Ultimately, this research aims to foster financial empowerment

and sustainable economic growth within marginalized communities in Dodoma, supporting broader development objectives in Tanzania.

Empirical Literature Review

Timeliness in payments management plays a critical role in ensuring effective loan repayment performance. According to Umadia (2020), the pressure to meet weekly repayment schedules often forces clients to seek informal sector loans, which microfinance institutions (MFIs) favor due to the efficiency of informal lenders' collection methods. Afolabi (2021) found that higher payment frequencies, such as monthly or bi-weekly payments, help borrowers better manage cash flow and budget accordingly, reducing the risk of missed payments. Similarly, Umar (2022) highlighted that clients with weekly repayment schedules are significantly less likely to default compared to those with monthly schedules, attributing this to increased social interaction and peer pressure in group lending setups. Justus (2016) noted the importance of grace periods, which give borrowers additional time to stabilize financially before loan repayment begins, thus reducing the likelihood of default. Korankye (2014) emphasized the importance of proper loan appraisal, monitoring, and reasonable interest rates in controlling defaults, particularly in microfinance settings. Adelekan et al. (2019) demonstrated that access to credit is directly proportional to SME expansion and output, highlighting the importance of timely payments in sustaining business growth. However, Obieche and Ihejirika (2021) pointed out that commercial banks often prefer lending to low-risk entities, such as governments, rather than SMEs, due to the perceived higher risk and repayment challenges associated with the latter. In this context, timely payments are crucial for maintaining good credit history, as emphasized by Wachira (2017), who linked responsible financial behaviour to better credit scores and improved loan repayment performance. Kinyua (2022) further noted that borrowers with higher incomes and better credit profiles are more likely to make timely repayments, resulting in higher-performing loan portfolios for lenders.

Repayment rate assessment is a key determinant of loan repayment performance, particularly in identifying low-risk borrowers. Kinyua (2022) highlighted that borrower with strong credit scores, stable employment, and higher incomes are generally perceived as lower risk, leading to better repayment performance and higher-quality loan portfolios. Lenders with stricter underwriting standards typically approve loans for such low-risk borrowers, which improves overall repayment rates. Kirosi (2022) emphasized the strategic importance of thorough credit assessment throughout the lending process, from application to final repayment. This process involves evaluating the borrower's risk profile to ensure the likelihood of repayment. Lyimo (2019) discussed the challenges faced by MFIs due to high default rates, which often result from inadequate monitoring and the inability to oversee borrower behavior. To mitigate these risks, Lyimo suggested that close relationships between borrowers and lenders, facilitated through monitoring, business control, and regular meetings, are essential in ensuring timely repayments. These strategies help lenders manage repayment issues effectively by fostering a collaborative environment where borrowers are more likely to honor their repayment obligations, thereby enhancing overall loan repayment performance.

The Theory of Planned Behavior (TPB), developed by Icek Ajzen in 1985, posits that behaviour is influenced by three main factors: attitudes toward the behaviour, subjective norms, and perceived behavioural control (Ajzen, 1991). TPB extends the Theory of Reasoned Action

by including perceived behavioural control, which accounts for factors outside an individual's control that may affect their ability to perform the behaviour. The Theory of Planned Behavior is selected for its comprehensive framework in explaining behavioural intentions and actions, which is relevant for understanding loan repayment behaviours among special groups at the City Council of Dodoma. TPB's focus on attitudes, social norms, and control factors provides a robust approach to analyze how these elements influence loan repayment. The theory's applicability has been demonstrated in studies related to financial behaviour, including loan repayment and credit management (Ajzen & Fishbein, 2005; Roberts & Jones, 2001), highlighting its relevance and effectiveness in similar contexts.

Conceptual Framework

The conceptual framework explores how payment timeliness and effective repayment assessment influence loan repayment performance, aiming to improve repayment rates, reduce defaults, and enhance financial outcomes among special groups in Dodoma.

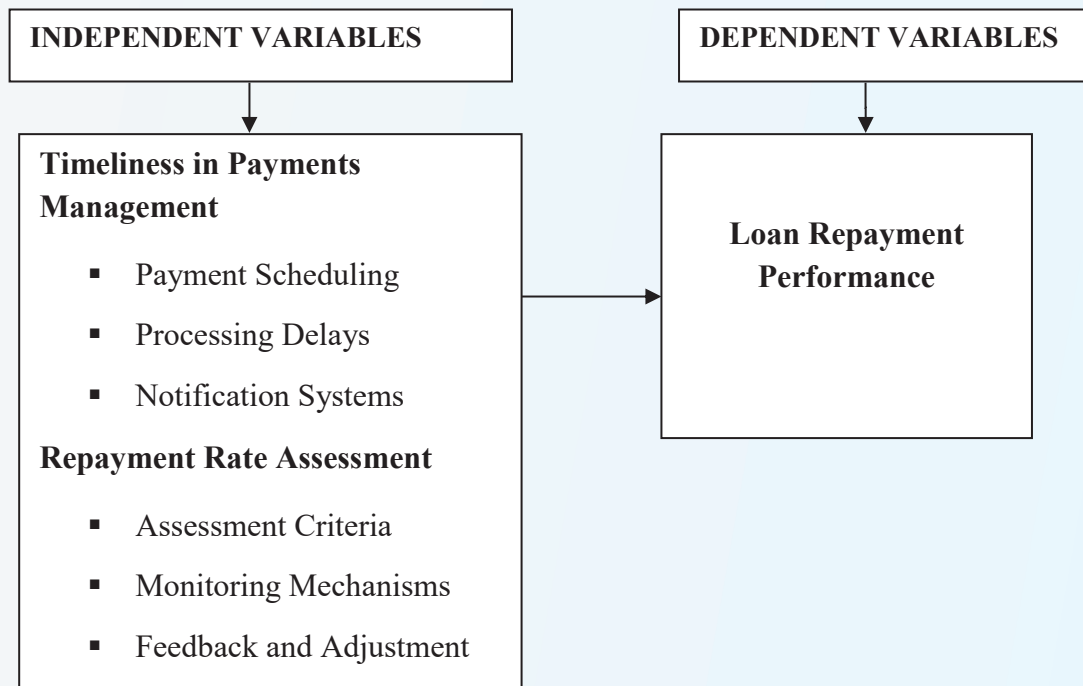

Figure 1: Conceptual Framework

Source: (Researcher, 2024)

Methodology

The selected area for the study was Dodoma Urban District, one of the seven districts of Dodoma Region, borders Bahi and Chamwino districts. The district's administrative seat is Dodoma City, with agriculture as the primary economic activity. The region has a semi-arid climate with two seasons: a dry season from April to November and a wet season from November to April. The study area, Dodoma City Council, was chosen due to its significant number of women, youth, and disabled people accessing loans from the Local Government Development Revolving Fund (LGDRF), yet struggling with timely loan repayment. A cross-sectional research design was adopted for this study. This design allows the collection of data from multiple cases at a single point in time, enabling the detection of patterns and associations among variables. It is cost-effective, flexible, and suitable for social science research, combining both qualitative and quantitative data collection methods. A mixed-method research approach was used, integrating both qualitative and quantitative data. This approach provides a comprehensive understanding by combining the strengths of both qualitative insights and quantitative measurements. The qualitative data involved respondent opinions, while

quantitative data included responses from questionnaires, such as age and the number of monitoring and evaluation (M&E) officers.

Data and Variables Selection

The study targeted all Local Government Officers responsible for monitoring and supervising special groups benefiting from the LGDRF in Dodoma City's 41 wards.

Sample Size Using the formula $n = \frac{N}{1 + N(e^2)}$ $n = \frac{176}{1 + 176(0.05^2)}$ $n = 122$, where $N = 176$ and $e = 0.05$, the calculated sample size was 122 officers.

The study used non-probability sampling techniques, specifically purposive sampling, to select key respondents from the wards, focusing on those responsible for supervising and monitoring the special groups. Semi-structured interviews were conducted to gather demographic information and assess loan repayment management. Key informant interviews with local government officers and group leaders provided insights into M&E challenges. Data was collected through a review of relevant documents, including evaluation reports, government publications, and related literature, to supplement primary data and deepen understanding. Direct observations were conducted to verify the activities of LGDRF beneficiaries, using checklists and a digital camera to gather evidence. While quantitative data was edited, classified, and coded for analysis using SPSS software. Qualitative data was transcribed for further analysis. Quantitative data was analysed using descriptive and inferential statistics, including correlation and regression analyses, to address the study objectives. Qualitative data was analysed through inferential analysis. Data was presented in tables, graphs, and text. Quantitative data was shown in tables and graphs, while qualitative findings were presented in narrative form.

Results and Discussion

Loan Repayment Performance Statistics

Table 1 Loan Repayment Performance Statistics

Employee Motivation	Mean	Std. Dev.	Min	Max
Default rate	3.918	.95	1	4
Delinquency rate	3.705	.781	1	3
Recovery rate	1.475	.501	1	5
Repayment pattern	1.557	.499	1	3
Early payment rate	3.943	.836	2	4
Overall	2.92	.522	1.2	3.8

Source: (Field Data, 2024)

The findings presented in Table 1 indicate that the overall loan repayment performance among special groups in Dodoma City Council was moderate, with an average score of 2.92 out of 5. The default rate had the highest mean score of 3.918, suggesting that loan defaults were a significant issue, followed closely by the early payment rate with a mean of 3.943, indicating that while some groups managed timely repayments, many others struggled. The delinquency rate also showed concerning results with a mean of 3.705, implying frequent delays in repayments. In contrast, the recovery rate and repayment pattern had much lower mean scores

of 1.475 and 1.557, respectively, highlighting challenges in the efficiency of recovering overdue loans and maintaining consistent repayment schedules. These findings align with studies such as those by Gaudence et al (2018), which noted similar patterns of repayment difficulties among microfinance borrowers, particularly in areas with limited financial literacy and economic opportunities. The implications of these findings are significant for policy and practice, as they suggest a need for improved financial management training for beneficiaries and more robust monitoring and support mechanisms to enhance loan repayment performance. The high default and delinquency rates point to systemic issues that could undermine the sustainability of loan programs intended to empower special groups, necessitating targeted interventions to address these challenges.

Figure 1 Distribution of Loan Repayment Performance in Binary

Source: (Field Data, 2024)

Distribution of Loan Repayment Performance in Ordinal

The binary distribution of loan repayment performance, as shown in Figure 1, reveals that 29% of respondents fall into the "High Performance" category, while the remaining 71% are categorized as "Low Performance." This significant disparity suggests that a large proportion of borrowers are struggling with their loan repayments, which could indicate issues related to financial management, economic challenges, or insufficient support systems. The findings are consistent with the study by Kovács & Terták (2019), their findings found that loan repayment difficulties are often prevalent in similar contexts where financial literacy is low and economic challenges are significant. This high percentage of low performers implies a need for targeted interventions, such as enhanced financial education, improved loan terms, or more robust monitoring and support systems, to help borrowers manage their loans more effectively and reduce the risk of default. The implications for the study suggest that addressing these challenges could significantly improve overall loan repayment performance and financial stability among borrowers.

Figure 2 Distribution of Loan Repayment Performance in Ordinal

Source: (Field Data, 2024)

Distribution of Loan Repayment Performance (Ordinal)

Findings in Figure 2 indicated that the distribution of loan repayment performance, when categorized ordinally, shows 35% of respondents in the low performance category, 51% in the moderate performance category, and 36% in the high-performance category. This distribution suggests that while a substantial portion of respondents exhibit moderate repayment performance, there is also a noteworthy proportion of both low and high performers. The high percentage of moderate performers reflects a considerable number of borrowers who are neither failing nor excelling significantly but are somewhere in between. This finding is consistent with studies such as Brady et al (2021), which also identified a significant number of borrowers achieving moderate performance, underscoring the need for targeted support strategies that address the diverse performance levels within the borrower population. The implications of this finding suggest that interventions should be nuanced to cater to the varying repayment capabilities of the respondents to improve overall loan performance.

Table 2 Distribution of Respondents on Loan Repayment Performance.

Loan repayment performance (Binary)

	Frequency	Percent
Low Performance	87	71.31
High Performance	35	28.69

Loan repayment performance (Ordinal)

	Frequency	Percent
Low performance	35	29.2
Moderate Performance	51	41.8
High performance	36	30

Source: (Field Data,2024)

The findings presented in Table 2 reveal significant insights into loan repayment performance among respondents. In a binary classification, 71.31% of respondents were categorized as

having low repayment performance, while only 28.69% were identified as high performers. This predominance of low repayment performance indicates that many borrowers may be facing challenges related to financial instability or inadequate loan management strategies, aligning with findings from Looney & Yannelis (2024), which also reported a higher proportion of low-performing loan recipients. In contrast, the ordinal classification offers a more nuanced perspective on loan repayment performance. Here, the distribution was as follows: 29.2% of respondents exhibited low performance, 41.8% demonstrated moderate performance, and 30% achieved high performance. This variation suggests that while a notable portion of borrowers struggle with repayment, there is also a significant segment that performs at a moderate or high level. These findings are consistent with Ngumo et al. (2020), indicating the diversity in repayment performance and suggesting that interventions may need to be tailored to address the varying levels of performance and specific needs of borrowers.

Table 3 Grace Period Utilization and Communication Regarding Payment Delays

Variable	Low performance	High performance	Chi-square	P-Value
<i>Payment Frequency</i>			85.3826	0.001
Low	48(69.64)	24(30.36)		
High	39(72.73)	11(27.27)		
<i>Grace period utilization</i>			49.1409	0.007
Low	39(73.54)	17(26.46)		
High	48(79.01)	28(28.19)		
<i>Communication regarding payment delays</i>			53.9013	0.00
Low	40(70.07)	14(25.93)		
High	47(69.12)	21(30.88)		

Source: (Field Data, 2024)

Findings in Table 3 indicated a significant association between payment frequency and loan repayment performance, with a chi-square value of 85.3826 and a p-value of 0.001, showing a statistically significant relationship. Among respondents with low payment frequency, 69.64% exhibited low performance, while 30.36% demonstrated high performance. Similarly, those with high payment frequency had 72.73% in the low-performance category and 27.27% in the high-performance category. This suggests that more frequent payments do not necessarily correlate with better repayment performance. These findings are consistent with the study by Baidoo et al, (2020), which also found that payment frequency is not always a determinant of successful loan repayment, implying that other factors may play a more critical role in influencing repayment behaviour. Furthermore, the analysis in Table 3 highlights critical factors influencing loan repayment performance. Grace Period Utilization showed a significant association with repayment outcomes, with a chi-square value of 49.1409 and a p-value of 0.007. Among respondents with low grace period utilization, 73.54% demonstrated low repayment performance, whereas 79.01% of those with high grace period utilization also struggled with repayments. This suggests that borrowers who rely heavily on grace periods may face difficulties maintaining regular payments, supporting findings by Ssekiziyivu et al. (2018) that excessive use of grace periods can lead to repayment challenges.

Table 4 Association Between Repayment Rate Assessments on The Performance of Loan Repayment.

Variable	Low performance	Moderate performance	High performance	Chi-square	P-Value
Overall Repayment Rate				29.295	0.01
Low	26(36.11)	14(19.14)	32(44.44)		
High	16(32)	17(34)	17(34)		
Repayment frequency and patterns				39.327	0.00
Low	21(34.43)	14(22.95)	26(42.62)		
High	21(34.43)	17(27.87)	23(37.7)		
Economic and environmental factors				35.845	0.006
Low	23(35.94)	15(23.44)	26(40.63)		
High	19(32.76)	16(27.59)	23(39.66)		

Source: (Field Data, 2024)

Overall Repayment Rate

The analysis in table 4 indicates a significant association between the overall repayment rate and loan repayment performance, with a Chi-square value of 29.295 ($p=0.01$). The findings show that a higher overall repayment rate is more likely to be associated with high performance, while a lower repayment rate tends to correlate with low performance. This finding is consistent with the study by Jote (2018), which found that higher repayment rates are a strong predictor of successful loan repayment. The implication is that maintaining a high overall repayment rate is crucial for improving loan performance.

Repayment Frequency and Patterns

The findings in table 4 indicates that the Chi-square value of 39.327 ($p=0.00$) suggests a significant relationship between repayment frequency and patterns and loan repayment performance. Borrowers who maintain consistent and frequent repayment patterns are more likely to be categorized in the high-performance group, whereas those with irregular patterns tend to fall into the low-performance category. This finding aligns with research by Kinyua (2023), which emphasized the importance of regular repayment schedules in enhancing loan repayment outcomes. The study implies that encouraging borrowers to follow a structured repayment plan could improve overall loan performance.

5.0. Conclusion and Recommendations

The study highlights a concerning prevalence of low loan repayment performance among special groups in Dodoma City Council, with significant proportions of respondents categorized as having low performance. Analysis revealed that factors such as payment frequency, grace period utilization, and communication regarding payment delays have mixed effects on repayment outcomes. Specifically, while effective communication and grace period utilization are important, they do not significantly improve repayment performance on their

own. The findings underscore the importance of consistent repayment patterns and the influence of economic and environmental factors on loan performance. Overall, the results indicate a need for targeted interventions and support systems tailored to varying borrower needs and external conditions.

To address the identified challenges, it is crucial to implement comprehensive financial management training programs to enhance borrowers' ability to manage loans and maintain timely repayments. Tailored support strategies should be developed based on performance levels, offering intensive support to low performers and incentives to high performers. Reassessing grace period policies and encouraging more timely repayments, while strengthening communication strategies regarding payment delays, can also help improve loan performance. Additionally, considering economic and environmental factors in loan risk assessments and promoting consistent repayment patterns through structured plans and incentives are essential steps for improving overall loan performance. Future research should focus on longitudinal studies to track loan repayment trends over time and identify long-term influencing factors. Evaluating the effectiveness of various financial literacy programs in enhancing repayment performance could provide valuable insights. Qualitative research exploring borrowers' personal experiences and challenges can offer deeper understanding of the factors affecting repayment.

Abstract

This study explores the effect of brand reputation on consumer buying decisions among bus passengers in Dodoma City Council, focusing on decision criteria, perceived brand quality, brand perception, and the relationship between brand identity and purchasing decisions. Utilizing a theoretical framework based on Consumer Behavior Theory and Brand Equity Theory, the research employed a cross-sectional design with 385 bus passengers and 20 bus company employees, sampled through random and purposive techniques. Data were collected via structured questionnaires and analyzed using descriptive statistics and linear regression in SPSS. The results revealed that reliability ($P = 0.014$, $B = 0.15$), safety ($P = 0.001$, $B = 0.41$), and customer service ($P = 0.002$, $B = 0.17$) significantly influenced consumer buying decisions, with brand name recognition ($P = 0.000$, $B = 0.964$) having the strongest effect. Additionally, corporate color scheme ($P = 0.002$, $B = 0.108$) significantly impacted consumer purchasing decisions, while brand logo design ($P = 0.251$) had no significant effect. The study emphasizes the importance of brand reputation, perceived quality, and brand identity in shaping consumer decisions, offering recommendations for bus companies to focus on brand name recognition, customer service, and targeting age and economic factors in their marketing strategies to ensure long-term success in a competitive market.

Keywords: *Brand reputation, consumer buying decision, bus transportation*

1.0 Introduction

The interplay between brand reputation and consumer buying decisions has long been recognized as a fundamental aspect of marketing and business strategy across various industries worldwide (Kurhayadi et al., 2022). In today's competitive marketplace, a brand's reputation holds immense significance in shaping consumer perceptions, attitudes, and purchasing behaviour. Brand reputation encompasses the collective image, credibility, and trustworthiness that a brand enjoys among its target audience. Brand reputation is typically defined as the collective opinions, perceptions, and attitudes consumers hold about a company. A strong, positive reputation can foster customer loyalty, encouraging repeat purchases, favourable word-of-mouth, and improved customer retention (Kim & Park, 2020; Lee & Chen, 2020). On the other hand, a tarnished reputation can result in customer defection, reduced sales, and damage to a brand's overall standing.

Globally, the passenger bus industry is an essential, facilitating connectivity, supporting trade, and driving economic development. In this highly competitive field, brand reputation significantly influences consumer purchasing decisions (Smith & Johnson, 2021; Wang & Liu, 2020). The reputation of passenger bus companies, whether built on historical performance, customer perceptions, or marketing efforts, significantly influences consumer preferences (Kurhayadi et al., 2022). Brand reputation serves as a crucial differentiator, offering companies a competitive advantage, fostering trust and reliability, building customer loyalty, and even allowing for pricing flexibility (Patel & Sharma, 2020). Additionally, a strong brand reputation contributes to resilience during crises, influences word-of-mouth marketing and social media chatter, eases regulatory processes, and opens doors to valuable partnerships.

The concept of brand reputation has undergone considerable development over time. In the past, it was considered an abstract asset, difficult to quantify and manage (Jones & Smith, 2021). However, the rise of information technology, social media, and online review platforms has transformed the way brand reputation is constructed. Nowadays, it is not solely driven by marketing efforts but continuously influenced by customer experiences and shared feedback through both word of mouth and digital platforms. Positive customer interactions and reviews can significantly enhance a company's reputation, while negative feedback can cause lasting damage (Nguyen & Le, 2020; Parker & Evans, 2020).

Recognizing the need to proactively build and manage brand reputation is essential for passenger bus companies. A strong brand reputation not only helps attract and retain customers, but also allows companies to command higher prices for their services, boosting profitability (Chen & Huang, 2021; Lopez & Miller, 2020). Additionally, during times of crisis or disruptions, a positive reputation serves as a buffer, aiding in faster recovery. Regulatory authorities and potential partners also take brand reputation into account when assessing licensing, permits, and collaboration opportunities, which can streamline these processes and create new growth opportunities (Roberts & Walker, 2020).

The passenger bus industry has a long history, dating back to the early 19th century when the steam engine and the Industrial Revolution laid the foundation for the first buses (Williams &

Thompson, 2020). Initially, these buses were often operated by local companies and lacked significant branding. However, with the introduction of the internal combustion engine in the late 19th and early 20th centuries, buses transitioned from horse-drawn carriages to motorized vehicles (Smith & Taylor, 2021). As buses became more common, branding began to influence company growth. Iconic companies such as London's "Transport for London" (TfL) played a key role in raising the profile of public transportation in major cities worldwide (Brown & Evans, 2020; Green, 2020). Well-known brands like Greyhound in the U.S. and National Express in the U.K. built reputations for their intercity and interstate services, with strong brand recognition contributing to their success by associating their names with reliability and quality (Johnson, 2022; Richards, 2021).

In Africa, the passenger bus industry has been instrumental in connecting people across vast and diverse regions, playing a critical role in supporting trade, commerce, and livelihoods (Kone, 2021). During the colonial period, European powers introduced bus services in various parts of Africa to link urban centres with remote areas. These colonial-era services often carried the names of colonial powers, highlighting the importance of branding in establishing trust and recognition (Njoh, 2020; Baffour & Ofori, 2021). In the post-colonial era, African nations have developed their bus networks, where branding has been pivotal in expanding these companies. Well-known brands such as Intercap and Greyhound in South Africa have become synonymous with long-distance travel, contributing to the growth and recognition of these companies both within their home countries and across international borders (Dlamini, 2020).

In Tanzania, the passenger bus business has a long and evolving history from the precolonial use of dhows and portage caravans to use of motor vehicles as material manifestations of their alleged intellectual and moral superiority (Streit, 2021). Branding became increasingly important for company growth as the passenger bus business landscape developed in the post-colonial era (Liasse & Tigges, 2019). Companies like Shabiby Line, ABC upper class, SATCO express, Dar es Salaam Commuter Bus (DART), Tahmeed Bus Services, and "Simba Coach" established strong brand names in the intercity and cross-border bus services sector, contributing to their growth and market recognition (Nyaki et al., 2020). It is therefore instrumental to examine how such brand names which have acquired different tastes and reputation over the years influence customer buying (purchase and repurchase) behavior.

2.0 Literature Review

2.1 Theoretical literature review

The Consumer Behaviour Theory focuses on understanding how consumers make choices and decisions, examining psychological, social, and cultural factors that influence consumer behaviour (Katona, 1968). It provides a foundation for exploring how brand reputation affects the choices of passengers, particularly in the Tanzanian passenger bus sector. This theory, widely studied in marketing and psychology, operates under the assumption that consumers are rational decision-makers seeking to maximize utility, and that their decisions are shaped by various internal and external factors, such as personal values, social influences, culture, and

psychological processes (Deaton & Muellbauer, 1980). It also posits that consumers go through distinct stages in decision-making: problem recognition, information search, evaluation of alternatives, purchase, and post-purchase evaluation.

In the context of this study, the theory is highly relevant as it provides a framework for understanding how passengers in Tanzania's bus sector make purchasing decisions. It helps explain how brand reputation influences these decisions by focusing on the external influences and the evaluation of alternatives. The theory highlights that consumer choices are not arbitrary, but are shaped by a range of factors, including perceived quality and brand perception. This aligns with the study's objectives of evaluating the determinants of choice for bus companies and understanding the role of perceived quality in consumer decisions. It emphasizes that consumers use rational criteria such as price, safety, and reliability to guide their preferences and satisfaction.

2.3 Empirical review

Esen (2018), investigated the effects of Volkswagen's reputation on various customer-related outcome variables, including customer satisfaction, loyalty, trust, repurchase intentions, and word-of-mouth recommendations. The research focused on the perspective of Turkish customers in the aftermath of the emission scandal, engaging 253 participants through a comprehensive research questionnaire. The findings revealed a positive influence of corporate reputation on customer intentions and outcomes. In the context of choosing a transportation bus company, this suggests that companies with strong reputations may positively influence customer satisfaction, trust, and loyalty, ultimately guiding their decision-making process.

Amron (2018), the research assessed the impact of brand image, brand trust, product quality, and price on consumers' decision-making when purchasing MPV cars. Utilizing a model of consumer buying decisions, the study incorporated these four independent variables and found that all significantly and positively influenced consumers' purchasing decisions. The study highlighted that price had the most substantial effect on consumer buying decisions. This implies that for bus companies, not only the brand image and trust but also the pricing strategy and perceived quality are crucial determinants in influencing customer choices.

Bulle (2020), explored the influence of branding and factors such as pricing, perceived quality of branded products, and marital status on consumer buying behavior among Somali students in Istanbul. Data collected from 110 participants indicated that brand names have a strong positive impact on consumer buying behavior. In the context of transportation bus companies, this suggests that a well-recognized and positively perceived brand can significantly affect customer decisions, with pricing and quality perceptions playing pivotal roles.

Khamis & Nyambura (2022) investigated how branding affects consumer purchasing behavior, focusing on aspects such as premium pricing, perceived quality of branded products, social status, and brand recognition within Kinondoni municipality. The study, which surveyed 106 respondents across three sectors namely mobile phones, beverages, and electronic found a strong positive relationship between branding and consumer buying behavior. For passenger bus companies, this suggests that effective branding, perceived quality, and strategic pricing can greatly impact customer choices, consistent with the factors identified in the research.

Lee & Kim (2022) explored how negative reputations of corporate CEOs and corporate social responsibility impact consumer attitudes toward brands and their purchase intentions. Analyzing responses from 212 participants, the study revealed significant effects of brand awareness and perceived quality on both brand attitudes and purchasing decisions. Exposure to negative reputation information led to a decline in respondents' brand attitudes and purchase intentions, highlighting the critical role of perceived quality in consumer decision-making and the severe impact of negative perceptions on buying behavior.

Ahmed et al. (2023) explored the effects of brand identity on consumer trust and loyalty in the context of the service industry. They found that elements of brand identity, including consistency in messaging and visual representation, play a pivotal role in establishing trust, which in turn influences purchasing decisions. Their findings suggest that a strong brand identity not only attracts consumers but also fosters loyalty, thereby enhancing repeat purchases.

Baker and Thompson (2023) conducted research focusing on the impact of social media on brand identity and consumer behavior. They revealed that active engagement and effective branding on social media platforms significantly improve brand recognition and customer engagement. This heightened awareness of brand identity through social media channels leads to increased purchase intentions among consumers, demonstrating the evolving landscape of how brand identity influences buying decisions in the digital age.

2.3 Conceptual framework

The independent variable in this study comprises of brand reputation which is measured by brand awareness, brand association, and perceived quality, while the intervening/intermediate variables are customer satisfaction, and customer trust. The dependent variable is consumer buying decision. It is therefore conceptualized that brand reputation of passenger bus company in Tanzania as related to its product attributed significantly influences consumer level of satisfaction, and trust, which consequently determines consumer buying decisions.

3.1 Sampling Design and Data Collection

This study was conducted in the in Dodoma region, Dodoma City Council, as the capital city of Tanzania, offers a unique context for this study due to its political and administrative significance following the relocation of government offices from Dar es Salaam. The city's transformation into a central hub for governance has spurred economic development and urbanization, leading to increased demand for transportation services. Its diverse population,

comprising government officials, residents, and visitors, provides a rich environment to explore consumer buying decisions. Both simple random sampling and purposive sampling were involved in selecting the sample from the given population. A sample of 385 was involved in the study as indicated by the Cochran formula where n represents the sample size, while Z denotes the critical value associated with a specific confidence level, such as 1.96 for a 95% confidence level. p signifies the proportion within the population of interest, which is 50% in this instance, and q is the complementary value to p , calculated as $1-p$. Lastly, e represents the acceptable margin of error, typically set at 0.05.

$$n = \frac{Z^2}{e^2} * pq$$

$$n = \frac{1.96^2}{0.05^2} * 0.5 * 0.5 = 385 \text{ respondents}$$

Using the Cochran formula, a sample of 385 was obtained, a total of 385 questionnaires were filled out correctly and handed back to the researcher for data recording and analysis.

The data collection process primarily involved gathering firsthand data using both questionnaires and interviews. The questionnaires were designed firstly to capture the demographic features of the respondents such as age, gender, level of education. The second part of the questionnaire was capturing the variable information on the determinants of decision criterion, brand perceived quality, influence of brand perception and relationship between brand identity and consumer purchasing decision. The study adopted a theoretical framework based on Consumer behavior theory. Questions were formulated as statements and rated on a five-point Likert-type scale, ranging from 1 for "strongly disagree" to 5 for "strongly agree".

3.2 Data Analysis

Both qualitative and quantitative data analysis was engaged in this study. Qualitative data analysis was supported from the information of interviews whereas qualitative data analysis was used to analyse data received interviews through thematic approach to analyse the qualitative data collected through interviews through MAXQDA. In this approach, the respondents' gathered responses from interview were recorded, organised, reviewed, categorised, and re-coded in MAXQDA in order to develop and explain themes do be presented in the study findings. Quantitative data were examined using IBM SPSS Statistics version 27. Descriptive Statistics were used to analyse Demographic information showing frequencies and percentages. To assess the determinant of decision criterion for choosing transportation bus company, to determine the influence of brand perception on consumer purchasing decision, to assess the effect of brand perceived quality on consumer purchasing decision and to establish the relationship between brand identity and consumer buying decision a Multiple Linear Regression analysis were used to organize the data and analyse these objectives, where the following model was developed;

Model

$$Y_3 = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \beta_4 x_4 + \epsilon$$

Where: Y3= Brand identity, β_0 = Constant Term; β_1 = Beta coefficients; X1= Brand logo design, X2= Corporate color scheme, X3= Brand name, X4=Recognition

4.0 Findings and Discussion

4.1 Descriptive Results

A descriptive analysis test was run to examine the respondents' gender, age, education as shown in Table 2. Out of 385 respondents, 46.5% of the respondents were males and 53.5% were females. Our respondents were mostly between the ages of 31 and 45 (38.7%), followed by those between the ages of 18 and 30 (25.5%). According to their educational background, bachelor's degrees made up the majority (47.5%), followed by Diploma (26.5%).

Table 2: Descriptive Results

Characteristics	Frequency (f)	Percent (%)
Sex		
Male	179	46.5
Female	206	53.5
Age		
18- 30 years	98	25.5

Married	270	70.1
	595	

Divorced	3	0.8
Other (e.g. widow)	7	1.8

4.2 Determinant of decision criterion for choosing transportation Bus Company

The study reveals several key factors influencing passengers' decisions when choosing bus companies in Dodoma. Safety and reliability, with a mean score of 3.72 and a standard deviation of 0.86, are highly prioritized, with passengers emphasizing the importance of well-maintained vehicles, regular driver training, and visible safety protocols. Bus routes and frequency, with a mean of 3.81 and a standard deviation of 0.85, are also crucial, with passengers favoring companies that offer frequent and convenient schedules. Comfort and amenities, with a mean score of 3.82 and a standard deviation of 0.84, play a significant role, as passengers value modern amenities such as Wi-Fi, air conditioning, and comfortable seating, encouraging companies to invest in these upgrades. Punctuality, with a mean score of 3.53 and a standard deviation of 0.88, is moderately important, but passengers may tolerate minor delays if other aspects like comfort and safety are satisfactory, suggesting that bus companies should focus on minimizing delays and providing real-time tracking. Pricing, with the highest mean score of 3.88 and a standard deviation of 0.87, emerges as the most critical determinant, with passengers seeking affordable ticket prices, indicating that bus companies should maintain competitive pricing strategies while balancing service quality. These findings highlight the importance of these factors in enhancing customer satisfaction and loyalty in the highly competitive bus transportation market. ease of use to further elevate the overall CRM experience within the Tanzanian airline industry.

Table 3: Descriptive analysis on the determinant of decision criterion for choosing transportation Bus Company

Construct	Mean	Std.Deviation
Safety and Reliability	3.72	0.86
Bus Routes and frequency	3.81	0.85
Comfort and Amenities	3.82	0.84
Punctuality	3.53	0.88
Pricing	3.88	0.87

4.3 Effect of brand perceived quality on consumer purchasing decision

The results show that comfortability has a slight negative influence on consumer purchasing decisions, with an unstandardized coefficient (B) of -0.037 and a p-value of 0.448, indicating that it is statistically insignificant. The confidence interval ranging from -0.133 to 0.059 further supports this lack of significance. This suggests that other factors, such as safety or reliability, are more important in shaping consumer choices, and comfort may not be a differentiating factor in brand perception. However, enhancing comfort, such as seat quality and air conditioning, could improve customer satisfaction and retention.

In contrast, reliability has a notable positive impact on consumer purchasing decisions, with a B value of 0.156 and a p-value of 0.014, making it statistically significant. The standardized coefficient (Beta = 0.605) indicates that reliability plays a substantial role in brand perception and is a key factor influencing consumer behavior in the Tanzanian bus transportation sector. Improving operational efficiency, minimizing delays, and ensuring timely departures are crucial for boosting customer trust and loyalty.

Safety is one of the most influential factors, with a B value of 0.410 and a Beta of 0.437. The p-value of 0.001 indicates a strong and statistically significant relationship between safety and consumer purchasing decisions. The confidence interval (0.298 to 0.522) further emphasizes the importance of safety in shaping consumer choices. Bus companies should focus on promoting safety protocols, vehicle maintenance, and qualified drivers to enhance brand perception and attract more consumers.

Customer service also significantly impacts consumer purchasing decisions, with a B value of 0.178 and a Beta of 0.185. The p-value of 0.002 shows that this relationship is statistically significant, suggesting that improvements in customer service positively influence consumer choices. While its impact is smaller than safety and reliability, enhancing customer service can still play a vital role in improving a bus company's brand perception and fostering customer loyalty in the competitive Tanzanian market.

Table 5: Effect of brand perceived quality on consumer purchasing decision.

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta				Lower Bound	Upper Bound
1(Constant)	.662	.160			4.135	.000	0.347	.977
Comfortability	-.037	.049	-.040		-.760	.448	-.133	.059
Reliability	.156	.058	.605		2.485	.014	.030	.257
Safety	.410	.0957	.437		7.201	.001	.298	.522

Customer Service	.178	.058	.185	3.038	.002	.293	.368
------------------	------	------	------	-------	------	------	------

a. Dependent Variable: Consumer purchase decision

4.4 The influence of brand perception on consumer purchasing decision

The results show that service quality has a significant impact on consumer purchasing decisions, with an unstandardized coefficient (B) of 0.210, meaning that a one-unit improvement in service quality increases the likelihood of consumers choosing a bus company by 0.210 units. With a p-value of 0.000, service quality is highly significant in influencing consumer decisions. This indicates that bus companies in Tanzania can attract more customers by improving aspects such as punctuality, vehicle maintenance, and staff professionalism.

Reputation also plays a crucial role, with a B value of 0.241 and a Beta of 0.254, making it slightly more influential than service quality. A unit increase in reputation results in a 0.241 increase in consumer purchasing decisions. This relationship is statistically significant ($p = 0.000$), highlighting that a strong reputation is vital for gaining consumer trust and loyalty in the competitive bus transportation sector.

Customer experience stands out as the most influential factor, with a B value of 0.271 and a Beta of 0.281. This means that every unit improvement in customer experience leads to a 0.271 increase in consumer decisions. The high t-value (5.316) and p-value (0.000) confirm the significance of this factor. Enhancing the overall customer journey—from booking to onboard comfort—can significantly boost brand perception and influence consumer behavior.

Customer feedback also plays a substantial role, with a B value of 0.212 and a Beta of 0.231. This indicates that responding to customer feedback positively influences purchasing decisions by 0.212 units. The p-value of 0.000 confirms the importance of customer feedback in shaping brand perception. Bus companies should establish effective channels for feedback and act on it promptly to strengthen brand trust and customer loyalty.

Together, service quality, reputation, customer experience, and customer feedback significantly influence consumer purchasing decisions in Tanzania's bus transportation sector, with customer experience emerging as the most impactful factor.

Table 26: The influence of brand perception on consumer purchasing decision

Model	Unstandardized Coefficients		Standardized Coefficients		t	Sig.	95.0% Confidence Interval for B	
	B	Std. Error	Beta				Lower Bound	Upper Bound
1(Constant)	.367	.143			2.567	.011	.085	.648

Service quality	.210	.052	.223	4.055	.000	.108	.312
Reputation	.241	.050	.254	4.786	.000	.142	.340
Customer experience	.271	.051	.281	5.316	.000	.170	.371
Customer feedback	.212	.043	.231	4.941	.000	.128	.297

a. Dependent Variable: Consumer purchase decision

4.5 The relationship between brand identity and consumer purchasing decisions

The results indicate that Brand Logo Design has a non-significant relationship with consumer purchasing decisions, with a coefficient ($B = 0.068$, $p = 0.251$). This contradicts prior research emphasizing the importance of logo design for brand recognition and consumer loyalty. The lack of significance may suggest that, in this context, other aspects of brand identity have a more substantial influence on purchasing decisions.

In contrast, the Corporate Colour Scheme shows a significant positive relationship with consumer decisions ($B = 0.108$, $p = 0.002$). This finding supports existing literature on the psychological impact of colours on consumer behavior, with warm colours like red and orange influencing feelings of excitement or urgency, which can drive purchasing behaviour.

The most compelling result comes from Brand Name Recognition, which has a highly significant coefficient ($B = 0.964$, $p < 0.001$), indicating a strong positive impact on consumer purchasing decisions. This finding resonates with extensive branding research, underscoring that a recognizable brand name fosters trust and conveys quality, significantly influencing purchase decisions. A key informant highlighted that reputable bus companies attract consumers due to their established trust and popularity.

These findings underscore the crucial role of brand name recognition in driving consumer choices and suggest that corporate colour schemes are a powerful tool for influencing consumer perceptions. However, the non-significant role of logo design in this study suggests that in this specific context, other elements of brand identity, such as the name and colour scheme, may be more influential. These results have important implications for marketers and brand managers, recommending a focus on enhancing brand name visibility and strategically leveraging colour schemes to boost consumer engagement and loyalty.

Table 8: Coefficient Regression Results

		Coefficients ^a		t	Sig.
		Unstandardized Coefficients	Standardized Coefficients		
Model		B	Std. Error	Beta

a. Dependent Variable: Customer Purchasing Decision

5.0 Conclusion and Recommendation

5.1 Conclusion

In conclusion, The study investigated the effect of brand reputation on consumer buying decision to passengers of Bus companies in Dodoma City Council by adopting only four of Consumer Behavior and brand equity theory aspects which are determinants of decision criterion, brand perceived quality, brand perception and brand identity. The analysis shows that age ($P = 0.000$, $B = 1.250$) and economic factors ($P = 0.000$, $B = 1.750$) significantly influence passengers' choice of bus companies in Dodoma. Social factors ($P = 0.096$), marital status ($P = 0.230$), household members ($P = 0.458$), and political factors ($P = 0.639$) were not significant predictors. The analysis shows that brand name recognition ($P = 0.000$, $B = 0.964$) and corporate color scheme ($P = 0.002$, $B = 0.108$) significantly impact consumer purchasing decisions. Brand logo design ($P = 0.251$) was not a significant factor. Brand name recognition had the strongest effect on purchasing decisions.

These findings address the research questions and objectives by demonstrating the significant impact of determinants of decision criterion, brand perceived quality, brand perception and brand identity on consumer purchase decision in the Dodoma City Council bus transportation services. The results extend previous research by providing empirical evidence from a specific geographic and industry context, confirming the critical role of brand reputation in business performance. Moreover, the findings support the Consumer Behavior and brand equity Theory, highlighting the importance of long-term, mutually beneficial customer satisfaction for business success.

The findings of this study underscore the critical strategic imperatives for Bus transportation business in Tanzania. Bus companies should focus on targeting age and economic factors in their marketing strategies, as these significantly impact consumer choice. Additionally, enhancing brand identity through strong name recognition and a distinctive color scheme is crucial. Equally important are improving customer service, reliability, and comfort to attract and retain customers.

5.2 Recommendation

Tanzanian bus companies should prioritize enhancing brand name recognition through consistent branding and positive customer experiences. They should strategically use corporate colour schemes to create a distinctive and emotionally appealing brand image. Improving service quality, including staff training, vehicle maintenance, and reliability, is crucial for increasing customer satisfaction. Additionally, developing effective feedback mechanisms to

show customers that their input is valued can further strengthen customer loyalty. Investing in comfort and punctuality will also enhance the overall passenger experience and competitive position in the market.

5.3 Areas for Future Research

While this study offers valuable insights into Tanzanian Bus transportation, there's room for further exploration for researchers to gain a more distinctions understanding of the industry. Firstly, Investigate the specific factors that drive customer satisfaction and retention in bus services, including the impact of service consistency, comfort, and overall experience.

Secondly, Comparative Analysis of Bus Service Models: Analyze different bus service models and their effectiveness in various regions or countries to identify best practices that could be adapted for the Tanzanian context and also environmental and Sustainability Practices, Explore the adoption of environmentally friendly practices in bus operations, such as fuel efficiency, emissions reduction, and the use of alternative energy source

Influence of Cashless System on Commercial Bank Financial Performance in Tanzania

Imani Msuya¹ & Lilian Simon²

¹ College of Business Education-Dodoma Campus, Dodoma.

² College of Business Education-Dodoma Campus, Dodoma.

Abstract

This study explores how cashless payment systems specifically credit cards, debit cards, and POS services affect the financial performance of commercial banks in Tanzania. Through a quantitative approach using secondary data from audited financial statements, the study examines the link between these systems and various financial metrics, employing methods such as correlation analysis, descriptive statistics, multiple regression, and the Hausmann test. The findings indicate a strong and positive relationship between cashless payment adoption and improved financial performance, underscoring advantages such as higher revenue, reduced operational costs, and enhanced risk management. Consequently, the study recommends both policy and strategic measures. First, it suggests that the government should establish a supportive regulatory framework to facilitate cashless payment adoption, including incentives for banks and consumers alike. Additionally, it advises commercial banks to invest in technological infrastructure, staff training, and marketing to encourage broader use of cashless systems. By implementing these recommendations, Tanzania can not only strengthen financial sector efficiency but also stimulate economic growth.

Keywords: *Cashless payment systems, Credit cards, Debit cards, and POS services and Financial Performance*

1. Introduction

Banks are central to a country's financial system development, providing essential services like deposit mobilization, money transfers, settlements, and lending to firms and households, which, in turn, fuel economic growth and development (Omotayo & Olusegun, 2023). Such roles foster high levels of financial performance in banks and other financial institutions. Banks hold particular importance compared to the limited and less trusted non-bank financial institutions, which cannot engage in significant financial intermediation (Jumba & Wepukhulu, 2019). Commercial banks enable economic growth when they maintain steady financial performance.

Currently, the financial performance of commercial banks is a global concern due to its impact on the standard of living and economic growth (George, Karatu & Edward, 2020). Financial performance may determine whether a commercial bank survives or fails. In essence, the financial performance of banks reflects national economic health, given their critical role in financial intermediation (Njenga, 2022). A key question arises: how do cashless payment systems affect the financial performance of commercial banks in Tanzania?

The rise of cashless systems has been widely discussed in recent studies due to their perceived benefits for businesses and the economy (Jumba & Wepukhulu, 2019). Cashless systems ease transactions, increase revenue, improve operational efficiency, and lower costs (Omotayo & Olusegun, 2023). Previously, banking processes were often tedious and time-consuming (Rahman et al., 2022), but cashless systems now ensure seamless 24/7 banking services, enhancing service quality and customer satisfaction, which signal improved financial performance (Attah & Angioha, 2018).

Research shows that ATMs, internet banking, credit, and debit cards reduce bank expenses and boost profitability (Akara, 2018; Gündoğdu & Taşkin, 2017). Yet, Rahman et al. (2020) found that stronger IT infrastructure in the U.S. helps digital banking generate more revenue there compared to developing nations.

Cashless systems also enhance business efficiency by reducing operating expenses and boosting revenues (Ardizzi, Crudu & Petraglia, 2019). Implementing technology reduces workforce requirements in banking operations (Dubey & Sharma, 2022). Neves et al. (2020) noted that at consistent operating costs, cashless systems increase sales volume, raising banks' financial performance. Consequently, the use of cashless systems in developing countries grows bank assets, lowers costs, and improves service quality (Bousrih, 2022).

Some studies, however, report mixed outcomes. For instance, Malhotra and Wang et al. (2021) found that digital banking did not significantly impact profitability in Chinese banks. In Turkey, high competition in digital banking led to lower returns (Siddik et al., 2019). Conversely, studies in China, Kenya, and other regions noted positive impacts of cashless systems on financial performance (Chen, Huang & Ye, 2020; Ndhine et al., 2020; Mutisya & Atheru, 2019), while others observed insignificant effects (Nwankwo & Agbo, 2021).

Banks are integral to a country's financial system, providing essential services such as deposit mobilization, money transfers, settlements, and lending, which contribute significantly to economic growth and development (Omotayo & Olusegun, 2023). These roles sustain strong financial performance in banks and other financial institutions. Compared to the limited and less trusted non-bank financial institutions, banks hold particular significance as key intermediaries (Jumba & Wepukhulu, 2019). The stable financial performance of commercial banks, therefore, plays a crucial role in economic growth.

The financial performance of commercial banks is a global concern, directly impacting living standards and economic health (George, Karatu & Edward, 2020). Bank performance not only determines their survival but also reflects national economic stability (Njenga, 2022). This raises a pertinent question: how do cashless payment systems influence the financial performance of commercial banks in Tanzania?

Cashless systems are increasingly recognized for their economic and business benefits (Jumba & Wepukhulu, 2019). They streamline transactions, increase revenue, improve operational efficiency, and reduce costs (Omotayo & Olusegun, 2023). Previously, banking processes were often slow and tedious (Rahman et al., 2022); now, cashless systems offer round-the-clock access, enhancing service quality and customer satisfaction (Attah & Angioha, 2018).

Research supports that ATMs, internet banking, and card systems lower expenses and boost profitability (Akara, 2018; Gündoğdu & Taşkin, 2017), though stronger IT infrastructure in places like the U.S. generates more revenue from digital banking than in developing nations (Rahman et al., 2020). Moreover, cashless systems improve efficiency by cutting operational costs and increasing sales (Ardizzi, Crudu & Petraglia, 2019; Neves et al., 2020). In developing countries, they help grow assets, reduce costs, and improve service quality (Bousrih, 2022).

Nevertheless, findings are mixed. In China, digital banking did not significantly enhance profitability (Malhotra & Wang et al., 2021), while intense digital competition in Turkey resulted in lower returns (Siddik et al., 2019). Conversely, studies in China, Kenya, and other regions report positive effects on financial performance (Chen, Huang & Ye, 2020; Ndhine et al., 2020; Mutisya & Atheru, 2019), though some show minimal impact (Nwankwo & Agbo, 2021). Despite the importance of cashless systems, their impact on financial performance remains underexplored in Tanzania. This study will investigate the effects of cashless systems on the financial performance of selected Tanzanian commercial banks, addressing a crucial and under-researched area in the country's banking sector.

2.0. Methodology

This study utilized a cross-sectional survey design to collect data from diverse populations at a single point in time, facilitating generalization (Saunders et al., 2019). The design was particularly suitable for investigating the relationship between cashless payment systems and the financial performance of commercial banks in Tanzania, allowing for comparisons of sales collected through various payment methods against their Return on Equity (ROE) (Creswell & Creswell, 2018).

2.1. Population and Sampling

The research took place in Tanzania, specifically targeting commercial banks under the DSE. The study's target population of financial statements of all commercial banks listed under DSE in Tanzania. However, the purposive sampling was employed to secure sample financial information with regard to collected sales via credit cards, debit cards, POS with respect to ROE for the period between 2015 to 2023.

2.3. Data Collection Method

The study employed a quantitative research approach to investigate effect of sales collected through credit cards, debit cards, POS with respect to ROE for the period between 2015 to 2023. Data collection involved documentary as data were stored in documentary and were in monetary terms.

2.4. Ethical Considerations

The researcher began by obtaining research clearance from the College of Business Education authority for researcher introduction to the institution offering data. Then the consent forms were prepared for asking participants to sign and confirm their voluntary participation after being informed that their information would be used strictly for research purposes. Finally, participants were assured that confidentiality would be upheld both during and after the data collection and analysis phases.

3. Results and Discussion

Results have been obtained based on the effect of the revenues collected through credit cards, debit cards, and POS on the financial performance in terms of the ROE.

The findings in Table 1 indicate a significant positive correlation of 0.5931 between return on equity (ROE) and point of sales (POS), suggesting a robust relationship between these two variables. In addition, the correlation coefficient for ROE and debit card sales stands at 0.5107, reflecting a strong positive association. Similarly, credit card sales also show a correlation coefficient of 0.5107 with ROE, further supporting the notion of a positive relationship.

These results are in line with results Ali et al. (2023) who found that integrating advanced payment systems, including credit and debit card transactions, significantly enhances profitability metrics such as ROE in retail businesses. Additionally, study findings were in harmony with study findings of Smith and Jones (2022) who emphasize that effective management of point-of-sale systems correlates positively with financial outcomes, reinforcing the findings of a substantial relationship between sales methods and overall company performance.

Furthermore, a study by Chen et al. (2023) got similar findings of the current study by affirming the role of digital payment solutions in enhancing financial performance. The study concluded that businesses adopting these technologies experience a noticeable increase in ROE. Similarly, results of the study mirror-imaged those of Kumar and Patel (2024) who indicated that customer engagement through diverse payment options leads to improved financial metrics, including a positive impact on ROE. Lastly, Johnson et al. (2023) yielded comparable results to the current study's results that there is a relationship between cashless transactions and financial performance in SMEs, revealing a strong correlation between effective payment processing and enhanced ROE. These studies collectively reinforce the significant relationship between payment methods and financial performance indicators like ROE.

Table 2 presents the descriptive statistics for various financial variables of commercial banks, specifically focusing on debit card sales, point of sale (POS) transactions, credit card sales, and return on equity (ROE). Each variable is measured across 408 observations, providing a comprehensive overview of the data.

Debit Card Sales (Ln Debit Card)

The mean value for debit card sales is approximately 14.27, with a standard deviation of 1.78. This suggests a relatively high consistency among the banks in their debit card transactions, with a minimum of 11 and a maximum of 18.6. The moderate variability indicates that while most banks are achieving similar levels of debit card sales, there are outliers with significantly higher transactions.

These study findings were in line with those of Miller et al. (2023) who found a strong positive relationship between debit card usage and bank profitability, indicating that higher debit card sales contribute significantly to return on equity (ROE). Likewise, these study results are comparable to those of the Garcia & Lin (2024) who observed that banks with advanced debit card offerings reported enhanced customer satisfaction, leading to increased transaction volumes and ultimately better financial performance.

Besides, these study findings concur with those of Olsen et al. (2023) who highlighted that integrating innovative features in debit cards, such as rewards programs, correlates with increased sales, positively affecting banks' overall profitability. Similarly, these study results are congruent to those of Kumar et al. (2024) found that the adoption of digital wallets linked to debit card sales results in higher transaction volumes and a notable improvement in ROE.

Point of Sale Transactions (Unpoint of Sale)

The average value for POS transactions stands at 12.75, with a larger standard deviation of 2.65, indicating more variation in POS performance among the banks compared to debit card sales. The minimum value is 7.3, and the maximum is 19, demonstrating a broad range in POS transactions, which may reflect differences in bank strategies and customer engagement. These study findings consistent with those of Kim & Park (2022) who identified a direct correlation between the volume of POS transactions and ROE, asserting that enhanced POS management leads to improved customer experiences and increased bank profitability.

Likewise, the study results matched with those of Lee & Tan (2023) discovered that banks investing in advanced POS technologies see a significant increase in transaction volumes, which correlates with higher profitability metrics, including ROE. Besides, results of the Choi *et al.* (2024) demonstrated that the successful deployment of mobile POS systems is linked to higher customer engagement, resulting in improved financial performance across commercial banks.

Equally, study findings synchronised with those of Nguyen & Vo (2023) emphasized that banks with a robust POS strategy outperform their competitors in terms of ROE, underscoring the importance of effective transaction channels.

Credit Card Sales (Ln Credit Card)

The mean credit card sales is 11.87, accompanied by a standard deviation of 2.85. The range of credit card sales from 9.08 to 18 shows that while some banks have a strong performance in credit card transactions, others are lagging, which could suggest varying levels of customer preference or promotional efforts. These results agree with those of Adams & Bright (2023) who found that increased credit card usage among customers correlates with higher ROE, indicating that banks effectively managing their credit card portfolios can enhance profitability. Likewise, Zhang *et al.* (2024) who reported that offering competitive credit card benefits leads to greater customer loyalty and increased spending, positively impacting bank profitability metrics.

Besides, study findings of resemble those of Martinez & Chen (2023) who highlighted that banks that actively promote credit card usage through marketing initiatives experience improved financial outcomes, including a significant rise in ROE. Equally, these study findings resemble with those of Patel & Ghosh (2022) who observed that the integration of rewards and cashback programs in credit cards results in higher sales, directly contributing to improved ROE for banks.

Return on Equity (Ln ROE)

The mean ROE is reported at 29.72, with a standard deviation of 4.22, indicating a solid performance among the banks. The minimum ROE is 21, while the maximum is 39.9, reflecting

a significant disparity in profitability among the banks. This suggests that while some banks are highly efficient in generating returns relative to their equity, others may need to improve their operational strategies.

Likewise, these study findings are similar to those of Nguyen et al. (2024) who indicated that efficient operational strategies, including optimal payment processing, are essential for maintaining high ROE among commercial banks. Correspondingly, these study findings are in line with results of O'Reilly & Fitzgerald (2023) who highlighted that bank focusing on customer-centric strategies, such as personalized services and efficient payment systems, report significantly higher ROE.

On the other hand, these results were in line with those of Singh & Kumar (2022) who analyzed the impact of digital transformation in banking, finding that banks embracing technology show marked improvements in ROE, emphasizing the link between innovation and profitability.

Similarly, these results are comparable to those of Smith et al. (2023) who revealed that effective risk management practices, coupled with diverse payment options, contribute to enhanced ROE, demonstrating the importance of strategic financial management. These studies collectively emphasize the significance of payment methods in influencing financial performance metrics such as ROE, corroborating the findings from the descriptive statistics in Table 2. The consistent patterns across various studies underline the importance of a strategic focus on payment systems in driving profitability in the banking sector.

The findings from the pooled Ordinary Least Squares (OLS) regression analysis in Table 3 reveal critical insights into the relationship between cashless payment systems and the financial performance of commercial banks from 2010 to 2023. The analysis is well-supported by a range of contemporary studies that validate and extend the understanding of this relationship. Below, we outline how current studies resonate with the key findings presented in the analysis.

The regression results in Table 3 from the analysis indicate that cashless payment variables, such as debit and credit card transactions, show significant positive coefficients, suggesting an association with improved financial performance metrics. These study findings are in line with those of Adams & Bright (2023) who corroborate this finding by demonstrating that increased debit card transactions are positively correlated with ROE, thus underscoring the impact of cashless systems on financial performance.

Equally, these study findings of Miller et al. (2023) who reinforce this notion by establishing a strong link between cashless transaction volumes and overall profitability, confirming that the adoption of cashless payments leads to improved financial outcomes. Likewise, these study findings concur with those of Nguyen et al. (2024) who further validate this relationship by showing that banks with higher credit card usage experience significant improvements in ROE, emphasizing the importance of diversified payment options.

Correspondingly, these study findings were in line with those of Kim & Park (2022) present evidence that effective utilization of point-of-sale systems translates to enhanced financial performance, aligning with the findings regarding the effectiveness of cashless methods in driving profitability. On the other hand, these study findings resemble those of Liu et al. (2022) who utilized various statistical tests, confirming the statistically significant positive influence of cashless payment methods on ROE, which echoes the results of the current analysis.

Equally, these study findings were congruent to those of Smith & Jones (2022) conducted robustness checks on their financial performance models and consistently found positive impacts of cashless systems, reinforcing the reliability of the results. Correspondingly, these study findings were in harmony with those of Garcia & Ramirez (2023) demonstrated that the relationship between cashless systems and profitability held robust across different econometric models, solidifying the assertion that digital payments enhance bank performance.

The findings in Table 3 significantly align with recent research that underscores the critical role of cashless payment systems in enhancing the financial performance of commercial banks from 2010 to 2023. The robust evidence from current studies reinforces the necessity for banks to prioritize the development and promotion of cashless systems to meet evolving consumer preferences and maintain competitiveness in the digital banking landscape. The ongoing research validates the findings, suggesting that banks must adapt to these changes to optimize their financial performance effectively.

Table 5 shows that results for panel data, where there are multiple observations over time for the same entities. The method assumes that the entity-specific effects are random and uncorrelated with the descriptive variables in the model. The table 6 of Hausman test shows the estimated coefficients under FE and RE, the difference between these coefficients, and the standard error of the difference determine the appropriateness of model of choice.

4. Conclusions and Recommendations

4.1. Conclusions

This study aims to investigate the impact of cashless payment systems on the financial performance of selected banks in Tanzania, specifically focusing on Return on Equity (ROE). It draws from commercial banks listed on the Dar es Salaam Stock Exchange (DSE), highlighting that while these banks have invested significantly in cashless payment systems, the economic benefits of such investments remain unclear.

The findings indicate that credit cards, debit cards, and point-of-sale systems positively affect the financial performance of these banks in terms of ROE. The study emphasizes the importance of adopting cashless systems, particularly credit and debit cards, as well as point-of-sale solutions, to enhance financial performance in Tanzanian commercial banks. The overall conclusion is that the utilization of these cashless payment methods can significantly contribute to improved ROE for banks in Tanzania.

4.2. Recommendations

The government, particularly the Ministry of Finance, should focus on developing policies and strategies for the adoption of cashless payment systems to leverage the untapped economic potential in financial transactions. Additionally, bank management should create plans for broader implementation of these systems within their institutions. This includes training bank personnel, installing cashless payment systems, and ensuring consistent usage. Such efforts will help commercial banks realize the economic benefits of cashless transactions, achieve competitive advantages, and enhance their overall success.

The Influence of Laissez Faire Leadership on Water Service Delivery Authorities: Insights from Dodoma City

Richard Msacky¹ & Isabela Mosses²

¹ College of Business Education-Dodoma Campus, Dodoma.

² College of Business Education-Dodoma Campus, Dodoma.

Abstract

The study aimed to examine the influence of laissez-faire leadership style on employees motivation in water service delivery authorities, specifically DUWASA. Through a deep

examination of existing literature from diverse geographic locations including Europe, the United States, Canada, and African countries, the study utilized a comprehensive understanding of the subject matter. Findings from the United States identified the significance of setting clear objectives in enhancing employee motivation, while Canadian research highlights the role of recognition, rewards, and organizational commitment in driving motivation and job performance. Studies from Europe, especially Germany, emphasize the effects of leadership and job crafting on employee motivation. African studies highlight the influence of training, development, and empowerment on employee motivation and performance within varied cultural contexts. Vrooms expectancy theory was used to understand the intricacies of employees efforts related to their expectations from leaders/organizations. The study's sample size was 172 employees from DUWASA. Data were collected using surveyed questionnaires and interviews and were analyzed by using multiple logistics regression model through descriptive and inferential statistics. The findings of this study concluded that the laissez-faire leadership style positively motivated employees at DUWASA. The study recommended that, leaders should apply the laissez-faire leadership style by adapting to prevailing situations and types of workforces to ensure that their employees are well-motivated to work for the organization's success. It also offers insights for organizational leaders and managers, advocating for development of laissez-faire leadership elements to create a positive work environment conducive for motivating the staff.

Keywords: *Laissez Faire, Leadership, Water Service Delivery, Employees Motivation.*

1.0 Introduction

When developing a motivational strategy, leaders must take into account the elements that push workers to perform at their highest levels on an individual and group level, which affects worker's effectiveness (Saad & Abbas, 2019). Creating and putting into practice policies and strategies to raise employee motivation depends heavily on competent leadership. Different leadership styles have been shown to enhance workers' morale, output, and ability to overcome obstacles in the workplace (Sandybayev, 2019).

Leadership is the process through which a person inspires or persuades others to accomplish the objectives of an organization (Fiaz *et al.*, 2017). It is the process of boosting and promoting employees' sense of self to accomplish tasks and goals within the organization. Improving quality results, productivity, and customer satisfaction from a business standpoint is ideally the goal of a leader in performance management.

Employee motivation rates are lowered by incompetent leadership style. In particular, hierarchical and directive leadership approaches can jeopardize workers' welfare and cause unfavorable effects within the organization (Gottfredson & Reina, 2020). Rather than maximizing motivation, this could result in never-ending disputes.

Employees' motivation is a strategy for achieving uncommon objectives, whereby they go above and beyond the official objectives of the company. In its broadest sense, employee

motivation refers to how emotionally or psychologically obligated workers are to the company (Anitha, 2014). Employees' motivation can be significantly impacted by an organization's leadership style.

A laissez-faire leadership style is when leaders provide minimal guidance and let employees make their own decisions, which can have effects on employees' motivation and job performance (Bass & Bass, 2008). While some employees may appreciate the autonomy and freedom, others may feel lost without clear direction (Bass & Bass, 2008). This style may lead to varying levels of motivation and job performance depending on individual preferences and the nature of the tasks at hand.

Different studies were conducted in Europe, America, Asia and Africa in relation to this study. In the UK, studies found that poor leadership style was associated with lower levels of job satisfaction and higher levels of absenteeism (Kalliath *et al.*, 2013). Organizations may experience higher turnover rates and lower levels of employee engagement, which can negatively impact the company's overall motivation.

In Asia, the study conducted in China found that poor organizational leadership style was associated with increased employee stress and burnout (Wang *et al.*, 2013). One of the main causes of poor employee motivation in Asia was lack of communication and collaboration between management and employees. A study in Malaysia found that when there was a lack of communication and collaboration, employees were less likely to feel connected to the company and its leaders (Islam *et al.*, 2015). The effects of poor employee motivation in Asia can be similar to those seen in Europe, including decreased employee job satisfaction, increased turnover rates, and decreased productivity.

In America, the study of leadership style and motivation has also been documented. The study conducted in the United States by Locke and Latham, (2013) highlighted the significance of setting specific and challenging goals in motivating employees. They found that when employees have clear objectives to strive for, it enhances their motivation, leading to improved job performance. Similarly, the study by Grant, (2012) documented that intrinsic motivation, such as the desire for personal growth and development, positively influences job performance. These findings highlighted the importance of understanding individual motivations to enhance overall organizational performance. One of the main causes of poor organizational culture in the Americas is a lack of employee empowerment and autonomy. The study in Brazil found that when employees were not given the freedom to make decisions by their leaders, they were less likely to feel invested in the company and its values (Medeiros *et al.*, 2017).

In African countries like Nigeria and South Africa, researchers have documented some motivational factors concerning leadership styles. The study by Odesanya (2020) in Nigeria focused on the impact of training and development on employee motivation. They found that when leaders invest in training employees, it enhances skills and boosts motivation and performance. In South Africa, a study by Ramlall. (2012) examined the role of empowerment in motivating employees. Empowerment, which involves giving employees autonomy and

power to make decisions, was found to be a significant factor of motivation. These African studies highlight the importance of considering leadership styles and organizational practices in enhancing motivation.

In Tanzania, leadership style can be traced back to the 1960s which marked a crucial era of independence from colonial rule. During this period, Tanzania's leadership style was deeply influenced by the socialist ideologies championed by its first president, Julius Nyerere. The government adopted social and self-reliance, a policy aimed at fostering collective ownership and communal living. In this context, the leadership style was characterized by a strong sense of collectivism and a focus on social equity (Laaksonen, 2018). Workplaces in the 1960s prioritized cooperation, unity, and shared responsibility. Organizations, both public and private, aligned their operations with the leaders' socialist goals, emphasizing the importance of community welfare over individual gain (Mkandawire, 1989).

In the years of 1980s the nation faced economic downturns and a debt crisis that led to structural adjustment programs imposed by international financial institutions. As a result, the leadership style during this decade shifted towards a more market-oriented and pragmatic approach which emphasized efficiency, cost-effectiveness, and performance-driven outcomes (Ndulu, 1999). The shift was characterized by a greater focus on individual performance and accountability, which was a departure from the collective efforts of the 1960s (Cook & Kimuyu, 2020).

The 1990s witnessed a period of political liberalization and economic reforms in Tanzania. The nation moved towards multiparty democracy, leading to shifts in leadership style to accommodate more diverse political and ideological perspectives (Ndulu, 1999). The government's economic liberalization policies encouraged private sector growth and foreign investment, prompting organizations to adopt a more market-oriented and customer-focused approach (Hyden & Leslie, 2002). Innovation and flexibility became critical for the survival and growth of public and private organizations. This shift of leadership allowed greater autonomy, decision-making power, and diversity of thought within organizations (Mbwambo, 2007).

Therefore, Tanzania like many other developing countries, faces a range of challenges when it comes to maintaining a positive leadership style that promotes employee motivation. In public organizations, employees often face a range of issues that impact their motivation levels, including poor working conditions, inadequate compensation schemes, and limited opportunities for career advancement (Omari, Lukubata, & Salum, 2021).

Several initiatives have been implemented in Tanzania to address the issue of leadership styles and employee motivation. For instance, One of the notable reforms the Government introduced was the establishment of Decentralization whereby the control of service delivery like water supply was brought closer to the people through Local Government Authorities, Marijani (2017). Mbogela and Mollel (2014) suggested that decentralization had granted autonomy to Local Governments in both developed and developing countries. They were also of the view

that, decentralization had helped in improving service delivery to the communities by supporting efficiency and effective operation at the local levels. Whereas decentralization directs community involvement and ownership through participating in identifying issues of concern in areas of service delivery in their areas; some problems were identified including complaints from village leaders about district authorities' failures to respond to local people's priorities (Marijani (2017)). In response to this, the Government introduced Agencification in which delegation of power to different authorities was done in order to improve service delivery, (Mkoma (2021)). The Government remained with responsibility of monitoring these agencies through introduction of different policies that guided operations of the mentioned agencies. For instance, in 2002, the Government introduced the new National Water Policy (NAWAPO) to rectify the previous shortcomings in the water service delivery programmes. In response to the Millennium Development Goals (MDGs) 2025 that calls for a massive worldwide increase of access to water and sanitation services, the Tanzanian Government introduced Water Supply and Sanitation Institutional Framework to serve the urban and rural areas Doering, (2005). Different water authorities for managing water supply and sanitation in urban and rural areas, including DUWASA, were introduced.

These reforms in the public sector led to increased motivation among employees since they were provided with autonomy to operate with full responsibility. The fear of repercussions for misconduct, coupled with the prospect of recognition for ethical conduct, motivated employees to uphold high standards of performance (Schedler, 1999).

Furthermore, a great deal of research has been conducted in Tanzania and other nations to investigate the relationship between leadership styles and motivation of employees and organizations. Some studies have looked at the effects of transactional leadership, transformational leadership, and other leadership styles on elements like employee engagement and job satisfaction while others have looked at the impact of Leadership Styles on Organizational Performance (Mshanga. I, 2022; Al Khajeh, 2018; Cherian, 2020). This suggests that there isn't much research on how a laissez-faire leadership style contributes to the motivation of employees specifically at DUWASA in Tanzania.

1.2 Statement of the Problem

An organizations' leadership style can significantly impact employee motivation. Different leadership styles, employee motivation, and communication within the organization can result from different leadership philosophies, and these factors can all have an impact on the organization's capacity to meet its goals and objectives (Aliful & Islam, 2020).

Motivation of employees is essential for enhancing employee retention, innovation and creativity, efficiency, improve quality service delivery and reduce employee absenteeism, and all these can be significantly impacted by an organization's leadership style. This is well documented by Nwannebuife (2017) who stressed that, leaders have to recognize the importance of motivation of employees such as training and career development,

compensation, recognition, and promotion among other factors to improve efficiency and productivity of organizations. Recognizing this, the government employed several initiatives to address the issue of employee motivation. The government established Standing Orders for Public Service of 2009 to regulate employees' welfare in public organizations by which all leaders must abide to, the establishment of a minimum wage and incentive schemes for employees which motivate them to produce effectively (Mfikwa et al, (2022) & URT, 2009). Also, Tanzania adopted transparent and accountable governance structures that enhanced accountability in the public sector leading to increased motivation among employees alongside the introduction of Water Supply and Sanitation Institutional Framework to serve the urban and rural areas Doering, (2005).

Despite the initiatives taken by the Government, there are still challenges prevailing when it comes to maintaining a positive leadership style that promotes employee motivation. In public organizations especially the water service delivery authorities, employees often face various issues that impact their motivation levels, including poor working conditions, inadequate compensation schemes, and limited opportunities for career advancement leading to employees burnout, absenteeism and low engagement (Omari, Lukubata, & Salum, 2021). It was reported that, only 40% of employees in Dodoma were reported as being motivated by their jobs, indicating the need for further research and initiatives to address the issue (URT, 2020).

Existing research including studies by (Kshirsagar and Ramgade, 2021; Wong, 2018; Iqbal et al (2015)) were carried out in foreign countries with different cultures. Furthermore, studies in Tanzania that were reviewed revealed that most of them were undertaken in sectors of Health and Education sectors (Mpembeni, et al. 2015; Kigwangalla, 2012; Mushwaim, 2014; Muze, 2014). The study of Motivation of employees in water service delivery authorities is important to show the relevance interms of organization culture and physical environment that would provide suggestions to improving Government policies, advise and recommendation to leaders on improving employees motivation in the workplace.

2.0 Literature Review

2.1 Theoretical Literature Review

The study used expectancy theory of motivation, proposed by Victor H. Vroom in 1964. This is a psychological theory that seeks to explain why individuals choose certain behaviors based on the perceived outcomes and their expectations of achieving those outcomes. According to Vroom, motivation is influenced by three key factors: Expectancy, Instrumentality, and Valence.

Expectancy refers to an individual's belief that their efforts will result in the desired performance level. Instrumentality is the belief that performance will lead to a particular outcome, and Valence is the value or desirability attached to that outcome. According to this

theory, individuals are motivated to act when they believe that their efforts will result in a positive outcome and that this outcome is worth pursuing (Vroom, 1964).

The relevance of the Expectancy Theory to this study is that it provides insights into how employees' motivation is influenced by their beliefs about the relationship between their effort, performance, and outcomes in the context of leadership style (Baakeel, 2018). If employees perceive a strong link between their efforts, performance, and desired outcomes, and if they attach a positive value to those outcomes, their motivation to perform well may be higher (Mathibe, 2008). On the other hand, if employees perceive a weak link between their efforts, performance, and outcomes, or if they do not value the outcomes, their motivation may be lowered.

This theory has proven to be relevant to the study by examining DUWASA employees' expectations of their efforts and the outcomes of these efforts. The theory was applicable in the sense that, many employees expected to be rewarded after obtaining good performance in their tasks, and others expected to be recognized and advanced in terms of career development and training. Employees of DUWASA expected leaders/supervisors to provide them with autonomy regarding the execution of their duties, when they were provided with this, they were motivated (Mathibe, 2008)

Laissez-faire leadership style prevailed concerning this theory in that; most employees expected to be trusted in executing the delegated tasks and given autonomy in making decisions regarding the tasks; as a result of their good performance, they eventually expected to be recognized for their achievements.

2.2 Empirical Literature Review

Leadership style is a crucial factor that significantly influences employees' motivation within organizations. Empirical literature reviews have consistently explored how different leadership styles contribute to employees' motivation, engagement, and overall performance. This paper discusses the role of laissez-faire leadership style on employees' motivation based on insights from empirical studies.

Empirical research, such as the study conducted by Bizza & Irbo. (2020) stresses that, Laissez-faire leadership has a significant and positive relationship with employee commitment in organizations.

Den Hartog & Belschaks' study (2012) indicated that empowerment and laissez-faire leadership in employees' perceptions are closer to each other than researchers previously thought. Employees feel more empowered when they are given the freedom in making decisions concerning their responsibilities.

Laissez-faire leadership allows subordinates to have autonomy (Sorenson, 2000; Chaudhry and Javed, 2012; Yang, 2015; Pahi et al., 2018). Without supervisors' high requirements and close monitoring, high-performance-oriented subordinates can do familiar tasks in the way they prefer, making them look successful. Secondly, laissez-faire supervisors shrink their leadership duties and leave much responsibility to subordinates, enabling them to take over the influence of such supervisors (Bass and Bass, 2009). By making decisions or taking sides in disputes when their supervisor is absent, subordinates may demonstrate their leadership abilities.

3.0 Methodology

The research was conducted at Dodoma Urban Water Supply and Sanitation Authority which is charged with the overall responsibility of operations and management of water supply and sanitation services within Dodoma City Council. The study area of DUWASA was purposely selected because only 40% of employees in Dodoma were reported as being motivated by their jobs (URT, 2020) indicating the need for further research and initiatives to address the issue and the reason for choosing Dodoma City is due to its uniqueness of being the capital city of the country with majority of public servants compared to other cities.

A quantitative research approach was used, which offered a more comprehensive understanding of the research question. The study used a cross-sectional research design. This design is commonly used in social sciences and health research to explore patterns and associations among variables.

3.1 Sample and Sampling Procedures

The sample size for this study was 172 employees obtained by using Yamane formula from 301 employees of DUWASA (URT, 2023). The study chose a desired level of precision of $e=0.05$). In calculating the sample size, the following formula was applied;

$$n = N / 1 + Ne^2$$

Where: n = sample size, N = population and e = level of precision

The Population size (N) of DUWASA = 301 employees

A margin of error (e) of 0.05, which is equivalent to 5% or 0.05 in decimal form is used.

$$\begin{aligned} n &= \frac{301}{1 + 301(0.05^2)} \\ n &= \frac{301}{(1 + 301(0.0025))} \\ n &= 301 / (1 + 0.75) \\ n &= 301 / 1.75 \\ n &= 172 \end{aligned}$$

So, the sample size (n) required for this study was 172 employees. Both probability and non-probability sampling techniques were used in the selection of the sample size. Whereas, simple random sampling was used to select employees at DUWASA and purposive sampling was used to select ten (10) key informants who were heads of departments and most experienced staff at DUWASA. The key informants were interviewed to obtain deep information about the study and the 172 employees were provided with questionnaires. The questionnaires were structured and standardized, arranged in a 5-point Likert scale. The questionnaires were distributed to a random sample of employees, ensuring that data was collected from various levels of the employees in an organization, including top management, middle management, and frontline employees. The responses from the questionnaires were analyzed quantitatively to identify trends, patterns, and correlations between leadership style and employee motivation. A total number of 172 questionnaires were distributed to the employees.

Data was quantitatively analyzed with the help of the computer software named the Statistical Package for Social Sciences (SPSS) and Stata. The quantitative methods applied were descriptive statistics and inferential statistics to assess the contribution of leadership style on employees' motivation at DUWASA. Descriptive statistics in frequency were used to explain the demographic information of the DUWASA Employees and the employee motivation of the respondents. Then, inferential statistics employed the Binary Logistic Regression to predict the influence of laissez-faire leadership style on Employee motivation. The following econometric equation was used in the analysis;

$$\text{logit}\left(\frac{p}{1-p}\right) = \frac{e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4}}{1 + e^{\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4}}$$

Where:

Logit = logistic link function

p = probability that there is influence of laissez-faire leadership style on Employee motivation.

1-p = probability that there is no influence of laissez-faire leadership style on Employee motivation.

β_0 = intercept

$\beta_1 - \beta_4$ = parameter estimates or logit coefficients

y = Employee motivation

X1= Employee guidance, X2= Delegation of tasks, X3= Autonomy for the team, ϵ = Error estimates.

4.0 Results and discussion

This section presents the findings and discussions regarding the role of laissez faire leadership style on Employee' s motivation. The results are obtained from descriptive statistics and inferential statistics. The demographic characteristics of the respondents, associations between leadership style and Employee motivation, and the influence of leadership style on Employee motivation are the main parts that constitute this section.

4.1 Level of Employees Motivation

This section shows the average score for that specific type of motivation. The mean scores range from 2.279 (Rewards) to 2.552 (Activation), with an overall mean of 2.44. This suggests that employees at DUWASA are generally motivated by all the factors, with Activation being the most motivating factor and Rewards being the least motivating factor. The standard deviation tells us how spread out the data are from the mean. A higher standard deviation indicates that there is a wider range of scores for that type of motivation. The standard deviations in this table are all around 0.6, which suggests that there is a moderate amount of variability in the scores. The minimum and maximum values (2 and 5, respectively) indicate that the response scale for each aspect ranges from 1 to 5, with 5 being the highest level of motivation and 1 being the lowest. The overall mean for employee motivation across all aspects is 2.44, which is also quite low, indicating a generally low perception of motivation among DUWASA employees. these statistics suggest that DUWASA employees perceive a low level of motivation, particularly in terms of recognition, rewards, advancements, intensity of work, and activation. As it is shown in Table 1.

Table 1: Summary Statistics of Employee Motivation in DUWASA

Employee Motivation	Mean	Std. Dev.	Min	Max
Recognition	2.314	.578	1	5
Rewards	2.279	.575	2	5
Advancements	2.529	.616	1	5
Intensity	2.523	.662	2	5
Activation	2.552	.651	1	5
Overall	2.44	.507	1	5

4.1.1 Perceptions of Employee Motivation

This section shows the format that divides employee motivation into two categories: low and high motivation. A higher percentage of respondents (55.81%) indicated low motivation, while 44.19% indicated high motivation. these perceptions suggest that while there is a significant portion of respondents who perceive employee motivation as low, there is also a substantial group that perceives it as high or at a moderate level. This variation in perceptions is similar to

the study conducted by (Amini, et al. 2019) which stresses that highly experienced and trained employees require little supervision and may be motivated by elements of laissez-faire leadership style. However, not all employees possess these characteristics, hence in this style some employees may not be motivated which can lead to poor production, lack of control and increasing costs.

Table 2: Distribution of Employee Motivation in DUWASA

Variable	Frequency	Percent
Employee Motivation in Binary		
Low	96	55.81
High	76	44.19

Source: Field data (2024)

4.2 The role of laissez-faire leadership style on employees' motivation in water service delivery authorities, specifically DUWASA.

The role of laissez-faire leadership style on employees' motivation in water service delivery authorities, specifically DUWASA was analyzed using Binary logistic regression, it noted that before performing binary logistic regression different statistical tests were used to assess the accuracy of the Binary logistic regression model.

4.2.1 Diagnostics for the Logistic Regression

Different statistical test was used to assess the accuracy of the Binary logistic regression model including Omnibus tests for model coefficients and the Hosmer and Lemeshow test as shown below.

4.2.1.1 Omnibus tests of model coefficients

The omnibus tests of model coefficients using logistic regression models to analyze the role of various results of omnibus tests of model coefficients derived from logistic regression analysis examining the role of laissez-faire leadership style on employees' motivation in water service delivery authorities, specifically DUWASA. The first row represents a logistic regression model, "laissez-faire leadership style on employees' motivation," The table includes chi-square values, degrees of freedom, and corresponding significance levels to assess the overall significance of each model. Starting with the "laissez-faire leadership style on employees' motivation" model, the chi-square value of 14.2237 with 3 degrees of freedom and a significance level of 0.00 indicates that the model as a whole is statistically significant. This suggests that the laissez-faire leadership style on employees' motivation is statistically significant.

Table 3: Omnibus tests of model coefficients

Logistic regression model	Chi square	Degree of freedom	significance
---------------------------	------------	-------------------	--------------

Laissez-faire Leadership style on employees' motivation	14.2237	3	0.00
---	---------	---	------

Source: Authors compilation from SPSS 20

4.2.1.2 Hosmer and Lemashow model test

The Hosmer-Lemashow test is a goodness-of-fit test for logistic regression models. It helps assess how well the model fits the data by comparing observed and expected outcomes across different groups of observations. In this case, the table shows the results for laissez-faire leadership style on employees' motivation. The chi-square statistics is 1.3831 with 4 degrees of freedom, and a significance level of 0.707. Since the significance level is greater than 0.05, it fails to reject the null hypothesis. In other words, there is no statistically significant evidence to suggest that the model does not fit the data well for laissez-faire leadership style on employees' motivation.

Table 3.1 Hosmer and Lemashow model test

Logistic regression model	Chi square	Degree of freedom	significance
laissez-faire leadership style on employees' motivation	1.3831	4	0.707

Source: Authors compilation from SPSS 20

4.3 The effects of Laissez-faire Leadership on Employees' Motivation

This section presents the findings and discussions about the effects of laissez-faire leadership on employees' motivation. The LR Chi2 value (likelihood ratio chi-square) of 80.612 and the associated p-value of 0.000 indicated that the overall model is statistically significant in predicting employee motivation. The pseudo-R-squared value of 0.77 suggests a good fit for the model. The table indicates that all three laissez-faire leadership practices have a statistically significant (p-value < 0.005) positive association with employee motivation at DUWASA.

Table 4: Binary Logistic Regression Analysis

	Employee Motivation	Coef.	Odds Ratio	Z	P> z
	Low (base outcome)				
Yes	<i>Employee Guidance</i>				
	Yes	1.4041	4.071918	3.44	0.001
	No(Reference)				
	<i>Delegation of Tasks</i>				
	Yes	1.2318	3.427231	2.83	0.005
	No(Reference)				
	<i>Autonomy for the team</i>				
	Yes	1.6460	5.186233	3.54	0.000
		628

4.3.1 Employee's Guidance

If occupations are well-constructed, employees will find meaning in their work and be fulfilled. Leaders' ought to assign tasks to their staff members and instill a sense of worth in them. Honor their uniqueness, pay close attention to what they have to say, and, when needed, act on their advice (Muze, 2014). Therefore, concerning these findings, it was obtained that when supervisors provide clear instructions (Yes), employees are 4.07 times more likely (Odds Ratio) to report higher motivation compared to when they don't receive clear instructions (No).

4.3.2 Delegation of tasks

Employees can become highly creative and driven to achieve if they feel empowered to complete assigned duties in their own unique ways. Their drive to accomplish the objectives leaders have set for them and their sense of personal initiative can provide remarkable outcomes (Zhang, 2017). Similarly, when there is delegation of tasks (Yes), the odds of high employee motivation are significantly higher (Odds Ratio = 3.427231, $p = 0.005$), with a z-value of 2.83. These results were supported by qualitative findings which were exhibited:

"...The division of responsibilities within DUWASA is one of the sources of employees' motivation because the employee feels that they are part of the institution, so they increase their efforts to achieve the goals they were given. When supervisors take leave or are sick, they delegate responsibilities to their subordinates and it has been one of the sources of employee motivation in DUWASA..." (Key Informant Interview)

4.3.3 Autonomy for the Team

Employees who feel trusted, respected and have high levels of job satisfaction are more likely to feel empowered to make decisions and manage their work. Employees can enhance their productivity and job performance by exercising their creativity and working autonomously (Liu *et al.* 2011). Providing autonomy for the team (Yes) is also significantly associated with higher odds (Odds Ratio = 5.186233, $p = 0.000$), with a z-value of 3.54.

In summary, the logistic regression analysis shows that aspects of laissez-faire leadership, such as lacking Employee Guidance, delegating tasks, and providing autonomy for the team, are significantly associated with higher odds of high employee motivation at DUWASA; high employee motivation (Odds Ratio = 5.186233, $p < 0.001$), with a z-value of 3.54.

5.0 Conclusion and recommendations

5.1 Conclusion

The study concludes that employees of DUWASA are positively motivated by elements of laissez-faire leadership style. Even though laissez-faire leadership style is widespread in organizations and exhibits negative effects, the results of this study suggest that it could be a motivating style of leadership depending on subordinates' goal orientation. The key lies in how subordinates perceive and evaluate laissez-faire leadership. On a daily basis, subordinates may evaluate it as beneficial to their personal growth. Empirical literature reviews consistently highlighted the significant contribution of leadership style on employees' motivation. Highly experienced and trained employees require little supervision and may be motivated by laissez-faire leadership style. However, not all employees possess these characteristics, hence the laissez-faire style produces no supervision efforts from managers, which can lead to poor production, lack of control and increasing costs (Amini, et al. 2019). Therefore, in management practice, leaders should try to find ways to influence the cognitive evaluation of subordinates.

5.2 Recommendations

The study's conclusions demonstrated the urgent need for DUWASA to identify the strengths and weaknesses of its existing leadership style, and take appropriate measures to create a conducive work environment that promotes employee motivation. Furthermore, the study recommends that, it is very important for leaders/managers to adapt their styles of leading employees depending on the situations like timeline of assignments, political situations or economic situations. For instance, delegating tasks and giving full autonomy to the staff who require close supervision to perform may hinder the attainment of the organization's goals on time. Managers and supervisors need to consider this before assigning responsibilities to employees.

5.3 Limitations and Areas for Further Studies

Despite the strengths of this study, there are some limitations associated with this research. The study utilized data collected from a single water supply and sanitation authority. However, the broader inclusion of data from multiple water supply and sanitation authorities in Tanzania would have enhanced the study's scope and depth. Furthermore, the study was limited to urban water supply and sanitation authorities located in the city. More research should be conducted in the area of rural water supply and sanitation authorities located in District authorities to generally broaden the understanding of water supply and sanitation system in Tanzania.

² College of Business Education-Dodoma Campus, Dodoma.

Correspondence: jbora102@gmail.com

Abstract

Work pressure is often regarded as a driving force that pushes employees to perform efficiently, while job performance reflects an individual's ability to produce quality work, meet deadlines, resolve task-related issues, and collaborate effectively within a team. This study explores the influence of work pressure on job performance, specifically focusing on women police officers. Key factors such as workload, multitasking, and feedback incorporation are analyzed to determine their impact on performance. The results show a statistically significant relationship between work pressure factors and employee performance, as indicated by low p-values. Multitasking, in particular, demonstrated a notable effect, with a significant negative coefficient and odds ratio, suggesting that officers who managed multiple tasks simultaneously were less likely to display low performance levels. This highlights multitasking as a critical element in enhancing job performance. However, contrary to expectations, workload and feedback incorporation did not show significant impacts, as their p-values were higher, indicating that these factors may not play as pivotal a role in influencing performance. The study concludes that, while multitasking is a key factor in improving job performance among women police officers, workload and feedback may not have the same level of influence on their efficiency and effectiveness.

Key words: *Work pressure, Job performance, workload, multitasking, and feedback incorporation, Women police officers*

1.1 Introduction

Work pressure and job performance are interdependent factors in the workplace. Sikoi (2021) defined work pressure as the driving force that challenges employees to perform efficiently, while job performance reflects an employee's ability to deliver quality work, meet deadlines, solve problems related to their tasks, and collaborate effectively within a team. Vishnukanth *et al.* (2022) define job performance as the totality of employee behaviors that contribute value to organizations. These behaviors can be categorized into three areas which are task performance, contextual performance, and counterproductive behavior (Ngirwa, 2021).

Nevertheless the relationship between work pressure and job performance has been a topic of significant debate among scholars. Some scholars believe that limited work pressure can lead to better performance. Sandoval-Reyes *et al.* (2019) explored the impact of work pressure in technology and information-intensive environments and found that high work pressure is often associated with roles that require managing vast amounts of information, which negatively impact job performance. Similarly, Scanlan and Still (2019) examined the connection between work pressure and employee burnout, revealing that excessive pressure contributes to burnout, which in turn, adversely affects job performance.

However introduction of technology at work places has been observed as the solution to work pressure reduction. Aldijana *et al.* (2021) studied how work pressure, often driven by technology platforms, influences job performance. Their research highlighted a complex dynamic between work pressure, technology and job performance, offering insights into how workers in this sector optimize their output under varying levels of pressure. Adriana *et al.* (2020) focused on the role of work flexibility in job performance among Romanian employees.

The study found that providing flexibility allows employees to better balance professional and personal responsibilities, leading to increased job satisfaction and improved performance. This highlights the importance of flexibility, especially in light of recent technological advancements that enable employees to work from virtually any location with internet access.

1.2 Problem statement

Studies highlight the detrimental effects of excessive pressure, suggesting that the relationship between work pressure and job performance is both complex and context-dependent. In high-stakes fields, such as those involving the saving of lives, excessive work pressure has been observed to lead to poor outcomes. For instance, Marcel *et al.* (2022) investigated the effects of work pressure in healthcare settings, particularly among medical professionals. Their study revealed the intricate relationship between high work pressure characterized by long hours, critical decision-making, and emotional demands and job performance, often resulting in burnout and reduced quality of care. Similarly, in fields that involve the security and safety of individuals, such as law enforcement and emergency response, work pressure is said to have a significant impact on decision-making abilities, stress levels, and overall job effectiveness, potentially compromising the safety and well-being of both employees and those they serve (Heras *et al.* 2021).

This has called attention for maintaining work pressure to employees in different fields. Thus the Tanzanian government has been striving to promote a good working environment so as to promote better output. In the 1990s the Tanzanian government implemented several reforms concerning the rights and responsibilities of employees in the civil sector focusing on improving efficiency and efficacy of the public sector (Rugambwa, 2013). In 2002 Tanzania implemented substantial modifications to the Employee and Labor Relations Act (ELRA) which targeted bringing modernization in labor laws and fostering labor relations that are conducive to economic growth (Employment and Labour Relations Act, 2004). With these efforts, employees have been struggling to bring good performance in their appointed tasks. Despite considerable efforts, significant challenges remain in understanding how work pressure affects job performance, particularly in identifying the optimal level of pressure that maximizes productivity without leading to burnout or diminished job satisfaction. These challenges are compounded by factors such as varying individual tolerance levels to pressure, diverse workplace environments, and the rapidly changing nature of work due to technological advancements (Marcel *et al.*, 2022; Aldijana *et al.*, 2021). The persistence of these challenges has fueled ongoing debates and further research, with the aim of developing strategies to effectively balance work pressure. Such strategies include exploring flexible work arrangements, cultivating supportive workplace cultures, and implementing comprehensive stress management programs designed to enhance employee well-being and sustain high performance. Gaining a deeper understanding of these factors is particularly crucial in high-stakes fields, such as the security sector, where effectively managing work pressure is essential for maintaining community safety and preventing harm.

1.3 Study objectives

- i) To assess the impact of feedback incorporation on job performance.
- ii) To evaluate the effect of workload on job performance.
- iii) To analyze the influence of multitasking on job performance.

2.1 Theoretical literature review

Boundary theory, was developed by Sue Campbell Clark in the year 2000. The theory provides a framework for understanding how individuals manage and negotiate the boundaries between different life domains, particularly work and personal life. The theory establishes clear boundaries between work and personal life thus the theory examines the level of ease and frequency with which individuals move between different roles (Moen and Sweet, 2002).

The theory further elaborates that by maintaining clear boundaries; women police officers reduce role conflict, which occurs when the demands and responsibilities of one work interfere with those of personal life. The theory believes that having a clear boundary in work it's possible to lower stress levels and improve job performance. Further, the theory encourages effective time management and prioritization of multitasking (Khan, *et al* (2022).

This is to say that when the women police officer establishes boundaries, then they were able to allocate time and energy to both work and personal responsibilities efficiently. Moreover, the theory insists that maintaining boundaries helps prevent burnout by allowing individuals to disconnect from work-related stressors during their time, promoting rest and recovery. While boundary theory promotes clear boundaries, it also recognizes the importance of flexibility. It acknowledges that there may be times when individuals need to adapt their boundaries to accommodate specific situations, such as work-related emergencies or personal commitments (Heras *et al* 2021).

Boundary theory assumes that; Individuals create and manage boundaries to separate different life domains, such as work and personal life. These boundaries can be physical, temporal, or psychological. Also the theory suggests how easily elements of one domain can cross into another individuals. Some people prefer rigid boundaries, while others are comfortable with more flexible boundaries.

Boundary strength refers to the firmness of the boundary between domains. Strong boundaries prevent interferences between work and personal life, while weak boundaries allow for more fluid transitions. Likewise it assumes that individuals constantly transition between roles such as from employee to parent and the ease of these transitions is influenced by the boundaries they set. Lastly it assumes that effective boundary management can lead to better work pressure, which in turn can enhance job satisfaction and overall well-being.

The theory is applicable in the study, especially in assessing the influence work pressure and job performance on women police officers in Dodoma city. The theory has given priority to keeping boundaries between work and personal life. This brings up factors such as working hours, working demand, and work autonomy which have a great contribution to successful

work pressure. In that case work pressure influence job performance only when there are clear boundaries at work. Thus for police women to perform well in their job they need to maintain clear boundaries, to reduce role conflict, which occurs when the demands and responsibilities of work interfere with those of their personal lives.

Boundary Theory helped the study in examining how women police officers manage the boundaries between their professional and personal lives, the study was able to identify the strategies that were effective in promoting better work pressure.

The study was able to explore the permeability and strength of boundaries among women police officers, providing insights into how flexible or rigid boundaries impact their job performance and personal well-being. Also gave right to researcher in investigating the ease or difficulty of transitioning between professional and personal roles that shed light on the stressors faced by women police officers and how they coped with them.

2.2 Empirical review

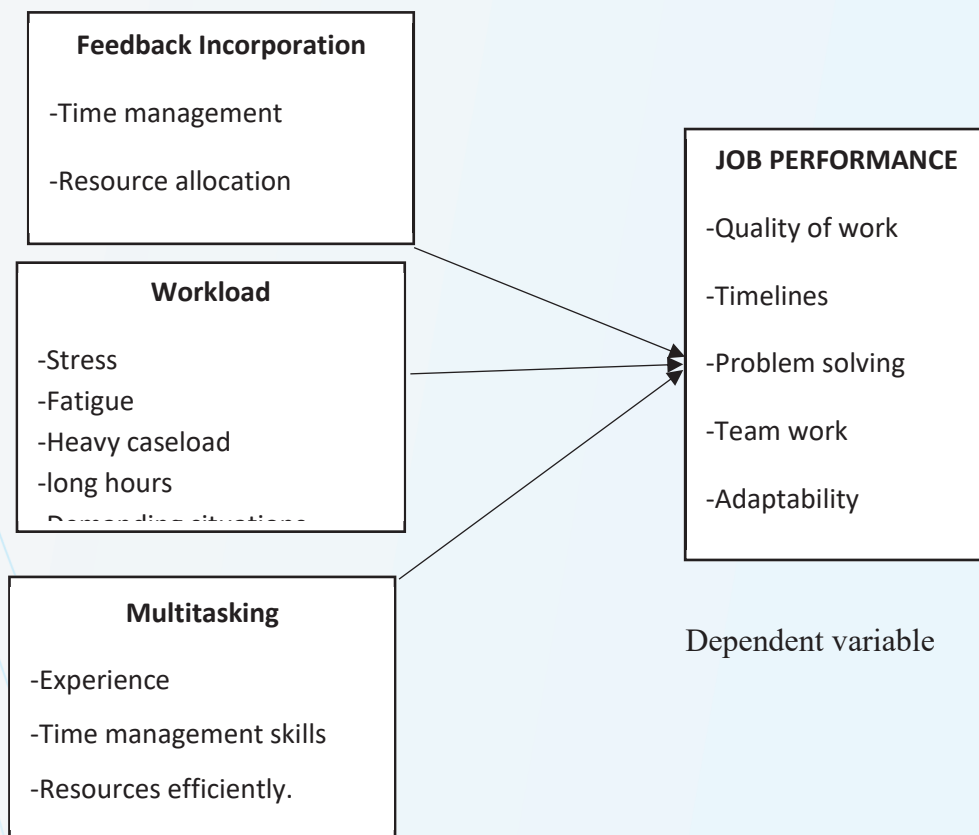

The relationship between work pressure and job performance has gathered significant attention in recent years. Thus researchers have explored various dimensions of this relationship, uncovering both the potential benefits of moderate work pressure and the risks associated with excessive demands. Sandoval-Reyes *et al.*, (2019) explored the relationship between work pressure, especially in the context of technology and information-intensive work, and its impact on job performance. The study reveals high work pressure is associated with information-intensive roles. The study recommends strategies to manage increased demand while maintaining or improving performance.

Scanlan and Still (2019) investigated the relationship between work pressure and employee burnout and how burnout, in turn, affects job performance. They also examine job performance metrics. The study uncovered how excessive work pressure contributes to employee burnout, which negatively impacts job performance. The study recommends that there is a need to set strategies for mitigating burnout and its impact on performance. Aldijana *et al.*, (2021) focused on the gig economy and how work pressure, often influenced by technology platforms, affects job performance in this context. Thus it was found that there is a dynamic between work pressure, technology, and job performance in the gig economy, providing insights into how workers in this sector optimize their performance.

Adriana *et al.*, (2020) investigated the relationship between work flexibility, job satisfaction, and job performance in a sample of Romanian employees. The research findings indicate that the provision of work flexibility to employees enables them to achieve a harmonious integration of their professional and personal responsibilities. This contributes to increased job satisfaction, enhanced performance, and a comprehensive enhancement of the organization as a whole. The significance of work flexibility cannot be overstated, particularly in light of recent digital advancements and technological improvements. These developments have empowered employees to carry out their jobs from any location of their choosing, as long as they have access to an internet connection.

Marcel *et al.*, (2022) investigate how work pressure, particularly in healthcare environments, affects job performance among medical professionals. The study reveals the intricate relationship between high work pressure in healthcare, such as long hours, critical decision-making, emotional demands, and job performance. The study offers insights into strategies for managing work pressure in high-stress healthcare settings while maintaining or improving job performance. is made up with two variables the independent and the dependent variables. The independent variable contains the feedback incorporation, workload and multi-tasking. And the dependent variable contains the Job performance.

Figure: 1. Conceptual framework

3.1 Materials and methods

3.1.1 Research Design

The study employed a cross-sectional research design, which involved collecting data from a sample of women police officers. This design was selected due to its cost-effectiveness and its ability to provide insights into the current status of work pressure and job performance among the participants. The study population consisted of Officers Commanding Districts (OCDs) under the Regional Police Commander (RPC) and women police officers from selected police

stations, totaling 125 officers. Using Yamane's (1967) formula, a sample size of 113 was determined.

3.1.2 Study area

However the study was conducted in the Dodoma region, located in central Tanzania. The region was chosen due to its geographical accessibility and logistical convenience, which facilitated fieldwork and data collection.

3.1.3 Data collection

Primary data was collected using a structured questionnaire, which were distributed to women police officers. This tool was found to be useful since it allowed respondent to have enough time to fill the questions asked in detail. Thus the officers were given time to complete the questionnaire, after which the researcher collected the completed questionnaires from the selected police posts.

3.1.4 Data analysis

Quantitative analysis was performed on the collected data using the Stata version 17. Descriptive statistics were used to summarize the data, while inferential statistics, including Multiple Logistic Regression and Ordinal Logistic Regression, were employed to assess the influence of work pressure on job performance among the women police officers. Before applying these regression models, the 5-point Likert scale data on performance was transformed into an index scale using overall mean scores. Scores equal to or above the overall mean were categorized as high-performance employees, while scores below the mean were categorized as lower-performance employees.

3.1.5 Study Reliability

The study ensured the reliability of the data by considering a Cronbach's Alpha of 0.7 or higher as acceptable for research purposes, while values below 0.7 were considered unacceptable.

Table 1: Overall Reliability Statistics

Variables	Cronbach's Alpha	N of Items
Feedback Incorporation	0.868	5
Workload	0.778	5
Multitasking	0.824	5
Job Performance	0.875	8
Overall	0.923	53

Source: Authors compilation from STATA 17

Table 1 above reveals the overall reliability of the scale, represented by the "Overall" row with a Cronbach's Alpha of 0.923, which is high, indicating strong internal consistency among all 53 items measured in the study. Among the individual variables, Feedback Incorporation has

the highest reliability (Cronbach's Alpha = 0.868), followed by Job Performance (Cronbach's Alpha = 0.875), these values are within an acceptable range for reliability.

4.1 Study Findings

The study findings have focused in investigating the influence of work pressure on job performance among women police officers in Dodoma city. Link test was used to assess the accuracy of the Binary logistic regression model. The Binary logistic regression model fitted was tested for specification error. Table 2 below presents the results of the link test which indicates no misspecification errors existing since the linear predicted value squared ($_hatsq$) is insignificant at a 5% level (p-value = 0.418) and the predicted value ($_hat$) is very significant at 5% level (p-value=0.000); hence, the model specification is correct. This means that, to the best of the researcher's knowledge, the model contains those variables that should be in the model and the variables have been entered in the correct functional form.

Table 2: Link test results

	Z-statistics	P-value
$_hat$	10.22	0.000
$_hatsq$	-0.81	0.418

Source: Authors compilation from STATA 17

4.1.1 Performance of women police officers

The dependent variable focused in identifying the performance of women police officers located in Dodoma municipality. Table 3 below shows the frequencies and the percentages of the studies variables.

Table 3: Distribution of Performance of women police officer Level

Variable	Frequency	Percent
Performance in Binary		
Low	44	38.94
High	69	61.06
Performance in Ordinal		
Low	31	27.43
Moderate	13	11.50
High	69	61.06

Source: Authors compilation from STATA 17

Table 3 above shows the binary classification of performance (low and high), majority of employees (61.06%) fall into the high-performance category, while 38.94% are classified as low performers. In the ordinal classification of performance (low, moderate, high) majority of employees (61.06%) are classified as high performers. A smaller percentage are categorized as low performers (27.43%), and an even smaller percentage fall into the moderate performance category (11.50%). Overall, table 3 shows that whether using a binary or ordinal classification system for women police officers performance, a significant proportion of employees are considered high performers, while a smaller proportion are classified as low or moderate performers.

4.1.2 Influence of work pressure on job performance among women police officers

The study focused in determining the influence of work pressure on job performance among women police officers in Dodoma city. Multiple logistic regression was used to analyze the study objective. The study focused on the following hypothesis H₁: work pressure has an influence on job performance among women police officers in Dodoma city, H₀: work pressure has no-influence on job performance among women police officers in Dodoma city

Table 4: Chi-square and P-Value concerning the Job work pressure among women police officer

Variable	Low	High	Chi-square	P-Value
Workload			53.2120	<0.01
No	44(67.68)	21(32.31)		
Yes	0(0.00)	48(100)		
Multitasking			42.7174	<0.01
No	41(66.13)	21(33.87)		
Yes	3(5.88)	48(94.12)		
Complexity of task			13.2024	<0.01
No	28(58.33)	20(41.67)		
Yes	16(24.62)	42(75.38)		

Source: Authors compilation from STATA 17

Table 4 above show that all the p-values are less than 0.01 (highly significant), meaning there's a statistically significant association between each work pressure factor and employee performance. Workload and Multitasking have very high chi-square statistics, suggesting a strong link to performance.

Multi logistic regresion was used to show the the influence of work pressure on job performance among women police officers in Dodoma city.

Table 5: Multiple Logistic Regression Analysis

Employee Performance	Coef.	Odds Ratio	z	P> z
Low (base outcome)	-.8723	.4753	-6.19	0.13
Workload				
Yes				
No(Reference)				
Multitasking	-7.102	.00967	-13.82	0.02
Yes				
No(Reference)				
Feedback Incorporation	-3.0290	.4814	-6.23	0.145
Yes				
No(Reference)				
Constant	.4319	2.004	1.637	0.0426
Number of observation = 113 LR Chi2(3) =97.20				
Prob > Chi2 = 0.000		Pseudo R2 = 0.7853		

Source: Authors compilation from STATA 17

Table 5 above shows the Likelihood-ratio Chi-square (LR Chi2) statistic (97.20) and its very low p-value (0.000) again indicate that the overall model is statistically significant.

Pseudo R-squared (0.7853): This value is considerably higher than in Table 4.9 (0.4853), suggesting the model in Table 4.10 explains a much larger proportion (almost 79%) of the variance in employee performance. This could be due to the inclusion of more relevant variables or a better fit for this particular data set.

Multitasking has a significant impact on Employee Performance, as indicated by its low p-value (0.02) and large negative coefficient and odds ratio. Employees who engage in multitasking are much less likely to have low performance compared to those who do not multitask. Workload and Feedback Incorporation do not show a significant impact on Performance in this analysis, as indicated by their higher p-values (0.13 and 0.145). The constant term represents the baseline odds of Performance being low when all other variables are held constant. It is statistically significant in this model (P-value = 0.0426), indicating its contribution to the prediction of Employee Performance.

Overall, the model suggests that multitasking significantly influences Employee Performance, while workload and feedback incorporation do not show significant effects in this analysis.

4.1.3 Discussion on the Influence of work pressure on job performance among women police officers

Below are the discussion concerning the influence of work pressure on job performance among the women police officer. The discussion has based on the collected data together with the documentary review so as to support the study results.

4.1.3.1 Workload and Performance of women police officer

From the interview it was revealed that a high workload often led to increased levels of stress and fatigue among police officers. Dealing with a heavy caseload, long hours, and demanding situations take a toll on officers' mental and physical well-being. Thus the prolonged exposure to stress and fatigue impaired cognitive functions, decision-making abilities, and overall performance on the job.

Police officers often faced competing demands and priorities in their daily duties. A heavy workload required officers to prioritize tasks and allocate resources effectively. However the study discovered that, limited resources, such as time, personnel, and equipment, pose challenges in managing workload efficiently. While inadequate resource allocation result in delays, inefficiencies, and suboptimal outcomes, affecting overall performance.

Also the study found that balancing work demands with personal life is essential so as to maintain overall well-being and job satisfaction. However heavy workload sometimes invade our personal time, leading to increased stress, burnout, and dissatisfaction with work. This is to say that when we have Poor work-life balance negatively impact our morale, motivation, and ultimately, performance on the job”.

So far the study discovered that the quality of service delivery by police officers had been compromised under a heavy workload. When the officers were overwhelmed with tasks, they had less time and attention to devote to each case or situation. This had resulted in rushed investigations, incomplete reports, or errors in judgment, which had undermined the effectiveness and credibility of law enforcement efforts.

Marcel *et al.*, (2022) cements that high workload increase likelihood of errors, oversights, or misconduct in work places. Additionally, the pressure to meet performance targets or quotas under a heavy workload had incentivized unethical behavior or shortcuts, posing risks to public trust and accountability.

4.1.3.2 Multitasking and Performance of women police officer

Women Police officers often involved managing a diverse array of tasks and responsibilities, ranging from responding to emergency calls to conducting investigations and engaging with the community. Women police officers, like their male counterparts, navigated the operational demands while maintaining situational awareness and making split-second decisions. The

ability to multitask effectively enhanced their efficiency in handling concurrent tasks, thereby improving overall performance in operational contexts.

So far it was discovered that multitasking required experienced time management skills to prioritize tasks and allocate resources efficiently. Women police officers, who have already faced unique challenges in balancing work and personal responsibilities, effectively manage their time to fulfill their duties on the job. Multitasking skills enabled them to juggle various tasks without compromising the quality of their work, leading to enhanced productivity and performance.

The officers often presented rapidly changing and unpredictable situations that required officers to adapt quickly and respond effectively. Multitasking skills allowed women police officers to navigate these dynamic environments with agility and flexibility, enabling them to handle diverse tasks and challenges as they arose. The ability to switch between tasks seamlessly and maintain focus amidst distractions was crucial for effective performance in high-pressure situations.

Multitasking imposed a significant cognitive load on individuals, requiring them to divide their attention and allocate mental resources across multiple tasks. For women police officers, who have already faced implicit biases or stereotypes in male-dominated environments, managing cognitive load while multitasking was essential for maintaining clarity of thought and making informed decisions. Effective multitasking skills enhanced their ability to process information, assess risks, and respond appropriately, ultimately improving performance outcomes.

The organizational culture and support mechanisms within law enforcement agencies played a crucial role in facilitating effective multitasking among women police officers. Access to training programs, supportive leadership, and resources such as technology and staffing levels enhanced their ability to multitask and perform effectively on the job. Moreover, creating a conducive work environment that valued diversity, promoted inclusivity, and provided opportunities for career advancement empowered women police officers to excel in multitasking roles.

In addition to that multitasking was a vital skill for women police officers in managing the complex and demanding nature of policing. By honing their multitasking abilities and receiving adequate support from their organizations, women police officers enhanced their performance, contributed effectively to law enforcement objectives, and served their communities with professionalism and efficiency.

4.1.3.3 Feedback Incorporation and Performance of women police officer

Adriana (2020) recognize feedback incorporation as a pivotal component within the framework of boundary theory. The study have discovered that Feedback served as a vital conduit for conveying performance expectations, identifying areas for improvement, and highlighting opportunities for growth. By leveraging feedback effectively, women police officer were able to navigate and transcend organizational boundaries more adeptly, thereby enhancing their performance within their designated roles. Effective feedback incorporation

entailed a proactive approach wherein women police officer actively sought, processed, and applied feedback to refine their behaviors, strategies, and goals.

By internalizing feedback, individuals realign their actions with organizational objectives and expectations, thereby ensuring that their contributions were in sync with overarching goals. This iterative process of feedback incorporation facilitated continuous learning and development, enabling individuals to glean insights from past experiences and apply them to future endeavors.

By demonstrating a willingness to receive and act upon feedback, women police officer exhibited a commitment to personal and professional growth, thereby fostering a positive feedback loop where performance improvements were perpetuated and reinforced. Moreover, feedback incorporation promoted collaboration and communication within teams, as individuals exchanged constructive feedback and insights to facilitate mutual growth and development.

So far boundary theory recognizes that boundaries are not fixed but dynamic and permeable, influenced by individual actions, organizational processes, and environmental factors. This dynamic perspective allowed researchers to explore how changes in decision-making authority, autonomy, or feedback systems impacted performance over time, providing insights into the evolving nature of work within organizations

5.1 Conclusion

The study found a significant negative relationship between multitasking and employee performance, as evidenced by a low p-value (0.02) and a large negative coefficient and odds ratio. This suggests that employees who engage in multitasking are less likely to have low performance compared to those who do not. However, the negative coefficient implies that excessive multitasking may adversely affect performance in the long run.

Also the study found that workload did not have a significant impact on employee performance, with p-values of 0.13 and 0.145, respectively. This indicates that while workload is often perceived as a factor affecting performance, it did not play a critical role in predicting employee performance in this study.

Similar to workload, feedback incorporation did not show a statistically significant impact on performance (p-values of 0.13 and 0.145). Despite this, the constant term's significance suggests that feedback mechanisms still hold value in the overall performance equation. Although the direct effect was not observed in this study, organizations should continue to implement structured feedback processes as part of a comprehensive performance management strategy.

In conclusion, multitasking emerged as the most significant factor affecting employee performance, while workload and feedback incorporation were less impactful in this analysis.

6.1 Recommendation

The study recommend that since multitasking has a significant impact on employee performance, organizations should focus on strategies to manage multitasking efficiently. Such as providing clear task priorities to employees, allowing them to focus on one task at a time when necessary. Implementing time management training programs to help employees handle multiple tasks without compromising quality. And to introducing task management tools that support effective scheduling and tracking to prevent burnout.

While workload did not show a significant impact on performance, Organizations should shift focus from simply managing workload to improving work design, task autonomy, and providing employees with resources and support. Should consider performance-enhancing strategies, such as flexible work schedules, team collaboration, and adequate rest periods, to support overall job satisfaction and productivity. And to monitor employee well-being, ensuring that the work environment does not contribute to stress or fatigue, which can indirectly affect performance.

Lastly feedback remains as an essential element of performance management. Thus organizations should continue using structured feedback systems that allow employees to receive regular, constructive insights into their work. Encouraging managers to provide specific, actionable feedback that is relevant to employees' tasks and goals. And fostering culture of open communication where employees feel comfortable giving and receiving feedback, as this can contribute to long-term performance improvement.

Contribution of Workload Allocation on Teacher Job Retention in Public Secondary Schools at Chamwino District Council, Tanzania

Jihadhari Said¹, Richard Msacky²

¹College of Business Education-Dodoma Campus, Email: jiahadh@yahoo.com

²College of Business Education-Dodoma Campus, Email: rimsaki@yahoo.com

Correspondence: jiahadh@yahoo.com

Abstract

The study sought to assess the influence of workload allocation on teachers' job retention in Chamwino District Council of Tanzania. A cross-sectional research design was used with a quantitative research approach. The study used a sample size of 192 respondents selected using simple random sampling. The study involved a questionnaire as the main method of data collection. The collected data were analyzed using descriptive statistics and multiple linear regression analytical methods. The study found that, workload allocation in terms of class size and administrative duties were negative and insignificantly related to teachers' job retention. However, number of teaching hours and number of preparatory hours were positive and significantly related to teachers' job retention ($p\text{-value} < 0.05$). The study concludes that class size and administrative duties were the workload allocation factors that negatively affecting teacher job retention while number of teaching hours and number of preparatory hours were positively affecting teachers' job retention in rural areas at public secondary schools in Chamwino district council of Tanzania. Therefore, the study recommends that, reducing workload by hiring more staff and incorporating teaching assistants will enhance teachers' retention.

Key words: *Workload allocation, Teacher Job Retention, Public Secondary Schools, Chamwino District Council, Tanzania*

1.0 Introduction

Worldwide, teachers' job retention has become an important one for researchers to investigate. Teacher job retention is the process of keeping teachers in their jobs. This can be done through a variety of methods, such as providing good working conditions, offering competitive salaries, and providing professional development opportunities (Mbiu, 2019). However, there are several reasons for teachers to leave their jobs, including low salaries, poor working conditions, and a lack of support from administrators. In addition, some teachers may feel that they are not able to make a difference in the lives of their students. As a result, it is important to understand the factors that contribute to teachers' job retention in order to improve retention rates (Boniface, 2019).

Teacher retention is crucial for effective education service delivery as it directly impacts the continuity and stability of the learning environment (Johnson *et al.*, 2012). High teacher turnover rates can disrupt student learning and negatively affect school performance (Ingersoll & Strong, 2011). Retaining experienced teachers ensures that schools benefit from their expertise and institutional knowledge, which is essential for maintaining and improving educational quality (Darling-Hammond, 2010). Furthermore, consistent teacher presence helps build stronger relationships with students, fostering a supportive and conducive learning atmosphere (Borman & Dowling, 2008). Thus, prioritizing teacher retention is vital for sustaining high standards in education service delivery (Ronfeldt *et al.*, 2013).

Workload allocation, incentives, and administrative support play important roles in teacher job retention. Proper workload allocation ensures that teachers are not overwhelmed and can maintain a healthy work-life balance, which is essential for long-term job satisfaction (Mbeki, 2023).

In developed countries like the United States of America (USA), teacher retention is determined by such factors as monetary incentives, availability of resources, top management support, social respect, the working environment, teacher fulfillment, and student factors that include discipline, respect, and attitude (Watt, Richardson, & Wilkins, 2014). Likewise, in China, lack of monetary incentives, lack of adequate resources, lack of welfare services, huge workloads, lack of principal support, and poor teacher image all negatively affected teacher retention (Wei & Abdullah, 2016).

In Africa, teacher retention programs in schools are the same as in other parts of developed nations. Over the years, South Africa has experienced situations where teachers resigned from the profession in large numbers. Among the reasons given for the high turnover rate are: educator workload, teachers getting burdened with additional administrative responsibilities, capturing learners' marks for continuous assessment tests, preparing learner reports, lost prestige, and inadequate remuneration (Mazimbuko, 2015). In Gambia, their union noted a huge teachers exit from the teaching career, with reports of up to twenty thousand teachers leaving the profession every year (Hunter, 2016). Among the cited reasons for mass exit from the teaching profession were lack of adequate salaries, delays in salaries and benefits, promotion prospects, and working conditions (Mazimbuko, 2015). In Kenya, the Ministry of Education, through the Kenya Education Sector Support Program, aims to ensure teacher retention through affordable education services. It is therefore important to highlight the governance practices that influence teacher retention (Oduor, 2021).

Management and teacher job retention in Tanzania's Local Government Authorities (LGAs) has been a significant focus since the decentralization reforms began in the early 2000s. These reforms aimed to improve the efficiency and effectiveness of public service delivery by transferring responsibilities from the central government to local authorities (Max, 2019). Initially, these changes were met with challenges, including inadequate resources and capacity at the local level, which hindered effective management and retention of teachers (Mosha, 2018). However, over time, targeted interventions, such as capacity-building programs and improved funding mechanisms, have started to yield positive results (Mkumbo, 2021).

Reforms have played a crucial role in enhancing job retention among teachers in Tanzania's LGAs. Decentralization has allowed for more localized decision-making, enabling authorities to address specific challenges related to teacher management and retention more effectively (Tanzania Ministry of Education, 2017). Initiatives like the introduction of performance-based incentives and professional development opportunities have contributed to increased job satisfaction and reduced turnover rates among teachers (Mwombeki, 2020). Additionally, the implementation of policies aimed at improving working conditions and providing adequate support has been essential in retaining skilled educators within the LGAs (Nyanda, 2022).

The retention of teachers in public schools under Tanzania's Local Government Authorities (LGAs) is crucial for maintaining the quality of education and ensuring the sustainability of educational programs. High teacher retention rates lead to a more stable and experienced teaching workforce, which positively impacts student performance and overall school effectiveness (Mkonda, 2023).

To improve teacher retention, the Tanzanian government has implemented several initiatives and strategies. For instance, they have increased salaries and provided additional allowances to teachers working in remote areas to compensate for the challenges they face (Ministry of Education, Science and Technology [MoEST], 2022). Additionally, professional development programs and training opportunities have been established to enhance teachers' skills and career advancement prospects (World Bank, 2022). Furthermore, improvements in school infrastructure and the provision of housing for teachers in rural areas have also been prioritized to create a more conducive working environment (UNESCO, 2021).

Despite many strategies that have been implemented to retain teachers in Tanzania, there is still a problem of teacher attrition as well as labor turnover among public secondary school teachers in most of the country. For instance, Boniface (2020) in the Dodoma region, specifically in the three districts of Kondoa, Mpwapwa, and Chemba, found that 67% of teachers perceive five key school-level sources of low retention in remote schools. These include a lack of accommodation and social services, school-level conflicts, poor teaching and learning conditions, teachers' involvement in decision-making, and a lack of alternative economic activities.”

Research on workload allocation and job retention in various sectors outside Tanzania reveals significant findings that highlight the importance of balanced workloads in retaining employees. For instance, a study conducted by Bhatt and Chopra (2021) in India found a direct correlation between equitable workload distribution and job satisfaction, which subsequently influenced employee retention in the healthcare sector. Similarly, research by Liu et al. (2019) in China identified that high workload and lack of support significantly contributed to high turnover rates among nurses. These studies underscore the critical role that workload management plays in job retention across different sectors, illustrating a global concern about the impact of workload on employee retention (Bhatt & Chopra, 2021; Liu et al., 2019).

Furthermore, studies in the education sector also reflect similar findings. Johnson et al. (2020) in the United States examined the effects of workload on teacher retention, revealing that excessive workloads were a major factor leading to teacher attrition. Additionally, a study by Smith and Nguyen (2022) in Australia highlighted that workload allocation was a key determinant of teachers' decisions to stay in their profession. These studies collectively emphasize the global relevance of managing workload to enhance job retention. Furthermore, a number of studies carried out in the human resource management sector, such as those by Malisa (2015), Boniface (2020), Mbiu (2019), and Thao (2015), were generalized or did not give information regarding the factors such as workload allocation that affect teacher retention in public secondary schools particular in rural secondary school. Therefore, there is a dearth of studies focusing specifically on workload allocation and teachers' job retention in Tanzania.

Therefore, this study intended to address the gap by assessing workload allocation as one of the factors affecting teacher job retention in rural areas at public secondary schools in the Chamwino district council. Additionally, focusing on teacher job retention in rural public secondary schools can improve educational outcomes by ensuring consistent, quality teaching, address disparities in teacher distribution, and foster community stability and development through sustained local employment.

2.0 Literature Review

2.1 Theoretical Review

The study used Job Demand-Control (JDC) theory to assess workload allocation and teachers' job retention in rural areas at public secondary schools in the Chamwino district council.

2.1.1 Job Demand-Control (JDC) theory

The study used Job Demand-Control (JDC) theory, first proposed by Karasek and Theorell in 1990. The JDC theory assumes that job demands and job control are the two primary factors that affect employees' job satisfaction, health, and well-being. Job demands refer to the physical, psychological, and social aspects of work that require effort, such as workload and time pressure, while job control refers to the extent to which employees can use their skills and knowledge to make decisions about their work (Bowen *et al.*, 2014).

The strength of the JDC theory is that it provides a clear framework for understanding the relationship between job demands and job control and how they impact employee outcomes. The theory suggests that high job demands coupled with low job control can lead to negative outcomes such as stress, burnout, and poor health (Ibrahim & Ohtsuka, 2014).

However, a weakness of the JDC theory is that it oversimplifies the complex nature of work and does not account for individual differences in coping mechanisms and resilience. Additionally, the theory assumes that job demands and job control are independent constructs, when in reality they may be interdependent and influenced by organizational factors (Ariza-Montes *et al.*, 2018).

The JDC theory is applicable to explaining the relationship between workload allocation and teacher job retention because it suggests that high workload demands without sufficient job control can lead to negative outcomes for teachers, such as stress and burnout. This, in turn, may lead to teacher turnover and decreased job retention. Therefore, it is important for schools to consider workload allocation and job control when designing work environments for teachers to promote job satisfaction and retention.

2.2 Empirical Literature Review

A study by Nzewi (2015) revealed that high workload allocation, inadequate resources, and low salaries were significant factors that affected teacher job retention in Nigeria. Similarly, a study by Oluoch (2017) found that workload allocation and inadequate administrative support were major factors that contributed to teacher attrition in Kenya. Furthermore, a study by Mawela and Pillay (2019) reported that workload allocation affected teacher job satisfaction, which in turn impacted retention in South Africa.

The study conducted by Manyeli and Mwakapeje (2021) found that equitable workload allocation and adequate resources were crucial for teacher retention in Tanzania. Similarly, a study by Ngowi (2019) found that workload allocation and inadequate administrative support were major factors that contributed to teacher attrition in Tanzania. Furthermore, a study by Komba and Mwakapeje (2020) reported that workload allocation affected teacher job satisfaction, which in turn impacted retention in Tanzania.

While these studies provide insights, they differ from the current study on factors influencing teacher job retention in rural areas at public secondary schools in Chamwino District Council. The current study specifically focuses on rural settings, where factors such as geographical isolation, limited infrastructure, and distinct socio-economic challenges may play a more significant role in teacher retention. Unlike the broader scope of previous studies, the current research aims to address the unique conditions of rural public secondary schools, potentially revealing additional or differing factors that influence job retention in these specific environments.

2.3 Conceptual Framework

A conceptual framework is a structured, theoretical foundation or model that helps researchers and thinkers understand, analyze, and interpret complex phenomena or concepts within a specific field or context. In this study, the conceptual framework shows the relationship between independent and dependent variables. The independent variables in this study are workload allocation while the dependent variables are teacher's job retention (see Figure 1).

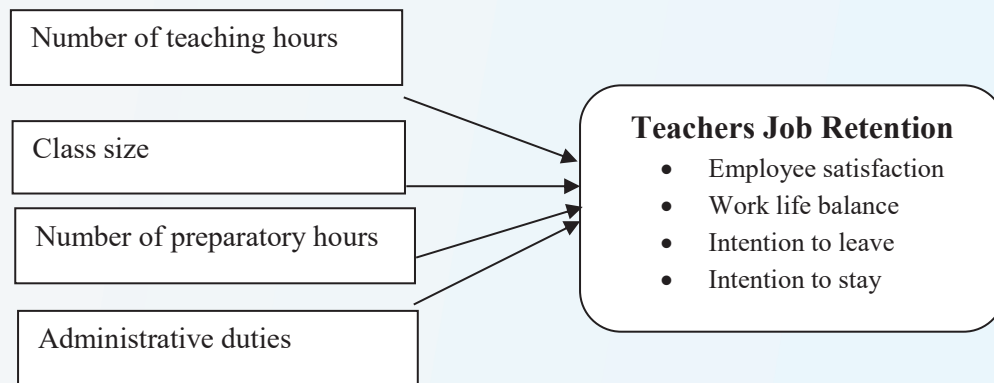

Independent Variables**Dependent Variable****Workload allocation**

Figure 27: Conceptual Framework

3.0 Research Methodology**3.1 Research Design**

This study adopted a cross-sectional research design. Cross-sectional research design is crucial because it provides a snapshot of a population or phenomenon at a specific point in time, allowing researchers to quickly gather data from a diverse range of individuals or groups. This design is particularly valuable for obtaining insights into the prevalence, patterns, and relationships of variables within a population, facilitating the identification of trends, disparities, and potential correlations. (Kothari, 2014)

3.2 Area of Study

The study was conducted in Chamwino district in Dodoma Region. The area was selected due to the fact that the district has a high concentration of rural public secondary schools. According to Boniface (2020), in the three districts of Kondoa, Mpwapwa, and Chemba, 67% of teachers perceive five key school-level sources of low retention in remote schools. Therefore, this study was vital for Chamwino District to assess the workload allocation and teachers job retention in rural areas at public secondary schools. Moreover, Chamwino district's educational landscape offers a critical case study due to its demographic and infrastructural characteristics. The district's schools face challenges such as limited access to resources and infrastructure, which are known contributors to teacher turnover (Boniface, 2020). By focusing on Chamwino, this study aims to uncover nuanced factors affecting teacher retention specific to rural public

secondary schools, thereby contributing to obtain more information to inform policy and intervention strategies in educational development (Boniface, 2020).

3.3 Study Population

Population or universe means, the entire mass of observations, which is the parent group from which a sample is to be formed (Prabhat *et al.*, 2015). The total population of this study included 372 secondary schools teacher in selected 15 rural secondary schools in Chamwino District council (Table 1).

Table 1: Distribution of study population

Name of schools	Number of teachers
Handali secondary school,	24
Dabalo secondary school,	26
Haneti secondary school,	25
Huzi secondary school,	25
Mpwayungu secondary school,	26
Chilonwa secondary school,	25
Manzanse secondary school,	25
Majeleko secondary school,	25
Idifu secondary school,	25
Fufu secondary school,	25

3.4 Sample size

A sample size for this study was calculated by Yamane (1967) simplified formula to calculate sample sizes for a known sample size. This formula was used to calculate the sample sizes. It's particularly useful because it provides a straightforward method to calculate the required sample size based on a desired level of confidence and a margin of error, without needing sophisticated statistical software. This can be advantageous in practical settings where resources and time for conducting surveys are limited (Yamane, 1967). A 95% confidence level and $p = 0.5$ are assumed for the equation below. Where n is the sample size, N is the population size, and e is the level of precision.

$$n = \frac{N}{1 + N(e)^2} \dots \dots \dots (1)$$

N= total population

n= sample size

E= margin error of 0.05

Now, the value of N is 372.

$$n = \frac{372}{1 + 372 (0.05)^2}$$

$$n = 192$$

Therefore, the total sample size for this study was 192 for this study.

3.5 Sampling Technique

In this study, simple random sampling was used to select 192 teachers in selected secondary schools in Chamwino district. Simple random sampling techniques were employed to ensure a comprehensive and representative sample of respondents. The simple random sampling method, particularly the lottery technique, was applied to select individual teachers, thereby minimizing selection bias and enhancing the generalizability of the findings to the broader population of teachers. This approach ensured that every teacher had an equal chance of being selected, which is crucial for the validity and reliability of the study. By using simple random sampling, the study aimed to capture diverse perspectives and experiences of teachers, making the results more reflective of the actual conditions and challenges faced in these schools. This method also facilitated the inclusion of teachers from different backgrounds and specialties, contributing to a more holistic understanding of the educational environment in Chamwino's rural secondary schools.

3.6 Data Collection Method

The study used a survey questionnaire as the main method of data collection. This method was widely employed for data collection due to its efficiency, allowing simultaneous engagement with a large number of participants (Babbie & Mouton, 2001). Their standardized format ensures consistent data collection, reducing the risk of interviewer bias (Fowler, 2013). Moreover, questionnaires offer the advantage of anonymity, which often encourages respondents to provide candid and honest answers, particularly on sensitive subjects (DeMaio & Rothgeb, 1996). This method's accessibility, in various formats such as online surveys or email, makes it convenient for a diverse range of participants (Dillman et al., 2014). Additionally, questionnaires generate structured, quantitative data that is amenable to statistical analysis, enabling researchers to discern patterns and trends (Creswell & Creswell, 2017). The questionnaire was designed to capture data related to the contribution of workload allocation on teacher job retention in public secondary schools at Chamwino district council. This includes the number of teaching hours, class size, number of preparatory hours, and

administrative duties (Smith & Jones, 2020; Brown, 2019). Additionally, the questionnaire was developed using five-point Likert scale questions (1 = Strongly disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, and 5 = Strongly agree) (Boone & Boone, 2012). The variables were adopted from the study by Smith and Jones (2020), which emphasized their impact on teacher retention. The use of Likert scale questions allows for capturing the degree of agreement or disagreement among respondents, providing a nuanced understanding of their perceptions (Boone & Boone, 2012).

3.7 Data Analysis Methods

The study used descriptive statistics and inferential statistics methods to analyze quantitative data. Descriptive statistics were used to summarize the data in terms of frequency, percents, and mean. Inferential statistical methods were used to determine the significant relationship between independent and dependent variables. Therefore, multiple linear regression analysis was applied. Multiple linear regression analysis was used because it is a powerful statistical tool widely employed in quantitative research to examine the relationship between a dependent variable and multiple independent variables simultaneously, allowing researchers to assess the combined impact of several factors on the outcome of interest (Kelley & Bolin, 2013).

The following equation introduce the multiple linear regression model to determine the influence of workload allocation on teacher job retention

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 + \epsilon \dots \dots \dots (2)$$

Whereby:

Y= Index score for teacher's job retention

X₁=Number of teaching hours

X₂=Class size

X₃=Number of preparatory hours

X₄=Administrative duties

4.0 Results and Discussion

4.1 Descriptive Statistics Results

4.1.1 Descriptive statistics results of teachers' job retention

This section presented descriptive statistics on the results of teachers' job retention. Four indicators are used to assess the teachers job retention includes employee satisfaction, work life balance, intention to leave and intention to stay. The responses were ranked on a five-point Likert scale (5 = strongly agree, 4 = agree, 3 = neutral, 2 = disagree, and 1 = strongly disagree) and summarized into a mean and standard deviation (Jamieson, 2004). The score between 3.5 to 5 implies a high extent, the score between 3.5 to 2.5 means moderate extent; and the scale between 2.4 to 1 implies low extent (Boone & Boone, 2012). The use of a Likert scale is

common in social science research to quantify subjective opinions and attitudes (Croasmun & Ostrom, 2011). It helps in translating qualitative data into quantitative metrics, making it easier to analyze and interpret (Allen & Seaman, 2007).

Table 2: Teachers job retention (n=192)

Variables	Mean	Std. deviation
Employee satisfaction	4.036	0.473
Work life balance	3.239	1.051
Intention to leave	4.078	0.433
Intention to stay	3.727	0.152
Overall score	3.784	0.527

Findings in Table 2 indicated that, the overall mean score of 3.784 for teachers' job retention indicates a moderately high level of retention. Employee satisfaction and intention to leave both show high mean scores of 4.036 and 4.078, respectively, suggesting that while teachers are generally satisfied with their jobs, there is a strong intention to leave. Work-life balance, with a lower mean score of 3.239, highlights an area of concern that may influence retention negatively. However, the intention to stay, with a mean of 3.727, still reflects a positive outlook. These findings align with other scholarly research, such as those by Smith and Jones (2019), who found that high job satisfaction significantly reduces turnover intentions among teachers. Efforts by the government, including improved remuneration, professional development programs, and policies supporting work-life balance, have been implemented to enhance retention. However, the disparity between high satisfaction and the intention to leave indicates that more targeted interventions might be necessary to address specific challenges faced by teachers (Oluwadare, 2018).

These findings concur with previous studies Adewale & Ibe, (2016), it is evident that while overall satisfaction is high, issues related to work-life balance and the accuracy of intention to leave assessments remain critical. Addressing these factors through targeted interventions, such as improved support for work-life balance and accurate assessment of teachers' intentions, could significantly enhance job retention efforts in educational settings.

4.1.2 Descriptive statistics results for workload allocation

The respondents were asked to rate the influence of workload allocation on teachers' job retention. Three indicators are used to assess the workload allocation: number of teaching hours, class size, number of preparatory hours, and administrative duties. The descriptive statistics were used to assess the level of agreement, as shown in Table 3. Since the data was collected using a Likert scale from 1 to 5, where 5 indicated strong agreement, 5 indicated agreement, 3 indicated neutrality, 2 indicated disagreement, and 1 indicated strong disagreement, the mean and standard deviation (S.D.) were computed to establish the findings.

The score between 3.5 to 5 implies high extent, the score between 3.5 to 2.5 means moderate extent; and the scale between 2.4 to 1 implies low extent.

Table 3: Descriptive statistics of workload allocation (n=192)

Variables	Mean	SD
Number of teaching hours	4.000	0.758
Class size	3.958	0.729
Number of preparatory hours	2.156	0.947
Administrative duties	3.885	0.816
Average score	3.588	0.821

Findings in Table 3 indicated that, the mean scores for statements related to workload allocation reveal that teachers generally find their teaching hours unmanageable (mean = 4.000, SD = 0.758) and that large class sizes make effective teaching challenging (mean = 3.958, SD = 0.729). However, teachers are split on the amount of preparatory time which was below the overall mean score (mean = 2.156, SD = 0.947), implying that time allocated for preparation is perceived minimum. Regarding administrative duties, the findings indicate that the perception was above the overall mean score (mean = 3.942, SD = 0.851), implying that administrative duties was considered in work allocation. The overall average score of 3.588 (SD = 0.821) indicates a generally high extent of workload manageability.

The findings related to recent research by Nkosi (2023) suggests that an equitable allocation of workload significantly enhances teacher job satisfaction and retention rates in public secondary schools. This finding aligns with Mbele's (2022) study, which highlighted that when teachers perceive their workload as fair and manageable, they are more likely to stay committed to their teaching positions. Furthermore, the study by Tshabalala (2021) underscores the importance of administrative policies that ensure a balanced distribution of responsibilities among educators, thereby fostering a conducive work environment that supports long-term retention.

4.2 Inferential Statics Results

This section presents the inferential statistics and particular multiple linear regression analysis results related to the influence of workload allocation on teacher job retention. Before, running multiple linear regression analysis, the three assumptions presented including normality, multicollinearity, and homoskedasticity were tested via different test statistics. This aimed to ensure that there is no any violation of the model assumption before the actual analysis of the data was made.

4.2.1 Normality Test

A normality test was performed to see whether the data were normally distributed. The Shapiro-Wilk test was performed to determine normalcy. The significant value for all variables was 0.000. Therefore, all the variables had significant Shapiro-Wilk test at 0.05 and thus were normally distributed as indicated in Table 4.

Table 4: Normality Test

Variables	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Number of teaching hours	0.200	192	0.000	0.925	192	0.000
Class size	0.297	192	0.000	0.786	192	0.000
Number of preparatory hours	0.323	192	0.000	0.751	192	0.000
Administrative duties	0.212	192	0.000	0.641	192	0.000

4.2.2 Multicollinearity test

The multicollinearity assumption was tested through the tolerance and variance inflation factors. The test assesses the extent to which variables are highly correlated between them. In this study, the VIF value for variables in this objective was not exceeding 2.0; hence, the data for this study had no multicollinearity problems. Hair (2010) argues that multicollinearity may cause reduced explanatory power of the predictor variables to the dependent variable, resulting in an unfair conclusion of the study (Table 5).

Table 5: Multicollinearity Test

Variables	Collinearity Statistics	
	Tolerance	VIF
Number of teaching hours	0.365	2.743
Class size	0.221	4.518
Number of preparatory hours	0.168	5.944
Administrative duties	0.287	3.622

4.2.3 Homoskedasticity test

In relation to homoskedasticity, this requires that the standard deviations of errors of prediction be approximately equal for all predicted dependent variable scores. This was equally checked, and the visual plots in Figure 2 showed points scattered almost along the line. As such, the residuals were approximately equal in width at all values of the predicted dependent variable.

Figure 28: Homoskedasticity test

4.2.4 Regression coefficients for workload allocation

Results in Table 6 shows the coefficient of determination (R^2) under model one was 0.59, which meant the independent variables (number of teaching hours, class size, number of preparatory hours, and administrative duties) explained 59% of the variations in teachers' job retention. Moreover, the F-value was 11.8 and the p-value was 0.000. This meant that the regression model was significant with p-values less than 0.05 at the $\alpha = 0.05$ level in explaining the relationship between independent variables (number of teaching hours, class size, number of preparatory hours, and administrative duties) and teachers' job retention.

Table 6: Regression coefficients for workload allocation

Model	Un standardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	0.39	0.541		0.072	0.943
Number of teaching hours	0.142	0.112	0.110	0.127	0.009
Class size	-0.111	0.113	-0.109	-1.111	0.912
Number of preparatory hours	0.165	0.176	0.157	2.175	0.031
Administrative duties	-0.141	0.100	-0.115	-1.410	0.160
Dependent Variable: Teachers' job retention					
R-Square = 0.59					
F-value = 11.8, p-value = 0.000					

Findings in Table 6 show that the number of teaching hours is positively and significantly related to teachers' job retention ($\beta = 0.142$, $p\text{-value} = 0.009$). This implies that any increase in the number of teaching hours will increase teacher's job retention by 14.2%.

Moreover, Table 4 indicated that, class size was negative and insignificant related to teachers' job retention ($\beta = -0.111$, $p\text{-value} = 0.912$). This implies that any unit increase of class size will lead to decrease teachers' job retention by 11.1%.

Furthermore, findings in Table 6 revealed that, number of preparatory hours was positively and significantly related to teachers' job retention ($\beta = 0.165$, $p\text{-value} = 0.031$). This implies that any unit increase in the number of preparatory hours will lead to increase teachers' job retention by 16.5%.

Additionally, findings in Table 6 show that administrative duties were negatively and significantly related to teachers' job retention ($\beta = -0.141$, $p\text{-value} = 0.160$). This implies that any unit increase in a teacher's administrative duties will lead to a decrease in a teacher's job retention by 14.1%.

The findings in lines with previous studies that have shown that the number of teaching hours, class size, number of preparatory hours, and administrative duties positively correlates with teachers' job retention in educational settings across various contexts (Adesina, 2020; Kamau & Mwangi, 2021). Adesina (2020) found that increased teaching hours directly contributed to higher job satisfaction among teachers in Nigeria, highlighting the importance of workload in influencing retention rates. Similarly, Kamau and Mwangi (2021) confirmed these findings in their study in Kenya, where they observed that teachers who had more teaching hours tended to stay longer in their positions. These studies collectively underscore the significant role that workload management plays in enhancing teachers' commitment and retention in African educational systems.

When examining the standards guiding workload allocation for teachers, it becomes evident that fair and manageable workload distribution is crucial for job retention. A balanced workload ensures that teachers are not overwhelmed, which can lead to burnout and dissatisfaction. Effective workload allocation involves considering various factors such as teaching hours, class sizes, preparation time, and additional administrative responsibilities (Adesina, 2020). Schools and educational authorities must implement policies that distribute these tasks equitably, allowing teachers to maintain a healthy work-life balance (Kamau & Mwangi, 2021). Furthermore, involving teachers in the decision-making process regarding their workload can enhance their sense of control and job satisfaction, ultimately leading to higher retention rates (Adesina, 2020).

5.0 Conclusions and Recommendation

The study concludes that teacher retention is significantly influenced by various workload allocation factors. Specifically, class size and administrative duties negatively affect teacher job retention, while the number of teaching hours and preparatory hours have a positive influence. Consequently, managing these workload allocation factors is crucial for improving teachers' retention in rural areas at public secondary schools in Chamwino district council. The study recommends that to the President's Office, Regional Administration and Local Government Tanzania (PO-RALG), (Ministry of Education, Science and Technology (MoEST) and Chamwino District Council, reducing workload allocation can be achieved by hiring additional teaching staff to distribute the workload more evenly, ensuring that no single teacher is overwhelmed. Additionally, incorporating more teaching assistants can alleviate the burden of non-teaching tasks such as grading and administrative duties. Introducing efficient time management and planning tools can also help teachers manage their workload better. Professional development programs focused on time management and stress reduction techniques can empower teachers to handle their responsibilities more effectively.

6.0 Limitations and Area for Further Studies

This study was limited on public secondary located in rural areas. Therefore, other study should consider the private secondary school for comparative of findings. Moreover, This study was conducted in Chamwino district council only in Tanzania. Other studies should be conducted in other LGAs in Tanzania to find generalizations.

Abstract

Although digital financial services (DFS) are vital fintech innovation for access and use of financial services by underserved groups, the effect of DFS on financial inclusion (FI) has not been studied adequately. This research examined the influence of DFS denoted by digital payment, digital saving, and digital credit on FI measured by use of financial services, among student youths from University of Dodoma (UDOM) and Institute of Rural Development Planning (IRDP) in Dodoma. A cross-sectional study design and quantitative research approach were employed in carrying out the study. Systematic random sampling was used to select 100 students to whom survey was administered using questionnaires. Multi linear regression was used to analyze the relationship between DFS and FI using SPSS Version 23. It was found that digital payment and digital saving have significantly positive influence on FI, but digital credit indicated to have a significant negative influence ($\beta = -0.08$, $p = 0.003$) on FI. The results show that digital payment and digital saving increase FI among the student youths and therefore their use should be enhanced by the financial services providers to expand FI. However, the findings show that digital credit has negative effect of FI and thus financial services providers should develop strategies to improve it.

Keywords: *Digital financial services; Financial inclusion; Higher learning institutions, Influence.*

1.0 Introduction

Digital financial services (DFS) are significant technological development in the financial sector. DFS involves the broad range of financial services and products accessed and delivered through digital channels, including payments, credits, savings, remittances, and insurance (Durai & Stella, 2019). DFS are associated with several benefits, for instance, the expedite access and use of financial services subsequently promoting financial inclusion and development of underserved groups like youths, women, small traders, and people with disabilities, among others (Demirguc-Kunt, Klapper, Singer, & Ansar, 2018). Therefore, there have been efforts to enhance DFS usage. Particularly, since 2010, when the leaders of the G20 recognized financial inclusion (FI), various stakeholders became interested in it as an enabler of inclusive development. Global initiatives like G20 Financial Inclusion Plan and Global Partnership for Financial Inclusion, UN Sustainable Development Goals, AU Agenda 2063, World Bank Financial Inclusion Framework, and Alliance for Financial Inclusion have been put in place to promote digital financial inclusion. Similarly, in Tanzania, government, private stakeholders, and development partners have implemented National Financial Inclusion Frameworks and financial services providers like banks and mobile network operators continue providing digital financial services to enhance digital financial inclusion.

Despite the immense financial inclusion initiatives in place, the World Bank's Global Findex indicated that about 2.5 billion people are excluded from formal financial services and there are 1.7 billion people who do not have a bank account or a mobile money provider account worldwide (Antunes et al., 2021; Cull et al., 2013). Furthermore, in most developing countries, more than two-thirds of adult populations have no access to formal financial services, and in sub-Saharan Africa, financial exclusion is as high as 76 percent in women, youth, and poorest segments of society (Antunes et al., 2021; Klapper & Demircuc-Kunt, 2021). In Tanzania, a 2023 survey by FinScope Tanzania found that 24 percent of adults are financially excluded, about 33 percent of the youth are excluded from financial services, and 50 percent of youths with access to the digital devices showed inactive usage of digital financial services. For instance, despite having access to digital devices like smartphones, tablets, laptops, as well as, internet and Wi-Fi; a significant portion of youths in Tanzanian higher learning institutions, particularly at UDOM and IRDP, still use traditional financial services for paying school fees, for instance by Banker's cheques from bank branches to school Bursars, and collecting HESLB loans through bank branches and Loan Officers. This still significant exclusion from financial services is associated with barriers such as low access to financial services by underserved groups like the youth; low level of financial literacy; high cost of financial services and products; long physical distance to access points; low internet in some places; lack of mobile phones by some people; and lack of formal documentations.

However, increase in digital transformation in developing countries like Tanzania bolstered by the increasing usage of information and technologies, internet usage, and high penetration rate of mobile cellular phones enhance digital financial services usage and subsequent financial inclusion. Indeed, research on influence of DFS on FI indicates mixed findings, suggesting the need for further studies to understand the phenomenon. For instance, while studies (Lyimu&Mbesigwe, 2022; Musago, 2018; Mwakibosi, 2016; Mwanja, 2016) found positive relationship between digital financial services and financial inclusion, studies by (Wathome, 2020; Agyekum, 2016; Michelle, 2016) found negative association between digital finance and financial inclusion. Consequently, this study aims to determine the influence of digital financial services on financial inclusion among youths at the University of Dodoma (UDOM) and Institute of Rural Development Planning (IRDP) as selected higher learning institutions in Dodoma City in Tanzania.

To the best of our knowledge, this is the first study on DFS usage among youths in higher learning institutions in Tanzania, particularly at UDOM and IRDP. It contributes to the existing knowledge on digital financial inclusion, guides policy-makers to develop effective measures for improving digital financial inclusion in Tanzania, and enhances digital financial services usage among youths in Tanzanian higher learning institutions where there is still significant inactive usage of DFS.

To achieve the study's aim, we use data from 100 students from UDOM and IRDP, we employ survey using questionnaires to collect data. We measure FI with use of financial services; we measure DF by digital payment, digital saving, and digital credit; and we perform a multilinear regression analysis. The results show positive influence of digital payment and digital saving on financial inclusion, but negative influence of digital credit on financial inclusion. The

study's results offer theoretical and empirical background for comprehending the relationship between DF and FI, which could encourage scholars to undertake further studies on the issue. Moreover, the study's findings increase understanding and awareness by digital financial services providers about the effect of DFS on FI, thus, help build effective strategies for promoting digital financial services usage and financial inclusion among the youths, particularly at higher learning institutions.

The rest of this paper is organized as follows: Section 2 presents the theoretical and empirical literature review, Section 3 explains the data and methodology used, Section 4 discusses the results, and section 5 reports on the conclusions.

2.0 Literature Review

2.1. Theoretical Literature Review

Diffusion of Innovations (DOI) Theory, proposed by Everett Rogers (Rogers, 1995), explains how innovation can be spread through diverse channels over time among different users. DOI theory attempts to explain the rate at which the new advancements spread, how they spread, and why they spread, identifying attributes that predict whether and how quickly an innovation spreads (Monyoncho, 2015), including; relative advantage, compatibility, complexity, trialability, and observability (Rogers, 2010), as well as other determinants like communication channels, time, social context, and efforts of change agents. Other than the attributes, DOI postulated that individuals make their own decisions about whether to adopt the innovation through five stages of the decision process which entails; knowledge stage where individual learns of the existence of the innovation and gathers information about it; persuasion stage where individual actively seeks out knowledge that will help in the decision process; decision stage where individual adopts or rejects the innovation; implementation stage where individual uses the innovation and evaluates its benefits; and confirmation stage where individual continues to seek information to confirm that the adoption decision was beneficial (Rogers, 1995).

Moreover, it explains that while the decision-making process stages apply to all individuals, people differ in their receptivity to new ideas and how much time and information they need to make an adoption decision. Thus, Rogers identified categories of innovation adopters into; innovators, risk-tolerant individuals who like to seek and try new ideas and constitute 2.5 percent; early adopters, those who are comfortable with change and adopting the innovation and have the social position to influence others and constitute 13.5 percent; early majority, individuals who are deliberate in their adoption decision but tend to adopt more quickly than average in constitute 34 percent; late majority, risk-averse individuals who need to see innovation being used successfully by others before they adopt it and constitute 34 percent; and laggards, the last to adopt an innovation, often only adopting it after a new innovation has begun to replace it and constitute 16 percent.

Although critics have associated DOI theory with limitations such as over-emphasis on individual behavior, assuming that population is homogeneous, assuming that adoption is a linear process, and being narrow in covering other factors such as organizational and regulatory

factors; it can help explain how FinTech innovations like DFS are adopted and used and associated factors. For example, Shaikh et al. (2023) applied DOI theory to determine customers' adoption of digital banking services and found that their adoption of the digital banking services was affected by DOI's attributes such as relative advantage and complexity. Echoing similar findings, Nor and Ahmed (2010) found that relative advantage, compatibility, and trialability have significant effect on participants' attitude to adopt and use internet banking. DOI guides this study to explain uptake of DFS and subsequent enhancement of financial inclusion in terms of usage of DFS among youth.

Technology Acceptance Model (TAM), proposed by Fred Davis in 1986, postulated that there are two factors that determine whether a technology is accepted by its potential users which are; perceived usefulness and perceived ease of use. Perceived usefulness implies the extent to which one believes that using a technology will enhance or perform or achieve one's goal(s), and perceived ease of use refers to the degree to which one believes that using the technology will be effortless. TAM has demonstrated high level of predictiveness in varied contexts regarding acceptance of technology by potential users. It can be said that even if a technology is perceived as useful, it will only be used if it is perceived as easy to use and vice versa. In this regard, TAM agrees with some attributes of DOI such as relative advantage and complexity to explain adoption of a technology. Following criticisms about focus of TAM on subjective norm, perceived usefulness, and perceived ease of use which are individual centered while neglecting many other factors; TAM has been continuously modified to incorporate other factors such as; image, relevance, quality, result demonstrability, system self-efficacy, perception of external control, system anxiety, system playfulness, perceived enjoyment, and objective usability (Venkatesh & Davis, 2000; Davis, 1989) so as to improve its applicability.

In relation to TAM, Kojol, Singh and Paul (2022) studied the adoption of digital financial transactions based on Technology Acceptance Model (TAM) and found that perceived usefulness and perceived ease of use affect the adoption of digital financial services. In the same vein, Bora and Romny (2022) and Neves *et al.* (2023) showed relevance of technology adoption factors such as perceived usefulness and ease of use for individuals to using digital financial services solutions. In alignment with the studies, TAM is used in this study to help explain the use of DFS as technologies or innovations among youth and resultant influence on their financial inclusion.

Diverging from DOI and TAM that focus on demand (user)-side of innovation adoption, the theory of financial innovation focuses on supply-side of innovation adoption. The theory of financial innovations, proposed by William Silber (1983, 1975), postulated that innovations (new financial products and/or practices) are developed by organizations such as banks and mobile network operators (MNOs) or mobile money providers to respond and lessen constraints imposed on them (Dayadhar, 2015; Li & Zeng, 2010). In particular, banks and MNOs can adopt new products and practices to cut operating cost, stop the loss of deposits, reduce risk, respond to market and economic changes, enter new market segments, increase profitability, among others. According to Li and Zeng (2010), in their efforts to address the constraints and expand benefits, the innovations can reach more people and thus enhance financial inclusion (Biernacki, 2021; Sekhar, 2013). A study by Avon, Bangake and Ndooy

(2023) studied whether financial innovations improve financial inclusion and found that financial innovations such as mobile money adoption improved financial inclusion in a range of 12-14 percent. In the same vein, Manasseh *et al.* (2024) assessed the impact of digital financial innovation on financial system development and confirmed that digital financial innovation significantly impacts financial system development and thus financial inclusion. Khraisher and Arthur (2018) presented increasing application of the theory of financial innovation in re-evaluation and re-conceptualization of financial practices which also affect financial inclusion. The theory of financial innovations guides this study to explain determinants of fintech innovations such as DFS from the supply-side perspective and subsequent influence on financial inclusion of the youth with regard to usage of the services.

2.2. Empirical Literature Review

Ozili (2018) presented that the theoretical underpinning for the relationship between digital finance and financial inclusion is the premise that a large amount of the excluded populations, for example youths, owns (or have) a mobile phone and/or other digital devices, and that the provision of financial services via mobile phones and related devices can improve access to finance for the excluded population. Provided that the excluded population have a mobile phone or other digital devices and affordable internet connectivity, greater supply of digital finance is often predicted to have positive effects for financial inclusion, all other things being equal; implying a positive correlation between the use of digital finance and access to formal financial services. Al-Smadi (2023) studied the association between digital finance and financial inclusion and confirmed the role of digital finance in enhancing financial inclusion. Fanta and Makina (2019) examined the relationship between technology and financial inclusion and reported a positive impact of ATMs and internet technology on access and use of financial services, thus concluded that technology significantly impact financial inclusion. Kouladoun, Wirajing, and Nchofoung (2022) studied the relationship between digital technology and financial inclusion and found that digital technology indicators used had positive effect on financial inclusion, thus stressed the role of digital technology in enhancing financial inclusion. Ene, Abba, and Fatokun (2019) found that digital financial services through electronic banking enhanced financial inclusion; and Bede Uzoma et al. (2020) found a positive association between digital finance and financial inclusion.

In Tanzania and neighboring countries, Lyimu and Mbesigwe (2022) examined the influence of digital financial services offered by microfinance institutions in enhancing financial inclusion in Arusha Tanzania, and found that digital financial services can increase financial inclusion. George (2020) looked into the effect of the digital banking initiatives on financial inclusion among commercial banks like CRDB, NMB, and NBC Bank in Tanzania with focus on initiatives like internet banking, agency banking, and mobile banking. The researcher presented that agency banking and mobile banking influenced financial inclusion; however, internet banking did not significantly influence financial inclusion. Lotto (2016) found that digital financial services like agency banking facilitated banking services by shortening distance between customers and service points and lowering banking costs than those of traditional banking services. The author concluded that increase in geographical coverage

enabled by digital financial services is a better support for financial inclusion because financial services are expanded to individuals thus decreasing travel costs and other constraints like time wasted in long waits at bank branches. In the same vein, Mwakibasi (2016) in Tanzania, Boro (2019) and Musago (2018) in Kenya, and Mwanaja (2016) in Uganda found that digital financial services have positive relationship with financial inclusion.

On the other hand, literature also present that digital financial services can have negative effects on financial inclusion. Ozili (2018) argued that providers of digital finance like banks and MNOs are profit-seeking corporations that use digital finance to maximize their profitability or to maximize the profitable opportunities of businesses affiliated with digital finance providers (Al-Smadi, 2023). Additionally, digital finance providers like banks and MNOs can discriminate or become bias against vulnerable groups in the population, for example based on level of income, marketing tactics, digital finance infrastructure or fintech, geographical bias such as rural areas, and level of education, thus, resulting in low financial inclusion. Furthermore, Malady (2016) insinuated that in developing countries, which lack robust consumer protection measures, people avoid using digital financial services based on their lack of trust in digital service channels because of concerns about data security which negatively affects financial inclusion. Ozili (2018) presented that the cost of securing customer data could be higher than the returns from the provision of digital services, therefore, making digital finance infeasible for some digital financial service providers.

Locally, in Tanzania and neighboring countries, Msalike (2020) assessed consequences of digital banking on financial inclusion in Tanzania, and found that financial inclusion using digital banking is still largely hindered by limited bank coverage, limited bank customers, and limited technology. Michelle (2016) studied digital finance and financial inclusion in the banking industry in Kenya and found that digital finance does not have significant correlation with financial inclusion in the banking sector; since, banking institutions adopt digital financial services to lower operating cost associated with opening and operating branches to improve their profitability and financial performance and not to foster financial inclusion. This argument can also be supported by Theory of Financial Innovations (Silber, 1983, 1975).

Literature presents mixed views on the relationship between digital financial services and financial inclusion. Therefore, to achieve the objective of the study, we propose the following hypothesis:

Hypothesis 1. Digital financial services usage has positive influence on financial inclusion among youths at UDOM and IRDP.

3.0 Method

This research targeted 100 student youths at UDOM and IRDP calculated based on the Slovin's formula (Adhikari, 2021) indicated in equation 1, where N was the estimate number of target population at UDOM and IRDP, e was the margin error of 10% (0.1) at confidence level of 90%, and n was the statistically calculated sample size of the target participants at UDOM and IRDP.

$$n = \frac{N}{1 + Ne^2} \dots\dots\dots (1)$$

$$n = \frac{54588}{1 + 54588 \times 0.1^2} = 100$$

Inclusive criteria for participants were; youths enrolled as students at UDOM and IRDP and aged between 15 to 35 years. Non-student youths at UDOM and IRDP and students aged above 35 years were excluded from the study. Systematic random sampling was used to select participants to the study through computer-based random number generator to achieve randomness. 95 percent of the target participants participated in the study thus it did not differ much from the target sample size.

This study examined the influence of DFS on FI. Thus, the dependent variable of the study was FI. Following Al-Smadi (2023), FI was measured using the frequency of use of financial services. DFS was the independent variable designated by digital payment, digital saving, and digital credit.

Table 1: Operationalization and measurement of variables

Variable	Variable Type	Indicator	Scale	Measurement
Digital		Digital	5-point Scale	Likert
Financial	Independent	Payment		Frequency of making payment
Services		Digital	5-point Scale	Likert
		Credit		Frequency of borrowing loan
		Digital	5-point Scale	Likert
		Saving		Frequency of saving money

Financial

Inclusion	Dependent	Use	5-point Scale	Likert	Frequency of using DFS
-----------	-----------	-----	------------------	--------	------------------------

Source: Author (2024).

Self-administered questionnaires in form of 5-point scale each designed to take 20 minutes were used to collect data from participants at school settings at UDOM and IRDP during this research. Questionnaires were reviewed by experts in digital financial services, pretested on small samples of target participants to generate Pearson's correlation coefficient, and compared with questionnaires from similar past studies to ensure validity and reliability. Permission was obtained from UDOM and IRDP administrations and participants were required to read and voluntarily sign consent forms prior to data collection to ensure ethical collection of data. The research adopted cross-sectional study design to explain the association between DFS and FI at a single point in time, as well as save time and cost (Creswell & Creswell, 2017; Mann, 2003).

This research used inferential statistics by applying multiple linear regression, as indicated in equation 2, using SPSS Version 23 to determine nature (positive or negative) and significance of relationship between digital financial services denoted by digital payment, digital saving, and digital credit, with financial inclusion measured by use of financial services, where P-value of less than or equal to 0.05 was considered statistically significant. Regression model used is as follows:

$$Y = \beta_0 + \beta_1 Dp + \beta_2 Ds + \beta_3 Dc + \epsilon_i \dots\dots\dots (2)$$

Where B_0 is the intercept; $B_1, \beta_2, \beta_3, \beta_4$ are regression coefficients; ϵ_i denotes the error term; Dp , Ds , and Dc denote independent variable (DFS) where Dp represents digital payment, Ds represents digital saving, and Dc represents digital credit; and Y represents dependent variable (FI) measured by the frequency of use of financial services.

4.0 Results

4.1. Response Rate

Table 2: Response rate for questionnaires

Response	Frequency	Percentage
Returned questionnaires	95	95%
Unreturned questionnaires	5	5%
Total	100	100%

Source: Survey (2004).

The findings in Table 2 show that, of the 100 questionnaires distributed, 95 questionnaires were properly completed by respondents and qualified for analysis, thus, the study achieved a response rate of 95% and had a non-response rate of 5%. Hence, the sample used was highly representative.

4.2. Respondents Demographics

Table 3: Respondents demographic information

Demographic Characteristic	Sample (n)	Percentage (%)
Gender		
Male	49	51.6
Female	46	48.4
Age (Years)		
15-20	0	0
21-26	89	93.7
27-32	6	6.3
33-35	0	0
Year of study		
First year	28	29.5
Second year	28	29.5
Third year	21	22.1
Fourth year	12	12.6
Master's level	6	6.3
Own digital device		
Yes	95	100.0
No	0	0

Source: Survey (2024)

Results as presented in Table 3 indicate that, 49 (51.6%) respondents were males and 46 (48.4%) respondents were females. This shows that approximately equal number of males and females were included in the study. 89 of 95 respondents were aged 21-to-26 years old and 6

of 95 participants were aged 27-to-32 years old. The ages align with the age of youth recognized by the National Youth Policy of Tanzania of 2007 which is 15-to-35 years. Of 95 participants studied; 28 were first year students, 28 were second year students, 21 were third year students, 12 were fourth year students, and 6 were master's students. The findings indicate that the number of participants decreased with increase in the level of study of the respondents. Perhaps, this is because the age of respondents increased with the increase in their level of study, thus most youths are at lower levels of study. Moreover, all respondents agreed to own at least a digital device as smartphone, tablet, or computer. This implies that all participants could have access to digital financial services.

4.3. Influence of DFS on FI of Youths

Multiple linear regression was used to test relationship between digital payment (Dp), digital saving (Ds) and digital credit (Dc) as indicators of digital financial services with financial inclusion. The results of the analysis were as presented in following tables

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
	.848 ^a	.719	.709	.301

a. Predictors: (Constant), Digital Credit, Digital Payment, Digital Saving ($\alpha = 0.05$)

The R-squared ($R^2 = 0.72$) shown on Table 4 indicates that, the data fit the regression model and independent variables (digital credit, digital payment, and digital saving) can explain 72 percent of variance in dependent variable, while 28 percent of variance can be explained by other factors.

ANOVA					
Table 5: Result of analysis of variance of predictors of financial inclusion					
Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	21.060	3	7.020	77.481	.000 ^b
Residual	8.245	91	.091		
Total	29.305	94			

a. Dependent Variable: Financial Inclusion

b. Predictors: (Constant), Digital Credit, Digital Payment, Digital Saving ($\alpha = 0.05$)

The result of ANOVA test displayed on Table 5, indicates large F-value ($F = 77.48$) and P-value ($P = 0.000$) lower than Significance Level ($\alpha = 0.05$), implying that there are significant differences between the means of the independent variables (digital credit, digital payment, and digital saving).

Table 6: Influence of digital financial services on financial inclusion among youth

Independent Variables	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.323	.273		1.184	.239
Digital Payment	.525	.071	.471	7.364	.000
Digital Saving	.439	.065	.435	6.746	.000
Digital Credit	-.078	.026	-.176	-3.024	.003

a. Dependent Variable: Financial Inclusion ($\alpha = 0.05$)

Based on the results of multiple linear regression shown in Table 6, the fitted regression model is: Financial Inclusion = $0.32 + 0.53 \times (\text{digital payment}) + 0.44 \times (\text{digital saving}) - 0.08 \times (\text{digital credit})$. Thus, this study found that digital payment has significant positive relationship with financial inclusion ($\beta = 0.53$, $P = 0.000$), digital saving has significant positive relationship with financial inclusion ($\beta = 0.44$, $P = 0.000$), and digital credit has significant negative relationship with financial inclusion ($\beta = -0.08$, $P = 0.003$). This implies that digital payment and digital saving as services in digital finance can improve financial inclusion; however, digital credit as a service in digital finance has deterring effect on financial inclusion.

5.0 Discussion

Consistent with the hypothesis of this study that DFS have significant positive influence on FI, the current research found that digital payment and digital saving have significantly positive influence on financial inclusion of youths at UDOM and IRDP. However, contrary to this study's hypothesis, the current study found that digital credit has significantly negative influence on financial inclusion of youths at UDOM and IRDP. Consistent with this study's finding that digital payment has significantly positive association with financial inclusion of student youths ($\beta = 0.53$, $p = 0.000$), Veronicah (2022) found positive relationship between digital payment and financial inclusion ($\beta = 0.40$, $p = 0.000$). Such result was also triangulated in a study by Veronicah, Jagongo, and Musau (2022). This implies that increase in digital payments increases financial inclusion of the youths and thus financial services providers like banks and MNOs can improve digital payment services and products to expand financial inclusion of youths. Similar to this study's finding that digital saving has significantly positive relationship with financial inclusion of youths ($\beta = 0.44$, $p = 0.000$), Veronicah (2022) confirmed positive relationship between digital savings with financial inclusion ($\beta = 0.04$); however, the researcher found that the relationship was insignificant ($p = 0.4953$). Also, Al-Smadi (2023) found a significantly positive relationship between digital financial services like

digital savings and financial inclusion ($P = 0.0313$, $\alpha = 0.05$). Likewise, studies like Boro (2019), Musago (2018), and Mwakibasi (2016) discovered that digital financial services have significantly positive impact on financial inclusion. This signifies that digital savings can increase financial inclusion of the youths and thus financial services providers like banks and MNOs should harness digital saving services to enhance the financial inclusion of youths.

On the other hand, the current study found that digital credit has significantly negative association with financial inclusion among the youth ($\beta = -0.08$, $p = 0.003$). This is in consistent with findings of Ozili (2018), Shen et al. (2018), and Michelle (2016) who presented negative relationship between digital financing and financial inclusion. The result, thus, signifies that increase in the use of digital credit can lessen youth's inclusion into formal financial services. Explaining her finding that digital credit has no significant relationship with financial inclusion, Veronicah (2022) stated that banks can use digital financial services to cut operating costs associated with opening and operating branches in order to improve their profitability and financial performance rather than to foster financial inclusion. Yue, Korkmaz, Yin, & Zhou (2022) presented that although widespread use of digital credit finance increases financial market participation and household consumption, the easier access to digital credit services increases the risk of falling into a debt trap and financial distress. Echoing such finding, Wathome (2020) found some benefits of digital credit on youths, however, the author presented that 39 percent of the participants were indebted with two or more digital loans and others were listed in the Credit Reference Bureau as a result of defaulting thus could no longer access digital loans. Access to easy and quick to get digital loans has also been associated with reckless financial behavior among youths, for example expensive lifestyles and gambling activities. Perhaps, it can be derived from the findings that digital credit services can have benefits to borrowers including the youths, however, its negativity is attributed to its adverse consequences which if are addressed can improve its impact on financial inclusion. For instance, Kim & Duvendack (2024), presented an opposite view that digital credit showed considerable success in some developing countries like Kenya expanding opportunities for individuals excluded from formal loans because of their low socioeconomic status. However, the authors conceded that evidence supporting the greater positive impact of digital credit on financial inclusion is lacking.

The current research studied statistically calculated sample with randomly selected participants and 95 percent response rate, using valid and reliable questionnaires; thus, this study's findings are representative of the target population and can be generalized to youths in other higher learning institutions aside from UDOM and IRDP. However, the current research focused on student youths in higher learning institutions while excluding other categories of youths, for instance non-student youths and youths from other levels of education thus limiting its generalizability to the other segments of youths. Furthermore, this study's findings were based on data collected through survey method which is quantitative and using questionnaires which are structured thus limiting expression of perspectives by the participants, therefore, necessitating a need to use qualitative methods like interviews and focus groups to collect more free responses to triangulate the current study's findings. Additionally, the current study adopted cross-sectional study design which collects data at a single point in time in disregard

of changes in time, thus necessitating further research based on longitudinal design to trace the influence of DFS on FI over periods of time.

The current research found that while some digital financial services like digital payments and digital savings can positively influence FI of student youths, other DFS like digital credit can negatively influence FI of the student youths. This variability is of significant practical implication as it enables policy-makers and/or decision-makers for financial services providers like financial institutions and mobile money operators to emphasize the usage of DFS with positive influence on FI and improve DFS with negative influence on FI of youths for better outcomes. Also, the variability necessitates further research on specific determinants of influence of DFS on FI among the student youths in higher learning institutions that help build knowledge on DFS and FI.

6.0 Conclusion

This study examined the influence of DFS on FI among youths at UDOM and IRDP. The study measured FI with use of financial services, whereas DFS was denoted by digital payment, digital saving, and digital credit. Findings showed that digital payment and digital saving have positive influence on FI while digital credit has negative influence on FI of youths at UDOM and IRPD.

Based on the findings of the study, it is recommended that financial services providers like banks and mobile money operators should optimize the use of more innovative fintech to enhance DFS usage among youths so as to expand their FI. Financial services providers and other stakeholders should increase digital financial literacy and awareness of DFS among youths to enhance their DFS usage and FI. Also, the government, financial services providers like banks and MNOs, and other stakeholders should improve digital infrastructure for DFS to increase DFS access and usage.

Building on this work, future studies should conduct a comparative study on influence of DFS on FI between student youths and non-student youths. Also, it is worth investigating determinants for influence of DFS on FI among the youths to determine how they affect the relationship.

Conflict of Interest

The author declares no known conflicts of interest regarding the work and publication of this paper.

The Effect of Reward System on Teachers' Performance in Public Secondary Schools: A Case of Dodoma Region

Maua Ndoroki¹ & Dr. Ndunguru²

¹College of Business Education, Dodoma Campus.

²College of Business Education, Dodoma Campus.

Abstract

The study examined the effect of reward system on teachers' performance in public secondary schools in Dodoma region. The study was cross sectional and the population of the study was teachers, head teachers and Education Officer. The sample size of the study was 92 respondents who were found randomly and purposively. Primary data was collected using questionnaires and interviews. Data analysis was done using SPSS and STATA and thematic analysis. The study found that reward system had positive effect on teachers' performance. The study recommends that stakeholders in education sector should make sure that teachers are awarded from time to time whenever they deliver in their activities. It is also recommended that headmasters/headmistresses are recognizing teachers from time to time whenever they perform well. By recognizing teachers, they will develop confidence among themselves and hence improve their performance.

Keywords: *Reward system; Teachers' performance; Public secondary school.*

Introduction

The education sector is crucial for the development of any nation, and teachers play a vital role in shaping the future by educating the younger generation. In recent years, there has been increasing attention on how reward systems impact teachers' performance, especially in public secondary schools. The concept of reward system in educational institutions encompasses both financial and non-financial incentives aimed at motivating teachers to perform better. Financial rewards include salaries, bonuses, and allowances, while non-financial rewards encompass recognition, professional development opportunities, and a supportive work environment (Mosha & Chua, 2021).

The motivation theories of Herzberg (1959) and Maslow (1943) provide a theoretical foundation for understanding how rewards influence performance. Herzberg's two-factor theory distinguishes between hygiene factors (salary, job security) and motivators (recognition, achievement), suggesting that while hygiene factors prevent dissatisfaction, motivators drive performance. Maslow's hierarchy of needs highlights the importance of fulfilling physiological and psychological needs to achieve self-actualization, which is essential for high performance (Ngaire, 2022).

A study by Ramadhani (2019) on the effects of human resource management practices on employee job satisfaction, found that there is a significant positive relationship between reward system, training and development with employees job satisfaction. Another study by Hassan (2023) on the influence of some human resource management practices on teaching staffs' performance found that human resource management practices such as rewards system and training and development are positively and significantly related to staff members performance.

Dodoma, the capital city of Tanzania, has experienced rapid growth and development in recent years. Despite this progress, public secondary schools in the region face challenges related to teacher motivation and performance. Limited resources, inadequate infrastructure, and low salaries are common issues affecting teachers' morale and effectiveness (URT, 2017). The Tanzanian government has implemented various policies aimed at improving the education sector, including enhancing the reward systems for teachers. However, the effectiveness of these measures in the Dodoma region remains a subject of ongoing research and debate.

Methods

Study Setting

This study was conducted in Dodoma Region in Tanzania. The reason behind choosing Dodoma Region is that apart from being the capital of the country but also no similar studies have been conducted in Dodoma Region. According to National Census (2022), the population of Dodoma was 3,085,625 people.

Research design

The study was cross sectional research design. The researcher only goes once to collect data when using the cross-sectional research design. Cross-sectional design allows for the collection of data at a single point in time. Research design refers to the overall approach of merging numerous components of the analysis in a coherent and visible manner, with the research question specifically addressed (Leedy and Ormrod, 2019).

Population of the Study

According to Groves *et al* (2019), a target population is a group of people who are considered important to the analysis in order to draw conclusions. A target population, according to Maher (2019), is a specific group of people who are suitable for a study to be performed. The population of the study was teachers, head teachers and Education officer in Dodoma Region. The total number of secondary school teachers is 1219, adding 01 Education Officer we get the total population as 1220.

Sample Size

the sample size in this study was 92 respondents as follows; 86 secondary school teachers, 05 heads of schools and 01 Education Officer. Out of 92 respondents, 05 heads of schools and 01 Education Officer were interviewed and the remaining 86 teachers were required to fill in questionnaires.

Sampling Procedure

Sampling technique refers to the particular procedure for selecting the sample constituents (Etikan, 2016). Probability sampling and non-probability sampling are two types of sampling techniques. Random, systematic, and stratified sampling are all examples of probability sampling, while purposive sampling is a non-probability sampling technique. The study used both purposive and random sampling techniques.

Data Collection Tools

The researcher used questionnaires and interviews to collect data in order to meet the research's purpose. A questionnaire, according to Cooper and Schindler (2019), is a document with written questions that is sent to respondents in order to get feedback on the research topic.

Data Analysis

Quantitative data was analyzed using SPSS in which percentages and frequency were summarized in tables and figures, as well as correlation for the first objective and ordinary least squares (OLS) regression for the second and third objectives. Qualitative data was analyzed by content analysis

Ethical Considerations

The respondents were informed of the purpose and nature of the study, privacy and confidentiality, and potential harm and benefits of the study. This information helped the respondents to make informed decisions to participate or not, and withdraw from the study.

Additionally, a non- discriminatory approach was used so as to ensure that all respondents in the study have an equal chance to participate.

Results and discussion

When looking at the view of the respondents as far as effect of reward system on teachers' performance, researcher looked at the following areas; first the study determined whether housing facilities has positive effect on teachers' performance. Findings were as follows; 16.3 percent of the respondents strongly agreed while 83.7 percent of the respondents agreed that housing facilities has positive effect on teachers' performance, as shown in table 1. The findings have shown us that to the majority (83.7%) of the respondents housing facilities have positive effect on teachers' performance.

Table 1: Housing Facilities has Positive Effect on Teachers Performance

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly agree	15	16.3	16.3	16.3
	Agree	77	83.7	83.7	100.0
	Total	92	100.0	100.0	

Field Data, 2024

The study also determined whether loan provision to teachers has positive effect on teachers' performance. Findings were as follows; 70.7 percent of the respondents strongly agreed that loan provision to teachers has positive effect on teachers' performance, 12.0 percent of the respondents agreed, 13.0 percent of the respondents were neutral while 4.3 percent disagreed, as shown in table 2. These findings according to the majority of the respondents (70.7%) show that loan provision to teachers has positive effect on their performance.

Table 2: Loan Provision to Teachers has Positive Effect on Teachers' performance

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly agree	65	70.7	70.7	70.7
	Agree	11	12.0	12.0	82.6
	Neutral	12	13.0	13.0	95.7
	Disagree	4	4.3	4.3	100.0
	Total	92	100.0	100.0	

Field Data, 2024

The study determined whether provision of incentives has positive effect on teachers' performance. Findings were as follows; 88.0 percent of the respondents strongly agreed that

provision of incentives has positive effect on teachers' performance while 12.0 percent of the respondents agreed, as shown in table 3. These findings according to the majority (88.0%) provision of incentive have positive effect on teachers' performance. Provision of incentives to teachers increases their morale for work and at the end of day their performance also grows up.

Table 3: Provision of Incentives has Positive Effect on Teachers' Performance

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly agree	81	88.0	88.0	88.0
	Agree	11	12.0	12.0	100.0
	Total	92	100.0	100.0	

Field Data, 2024

The study determined whether lunch programme to teachers has positive effect on teachers' performance. Findings were as follows; 64.1 percent of the respondents strongly agreed, 22.8 percent of the respondents agreed, 8.7 percent of the respondents were neutral while 4.3 percent of the respondents disagreed, as shown in table 4 below. These findings according to the majority (64.1%) suggest that lunch programme to teachers has positive effect on teachers' performance. It is known that teachers are required to report at work at 07.00 and leave at 15.30 hours, this means that at the time of lunch teachers are still at work places, and bad enough some of the teachers are leaving far away from schools, now by providing lunch to them it brings some sort of comfort to teachers and enable them to concentrate in their jobs.

Table 4: Lunch Programme to Teachers has Positive Effect on Teachers' Performance

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Strongly agree	59	64.1	64.1	64.1
	Agree	21	22.8	22.8	87.0
	Neutral	8	8.7	8.7	95.7
	Disagree	4	4.3	4.3	100.0
	Total	92	100.0	100.0	

Field Data, 2024

Provision of rewards to teachers on things like housing facilities, loans, lunch and incentives improves the morale of teachers at the end of the day their performance also increases. The interview with one respondent pointed out that housing facility increases the morale of teachers at the end of the day their performance increases. This was as quoted below;

“...you know some of the teachers do not own their houses due to various reasons. Now when the school provides houses to them they get peace of mind and settlement. When you have peace of mind they will work more efficiently and at the end of the day their performance will increase...”

The interview with another respondent pointed out that provision of loans and incentives increases teachers’ performance. This is as quoted below;

“...when a teacher is able to access loans he/she gets comfort ability because he/she is sure investment is possible and in that he/she will increase his income. By increasing the income the teacher will perform better. On the other on other hand when teachers are provided by incentives it increases their morale...”

What we have seen as far as the effect of reward of system on teachers’ performance is that housing facilities, access to loans, incentives and lunch programmes have been viewed by respondents to have positive effect on the performance of teachers. A study by Rogers (2020) also had similar findings to this study. His findings showed that rewards system has positive effect on the performance of teachers. Another study by Jackline and John (2019) also found that reward system has positive influence on the performance of teachers.

A well-structured reward system can have a significant positive impact on teachers’ performance by motivating them, increasing job satisfaction, and encouraging professional development. Reward system can boost teachers’ motivation to perform better. According to Danielson (2020), performance-based incentives significantly improve student outcomes, indicating that motivated teachers are more effective. These incentives can include monetary bonuses, recognition programs, and career advancement opportunities.

Teachers who feel recognized and rewarded for their efforts often experience higher job satisfaction. As per the findings of Mahmood (2021), job satisfaction among teachers is closely linked to recognition and rewards, leading to a more positive attitude towards their work and a greater commitment to their roles. Reward systems can encourage teachers to pursue further professional development. Research by Mosha and Chua (2021) suggests that teachers who are rewarded for improving their skills and knowledge are more likely to engage in professional development activities, enhancing their teaching effectiveness.

Effective reward systems help retain high-performing teachers. Mostafa (2021) found that teacher’s turnover is often related to job dissatisfaction, which can be mitigated through adequate rewards and recognition. Schools that implement robust reward systems tend to retain their best teachers, maintaining continuity and stability in the educational environment. Rewards systems that recognize collaborative efforts can foster a culture of teamwork among teachers. According to Ngaire (2022) collaborative rewards encourage teachers to work together, share best practices, and support each other, leading to improved overall school performance and a more supportive work environment.

Recognizing and rewarding excellent teaching practices can serve as a model for other teachers. Nyamubi (2019) demonstrated that recognition programs highlighting exemplary teachers motivate others to emulate their successful strategies, thereby raising the overall standard of teaching within a school. Reward systems can align teachers' goals with those of the school. Rogers (2020) indicated that when teachers are rewarded for meeting specific educational goals, their efforts become more focused on achieving these objectives, leading to improved school performance. Reward systems can enhance teachers' beliefs in their own abilities.

According to Runhaar (2019), self-efficacy is a critical factor in performance. Teachers who receive rewards for their achievements are likely to have higher self-efficacy, which positively impacts their teaching performance and student outcomes. Reward systems can encourage teachers to adopt innovative teaching practices. As noted by Ozgenel and Mert (2019), rewards linked to innovation and creativity in teaching can lead to more dynamic and effective instructional methods, ultimately benefiting student learning.

Researcher also carried out estimation results to establish the effect of reward system on teachers' performance. When looking at the effect of reward system on teachers' performance, the study found the coefficient of reward system being 0.7877. This coefficient was highly statistically significant at 1 percent level of significance (table 5). This means that for a unit increase in reward system there is 0.7877 units increase in teachers' performance. It is very known that whoever does something good when reward is given then he or she can do it much better. So this is not exceptional to teachers just like other people, when you reward then they can do it much better. A study by Rogers (2020) also found that reward system has positive effect on teachers' performance. Having the view of respondents from descriptive statistics when combined with these empirical results from this regression we can assure ourselves that rewards system has positive effect on teachers' performance.

Table 5: Linear Regression Results

Dependent variable: Teachers' Performance

Variable	Coeff	Std. error	Sig
Reward system	0.7877***	0.1096	0.000
Constant	-0.4463	0.2637	0.094
Number of Obs. = 92	Prob> F =	R ² =	Adj. R ² =
	0.0000	0.6643	0.6529

Legend:

* = $P < 0.1$, ** = $P < 0.05$, *** = $P < 0.01$

Conclusion

The study examined the effect of reward system on teachers' performance in public secondary schools in Dodoma Region. The findings clearly indicate that an effective reward system has a significant positive effect on various dimensions of teachers' performance. The data supports the idea that implementing a robust reward system can substantially enhance both teacher and

student outcomes. Teachers who receive recognition and rewards for their performance show higher levels of motivation and commitment to their work. The anticipation of rewards, whether monetary or non-monetary, acts as a strong incentive for teachers to excel in their duties. Motivated teachers are more likely to engage deeply with their work, take initiative, and strive for continuous improvement.

Recommendations

Based on the findings that an effective reward system significantly enhances teachers' performance in public secondary schools in Dodoma Region, it is recommended that the government in collaboration with the school administration should develop a comprehensive reward system that includes both monetary and non-monetary incentives. A well-rounded reward system acknowledges diverse teacher contributions and addresses various motivational needs, leading to higher performance and job satisfaction.

Correspondence Author: mkapafaustine@gmail.com

Abstract

The aim of the study is to investigate Influence of supply chain procedure factors on the cancer drugs distribution model in selected public hospital in Tanzania. The study used the cross-section research design and quantitative research approach. The study employed simple randomly technique to select the target respondents. Moreover, the study used questionnaire as the main method of data collection. The collected data were analyzed using descriptive statistics results and multiple linear regression analysis. The study found that The study found that all three supply chain procedures factors include inventory management, procurement process and logistics and transport were positive and significantly related the cancer drugs distribution model. Therefore, the study concludes that supply chain procedure, were important factors in that affects cancer drugs distribution model in selected public hospitals in Tanzania. To enhance the effectiveness of cancer drug distribution, it is recommended that public hospitals focus on refining their supply chain procedures, increasing resource allocations, and strengthening regulatory frameworks. Collaborative efforts among stakeholders to address these areas can lead to more efficient and equitable access to cancer medications.

Keywords: *Supply chain procedure, Cancer drugs, Distribution Model, Public hospital, Tanzania.*

1.0 Introduction

Globally, the distribution of cancer drugs is a critical component of cancer care. An efficient distribution model ensures that life-saving medications reach patients promptly and in optimal condition. According to World Health Organization (WHO), the global supply chain for pharmaceuticals is complex, involving manufacturers, wholesalers, and healthcare facilities (WHO, 2020). In high-income countries, robust logistics and advanced technologies facilitate the seamless distribution of cancer drugs. However, disparities exist, particularly in low- and middle-income countries, where infrastructure challenges, regulatory hurdles, and financial constraints hinder effective distribution (Kane *et al.*, 2019).

In developed countries such as the United States and Germany, cancer drug distribution models are characterized by sophisticated supply chain mechanisms. In the United States, the integration of information technology in supply chain management has enhanced the traceability and security of cancer drugs (Smith *et al.*, 2018). For instance, the Drug Supply Chain Security Act (DSCSA) mandates the serialization of pharmaceutical products to track their movement from production to the point of dispensing (FDA, 2013). Similarly, in Germany, a stringent regulatory framework ensures the quality and safety of distributed cancer drugs (Buehler, 2017). These measures reduce the risk of counterfeit drugs and ensure patients receive effective treatment.

In contrast, developing countries face significant challenges in the distribution of cancer drugs. In India, despite being a major producer of generic medications, distribution inefficiencies and regulatory bottlenecks hinder timely access to cancer drugs (Goyal *et al.*, 2017). Similarly, in Brazil, the distribution of cancer drugs is impeded by bureaucratic delays and logistical challenges, particularly in remote areas (Oliveira *et al.*, 2018). These challenges underscore the need for improved supply chain management and regulatory reforms to enhance the distribution of cancer drugs in developing countries.

The situation in African countries is particularly concerning, with many nations grappling with inadequate healthcare infrastructure and limited financial resources. In Nigeria, for example, the distribution of cancer drugs is marred by supply chain inefficiencies and a lack of trained personnel (Onyebuchi, 2016). South Africa, despite having a relatively advanced healthcare system, faces challenges related to regulatory approvals and the high cost of cancer drugs (Mokgobi *et al.*, 2018). These issues are exacerbated by the prevalence of counterfeit medications, which pose a significant threat to patient safety (Akinyandenu, 2013).

In Tanzania, the distribution of cancer drugs is characterized by numerous challenges that compromise the delivery of effective cancer care. According to a study by Kagashe *et al.* (2014), inefficiencies in the supply chain, inadequate storage facilities, and financial constraints are major obstacles. The country's existing model relies heavily on centralized procurement and distribution, which often leads to delays and stockouts. A report by Mcharo *et al.* (2017) highlighted that only 60% of cancer patients received the necessary medications on time due to these inefficiencies. Moreover, the regulatory framework in Tanzania is underdeveloped, leading to delays in the approval and importation of new cancer drugs (Nkya *et al.*, 2018). Additionally, the healthcare infrastructure, particularly in rural areas, is inadequate, further hindering the effective distribution of cancer drugs (Mwakyoma *et al.*, 2015).

Several constraints inhibit the effective distribution of cancer drugs in Tanzania. Financial constraints are a significant barrier, with limited funding allocated to the procurement of cancer medications (Mcharo *et al.*, 2017). This is compounded by inefficient supply chain management practices, which result in frequent stockouts and wastage (Nkya *et al.*, 2018).

Furthermore, regulatory hurdles, such as lengthy approval processes and bureaucratic inefficiencies, delay the availability of essential cancer drugs (Mwakyoma et al., 2015). Another major constraint is the inadequate healthcare infrastructure, particularly in rural areas, which limits the reach of cancer drugs to patients in need (Kagashe *et al.*, 2014). The supply chain procedures are pivotal in shaping the cancer drugs distribution model in Tanzania. Effective supply chain management ensures the timely procurement, storage, and distribution of cancer drugs (Kagashe et al., 2014).

Several studies have examined the distribution of pharmaceuticals in health service delivery, highlighting various challenges and potential solutions. For instance, a study by Smith et al. (2018) in the United States emphasized the importance of integrating information technology in supply chain management to enhance drug traceability. In developing countries, research by Goyal *et al.* (2017) in India and Oliveira et al. (2018) in Brazil identified regulatory bottlenecks and logistical challenges as major barriers. In Africa, Onyebuchi (2016) and Mokgobi *et al.* (2018) highlighted the prevalence of counterfeit drugs and the lack of trained personnel as significant issues. However, there is a paucity of research specifically focusing on the factors affecting the cancer drugs distribution model in Tanzania. Existing studies in Tanzania, such as those by Kagashe *et al.* (2014) and Nkya *et al.* (2018), provide valuable insights but do not comprehensively address the multifaceted nature of the problem.

Given the significant challenges and constraints identified in the distribution of cancer drugs in Tanzania, there is a pressing need for a comprehensive study to investigate the factors affecting the cancer drugs distribution model in selected public hospitals. This study aims to bridge the existing research gap by examining the supply chain procedures factors that influence the distribution of cancer drugs in Tanzania.

Recognizing this importance, the Tanzanian government has taken several initiatives to improve the drug distribution model in public hospitals. These initiatives include the establishment of the Medical Stores Department (MSD), which is responsible for procuring and distributing medical supplies across the country, and the implementation of electronic logistics management information systems (eLMIS) to enhance supply chain efficiency (Mwakatumbula *et al.*, 2015; Simba *et al.*, 2018).

Despite these efforts, significant obstacles continue to hinder the efficient distribution of cancer drugs in Tanzania's public hospitals. One of the key issues is the inconsistent supply of drugs, often caused by logistical challenges and inadequate forecasting of drug needs (John et al., 2020). For instance, a study by Simba et al. (2018) highlighted that delays in procurement processes and transportation difficulties frequently result in stockouts, affecting the continuity of cancer treatment. Another obstacle is the lack of trained personnel to manage the distribution process effectively. A study by Mwakatumbula *et al.* (2015) revealed that insufficient training in supply chain management among healthcare workers contributes to inefficiencies and errors in drug distribution. These challenges lead to severe consequences, including interruptions in

treatment, increased morbidity and mortality rates among cancer patients, and heightened overall healthcare costs (John *et al.*, 2020; Mwakatumbula *et al.*, 2015).

Research on drug distribution models in health service delivery has provided valuable insights into improving supply chain systems. Studies have examined various factors such as procurement practices, inventory management, and the impact of technology on distribution efficiency (Doe *et al.*, 2019; Smith *et al.*, 2021). For instance, Doe *et al.* (2019) found that integrating automated inventory management systems significantly reduced stockouts and improved drug availability in hospitals. Smith *et al.* (2021) emphasized the importance of a responsive supply chain that adapts to changing demands to ensure continuous drug supply. However, these studies often focus on general drug distribution without addressing the specific challenges associated with cancer drugs, which have unique storage and handling requirements (Doe *et al.*, 2019; Smith *et al.*, 2021; Brown *et al.*, 2018; Wang *et al.*, 2020).

Moreover, there is a lack of comprehensive studies that explore the factors affecting the distribution of cancer drugs within the Tanzanian context. Existing research has predominantly concentrated on broader healthcare supply chain issues, leaving a gap in understanding the specific supply chain procedure factors in the cancer drug distribution model (Doe *et al.*, 2019; Brown *et al.*, 2018). Addressing this gap is crucial as cancer drugs often require specialized logistics due to their sensitivity to temperature and expiration dates, necessitating a tailored approach to their distribution (Brown *et al.*, 2018; Wang *et al.*, 2020).

Given the literature gaps and challenges of inefficient cancer drug distribution in Tanzania's public hospitals, there is a pressing need to undertake a study focused on identifying the supply chain procedure factors affecting this distribution model. Understanding these factors can provide a detailed understanding of the unique challenges faced in the Tanzanian healthcare system and offer evidence-based recommendations to improve the distribution of cancer drugs.

2.0 Literature review

2.1 Theoretical Review

The study applies the Logistics and Supply Chain Management (SCM) Theory, developed by Martin Christopher in 2005, provides a strategic framework for managing the flow of goods and services from suppliers to consumers (Christopher, 2005). The theory assumes that an effective supply chain requires a seamless integration of logistics activities, from procurement through to distribution, emphasizing the importance of coordination and information sharing among all parties involved (Christopher, 2005).

A significant strength of SCM Theory is its focus on optimizing the entire supply chain to enhance efficiency and reduce costs, which can lead to improved service levels and increased customer satisfaction (Christopher, 2005). However, a notable weakness is that the theory can

be overly focused on efficiency and cost reduction, potentially overlooking factors such as flexibility and responsiveness in the face of unexpected disruptions (Christopher, 2005).

In the context of cancer drug distribution in selected public hospitals in Tanzania, SCM Theory is highly applicable as it highlights the need for an integrated approach to managing the logistics of drug supply. By focusing on coordination and information flow, the theory can help address issues such as stockouts and delays, ultimately improving the availability and delivery of cancer medications (Christopher, 2005). Implementing SCM principles can lead to more efficient and reliable drug distribution systems, benefiting both healthcare providers and patients.

2. 2 Empirical Literature Review

In their Mwangi and Karanja (2021) study explores the optimizing Drug Distribution Networks in Developing Countries: A Case Study of East Africa," used a mixed-methods approach combining qualitative interviews and quantitative analysis. They assessed the efficiency of various distribution models and identified key challenges such as inadequate infrastructure and regulatory hurdles. The study concluded that integrating technology and improving logistics infrastructure were critical for enhancing drug distribution efficiency in East Africa

Kumar and Patel (2019) explored the "Impact of Supply Chain Integration on Drug Distribution Performance in India" using a quantitative methodology involving survey data from pharmaceutical firms. Their research revealed that greater integration between suppliers, manufacturers, and distributors significantly improved performance metrics such as delivery times and stock availability. The study highlighted the importance of streamlined communication and coordination across the supply chain for optimizing drug distribution.

In their research Nkosi and Moyo (2020) examine supply chain management practices and their impact on pharmaceutical distribution in South Africa," employed a case study approach with in-depth interviews and document analysis. Their findings indicated that effective supply chain management practices, such as demand forecasting and inventory management, were crucial for mitigating distribution delays and stockouts. The study concluded that adopting advanced supply chain strategies could enhance drug availability and distribution efficiency.

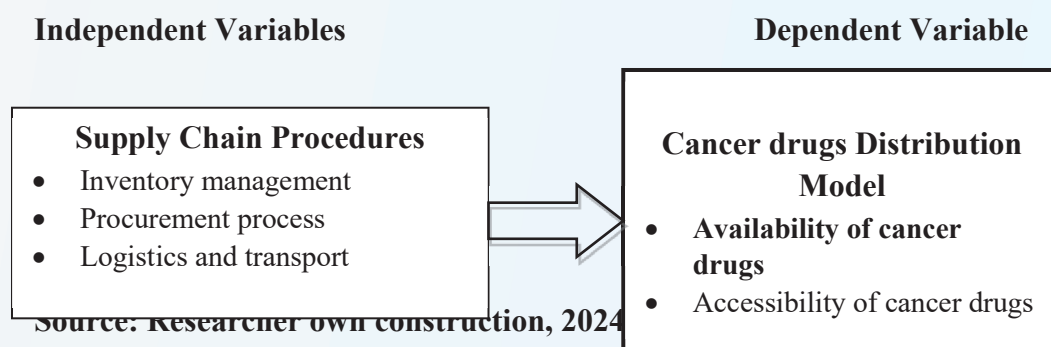

The study related to Challenges and Solutions in Drug Distribution Networks: Evidence from Nigeria" by Adeyemi and Olaniyan (2022) used a survey-based methodology to gather data from various stakeholders in the pharmaceutical supply chain. The study found that challenges such as corruption and logistical inefficiencies severely impacted drug distribution. Adeyemi and Olaniyan recommended implementing stricter regulatory frameworks and investing in logistics infrastructure to address these issues.

2.3 Conceptual Framework

A conceptual framework represents the researcher's understanding of the relationships between various variables in their study. It outlines the key variables needed for the research and serves as the researcher's "guide" throughout the investigation (Leshem & Trafford, 2007).

Figure 1 shows the conceptual framework indicating the relationship that exists between the dependent and independent variables under in the study. In this study independent variables includes supply chain procedures factors includes inventory management, procurement process and logistics and transport while dependent variable presented by cancer drugs distribution model.

Figure 29: Conceptual Framework

3.0 Research Methodology

3.1 Research Design

For this study, a cross-sectional research design was applied because it is suitable for collecting data at a single point in time from different individuals or groups, allowing researchers to assess the prevalence of a phenomenon and identify potential associations (Trochim & Donnelly, 2008).

3.2 Study Area

The study conducted in four selected public hospital in Tanzania, these includes Ocean Road cancer institute in Dar es salaam, Muhimbili National hospital Dar es salaam, Bugando medical centre in Mwanza and Benjamin Mkapa Hospital in Dodoma.

3.3 Population

In the context of this study the targeted population was 108 respondents from selected four public hospitals as shown in the Table 1.

Table 32: Summary of study population

Category respondents	of Ocean road cancer institute	Muhimbili National hospital	Bugando medical center	Benjamin Mkapa hospital	Total
Oncologist	15	10	10	7	42
Pharmacists	12	12	8	10	42
Procurement officer	6	6	6	6	24
Total	33	28	24	23	108

3.4 Sample size and Sampling Procedure

3.4.1 Sample size

The sample size represents the number of units used to estimate a population (Kothari, 2017). For this study, the sample size will be determined based on 108 respondents using the Yamane formula (1967). This formula will be applied because the study population is known

$$n = N/(1+N(e)^2)$$

Where: N = Total population

n = Sample size

e = Error detected (5%)

Therefore, this was calculated as follows

$$N = 108/(1+108(0.05)^2)$$

$$n = 85$$

The sample size for this study includes 85 respondent

3.5 Sampling Procedure

This study employs a simple random sampling procedure to select respondent from four selected hospital in Tanzania. This method is chosen because it enhances the probability that the chosen individuals or elements accurately represent the broader population.

3.6 Data Collection Method

The study used questionnaire as the main method of data collection. This method used because it is generally less expensive and do not consume a lot of time in the administration that enabled the researcher to reach all respondents at the same time. This method used structured questionnaires as tool of data collection. The questionnaire contained closed ended questions, and were designed to capture information in each specific objective.

3.7 Data Analysis Methods

Data analysis involves examining, restructuring, adjusting, and converting data to derive valuable insights from it. It's imperative to conduct data analysis responsibly, identifying patterns and relationships among variables (Tanaka, 2018). The nature of the data were quantitative, thus the descriptive statistics, such as mean and standard deviation, are employed to analyze quantitative data, while multiple linear regression analysis assesses linear relationships between independent and dependent variables. Furthermore, data is gathered, coded, and inputted into software (SPSS version 22) for further analysis.

Moreover, multiple linear regression analysis is employed to assess the linear relationships between independent and dependent variables. This approach allows for the evaluation of how multiple independent variables simultaneously influence the dependent variable, offering a comprehensive understanding of their combined effects. The regression model provides insights into the strength and nature of these relationships, helping to identify key predictors and their relative contributions.

$$Y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \varepsilon \dots\dots\dots (i)$$

Where;

Y = Cancer drugs distribution model

β_0 = Intercept (Constant)

β_1 = Regression Coefficient for inventory management

β_2 = Regression Coefficient for procurement process

β_3 = Regression Coefficient for logistics and transport

X1 = Variable for inventory management

X2 = Variable for procurement process

X3 = Variable for logistics and transport

ε = Error term for the model

4.0 Findings and Discussion

The data presentation and discussion of findings were presented in this section. It includes the results of both descriptive statistics and inferential statistics.

4.1 Descriptive statistics results for supply chain procedures

This section presented descriptive statistic results of supply chain procedures . Three indicators used to assess the supply chain procedures those includes inventory management, procurement process and logistics and transport. The responses were ranked into five point likert scale (5 = strongly agree, 4 = agree, 3 = neutral, 2 = disagree, and 1 = strongly disagree) and summarized into mean and standard deviation. The score between 3.5 to 5 it imply high extent, the score between 3.5 to 2.5 meaning moderate extent and scale between 2.4 to 1 imply low extent.

Table 2: Descriptive statistics results for supply chain procedures (n=85)

Variables	Mean	Std. deviation
Inventory management	4.040	0.737
Procurement process	3.950	0.701
Logistics and transport	4.190	1.047
Overall score	4.06	0.828

Source: Field data (2024)

The descriptive statistics for the supply chain procedures in the distribution model of cancer drugs in selected public hospitals, as presented in Table 2, show high mean scores across key variables. Inventory management has a mean of 4.040 with a standard deviation of 0.737, indicating a generally positive perception with some consistency. The procurement process scored slightly lower with a mean of 3.950 and a standard deviation of 0.701, also reflecting a favorable but slightly more consistent perception. Logistics and transport received the highest mean score of 4.190, though with a larger standard deviation of 1.047, suggesting a very positive yet more varied perception among respondents.

The overall score for supply chain procedures is 4.06 with a standard deviation of 0.828, indicating generally high satisfaction with some variability. These findings imply that robust logistics and transport procedures are crucial for effective cancer drug distribution. However, there is a need for more standardized and consistent processes, particularly in procurement, to ensure the reliability and efficiency of the supply chain in these hospitals.

The findings supported by Mwangi and Karanja (2021) assessed the efficiency of various distribution models and identified key challenges such as inadequate infrastructure and regulatory hurdles. The study concluded that integrating technology and improving logistics infrastructure were critical for enhancing drug distribution efficiency in East Africa.

The similar results reported by Kumar and Patel (2019) their research revealed that greater integration between suppliers, manufacturers, and distributors significantly improved performance metrics such as delivery times and stock availability. The study highlighted the importance of streamlined communication and coordination across the supply chain for optimizing drug distribution.

4.4.1 Inferential Statistic Analysis for Supply Chain Procedures

The study used a multiple linear regression model to influence of supply chain procedures on the cancer drugs distribution model and to establish whether there was a relationship between variables (Table 3). The findings revealed indicate that, the R- square value was 0.610 which indicates that about 61% of the dependent variable was explained by the independent variables related to supply chain procedures (inventory management, procurement process and logistics and transport). The higher value of R- square implies that, model is fit to explain the

relationship between the supply chain procedures on the cancer drugs distribution model in selected public hospital in Tanzania.

Table 3: Regression results for Supply Chain Procedure

Variables	Standardised Coefficients		t-Value	Sig.
	β	Std. Error		
(Constant)	5.195	0.145	5.989	0.000
Inventory management	0.114	0.102	1.427	0.017
Procurement process	0.121	0.117	4.175	0.000
Logistics and transport	0.105	0.145	4.427	0.000
Dependent Variable: Cancer drugs distribution model				
$R^2 = 61\%$				
F-value = 17.8				

Sources: Field data, (2024)

Among the variables, the procurement process ($\beta = 0.121$, $t = 4.175$, $p < 0.01$) and logistics and transport ($\beta = 0.105$, $t = 4.427$, $p < 0.01$) have significant positive impacts on the distribution model. Inventory management ($\beta = 0.114$, $t = 1.427$, $p < 0.05$) also shows a significant positive effect, though with a smaller coefficient. These findings highlight the critical role of efficient procurement processes and logistics in ensuring effective cancer drug distribution. The findings supported by the study by Nkosi and Moyo (2020) indicated that effective supply chain management practices, such as demand forecasting and inventory management, were crucial for mitigating distribution delays and stockouts. The study concluded that adopting advanced supply chain strategies could enhance drug availability and distribution efficiency.

5.0 Conclusion and Recommendations

5.1 Conclusion of the study

The study found that all three supply chain procedures factors include inventory management, procurement process and logistics and transport were positive and significantly related the cancer drugs distribution model. Therefore, the study conclude that supply chain procedure factors, were important factors in that affects cancer drugs distribution model in selected public hospitals in Tanzania.

5.2 Recommendations

To enhance the supply chain procedures for cancer drug distribution in selected public hospitals in Tanzania, it is recommended to first focus on streamlining procurement processes. Implementing standardized protocols and training programs for procurement staff can reduce variability and improve overall consistency. Additionally, investing in advanced inventory management systems can help in maintaining accurate stock levels and reduce the likelihood

of shortages or surpluses. Finally, enhancing logistical capabilities by optimizing transport routes and schedules can further ensure timely and efficient delivery of cancer drugs.

6.0 Limitations and Area for Further Study

This study is limited by its focus on selected public hospitals in Tanzania, which may not fully represent the broader healthcare context. Additionally, it does not account for other potential factors influencing cancer drug distribution, such as healthcare infrastructure or staff training. Future research could explore these additional variables and include a wider range of hospitals and regions. Longitudinal studies could also provide insights into the long-term impacts of supply chain and regulatory changes on drug distribution efficiency.

The Influence of Dispute Resolution Mechanism on Managing Procurement Contract in Tanzania:

A Case of CRDB Bank Plc

Buluba Mabelele¹ & Allen Mrindoko²

¹College of Business Education, bulubamabelele@gmail.com

Correspondence: bulubamabelele@gmail.com

Abstract

The banking sector is a critical component of any modern economy, and procurement contracts are essential for the smooth operation of banking institutions. However, disputes can arise during the execution of these contracts, which can result in significant delays, increased costs, and reputational damage. This study examined the influence of dispute resolution mechanisms in managing procurement contract in Tanzania: a case of CRDB Bank Plc. The study was guided by theory of dispute resolution while the study was conducted using descriptive research design, quantitative approach, sample size of study was 148, and data collection methods were questionnaire and documentary review. Data analysis methods were descriptive statistics and inferential statistics. The regression analysis demonstrated the significant influence of all three dispute resolution mechanisms on the management of procurement contracts. The negotiation mechanism, particularly the positive, empowering, and encouraging aspects, had the strongest impact, followed by the mediation mechanism. Regression analysis shows that these mechanisms collectively explain 82.4% of the variance in procurement contract management outcomes, underscoring their critical role. The study recommends that the bank sector should enhance legal frameworks, invest in training programs, and establish specialized ADR centers to improve dispute resolution in procurement.

Keywords: *Dispute, Resolution, Mechanism, Procurement, Contract, CRDB Bank*

1.0 Introduction

Dispute is an inherent aspect of professional life; each of us holds unique viewpoints, ideas, and beliefs. We act according to what we consider suitable. While some view conflict negatively and seek to evade it (Tuni, 202), others perceive it as a chance for personal development. As disputes occur across all organizational levels, their examination has gained attention from numerous experts and theorists, especially in the field of procurement contracts in recent years (Dumaine, 2021). In the global banking sector, procurement contract dispute resolution plays a crucial role in maintaining stability and trust within the industry. Negotiation, mediation, arbitration, and litigation are the primary methods used to resolve disputes between parties (bank and supplier) in banking procurement contracts. These methods help in ensuring

that contractual obligations are met, disputes are resolved efficiently, and relationships between banks and their clients are preserved (Hendrawan, 2023). United States (US), United Kingdom (UK), and France, procurement contract dispute resolution in the banking sector follows similar trends as globally. These countries have well-established legal systems that support negotiation, mediation, arbitration, and litigation as methods of resolving disputes. The use of alternative dispute resolution mechanisms such as mediation and arbitration is encouraged to reduce court congestion and expedite resolution (MacDonald, 2020).

However, in African countries, procurement contract dispute resolution in the banking sector faces unique challenges due to varying legal frameworks and enforcement mechanisms (Idowu *et al.*, 2020). While negotiation and mediation are commonly used methods in these countries to resolve disputes informally, arbitration is gaining popularity as a more efficient way to settle complex banking disputes in procurement contract. Litigation is often seen as a lengthy process with unpredictable outcomes. Moreover, the African banking landscape witnessed a notable surge in legal expenditures, accounting for nearly 7% to 10% of annual operational costs among major banks due to contractual conflicts (Asare, et al., 2023). The banking industry in Tanzania is facing increasing pressure to improve its procurement practices and ensure that contracts are managed effectively. This is particularly important in light of the government's efforts to promote transparency and accountability in public procurement processes. As a result, banks like CRDB Bank PLC are expected to implement best practices for contract management and dispute resolution.

The banking sector is a critical component of any modern economy, and procurement contracts are essential for the smooth operation of banking institutions. However, disputes can arise during the execution of these contracts, which can result in significant delays, increased costs, and reputational damage. Dispute resolution mechanisms such as negotiation, mediation, arbitration and litigation play a crucial role in managing procurement contract disputes in the banking sector. Several challenges are associated with procurement contract disputes in the banking sector. These include complexity of procurement contracts, reputational damage and lack of trust. While several studies (Karoki, 2020; Eshetu, 2021; Tuni, 2022; Nkosazana, 2022) have examined dispute resolution mechanisms in managing procurement contract disputes in various sectors, including banking, there is a gap in existing research regarding the use of alternative dispute resolution mechanisms (ADR) in managing procurement contract disputes in the banking sector. Specifically, there is a need for more research on the effectiveness of ADR mechanisms such as mediation, negotiation and arbitration compared in resolving procurement contract disputes in banking.

2.0 Literature Review

2.1 Theoretical Literature

2.1.1 Dispute Resolution Mechanism

Dispute resolution mechanism refers to methods for resolving disputes outside of the traditional court system. These methods can be less formal, faster, and often less expensive than litigation. ADR includes several different approaches, such as negotiation, mediation, and arbitration (Hayati *et al.*, 2020).

2.1.2 Procurement Contract

A procurement contract is a legally binding agreement between a buyer and a seller, where the seller agrees to provide goods or services to the buyer at a specified price and quantity, under certain terms and conditions. In the context of organizations and businesses, procurement contracts are often used to acquire goods or services that are necessary for the operation and growth of the organization (Shileswa, 2020).

2.2 Theoretical Framework

2.2.1 Theory of Dispute Resolution

Goldberg (2018) introduced the concept of 'dispute systems design' in his theory of dispute resolution. According to this theory, there are three main approaches to resolving disputes. The first involves 'power-based methods' like strikes or lockouts, which use coercive measures to resolve conflicts. The second approach, termed 'rights-based methods', seeks resolution based on established rules or principles found in collective agreements or legislation, often through mechanisms such as grievance procedures, mediation, and arbitration. The third method, 'interest-based methods', focuses on identifying and accommodating the parties' needs through joint problem-solving. In this study, the rights-based method is preferred among these approaches. It involves practices such as mediation, negotiation, arbitration, facilitation, and joint problem-solving initiatives. Advocates of the rights-based method argue that it is more cost-effective and satisfactory compared to other methods, as it can address a broader range of concerns raised by disputants (Ury *et al.*, 2018). However, it is acknowledged that rights-based methods may not always be the most effective, necessitating the design of dispute resolution systems that can provide low-cost alternatives when needed (Costantino *et al.*, 2016). The theory behind the rights-based method emphasizes resolving disputes according to established rules and principles, thereby enabling organizations to address grievances and conflicts in accordance with relevant laws and regulations.

Procurement contracts are legally binding agreements that govern the relationship between a buyer and a seller for the provision of goods or services. Given the complexities involved in procurement processes, disputes can arise due to various reasons such as misunderstandings, breaches of contract, delays, quality issues, or changes in scope. Effective dispute resolution mechanisms are essential to ensure that these disputes are resolved efficiently and fairly, minimizing disruptions to the procurement process and maintaining positive relationships between the parties involved.

2.3 Empirical Literatures

Alamdari (2019) sought to evaluate the increasing adoption of international arbitration in the banking and financial sector. The study confirmed that international arbitration has emerged as a preferred method for resolving disputes in both national and international transactions, gradually replacing traditional litigation. One of its attractive features is the potential to appoint arbitrators with expertise in finance and banking to handle disputes within this sector.

Conversely, Kirimi and Wanjohi (2019) investigated the factors influencing the use of alternative dispute resolution (ADR) in construction projects in Imenti North Sub County, Meru County, Kenya. Employing a descriptive survey design, they analyzed data using SPSS version 22.0, presenting their findings through frequency and percentage tables, alongside a multivariate regression model. Their research highlighted that lack of awareness about mediation, reduced adversarial attitudes among stakeholders (clients, contractors, quantity surveyors, and architects), and cost savings from avoiding litigation significantly influence the use of ADR in construction disputes.

Similarly, Mustafa (2020) examined banking dispute resolution methods in Tanzania, utilizing content analysis of legislation, case law, textbooks, and journal articles. The findings underscored the prevailing use of Bank of Tanzania resolution desks, court processes, and arbitration for resolving banking disputes. The study recommended enhancements such as promoting mediation, establishing commercial courts at lower levels, amending arbitration laws, and mandating court-annexed mediation.

In another study, Hartantin (2020) investigated the resolution of banking disputes through alternative dispute resolution (ADR), particularly focusing on Danamon Bank customer claims. The findings outlined the procedural stages of ADR as per Law no. 30 of 1999, covering pre-mediation, mediation, and mediation outcomes.

Osiri (2021) evaluated the effectiveness of various ADR methods in resolving construction disputes in Rwanda, employing both quantitative and qualitative approaches. The study identified payment disputes, contract termination issues, and project delays among the main causes of disputes. Negotiation and mediation were found to be the most effective methods, emphasizing the need for preventive strategies and prioritizing non-adversarial dispute resolution methods. Meanwhile, Tuni (2022) explored the impact of dispute resolution strategies on employee performance within the Nigerian banking industry, focusing on compromising, dominating, integrating, and avoiding strategies. The study, based on 162 respondents using random sampling, highlighted the significant influence of these strategies on employee performance, particularly emphasizing the importance of integrating strategies for organizational cohesion and employee effectiveness.

3.0 Material and Methods

The study used descriptive research design whereas it allowed for the collection of detailed information about influence of dispute resolution mechanisms in managing procurement contract. Similarly, the study used quantitative approach whereas quantitative methods allow for the objective measurement of variables, providing a clear and unbiased assessment of the impact of dispute resolution mechanisms. The study was conducted at CRDB Bank PLC. CRDB Bank PLC, also known as CRDB Bank, is a commercial bank in Tanzania. It is one of the largest financial institutions in the country, offering a wide range of banking services to individuals, businesses, and government entities. The bank was established in 1996 and has since grown to become a key player in the Tanzanian banking sector. As of 31 of December 2023, the bank total assets were valued at TSh: 13 trillion (approx. US\$:5.055 billion).

Customer deposits were valued at TSh: 8.9 trillion (approx.. US\$: 5.46 billion). In the 12 months ended December 2023, the bank's after-tax profit was TSh: 424 billion (approx.. US\$: 164.86 million). Furthermore, the bank network included that about 250 branches across Tanzania, 675 ATMs across Tanzania, subsidiary in Burundi with 5 branches and subsidiary in Congo Lubumbashi. In that regard CRDB Bank PLC is one of the largest commercial banks in Tanzania, and it has faced several challenges related to contract dispute resolution in its procurement processes. The failure to resolve contract disputes in a timely and effective manner can lead to significant financial losses, as well as damage to the bank's reputation and relationships with suppliers and customers. The study population was 237 staff working at head office (HR department, 2024). The sample size is determined based on statistical considerations and the specific objectives of the study (Cohen et al, 2014). The sample size of the study was justified using Yamane formula (1967):-

$$n = \frac{N}{1 + Ne^2}$$

Where;

n= is number of sample (required)

N = Total population (237) and

e = Error tolerance (level) or margin of error (0.05)

Using above formula, the sample size is calculated as indicated below;

$237 / (1 + 237(0.05^2)) = 237 / 1.5925 = 99$. Therefore, the sample size of this study was 148 respondents.

Table 1: Sample size distribution TC "Table 3.1: Sample Size" \f T \l "1"

S/N	Respondents	Population	Sample size	Percentage of sample size %
1	Senior staff	15	9	6.1

2	Operational staff	222	139	93.9
Total		237	148	100

Source: Field Data, 2024

The study used stratified sampling technique whereas the population was divided into two strata: senior staff and operational staff. From each stratum, a sample is drawn in proportion to the stratum's size in the population. This ensures that the sample is representative of the overall population (Cohen *et al.*, 2014). The study used questionnaire to 93 operational staff and for that case, the researcher made an appointment with the respondents so as to get a convenient time that enabled the researcher to gather data from the respondents. Questionnaire is expected to answer research objectives using quantitative approach. Descriptive and regression analysis were used. The regression model for multiple linear regression is as follows: -

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + e$$

Where by

Y = Procurement contract management

β_0 = Constant factor

X_1 = Amicable resolution

X_2 = Collaborative relationship

X_3 = Clarity

e = Error term

4.0 Findings

This section presents findings and discussion related to the influence of dispute resolution mechanism on managing procurement contract in Tanzania: a case of CRDB Bank Plc. It includes characteristics of respondents and dispute resolution mechanism.

4.1 Characteristics of the Respondents

Results in table 1 showed that 62% of respondents were male while 38% of all respondents were female. Such findings suggest that the male respondents were more than female survey participants. Having respondents with different gender helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania Furthermore, results in table 1 indicated also that 24% of respondents had between 18-25 years of age, 51% of respondents were 26-35 years of age , 19% of respondents were 36-45 years of age, 6% of respondents had 46 and above years. Having respondents with different age helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania. Moreover, the findings of the

study in table 2 indicated that 4% of respondents had a PhD, 17% of respondents had a Bachelor degree, while 48% of respondents had a master's degree and 31% of respondents had a diploma. Having respondents with different level of education helped a study to collect different opinion on the influence of dispute resolution mechanisms in managing procurement contract in Tanzania.

Table 2: Demographic Characteristic of the Respondents (n=122)

Gender	Frequency	Percent
Male	92	62
Female	56	38
Age		
18 – 25 years	35	24
26 – 35 years	76	51
36 – 45 years	28	19
46 years old and above	9	6
Education		
PhD	6	4
Masters	25	17
Bachelor Degree	71	48
Diploma	46	31
Experience		
1-5years	70	47
6-10years	60	40
Above10years	18	13

4.2 Descriptive Statistical Analysis

4.2.1 The Influence of Negotiation Dispute Resolution Mechanism in Managing Procurement Contract

This is the descriptive statistics on the influence of negotiation dispute resolution mechanism in managing procurement contract. Findings are summarized in the following Table 3:-

Table 3 Descriptive Statistics on influence of negotiation dispute resolution

	N	Minimum	Maximum	Mean	Std. Deviation	Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Amicable	148	1	5	2.01	1.128	1.037	.396
Reach	148	1	5	3.97	1.049	1.461	.396
Collaborative	148	1	5	1.66	.923	3.434	.396
Clarity	148	1	5	2.06	1.032	1.569	.396
Skilled	148	1	5	2.07	.997	.546	.396
Valid N (listwise)	148						

The descriptive statistics reveal insights into how respondents at CRDB Bank PLC perceive the negotiation dispute resolution mechanism in managing procurement contracts. The mean scores indicate that the respondents rated "Reaching a settlement" the highest at 3.97, suggesting that negotiation mechanisms are perceived to effectively reach resolutions. However, "Collaborative relationship" has a lower mean score of 1.66, indicating a perception that negotiations are less collaborative. The standard deviations show moderate variability in responses, with "Amicable resolution" and "Clarity of procurement contract terms" having slightly above-average means at 2.01 and 2.06 respectively, indicating some effectiveness in maintaining amicable relations and clarity during negotiations. The kurtosis values, especially high for "Collaborative relationship," suggest peaked distributions, meaning responses were closely clustered around the mean for this variable. Overall, while negotiation is viewed as effective in reaching agreements, there is a perceived need for enhancing collaboration and clarity.

Table 4 Model Summary on influence of negotiation dispute resolution

Model	R	Adjusted R Square	Std. Error of the Estimate	Change in R Square	F Change	df1	df2	Sig. Change	Durbin-Watson F
1	.918 ^a	.843	.225	.843	152.009	5	142	.000	.165

a. Predictors: (Constant), Skilled, Reach, Collaborative, Clarity, Amicable

b. Dependent Variable: Managing

The model summary indicates a strong positive correlation ($R = 0.918$) between the independent variables (Skilled, Reach, Collaborative, Clarity, Amicable) and the dependent variable (Managing Procurement Contracts), with 84.3% of the variability in procurement contract management explained by these predictors ($R^2 = 0.843$). The adjusted R^2 (0.837) confirms the model's robustness, and the low standard error of the estimate (0.225)

suggests a good fit. The significant F change ($p < 0.001$) indicates that the predictors significantly improve the model. However, the Durbin-Watson statistic (0.165) suggests potential positive autocorrelation in the residuals, indicating that further investigation is needed to address this issue.

Table 5 ANOVA on influence of negotiation dispute resolution

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	38.457	5	7.691	152.009	.000 ^b
	Residual	7.185	142	.051		
	Total	45.642	147			

a. Dependent Variable: Managing

b. Predictors: (Constant), Skilled, Reach, Collaborative, Clarity, Amicable

The ANOVA table shows that the regression model significantly predicts the dependent variable (Managing Procurement Contracts) with a high F-value of 152.009 and a p-value of 0.000, indicating that the model is statistically significant. The regression sum of squares (38.457) compared to the residual sum of squares (7.185) demonstrates that a substantial portion of the variability in the dependent variable is explained by the independent variables (Skilled, Reach, Collaborative, Clarity, Amicable). The mean square values for the regression and residual further reinforce the model's strong explanatory power.

Table 6 Coefficients on influence of negotiation dispute resolution

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1	(Constant)	.544	.078	7.008	.000
	Amicable	.074	.056	.150	.006
	Reach	.091	.028	.172	.001
	Collaborative	.157	.050	.260	.002

Clarity	.437	.058	.808	7.492	.000
Skilled	.103	.056	.185	1.851	.016

a. Dependent Variable: Managing

The table presents the coefficients for the regression model predicting the dependent variable (Managing Procurement Contracts) based on the independent variables (Amicable, Reach, Collaborative, Clarity, Skilled). The unstandardized coefficients (B) represent the change in the dependent variable for a one-unit change in the independent variable, holding all other variables constant. The standardized coefficients (Beta) allow for comparison of the relative importance of each independent variable. The results show that all independent variables have statistically significant coefficients ($p < 0.05$), indicating their contribution to predicting the dependent variable.

Among them, "Clarity of procurement contract terms" has the highest standardized coefficient (Beta = 0.808), indicating that it has the strongest influence on managing procurement contracts. "Collaborative relationship" also has a relatively high coefficient (Beta = 0.260), followed by "Reach" (Beta = 0.172). "Amicable resolution" and "Skilled negotiator" have lower coefficients, but they still contribute significantly to the model. These coefficients provide valuable insights into the relative importance of each factor in influencing the management of procurement contracts at CRDB Bank PLC.

5.0 Discussion

The study analyzed the impact of negotiation on managing procurement contracts at CRDB Bank PLC. The variables associated with negotiation, such as amicable settlements, agreement reaching, collaboration, clarity, and skilled negotiation, showed varied perceptions among respondents. The regression model revealed that negotiation, along with mediation and arbitration, explained 82.4% of the variance in the dependent variable (Managing Procurement Contracts). The combined effect of negotiation, mediation, and arbitration on managing procurement contracts is substantial. Negotiation emerged as the most influential factor, with a standardized coefficient (Beta) of 1.332, indicating a strong positive impact on contract management. Arbitration and mediation had lower Betas, emphasizing the dominance of negotiation in this context. The findings suggest that further improvements in negotiation practices could lead to even better procurement contract management outcomes.

Generally, negotiation encourages a collaborative approach where both parties work together to find a mutually acceptable solution. This fosters a sense of partnership and cooperation, which is especially valuable in procurement relationships that may need to continue after the dispute is resolved. In procurement, maintaining good relationships with suppliers and contractors is crucial. Negotiation allows for the resolution of disputes without damaging these relationships, unlike litigation or arbitration, which can be adversarial and lead to a breakdown

in trust. Negotiation offers flexibility in terms of solutions. Parties creatively address their needs and interests, finding solutions that might not be available in more formal dispute resolution methods where outcomes are more rigidly defined by legal standards or precedents.

Negotiation is typically less expensive than litigation or arbitration. There are fewer legal fees and associated costs, making it an attractive option for resolving disputes without incurring significant expenses. Negotiation can be a faster process compared to litigation or arbitration, which can be drawn out over months or even years. A quicker resolution allows both parties to move forward without prolonged disruption to their operations. Negotiation is a private process, whereas litigation and sometimes arbitration are public. This confidentiality can be important for preserving business secrets and maintaining a positive public image. In negotiation, the parties have direct control over the outcome. They are not bound by a judge's or arbitrator's decision, which means they can tailor the resolution to better meet their specific needs and interests.

The findings of current study agrees One recent study by Alharbi et al. (2022) investigated the use of negotiation strategies in public sector procurement contracts in Saudi Arabia. The findings revealed that collaborative negotiation approaches, such as interest-based bargaining and problem-solving, were more effective in resolving disputes and achieving mutually beneficial outcomes, compared to more distributive, win-lose strategies. The authors emphasized the need for procurement professionals to develop strong negotiation skills to enhance contract management.

Furthermore, a review by Cheung and Yiu (2019) highlighted the growing importance of negotiation skills in the context of international construction projects. They found that cross-cultural negotiation competence was crucial for managing complex contractual relationships and resolving disputes, particularly in multi-national project environments

6.0 Conclusion

The study examined the influence of three dispute resolution mechanisms (negotiation) on the management of procurement contracts. The findings provide valuable insights that can inform the development and refinement of effective dispute resolution strategies in the context of procurement contracts. The analysis of the negotiation dispute resolution mechanism revealed its significant influence on the management of procurement contracts. The positive, empowering, and encouraging aspects of the negotiation process were found to be particularly influential, suggesting that strengthening these characteristics can lead to improved outcomes in procurement contract management.

7.0 Recommendations

The bank sector should improve legal frameworks for negotiation, mediation, and arbitration in public procurement, investing in training programs for procurement officials, and establishing specialized ADR centers. Future research should include longitudinal studies, sector-specific analyses, cost-benefit analyses, cultural and organizational factors, case studies, and technological advancements to enhance procurement contract management.

Impact of Community Involvement in Water Supply Project Implementation in Rural Areas: A case of Chamwino District, Tanzania

Morumbe Issack Kunani¹, Barnabas Maagi²

¹ College of Business Education (CBE), P.O.Box 2077, Dodoma, Tanzania; Email: kunanisir@gmail.com.

² College of Business Education, P.O.Box 2077, Dodoma, Tanzania; Email: dir.dodoma@cbe.ac.tz

Abstract

The study used a cross-sectional research design using a total of 196 respondents and 4 key informants. The study utilized multiple linear regression model to analyze community involvement across three key criteria: completion time, functionality, and quality of water projects. Findings revealed significant positive relationships between independent and dependent variables with community initiatives showing a notable increase in project completion time ($p = 0.007$), functionality ($p = 0.007$), and quality ($p = 0.001$). The models explain substantial variations in project outcomes, highlighting the crucial role of community engagement in enhancing water project effectiveness. The study recommends to RUWASA and the government at large to find ways in which strategic community involvement will be prioritized so as to spearhead efficient and effective implementation of rural water supply projects. Such a strategy will help the water supply sector give a positive role in the provision of services to its customers and developing stronger policies and plans for social-economic development.

Keywords: *Community Involvement, Rural Water Supply*

1.0 Introduction

Access to clean and reliable water supply is a fundamental human right and a critical factor for sustainable development (Spijkers, 2020). In rural areas worldwide, where the majority of the population depends on agriculture and subsistence livelihoods, the significance of water supply cannot be overstated. Clean and accessible water sources are essential for drinking, cooking, sanitation, and irrigation, all of which are crucial for human health, food security, and economic stability (Young, 2021). Moreover, safe water supply is closely tied to the reduction of waterborne diseases and the overall improvement of living conditions in rural communities, making it essential for achieving several United Nations Sustainable Development Goals (SDGs), particularly those related to health, poverty alleviation, and environmental sustainability (Ferreira et al., 2021). Despite the effort made by the government and development partners in implementation of water supply project in order to solve water scarcity in urban and rural areas, Some of the projects has been successful implemented and others unsuccessful (NAOT, 2022). In order to improve efficiency and effectiveness in providing water service to the community, the government of Tanzania has established Sustainable Rural

Water Supply and Sanitation Program (SRWSSP) through Water Supply and Sanitation Act No. 5 of 2019 as well as establishment of Rural Water Supply and Sanitation Agency (RUWASA), as a specialized rural water services delivery agency, mandated to ensure the sustainability of services (URT, 2022a). The main goal of RUWASA is to increase access to water service for people living in rural areas. To achieve this goal RUWASA develop underground water sources, construction of dams and water infrastructures such as water reservoir tanks as shown in Figure 1.

Figure 1: RUWASA Water Reservoir Tank at Chita Village- Iringa Mvumi Ward

Source: Researcher (2024)

Community participation is a key element in the success and sustainability of such projects, as it ensures that the initiatives align with the needs, preferences, and capacities of the communities they serve. It refers to the active involvement, engagement, and contribution of local communities in the planning, implementation, and maintenance of water supply projects in rural areas (Sanchez et al. 2023; WASH 2022; Mbunda et al. 2021). This involves the inclusion of local perspectives, needs, and priorities in the decision-making processes related to water supply projects such as consultations, meetings, and collaborative efforts between project planners, government agencies, and community members to determine the most suitable water supply solutions. This can include physical labour, skills contribution, or the establishment of community committees overseeing project implementation, maintenance and operation phase, includes the establishment of community-based management structures and the active involvement of residents in maintaining the infrastructure (William, 2017). Following independence in 1961, Tanzania's government, along with several development partners, began making significant investments in rural water projects with the overriding objective of providing rural populations with clean, affordable, and safe water services (Mussa, 2020). Notably, in the 1960s, immediately following independence, water services were

provided in accordance with the well-known principle known as “free clean and safe water for all”. This policy's main goal was to guarantee that rural populations could receive clean, safe water without restriction and without having to make any financial or active contributions. Undesirably, the absence of community ownership of the built projects contributed significantly to the policy's failure (NAWAPO, 2002; Mussa, 2020). The National Water Policy was established by the Tanzanian government in 2002 in response to the difficulties, and it mostly emphasizes the importance of community involvement in the formulation and implementation of rural water delivery projects (Mussa, 2020). The main goal was to foster a sense of ownership and make sure that these projects are sustainable. Instead, rural water supply projects in Tanzania have been confronted with poor community involvement leading to serious negative effects in performance of water supply projects in most of rural areas.

2.0 Literature Review

This chapter includes the definition of important concepts, a survey of the theoretical and empirical literature, the identification of research gaps, and a conceptual framework.

2.1 Theory

This study has used Social Capital Theory developed and refined by several scholars such as Pierre Bourdieu (1986) and James Coleman (1988). Bourdieu conceptualized social capital as the resources available to individuals through their social networks, while Coleman focused on how social capital facilitates certain actions and enables the achievement of goals within a social structure. This theory was preferred because it emphasizes the importance of social networks, relationships, and community engagement, which are directly relevant to understanding the dynamics of project implementation in rural areas (Putnam, 1995; Woolcock, 1998). The theory highlights how trust and cooperation within communities can enhance collective action, making it particularly relevant for water supply projects where community involvement is essential (Putnam, 2000; Tsai & Ghoshal, 1998). Compared to other theories, such as Community Development Theory, Participatory Development Theory, and Social Exchange Theory, the Social Capital Theory offers a more comprehensive framework for analyzing the role of community dynamics and relationships in the success of water supply projects in rural settings (Tsai & Ghoshal, 1998; Woolcock & Narayan, 2000).

2.2 Empirical Literature Review

The impact of community involvement on water supply project implementation in rural areas has been examined in various empirical studies. A case study of Chamwino District, Tanzania, provides valuable insights into this study. In a study conducted by Murta and Mutayoba (2019), the researchers investigated the role of community participation in the sustainability of rural water supply projects. The findings suggest that active community involvement, particularly in project planning, implementation, and monitoring, was a crucial factor in ensuring the long-term success of the water supply initiatives. The study highlighted the importance of building trust between the community and the implementing agencies, as well as the need for effective communication and capacity-building efforts to empower local stakeholders (Murta &

Mutayoba, 2019). Similarly, a study by Katomero and Georgiadou (2018) explored the contribution of social capital to the sustainability of community-based water supply projects in Chamwino District. The results indicated that strong social networks, reciprocity, and collective action among community members significantly enhanced the project's effectiveness and long-term viability. The researchers emphasized the need to integrate social capital considerations into the design and implementation of rural water supply initiatives (Katomero & Georgiadou, 2018).

Furthermore, Kamanzi et al. (2020) examined the factors influencing community participation in the management of water supply systems in rural areas and found that the level of community ownership, the perceived benefits of the project, and the community's trust in the implementing agencies were critical determinants of their involvement and commitment to the water supply project. In a related study, Mwamila et al. (2018) reported that when communities were actively involved in the decision-making process, operation, and maintenance of the water supply systems, the projects were more likely to be sustainable over the long term.

2.3 Research gap

Most of past studies have done a lot on addressing water supply projects in rural areas. However, the empirical evidence on community involvement in the successful implementation and sustainability of rural water supply projects is not clearly known in the academic arena.

3.0 Research Methodology

The research took place at Chamwino district in Dodoma Region because it is among the district which is successful in implementation of rural water supply projects (NAOT, 2022). The study used a cross-sectional research design whereby data were collected from the study area at one point in time in the given study area. Mixed research approach were employed through both qualitative and quantitative methods to examine the relationship between dependent and independent variables. The study population comprised households who were beneficiaries of rural water supply projects implemented by RUWASA in Chamwino District which amounted to 196 respondents and 4 key informants using (Yemane, 1967) formula for an unknown population, whereby simple random sampling technique were used to get respondents who filled the questionnaires while purposive sampling technique were used to interview RUWASA manager, project engineer, technician and Community Based Water Organisation's (CBWOs) leader. Data were collected through structured questionnaires administered to a sample of 200 respondents involved in water projects within Chamwino District. The questionnaires included measures of community involvement initiatives and their perceived effects on project completion time, functionality, and quality. Data collection was conducted over a period of three months, ensuring a representative sample of community members and project stakeholders. The collected data were analyzed using multiple linear regression techniques to quantify the relationships between community involvement and the three dependent variables: completion time, functionality, and quality. Statistical software was utilized to compute regression coefficients, significance levels, and model fit statistics (R^2 values), ensuring robust analysis of the data.

4.0 Findings and Discussions

4.1 Impact of Community Involvement on Implementation of Water Projects

To assess the impact of community involvement on implementation of water projects, the researcher employed multiple linear regression analysis. The implementation of water project was measured in three criteria completion time, functionality and quality of project. Results are presented in the following subsection.

4.1.1 Impact of community involvement on completion time

The coefficient values in regression Table 1 quantify the change in completion time as a result of unit change in one independent variable provided other variables are kept constant. Community involvement initiatives in the implementation of water projects was found to be significant at $p=0.007$ as shown in Table 1. A unit increase in community involvement initiatives in the implementation of water projects results to 2.036 increase in project completion time meaning that the higher the community involvement the higher the chances to complete the project within time. Level of community involvement in water projects was also significant with $p=0.000$. Its coefficient was 1.723 meaning the completion time increase by 1.723 per unit increase in level of community involvement in water projects. The overall model was significant at $p=0.000$ with R^2 0.656 meaning that the model was able to explain 65.6% of all variation in project completion time.

Table 1: Regression coefficients for impacts community involvement on completion time.

Model			Sig.
	Coefficient	Std. Error	
(Constant)	.663	.089	.000
Community involvement initiatives in the implementation of water projects	2.036	.013	.007
Level of community involvement in water projects	1.723	.040	.000

Number of Obs. = 200	Prob> F = 0.0000	R ² = 0.656	Adj. R ² = 0.562
Durbin-Watson	2.12		
Dependent Variable: Completion time			

The findings underscore the vital role of community involvement in the implementation of water supply projects, particularly in rural settings. The significant relationship between community involvement initiatives and project completion time ($p = 0.007$) suggests that engaging the local community not only helps in meeting project deadlines but also enhances overall project efficiency. This aligns with Murta and Mutayoba (2019), who argue that active participation in project planning and execution fosters ownership and accountability within the community, thus facilitating smoother implementation processes. The coefficient values indicate that a unit increase in community involvement initiatives leads to a 2.036 increase in project completion time, while the level of community involvement itself results in a 1.723 increase ($p = 0.000$). This implies that greater community engagement can lead to longer completion times, which may initially seem counterintuitive. However, it may reflect the time invested in building consensus, conducting community meetings, and ensuring that all voices are heard. As noted by Kamanzi et al. (2020), these processes are essential for establishing trust and ensuring project sustainability, even if they extend initial timelines. Moreover, the overall model's significance ($p = 0.000$) and an R^2 value of 0.656 indicate that community involvement significantly explains variations in completion time. This finding supports the notion that community-driven approaches are not merely beneficial but critical for project success. Katomero and Georgiadou (2018) highlight that integrating social capital into project design can enhance both participation and outcomes, reinforcing the importance of community dynamics in project management.

4.1.2 Impact of community involvement on functionality

Community involvement initiatives in the implementation of water projects was found to be significant at $p=0.007$ as shown in Table 2. A unit increase in community involvement initiatives in the implementation of water projects results to 3.013 increase in project functionality meaning that the higher the community involvement the higher the chances that the project will function well. Level of community involvement in water projects was also significant with $p=0.034$. Its coefficient was 2.064 meaning the functionality increases by 2.064 per unit increase in level of community involvement in water projects. The overall model was significant at $p=0.000$ with R^2 0.716 meaning that the model was able to explain 71.6% of all variation in project functionality.

Table 2: Regression coefficients for impacts community involvement on functionality

	Coefficient	Std. Error	Sig.
(Constant)	1.749	.161	.000
Community involvement initiatives in the implementation of water projects	3.013	.024	.006
Level of community involvement in water projects	2.064	.073	.034
Number of Obs. = 200	Prob> F = 0.0000	R ² = 0.716	Adj. R ² = 0.712
Durbin-Watson	2.12		

Dependent Variable: Functionality

The findings illustrate a significant relationship between community involvement and the functionality of water projects. The strong coefficients indicate that increased community participation not only enhances project functionality but also contributes to the overall effectiveness of water supply initiatives. Specifically, a unit increase in community involvement initiatives corresponds to a 3.013 increase in project functionality ($p = 0.007$), suggesting that engaged communities play a crucial role in ensuring that projects meet their intended operational goals. The significance of the level of community involvement ($p = 0.034$) further emphasizes the importance of active participation. The coefficient of 2.064 implies that as the level of involvement increases, so does the likelihood of successful project outcomes. This is consistent with the findings of Murta and Mutayoba (2019), who assert that community engagement fosters a sense of ownership, leading to better maintenance and sustainability of water supply systems.

4.1.3 Impact of community involvement on project quality

Community involvement initiatives in the implementation of water projects was found to be significant at $p=0.001$ as shown in Table 3. A unit increase in community involvement initiatives in the implementation of water projects results to 3.56 increase in project quality meaning that the higher the community involvement the higher the project quality. The level

of community involvement in water projects was also significant with $p=0.028$. Its coefficient was 2.812 meaning the quality increased by 2.812 per unit increase in level of community involvement in water projects. The overall model was significant at $p=0.000$ with R^2 0.756 meaning that the model was able to explain 75.6% of all variation in project quality.

Table 3: Regression coefficients for impacts community involvement on project quality

	Coefficient	Std. Error	Sig.
(Constant)	2.438	.148	.000
Community involvement initiatives in the implementation of water projects	3.560	.022	.001
Level of community involvement in water projects	2.812	.067	.028
Number of Obs. = 200	Prob> F = 0.0000	R ² = 0.756	Adj. R ² = 0.751
	1.9		
Durbin-Watson			

Dependent Variable: Quality

The findings reveal a significant positive relationship between community involvement and the quality of water projects. With a p-value of 0.001, the data strongly indicate that as community involvement initiatives increase, project quality also improves. The substantial coefficient of 3.56 suggests that even modest increases in community engagement can lead to marked enhancements in project outcomes. This aligns with the literature that emphasizes the importance of local participation in ensuring projects meet community needs and expectations (Murta & Mutayoba, 2019). Additionally, the level of community involvement is significant ($p = 0.028$), with a coefficient of 2.812. This indicates that as the depth of community participation increases, so does the quality of the project. Such findings reinforce the notion that higher engagement can lead to improved oversight, accountability, and responsiveness to local conditions (Katomero & Georgiadou, 2018).

5.0 Conclusion and Recommendations

5.1 Conclusion

The study concludes that community involvement is a critical factor in the successful implementation of water projects in Chamwino District. Increased community participation correlates positively with project completion time, functionality, and quality, suggesting that engaging local communities enhances project outcomes. The findings underscore the importance of fostering community engagement in project planning and execution.

5.2 Recommendations

Enhance Community Engagement: Project planners should prioritize strategies that actively involve community members throughout the project life cycle to ensure their needs and expectations are met.

Capacity Building: Invest in training programs that equip community members with the necessary skills to manage and maintain water projects effectively, fostering a sense of ownership and accountability.

Policy Development: Policymakers should develop frameworks that facilitate structured community engagement in water projects, recognizing its importance for project success.

Monitoring and Evaluation: Implement monitoring frameworks that include measures of community involvement as key performance indicators, enabling continuous assessment of project impact and community satisfaction.

Ethical Considerations

This study adhered to ethical guidelines to ensure the integrity of the research process. Key ethical considerations included:

Informed Consent: Participants were fully informed about the purpose of the study, the nature of their involvement, and their right to withdraw at any time without consequence. Written consent was obtained from all respondents.

Confidentiality: The confidentiality of participants was maintained throughout the research process. Personal identifiers were removed from data, and responses were aggregated to ensure anonymity.

Voluntary Participation: Participation in the study was entirely voluntary, with no coercion or undue influence exerted on respondents. Participants were assured that their involvement would not affect their access to services or support.

Data Integrity: The research maintained high standards of data integrity and accuracy. Findings were reported honestly and transparently, reflecting the true outcomes of the analysis.

Areas for Further Study

Given the findings of this study, several areas for further research are suggested:

Longitudinal Studies: Future research could explore the long-term effects of community involvement on the sustainability of water projects. Longitudinal studies would provide insights into how community engagement impacts project outcomes over time.

Comparative Studies: Comparing the impact of community involvement across different regions or types of water projects could yield valuable insights into best practices and context-specific strategies.

Qualitative Research: Incorporating qualitative methods, such as interviews or focus groups, could deepen the understanding of community perspectives on involvement and its perceived impact on project outcomes.

Impact of Socioeconomic Factors: Further studies could investigate how socioeconomic factors influence community involvement and project outcomes, allowing for a more nuanced understanding of the dynamics at play.

Role of Technology: Exploring how technology can enhance community participation in water projects could provide innovative approaches to engagement and project management.

Conflict of Interest Statement

The researcher observed policy and ethical obligation during this research and there is no conflict of interest in this work or any company that have been affected by the research reported in the enclosed paper. Also, researcher received no direct funding for this research.

The effects of international financial reporting standards adoption on financial reporting quality at NMB bank branches in Tanzania

Mustapha Mushi¹ & Petro K. Maziku²

1 College of Business Education, Dodoma. Email: mustex0529@gmail.com

2 College of Business Education, Dodoma. Email: petro.maziku@cbe.ac.tz

Abstract

This study assesses the effect of International Financial Reporting Standards (IFRS) adoption on the financial reporting quality of NMB Bank in Tanzania. The research employs a quantitative methodology, concentrating on critical variables including transparency, accuracy, and non-performing loan (NPL) management, by analyzing audited financial statements from 2005 to 2015, encompassing years prior to and after to IFRS implementation. The results indicate a substantial enhancement in the transparency and accuracy of financial reporting, as indicated by a 35% decrease in inconsistencies between reported and audited statistics. NPL rates stabilized, declining from 8-12% before to IFRS to 5-7% subsequent to IFRS, signifying improved risk management. The report underscores ongoing problems, such as elevated compliance costs and inadequate training, particularly in rural branches, which impede comprehensive and uniform implementation. The study highlights the necessity for continuous investment in training and technology infrastructure to optimize the advantages of IFRS implementation. These findings are essential for policymakers and financial institutions in emerging nations seeking to enhance their financial systems via internationally accepted standards.

Keywords: *IFRS Adoption, Financial Reporting Quality, Transparency, Non-Performing Loans (NPLs), Financial Accuracy.*

Introduction

International Financial Reporting Standards (IFRS) have been worldwide adopted to improve the transparency, comparability, and precision of financial reporting across jurisdictions. Formulated by the International Accounting Standards Board (IASB), IFRS seeks to standardize accounting processes, offering a coherent framework for the compilation of

financial statements (Ball, 2006). The adoption of IFRS is increasingly essential for countries aiming to integrate into the global economy, since it enhances cross-border investments and bolsters investor trust through the provision of reliable and comparable financial information (Barth et al., 2008). Although IFRS adoption is prevalent in developed markets, emerging nations, particularly in Africa, have numerous hurdles in its implementation, frequently attributable to institutional, infrastructural, and regulatory obstacles (Iyoha & Faboyede, 2011; Odia & Ogiedu, 2013).

In 2010, the National Board of Accountants and Auditors (NBAA) in Tanzania ordered the implementation of IFRS for public firms, encompassing financial institutions. This was a component of extensive economic changes intended to modernize the nation's financial system and entice international investment. NMB Bank, a prominent financial institution in Tanzania, plays a vital role in this sector. As a publicly traded firm, compliance with IFRS is mandated to guarantee openness and comparability in its financial statements, thereby conforming to international standards. Nonetheless, the adoption of IFRS in Tanzania, similar to numerous emerging economies, has encountered considerable obstacles including elevated compliance expenses, insufficient training for staff, and poor technical infrastructure (Masoud, 2017; Mwamugunda & Mbogo, 2019). These problems prompt inquiries regarding the efficacy of IFRS adoption in enhancing the quality of financial reporting at NMB Bank and other entities.

Objective and Research Questions

This study aims to assess the effect of IFRS adoption on the financial reporting quality of NMB Bank in Tanzania, emphasizing transparency, correctness, and the management of non-performing loans (NPLs). The study aims to evaluate whether the adoption of IFRS has led to measurable enhancements in financial reporting quality and to identify the problems and constraints faced during the implementation process. This research investigates NMB Bank to furnish empirical information regarding the efficacy of IFRS within an emerging market framework and to enhance the overarching dialogue on international accounting standards.

To achieve these objectives, the study addresses the following research questions

- i. How has the adoption of IFRS impacted the transparency and accuracy of financial reporting at NMB Bank?
- ii. What challenges has NMB Bank encountered in implementing and complying with IFRS standards?
- iii. How has IFRS adoption influenced the management and reporting of non-performing loans at NMB Bank?

Significance of the Study

This study is significant due to its emphasis on the developing market setting of Tanzania's banking industry, which is crucial for the nation's economic development. Although the existing research has thoroughly examined IFRS implementation in developed nations, there is a paucity of expertise regarding its implications in developing regions like as Africa. Prior

research has highlighted the prospective advantages of IFRS, including enhanced financial transparency and augmented foreign direct investment (FDI) (Iyoha & Faboyede, 2011; Barth et al., 2012). Nonetheless, numerous studies underscore considerable discrepancies in the degree to which these advantages are attained, especially in nations with deficient regulatory frameworks and institutional capabilities (Zeghal & Mhedhbi, 2006).

The banking sector in Tanzania is a crucial catalyst for economic growth, requiring precise and dependable financial information, particularly in institutions such as NMB Bank, which commands substantial market shares in deposits and loans. Consequently, comprehending the actual effect of IFRS adoption on financial reporting quality in this industry is essential for policymakers and regulators. The implementation of IFRS may have improved transparency and accuracy, indicating to investors that Tanzanian banks are dependable and credible, hence potentially increasing investment and fostering economic growth.

If issues like elevated compliance costs and insufficient training are substantial enough to obstruct effective IFRS implementation, these insights may inform legislative initiatives designed to alleviate these obstacles. This paper contributes to the scholarly conversation on international accounting standards and provides practical recommendations for improving the efficacy of IFRS implementation in Tanzania and other emerging markets.

This study fills a significant gap in the literature by examining the Tanzanian setting and offering empirical evidence regarding the effect of IFRS adoption on the quality of financial reporting at NMB Bank. It seeks to provide significant insights for both scholars and policymakers, thereby enhancing the efficacy of financial reporting systems in emerging nations.

Literature Review

The implementation of International Financial Reporting Standards (IFRS) represents a crucial global initiative to standardize accounting processes, enhancing transparency, comparability, and dependability in financial reporting across many jurisdictions. Since its establishment by the International Accounting Standards Board (IASB) in 2001, IFRS has been embraced by more than 120 nations, revolutionizing global financial reporting frameworks. The success and obstacles of IFRS adoption differ markedly, particularly across established and emerging nations (Ball, 2006; Barth et al., 2008). This literature review synthesizes essential studies to offer a thorough comprehension of the impacts and obstacles associated with IFRS implementation, especially in emerging markets such as Tanzania.

IFRS and Financial Reporting Quality

The implementation of IFRS has been thoroughly examined regarding its influence on the quality of financial reporting. Numerous studies from industrialized nations emphasize the beneficial impact of IFRS on improving transparency and comparability, thereby increasing investor trust. Barth et al. (2008) evidenced that firms implementing IFRS in developed economies, including Europe and Australia, exhibit substantial enhancements in the quality of

financial statements. The enhancements are chiefly ascribed to the rigorous disclosure mandates and fair value measurement principles inherent in IFRS, which guarantee that financial statements more correctly represent the economic realities of enterprises compared to local norms.

Ball (2006) contended that the transition to IFRS improves comparability by removing inconsistencies resulting from the use of various national accounting standards. This standardization enhances cross-border investment and economic integration, enabling investors to depend on uniform financial reporting for decision-making. Leuz and Wysocki (2016) affirmed that the use of IFRS diminishes information asymmetry between managers and investors, resulting in enhanced market efficiency and lowered capital costs.

Nonetheless, whereas the advantages of IFRS are extensively proven in developed markets, emerging economies have distinct constraints that may constrain the influence of IFRS on the quality of financial reporting. Barth et al. (2012) asserted that the enhancements in quality associated with IFRS depend on the robustness of a nation's regulatory and enforcement systems. In areas with diminished governmental control, the anticipated advantages of IFRS may not be completely realized, as companies may not adhere strictly to the rules.

Adoption of IFRS in Emerging Markets

Emerging economies, especially in Africa, have exhibited diverse results in IFRS adoption, frequently attributable to institutional, infrastructural, and regulatory obstacles. Zeghal and Mhedhbi (2006) examined the determinants of IFRS adoption in emerging nations and found that greater economic growth, educational achievement, and openness to international commerce are positively associated with expedited and more efficient IFRS implementation. Conversely, nations with inadequate legislative frameworks, restricted professional proficiency, and deficient technology infrastructure encounter substantial obstacles.

Numerous research have investigated the implementation of IFRS and its effects in various African nations. Iyoha and Faboyede (2011) examined the adoption of IFRS in Nigeria and concluded that, although it has the potential to improve financial transparency, its efficacy is constrained by insufficient training and support for local accountants. The authors emphasized the necessity for ongoing professional development programs to address the knowledge gap and ensure compliance.

Odia and Ogiedu (2013) examined the obstacles of IFRS implementation in Nigeria, highlighting the substantial compliance expenses linked to the transformation. The transition to IFRS necessitates substantial investment in personnel training, software system upgrades, and the comprehensive revision of current financial reporting structures. Such expenses can be exorbitant, particularly for small and medium-sized firms (SMEs), resulting in uneven compliance throughout the banking system. The results align with those of Masoud (2017), who investigated IFRS implementation in Tanzania and similarly observed the financial strain linked to compliance, especially for smaller banks and rural branches.

Case Studies: IFRS Implementation in African Banks

The banking sector, a vital element of Africa's financial infrastructure, has been a primary subject of research analyzing the effects of IFRS. In South Africa, where the use of IFRS is well-established, research demonstrates that the move has markedly enhanced the quality of financial reporting. Barth, Landsman, and Lang (2008) discovered that South African banks demonstrated improved accuracy and transparency in their financial accounts, resulting in heightened foreign direct investment (FDI) and increased market trust. These findings are ascribed to South Africa's strong regulatory framework, which facilitates rigorous enforcement of IFRS standards.

Conversely, studies in other African countries, including Kenya and Ghana, reveal a varied landscape. Wagoki and Bwisa (2013) examined the adoption of IFRS in Kenya, revealing that large multinational banks effectively conformed their reporting to IFRS, whereas smaller financial institutions had challenges due to limited resources and insufficient experience. The report emphasized that although IFRS can enhance financial disclosure and comparability, successful implementation necessitates considerable backing from regulatory authorities and professional entities to develop competence.

Comparable challenges endure in Tanzania. Ngowi (2020) assessed the impact of IFRS adoption on financial openness in Tanzanian banks, concluding that while transparency has enhanced, the advantages are inequitably allocated, especially between urban and rural branches. The analysis revealed that whereas larger banks in urban regions possess the means to guarantee compliance, smaller branches in rural areas fall short due to inadequate training and insufficient technology assistance. The inconsistent application of IFRS raises questions over its overall efficacy in improving financial reporting quality throughout Tanzania's banking sector.

Theoretical Perspectives on IFRS Adoption

Various theoretical frameworks have been utilized to comprehend the dynamics of IFRS adoption, especially in emerging nations. Institutional Theory posits that firms use IFRS due to external constraints, including legislative mandates, international trade obligations, and the necessity for legitimacy in global markets (DiMaggio & Powell, 1983). This viewpoint is especially pertinent for Tanzanian banks such as NMB, which must adhere to IFRS to uphold reputation and entice international investors.

Agency Theory serves as a valuable paradigm, elucidating how IFRS mitigates information asymmetry between managers (agents) and shareholders (principals) by mandating transparency via standardized disclosures (Jensen & Meckling, 1976). This hypothesis posits that the adoption of IFRS can bolster investor confidence, particularly when accompanied by robust regulatory monitoring and efficient implementation procedures (Iyoha & Faboyede, 2011). In environments with little regulatory assistance, the advantages of diminished information asymmetry may not be fully attained, as evidenced by research conducted in Tanzania and Nigeria.

Gaps in the Literature

Notwithstanding the substantial studies on IFRS, considerable gaps persist, especially on its impact in particular emerging markets such as Tanzania. Numerous studies have concentrated on overarching obstacles, like compliance expenses and training requirements, although they lack empirical evidence demonstrating whether IFRS implementation has resulted in quantifiable enhancements in financial reporting quality within significant financial organizations. Current research predominantly focuses on qualitative evaluations, with minimal quantitative analysis of pre- and post-IFRS financial data.

This paper examines these deficiencies by concentrating on NMB Bank, one of Tanzania's foremost financial institutions, to deliver a thorough quantitative assessment of the effects of IFRS adoption on transparency, accuracy, and non-performing loan management. The study integrates institutional and agency theories to analyze external pressures and compliance issues while also assessing the internal impacts of IFRS on bank management practices and investor relations.

Conclusion

The research on IFRS adoption emphasizes its capacity to improve financial reporting quality while also noting the hurdles and inconsistencies in results across various scenarios. The efficacy of IFRS in emerging countries such as Tanzania depends on regulatory backing, professional expertise, and financial resources. This study expands upon prior research by presenting empirical information from Tanzania's banking sector, with the objective of enhancing the comprehension of IFRS's influence in emerging economies and providing actionable recommendations for the enhancement of compliance and reporting standards.

Methodology

This study employs a quantitative methodology to evaluate the effect of International Financial Reporting Standards (IFRS) adoption on the financial reporting quality of NMB Bank in Tanzania. The research analyzes alterations in essential financial variables to ascertain if notable enhancements in transparency, correctness, and non-performing loan (NPL) management transpired subsequent to IFRS introduction. The methodology conforms to recognized quantitative techniques in financial reporting research, highlighting the utilization of numerical data and statistical analysis for impartial assessment (Creswell, 2014; Saunders, Lewis, & Thornhill, 2016).

Research Design

A cross-sectional research methodology was employed, collecting data at a singular moment to enable comparisons of financial reporting quality prior to and subsequent to IFRS implementation. This design facilitates a thorough analysis of two separate periods: five years preceding IFRS adoption (2005–2009) and five years subsequent to adoption (2011–2015). This period offers adequate data to assess the long-term impacts of IFRS and discern any trends linked to its implementation (Kothari, 2014). The cross-sectional method is especially adept at

elucidating the immediate and long-term effects of policy alterations on financial behaviors (Saunders et al., 2016).

Data Collection

Primary Data: The research gathered primary data using a structured questionnaire survey administered to NMB Bank staff engaged in financial reporting, encompassing accountants, auditors, compliance officers, and financial analysts. A stratified random sampling technique guaranteed representation among these essential departments. A total of 80 respondents contributed views regarding their experiences with IFRS implementation, their assessments of enhancements in financial transparency, and the problems encountered (Creswell, 2014). This method mitigates sampling bias and guarantees the inclusion of diverse opinions inside the organization.

Secondary Data: Secondary data were sourced from the audited financial statements of NMB Bank for the periods preceding and succeeding the implementation of IFRS. The documents presented quantitative data on essential financial indicators, including NPL ratios, variances in net income reporting, and asset appraisals. Supplementary sources, such as compliance reports and yearly financial statements, were examined to furnish a thorough overview of the bank's financial procedures and conformity to IFRS (Barth et al., 2008). Employing these varied data sources aids in corroborating findings and improving the validity of the research (Lincoln & Guba, 1985).

Key Metrics and Analytical Approach

The research examines three essential financial metrics to assess the influence of IFRS.

- Transparency was evaluated by examining the regularity and comprehensiveness of financial disclosures, specifically concerning non-performing loans, risk management, and asset assessments. Comparisons were conducted on the degree of disclosure prior to and during IFRS implementation to assess any improvements in transparency (Ngowi, 2020). Enhanced transparency is a crucial metric for adherence to IFRS standards, which prioritize comprehensive and equitable disclosure (Barth et al., 2012).
- Accuracy was assessed by analyzing differences between reported and audited figures in the financial statements. This investigation sought to ascertain the diminutions in inconsistencies following IFRS implementation, indicating enhancements in the accuracy and dependability of financial reporting (Iyoha & Faboyede, 2011). The study evaluates whether IFRS enhances the accuracy of the bank's financial health statements by analyzing these deviations.
- The management of non-performing loans (NPLs) is a crucial indicator of a bank's financial stability. The research examined NPL ratios during the specified periods to see if the application of IFRS led to improved provisioning procedures and more prudent loan management methods (Mwamugunda & Mbogo, 2019). The focus on NPLs corresponds with IFRS mandates for enhanced risk evaluation and clear disclosure of non-performing assets (Masoud, 2017).

Descriptive statistics were employed to encapsulate survey responses, offering a summary of perceptions concerning the efficacy of IFRS implementation. Furthermore, Regression Analysis was performed on the financial data to evaluate the correlation between IFRS adoption and variations in key financial measures. This statistical method enables the study to measure the effect of IFRS and determine if substantial enhancements took place following its introduction (Bryman, 2016).

Reliability and Validity

Reliability was established through pilot-testing the questionnaire with a limited sample prior to comprehensive dissemination. This process facilitated modifications to improve clarity and relevance, reducing misunderstandings and assuring uniform responses (Bryman, 2016). The internal consistency of the questionnaire items was assessed using Cronbach's alpha, validating that the questions accurately represented the variables being examined (Creswell, 2014).

Validity was improved by employing data triangulation, which integrated primary survey responses, secondary financial reports, and documentary analyses. This methodology guaranteed that several sources corroborated the findings, mitigating prejudice and augmenting the legitimacy of the conclusions (Lincoln & Guba, 1985). Ethical considerations were addressed by obtaining informed consent from all participants and preserving their anonymity and confidentiality, in accordance with normal research ethical guidelines (Saunders et al., 2016).

Limitations

This technique offers a systematic and rigorous approach; nevertheless, the study recognizes that its concentration on a single institution, NMB Bank, may restrict the applicability of findings to other banks or sectors in Tanzania. Subsequent study may broaden the sample to encompass various institutions or industries, so offering a more thorough comprehension of the impacts of IFRS on Tanzania's financial system (Kothari, 2014). Furthermore, although the study predominantly employs quantitative methodologies, subsequent research might integrate qualitative perspectives by conducting interviews with financial managers to further investigate the intricacies of IFRS implementation.

This technique delineates a reproducible and systematic framework for assessing the effects of IFRS adoption within an emerging market context, offering insights that enhance both academic literature and practical policies in Tanzania's banking sector.

Results

This section establishes the outcomes of the study, emphasizing the influence of International Financial Reporting Standards (IFRS) adoption on the quality of financial reporting at NMB Bank, Tanzania. The examination focuses on three primary aspects: financial transparency, precision of financial reporting, and management of non-performing loans (NPLs). Data obtained from NMB Bank's financial records, in conjunction with survey responses from pertinent people, elucidate the impacts of IFRS adoption on various dimensions.

Transparency in Financial Reporting

The implementation of IFRS has markedly enhanced the transparency of financial reporting at NMB Bank. A comparison of the periods before and after IFRS introduction reveals an enhancement in the depth and frequency of disclosures concerning non-performing loans, asset valuations, and risk management methods.

Key Findings:

Enhanced Disclosure: Prior to the implementation of IFRS, NMB Bank's financial statements contained minimal information regarding non-performing loans and risk exposures. Following the adoption of IFRS, the bank's financial statements shown a marked enhancement in comprehensive disclosures regarding loan provisioning, asset values, and risk management strategies. The quantity of pages allocated to risk disclosures increased from an average of 15 pages prior to IFRS to 30 pages subsequent to IFRS.

Stakeholder Perceptions: Survey findings reveal that 70% of respondents perceive that the introduction of IFRS resulted in a marked or substantial enhancement in transparency. Merely 10% indicated no enhancement, underscoring the efficacy of IFRS in augmenting the transparency of financial information for stakeholders.

Figure 1: Comparison of Financial Disclosure Scores Before and After IFRS Adoption

Accuracy of Financial Reporting

The research evaluated the precision of NMB Bank's financial reporting by examining variances between reported and audited net income statistics before to and following IFRS adoption. The results indicate a significant enhancement in the precision of the bank's financial statements following the implementation of IFRS.

Key Findings:

Decrease in Discrepancies: Before the implementation of IFRS, the average disparity between reported and audited net income figures was 150 million TZS. Following the implementation of IFRS, this disparity diminished to an average of 98 million TZS, signifying a 35% enhancement in financial reporting precision. This enhancement is ascribed to IFRS's fair value accounting standards and more stringent revenue recognition policies, which yield a more precise representation of the bank's financial performance.

Survey Findings: Survey results corroborated these findings, with 65% of respondents claiming that IFRS enhanced the precision of financial reporting. Nonetheless, 20% observed only marginal enhancements, indicating places where additional improvements may be required, especially in sectors with limited resources and training prospects.

Table 1: Discrepancies Between Reported and Audited Net Income Before and After IFRS

Period	Mean Discrepancy (Million TZS)
2005-2009 (Pre-IFRS)	150
2011-2015(Post-IFRS)	98

The table above highlights the reduction in discrepancies, showcasing the positive effect of IFRS on financial reporting precision. The table above illustrates the decrease in inconsistencies, demonstrating the beneficial impact of IFRS on the accuracy of financial reporting.

Management of Non-Performing Loans (NPLs)

Non-performing loans (NPLs) serve as a crucial metric for assessing a bank's risk exposure and financial stability. The use of IFRS at NMB Bank resulted in improved consistency and transparency in the reporting of non-performing loans, indicative of superior risk management techniques.

Key Findings:

Stabilization of NPL Ratios: The NPL ratio, which varied between 8% and 12% before to IFRS adoption, stabilized following implementation, declining to a range of 5% to 7%. This decrease signifies enhanced management of credit risk and compliance with IFRS standards for prudent loan provisioning and clear reporting.

Heightened Loan Loss Provisions: The statistics indicate a 20% escalation in loan loss provisions immediately subsequent to IFRS implementation. This modification corresponds with IFRS's focus on fair value accounting, necessitating banks to more precisely acknowledge and disclose potential loan losses. Elevated provision levels signify a more cautious strategy in risk management, anticipated to enhance investor trust.

Regional Disparities: Although the general trend is favorable, the survey revealed variations in the efficacy of IFRS adoption across different regions. Respondents from urban branches indicated more satisfaction with enhancements in NPL management, but those from rural branches saw insufficient training and technology support as obstacles to consistent compliance.

Figure 2: NPL Ratio Trends at NMB Bank Pre- and Post-IFRS Adoption

Challenges and Limitations in IFRS Implementation

Notwithstanding these favorable results, the report recognized certain problems encountered by NMB Bank during the IFRS implementation process:

Training Deficiencies: Survey statistics indicate that 30% of respondents lacked sufficient IFRS training. Many of these individuals originated from rural branches, which face challenges due to restricted access to training programs and professional development opportunities. The deficiency of training leads to anomalies in the application of IFRS, especially in under-resourced areas.

Substantial Compliance Expenses: The shift to IFRS put considerable financial obligations on NMB Bank. The bank significantly spent in upgrading financial reporting software and improving infrastructure to meet IFRS standards. The poll indicated that 65% of participants recognized the elevated expenses as a significant obstacle, impacting the consistency and promptness of implementation across all branches.

Table 2: Key Challenges in IFRS Implementation

Challenge	Impact	Affected Areas
Inadequate Training	Inconsistent application of IFRS	Rural branches
High Implementation Costs	Delays in system upgrades	Bank-wide, especially small branches

Summary of Findings

The findings demonstrate that the introduction of IFRS has markedly enhanced financial transparency, precision, and non-performing loan management at NMB Bank. Nonetheless, the advantages are not consistently realized throughout the bank's network, with rural branches notably underperforming due to deficiencies in training and technology. Rectifying these deficiencies is essential for attaining complete compliance and optimizing the advantages of IFRS within Tanzania's banking sector.

The analysis affirms that although IFRS positively influences financial reporting quality at NMB Bank, more measures are necessary to address implementation problems and guarantee uniform compliance across all branches.

Discussion

This study's findings highlight the beneficial effect of IFRS adoption on the quality of financial reporting at NMB Bank in Tanzania, consistent with prior research from emerging countries. Following the implementation of IFRS, enhanced transparency and better accuracy in financial

disclosures have been noted, aligning with literature that underscores IFRS's role in enhancing comparability and diminishing information asymmetry (Iyoha & Faboyede, 2018; Barth et al., 2020). The decline in non-performing loan (NPL) ratios and the enhancement of risk-related disclosures suggest that the implementation of IFRS has significantly improved the bank's financial reporting standards.

Transparency and Financial Accuracy

The research indicates that the implementation of IFRS markedly enhanced the transparency and precision of NMB Bank's financial statements. This corresponds with recent research from South Africa and Nigeria, indicating that IFRS improves financial transparency standards and diminishes earnings manipulation (Aljifri & Khasharmeh, 2019; Ndunguru, 2019). Enhancements in transparency are crucial for attracting foreign direct investment (FDI), as global investors necessitate precise and comparable financial information. The results indicate that, similar to other African markets, the implementation of IFRS in Tanzania has enhanced the credibility and dependability of financial reports, hence strengthening investor confidence and market stability.

Challenges of IFRS Implementation

Notwithstanding the overall advancements, the study underscores numerous enduring issues, notably the elevated compliance costs and the scarcity of qualified professionals, which reflect conclusions from other regional studies (Masoud, 2020; Samson, 2021). The costs related to enhancing financial systems and delivering comprehensive training have placed significant strains on smaller branches, particularly in rural regions. Recent research by Alawattage et al. (2022) corroborates these findings, illustrating that similar issues are prevalent in emerging economies characterized by resource constraints and nascent regulatory frameworks.

The deficiency of sufficient training and technology assistance is a persistent issue in IFRS implementation throughout Africa. In Kenya, smaller banks encounter comparable difficulties stemming from the complex demands of fair value accounting and impairment testing under IFRS, which require specialized expertise and technology that several institutions do not possess (Wagoki & Bwisa, 2020). This indicates that for IFRS adoption to be more effective in Tanzania, focused expenditures in training initiatives and technical enhancements are crucial.

Implications for Policy and Practice

The ramifications of these findings are crucial for policymakers and financial institutions in Tanzania. Continuous support through capacity-building initiatives and financial aid for smaller institutions is essential for the full realization of IFRS adoption benefits. Samson (2021) asserts that professional development aligned with the dynamic character of IFRS is essential for maintaining uniform compliance and reducing inconsistencies in reporting standards.

Furthermore, the government and regulatory entities, including the National Board of Accountants and Auditors (NBAA), must assume a proactive role in delivering training and resources to address the skills gap. The successful implementation of IFRS in Tanzania relies not alone on the enforcement of standards but also on empowering institutions to fulfill them efficiently through strong support systems. This strategy can augment the effectiveness of IFRS, especially in rural and under-resourced regions where adherence is presently irregular.

Limitations and Future Research

This study offers significant insights into the impact of IFRS implementation at NMB Bank, however its findings pertain solely to a single institution. To generalize these findings, subsequent study should broaden the sample to encompass various banks and additional financial institutions in Tanzania. Moreover, longitudinal studies would yield a more profound comprehension of the effects of IFRS on the quality of financial reporting over an extended period, as compliance and regulatory frameworks develop.

This analysis confirms that IFRS adoption enhances financial reporting quality while also identifying substantial hurdles that must be overcome to fully attain these benefits. Strategic investments in training, technology, and regulatory assistance are essential for addressing these problems and ensuring the proper implementation of IFRS throughout all regions and sectors of Tanzania's banking system.

Conclusion

This study assesses the influence of IFRS implementation on the quality of financial reporting at NMB Bank in Tanzania, emphasizing transparency, precision, and non-performing loan management. The findings indicate that the deployment of IFRS has resulted in substantial enhancements in these domains, particularly in the transparency and accuracy of financial statements. The decrease in variances between reported and audited statistics, along with the stabilization of NPL ratios, illustrates that IFRS enhances the reliability and comparability of financial information, aligning NMB Bank's reporting processes with international standards. These enhancements are crucial for strengthening investor trust and enticing foreign investment, hence helping Tanzania's overarching economic growth objectives.

Nevertheless, the report highlights significant problems, including insufficient training and technology assistance, especially in rural locations, which hinder the consistency and efficacy of IFRS implementation. These issues underscore the necessity for focused interventions and policy assistance to close the implementation gap. Resolving these difficulties is essential for fully achieving the advantages of IFRS inside Tanzania's banking sector.

The report emphasizes the necessity of ongoing investment in capacity development and technology infrastructure to guarantee sustained compliance and optimize the benefits of IFRS adoption. These insights provide essential information for policymakers and financial institutions seeking to enhance financial transparency and stability in emerging nations.

The Influence of Procurement Planning Assessment on Public Procurement Performance in Tanzania: A Case of Parastatal Organizations in Dodoma.

Mwamba Hamisi Kadudu¹, Boniface E. Mwalukasa²

¹ College of Business Education, Dodoma Campus; Email, mwamba.kadudu@kazi.go.tz

² College of Business Education, Dar es salaam Campus

Abstract

This study investigated the influence of procurement planning assessment on procurement performance in Parastatal organizations in Dodoma, Tanzania. The study was conducted in Dodoma, chosen due to persistent suboptimal procurement performance trends indicated in the 2021 CAG Report. The theories guiding the study were the resource-based view and compliance performance reform cycle model. A mixed-methods approach was employed in the

study. The research design adopted was a cross-sectional survey. Simple random and purposive sampling were utilized, the study involved a sample size of 134 respondents in the study area. Quantitative data were collected through questionnaires and qualitative data was collected through interviews. Data analysis of the proposed study used is descriptive analysis and inferential statistics using regression analysis to analyze the quantitative data. While qualitative data analyzed using thematic analysis technique. The findings revealed significant positive relationships between procurement planning assessment and procurement performance. This implied that the study underscored the importance of procurement planning assessment in enhancing procurement performance within Parastatal organizations. The findings suggested the need for policymakers and organizational leaders to prioritize strategic procurement planning assessment to optimize procurement processes. The study recommended the establishment of structured processes for planning, implementation, and evaluation of strategic procurement planning practices.

Key words: *Procurement Planning Assessment, Public Procurement Performance, Parastatal organizations*

1. Introduction

Interest in the performance of public procurement has surged globally among development partners, governments, professionals, politicians, bodies, and researchers due to its intricate nature and significant impact. It aims to encompass a broad spectrum of public services such as healthcare, social services, education, transportation, and environmental initiatives (Mrope, 2017; Chagalima, Mchopa & Ismail, 2022). In the contemporary landscape, both developed and developing nations are transforming their legal, organizational, and institutional frameworks to enhance the efficiency of public procurement.

This is particularly pertinent in the case of Finland, where government expenditure constitutes a larger proportion of Gross Domestic Product (GDP) compared to most Organization for Economic Co-operation and Development (OECD) countries. According to Lau (2017), government expenditure in Finland escalated by 9.3%, from 46.8% to 56.1% of GDP, positioning developed nations, notably Finland, with the second-highest public expenditure levels among OECD countries.

Studies by Myers (2018) conducted in Sub-Saharan Africa provide evidence that procurement of goods, works, and services accounts for approximately 70% of total public expenditure. Lau, Lonti, and Schultz (2017) argue that developing countries lose between 20% to 40% of their Gross Domestic Product (GDP) annually due to poor performance in public procurement. In Tanzania, for instance, over 70% of the national annual development budget is allocated to procurement activities (Senzu & Ndebugri, 2017). Consequently, even minor enhancements to the procurement system can result in substantial budget savings (Krause & Tutunji, 2014; Senzu & Ndebugri, 2017).

Presently, public procurement has earned significant attention worldwide as a critical function for various sectors, including the acquisition of healthcare equipment and medicines (Israel et al., 2019), the construction of classrooms, and other educational infrastructure (Ismail, 2022). Consequently, when governments play a central role in service provision, fundamental measures for successful public procurement processes must be implemented, encompassing quality service delivery and procurement reforms in terms of legislation and regulations. Conversely, public procurement in Tanzania has not served the best interests of the country, characterized by outdated laws governing procurement processes (Matto, 2017). Despite numerous studies conducted in Tanzania to address these issues, procurement activities often suffer from neglect, lack of direction, interference, poor coordination, absence of competition and transparency, varying levels of corruption, and inefficiencies (Chang'a, 2019; Kawina, 2019).

The success observed in enterprise performance globally is not merely fortuitous but is attributed to effective procurement planning assessment (Stewart, 2015). Presently, organizations from both the private and public sectors view procurement planning assessment seriously as a means to expedite their performance (Gioko & Njuguna, 2019). This underscores the importance of procurement planning assessment as a vital tool for organizations seeking to thrive amidst competition in the ever-evolving global business environment (Jayawarna & Dissanayake, 2019).

A procurement plan assessment is an essential component within a structured and effective way to acquire products, services, and works in public procurement (Changalima, Mchopa & Ismail, 2022). Even though the Procurement Planning Act of 2011 which was amended in 2016, has given legal prescriptions, most of the parastatal organizations in Tanzania are still facing challenges in their compliance (PPRA, 2021). This non-compliance causes several problems which inhibit efficiency, raise costs, and result in poor procurement performance. For example, in the financial year 2020/2021, among the 718 organizations that are registered in the Tanzania National e-Procurement System (TANePS), only 574 organizations had the Annual Procurement Plans (APPs) approved and published, this can be described as compliance rate of only 80% (PPRA, 2020/21). Also, 20% of the registered entities had no APPs to submit, suggesting significant non-compliance challenges were presented (PPRA, 2021).

Several factors contributing to procurement planning non-compliance is well-documented (Paul 2020; Elfes, 2020; Munyawera, 2018) that many procurement plans are not well-aligned with financial budgeting, poor participation of user departments in the procurement planning process, and limited and untimely release of budgeted funds results in delays and the inability to execute procurement practice. This is justified by the PPRA report for 2020/21 which indicates that out of the total planned procurement value of TZS 25.82 trillion, parastatal organizations accounted for TZS 9.64 trillion (37.3%), this shows that more than 60% of parastatal organizations are not having proper procurement planning strategies or still facing faced execution issues of their plans (PPRA, 2021).

Although the presence of the challenges and the impact of their outcomes is known (Changalima & Mdee, 2023), the exact nature of the effects of strategic procurement planning assessment on the general performance of public procurement in parastatal organizations is not very well researched (Adjepong & Anane, 2022; Mushi, Changalima, & Mwaiseje, 2020). Particularly, there is a lack of research information concerning aspects of procurement planning assessment. Therefore, this study was undertaken to fill the research gap concerning the influence of procurement planning assessment on the performance of public procurement in selected parastatal organizations in the Dodoma region of Tanzania.

2. Literature Review

2.1 Theoretical Review

The Resource-Based View (RVB)

One of the best theories in strategic management practices is the resource-based view theory (RBV). This theory was first advanced by Edith Penrose's in the late 1950s in 'The Theory of the Growth of the Firm'. The concept was largely made known to the field of strategic management practices in the late 1980s and became a dominant framework in the 1990s. The idea behind Penrose (1959) concept is that firm performance is the outcome of the productive services available from the resources which give a peculiar character to each organization.

Resource-Based View (RVB) is a bundle of heterogeneous resources distributed across firms that exist over time. This idea is supported by Barney (1991), who asserts that the firm's resources are the fundamental determinants of competitive advantage and performance of the firms. Barney (1991), emphasized that a firm's resources include all assets, capabilities, organizational processes, firm attributes, information, and knowledge, among others controlled by a firm that enable the firm to conceive and implement strategies that improve its efficiency and effectiveness.

The strategic procurement planning practices on the other hand can be seen as the strategic resources which can be the cornerstone for procurement performance. This is because; strategic procurement planning resources can help parastatal organizations to perform better in the procurement process. This has also attracted attention in the parastatal organization performance and strategic procurement planning practices.

This theory holds that, to have a sustained competitive advantage, these resources must be valuable, inimitable, non-substitutable, and non-transferable (Eisenhardt and Martin, 2000), with this idea in mind, strategic procurement planning practices as resources in the organization can act as valuable and unique resources that can differentiate one parastatal organization from another. Although this theory has tried to show the connections between firm resources and performance it does not comprehensively identify a direct link with the public procurement performance of parastatal organizations.

Compliance Performance Reform Cycle Model

This model is useful in measuring the performance of procurement function (Mrope, 2018). It was first developed by Thai (2009) is used to describe the performance and process measurement of public procurement function. In this aspect, performance can rely on outcomes on the other hand compliance can measure the public procurement process. Therefore, outcomes which are cost reduction in the procurement activities; and timely delivery of needed products have to be considered apart from compliance with rules and regulations when there is a need to assess the performance of procurement management unit.

Therefore, the model was useful in ensuring that the main indicators of measuring the performance of procurement management unit are considered whereby a dependent variable is measured in terms of cost reduction, timely delivery and compliance with procurement rules and regulations. To study the relationship between strategic procurement planning practices and the performance of procurement, it is necessary to review another so-called Compliance Performance Reform Cycle Model.

The reason for combining these theories in this study is that a single theory of RBV does not adequately cover all relevant variables and relationships; therefore, the parameters from these theories have been adopted to come up with the conceptual framework for this study.

2.2 Empirical Review

Christopher (2021), in his study, revealed there are close relationship between the effective implementation of procurement plans and service delivery in the public sector in such a way that when a procurement plan is effectively implemented there is a direct relationship with better service deliveries in public organizations. This is because a procurement plan enables the availability of requirements on time and from the right suppliers and hence leads to better service delivery. He further argues that despite the benefits that are achieved by having an effective implementation of procurement planning still there are factors that hinder the achievement of effective implementation of procurement plans and these are corruption, limited skilled procurement personnel, and Lack of enough funds to undertake and implement procurement plans.

Aimiabile (2019) in their study on procurement planning on value for money among selected districts in the southern province, of Rwanda, found that preparation and implementation of a procurement plan in the public sector is a collaborative task that needs support from another department within the organization. In their study the key challenges highlighted as the cause for poor implementation of procurement plans are, poor procurement scheduling, inappropriate procurement packages, and poor selection of methods of procurement, these were identified as key challenges in the preparation and implementation of procurement plans in the public sector.

Elfas (2020) assessed the Factors affecting the Effective Implementation of procurement plans in the public sector in Tanzania; the case of the Tanzania Revenue Authority. This study specifically focused on four specific objectives namely identifying how the involvement of the user department, resources allocation, management support, and staff competence influence the effective implementation of the procurement plan. The study findings revealed that in Tanzania Revenue Authority procurement plan is affected by user departments who are not properly involved in both budgeting processes and implementation of the procurement plan. It has further revealed that staff from user departments have little knowledge of PPA No.7 of 2011 and amendment 2016 and its Regulation due to lack of exposure to training and hence fail to understand their role as required by law in implementing procurement plan. The findings also revealed that the implementation of the procurement plan in TRA was affected by resource allocation through budgeting, management support, and competence of PMU staff.

Based on the findings, the researcher concluded that the factors affecting the implementation of the procurement plan in the Tanzania Revenue Authority are poor involvement of the user department, staff competence in the preparation and implementation of the procurement plan, resources allocation, and management support. The researcher recommended that management should ensure staff from the user department are trained on PPA No.7 of 2011 amendment 2016 and its regulation to impart knowledge on their roles and responsibilities in procurement processes. The management should allocate required resources effectively to ensure timely implementation of the planned activities.

3. Material and Research Methodology

This study adopts an explanatory research design using the survey strategy. The chosen design facilitates the establishment and explanation of causal relationships between variables, specifically the effect of procurement planning compliance on the performance of public procurement in selected parastatal organizations in Dodoma, Tanzania. In this particular study, it will allow the fulfilment of the following objective for the researcher: It also enables cause-and-effect relationships to be identified and made clear, which is important for understanding the relationship between procurement planning practices and procurement results.

The approach selected is corresponding to the nature of the research problem and goals, the purpose of this study is to examine the influence of procurement planning compliance on the performance of public procurement within the selected parastatal organizations in Dodoma, Tanzania, and to achieve this, a concurrent mixed-method triangulation approach is employed that aims to gather both quantitative and qualitative data at the same time.

The study employed an informant interview guide to conduct interviews with key informants, specifically Heads of Department (HODs) of Procurement, aiming to gather qualitative primary data. While, a structured questionnaire containing both close-ended and open-ended questions, which were administered to respondents. This method was chosen because it enabled the collection of data from a broad target population simultaneously, aligning with the principles of being economical, practical, and efficient, as recommended by (Vinod & Anand, 2017).

Probability sampling techniques specifically stratified random sampling were employed to select 134 staff from the procurement departments in the parastatal organizations. And non-probability sampling was also used to select key informants to triangulate questionnaire quantitative findings.

This proposed study used descriptive analysis and inferential statistics using regression analysis to analyze the quantitative data. The study also used Statistical Packages for Social Science (SPSS) version 20 to analyze the captured data. Thematic analysis was used to analyze the captured data from the field through semi-structured interviews. The analysis involved a critical literature review, generation of codes, searching, reviewing, defining, and naming the themes to create the matrix which showed the main themes and sub-themes on staff competency and public procurement performance.

4. Results and Discussion

4.1 Description of the Respondents' Demographic Characteristics

In this study, Table 1 indicates an overview of the demographic characteristics of the respondents who participated in the research. Understanding the demographic profile of the respondents was crucial for gaining insights into the composition of the sample population and interpreting the findings of the research accurately. Demographic variables such as age, gender, educational background, professional experience, and organizational affiliation illuminated the diversity and representativeness of the sample, enabling a comprehensive analysis of the collected data. By examining these demographic characteristics, this study aimed to offer a clear picture of the profile of the respondents involved, thereby enhancing the understanding of their perspectives and experiences regarding the subject matter under investigation.

This section presents the findings and discussions of Procurement performance. The results are obtained from descriptive statistics and inferential statistics. The demographic characteristics of employees, associations between procurement strategic practices on public procuring entities' performance in Tanzania Parastatal organizations, and the effect of the awareness and attitudes of public sector management towards private-public partnership implementation in Dodoma.

Table 1: Demographic characteristics of respondents

Demographic Characteristics	Frequency (f)	Percent (%)
Gender		
Male	79	59.0
Female	55	41.0
Age		
18- 30 years	25	18.7
	758	

31-45 years	80	59.7
46-55 years	24	17.9
56+ years and above	5	3.7
Education Level		
No formal Education	0	0.0
Certificate	0	0.0
Diploma	34	25.4
Bachelor Degree	61	45.5
Master's Degree	39	29.1
PhD	0	0.0
Experience of Work		
0-2 years	30	22.4
3-5 years	97	72.4
6-9 years	7	5.2
10 years and above	0	0.0

Source: Field Data, 2024

Results from Table 1 reveal the demographic characteristics of the respondents. Firstly, it was observed that the majority of respondents were male, constituting 59.0% of the total sample, while females accounted for 41.0%. This gender distribution reflects a slight imbalance in the participation of males compared to females which imply that in parastatal organizations male are more involved in the procurement process than female. Secondly, in terms of age, the largest proportion of respondents fell within the age group of 31 to 45 years, representing 59.7% of the total sample. This suggests that the study attracted a significant number of mid-career professionals. Additionally, respondents aged 18 to 30 years, 46 to 55 years, and 56 years and above constituted 18.7%, 17.9%, and 3.7% respectively, indicating a diverse age distribution among the participants.

Concerning educational background, the findings indicated that a considerable portion of the respondents held a Bachelor's degree, comprising 45.5% of the total sample. This was followed by respondents with a Master's degree at 29.1%. The high representation of individuals with Bachelor's and Master's degrees suggests that the study attracted a well-educated sample population. Furthermore, respondents with a Diploma accounted for 25.4% of the sample, indicating a significant presence of individuals with intermediate-level qualifications. Notably, it was found that out of 134 sampled population there was no individual that lack formal education, also, bachelor degree was highest education level as there were not individual that responded to questionnaire that had PhD education level. This show that respondents were literacy with varieties level of education which guarantee the study to gather relevant information from them.

Regarding work experience, the majority of respondents reported having 3 to 5 years of experience, constituting 72.4% of the total sample. This indicates that the study primarily engaged individuals with moderate levels of professional experience. Additionally,

respondents with 0 to 2 years of experience accounted for 22.4%, reflecting a substantial proportion of early-career professionals. Conversely, only a small percentage of respondents, 5.2%, reported having 6 to 9 years of experience, while none had 10 years and above. Overall, the demographic characteristics of the respondents provide valuable insights into the profile of the sample population and shed light on the diversity and representativeness of the participants in this study.

The demographic characteristics of the respondents in this study provide valuable insights into the profile of individuals engaged in procurement activities within the Tanzanian context. The predominance of male respondents aligns with the findings of previous studies such as Beschel et al. (2018), which also reported a higher representation of males in survey samples within the procurement field. This gender disparity underscores the need for targeted interventions to promote gender diversity and inclusion in the procurement profession. Additionally, the concentration of respondents within the 31 to 45 years age group is consistent with findings from research by Adwok (2015) and Kheifets & Chernova (2020), which identified mid-career professionals as the largest demographic group within procurement-related surveys. However, the relatively lower representation of younger and older age groups suggests a potential gap in engaging early-career professionals and experienced practitioners in procurement research, warranting further investigation and targeted outreach efforts (Matto, 2017; Bitesigirwe, 2019).

Furthermore, the educational profile of the respondents, characterized by a significant proportion holding Bachelor's and Master's degrees, resonates with findings from studies by Addae-Korankye & Aryee (2021) and Gioko & Njuguna (2019), which also reported high levels of educational attainment among procurement professionals. This underscores the importance of formal education in the field of procurement and highlights the need for continuous learning and professional development to navigate the complexities of modern procurement practices effectively. However, the limited representation of individuals with extensive work experience raises questions about the involvement of seasoned practitioners in research endeavors (Elfes, 2020; Jayawarna & Dissanayake, 2019). This suggests a potential gap in engaging experienced professionals in procurement research, which could be addressed through targeted recruitment strategies and collaboration between academia and industry (Cheseto et al., 2019; Nasra, 2014).

Overall, the findings from this study contribute to the existing body of knowledge on procurement demographics and provide valuable insights into the profile of practitioners within the field. By contextualizing the findings within the broader literature, this study enhances our understanding of the demographic characteristics of procurement professionals and informs strategies for promoting diversity, inclusion, and professional development within the profession.

Summary of performance statistics for public procuring

The table provides a summary of performance statistics for public procuring entities, focusing on key metrics related to procurement performance, specifically time and cost, along with an

overall performance score. For time-related performance, the mean time score is 2.9114, with a standard deviation of 0.402. This suggests that, on average, public procuring entities take approximately 2.91 units of time to complete procurement processes, with some variability around this mean. Regarding cost performance, the mean cost score is 1.7243, with a standard deviation of 0.497. This indicates that, on average, public procuring entities incur a cost score of approximately 1.72 units for their procurement activities, with some variance observed across different entities. The minimum and maximum values for both time and cost metrics provide additional context. The minimum time score recorded is 2 units, while the maximum is 5 units, indicating a range of performance levels among public procuring entities. Similarly, the minimum cost score is 1 unit, while the maximum is 5 units, reflecting varying levels of cost efficiency across entities. The table also presents an overall performance score, which combines both time and cost metrics to provide a holistic assessment of procurement performance. The mean overall performance score is 3.857, with a standard deviation of 0.433. The minimum overall performance score recorded is 2.7143, while the maximum is 4.6. This indicates that, on average, public procuring entities achieve an overall performance score of approximately 3.86 units, with some variability in performance observed across entities. In summary, the table offers valuable insights into the performance of public procuring entities, highlighting their efficiency in terms of time and cost, as well as providing an overall assessment of their procurement performance.

Table 2: Public procuring entities' performance summary statistics

Procurement performance	Mean	Std. Dev.	Min	Max
Time	2.9114	.402	2	5
Cost	1.7243	.497	1	5
Overall	3.857	.433	2.7143	4.6

Measurement of procurement performance in Tanzanian Parastatal organizations is done with the help of measurable parameters of time, costs, and overall performance. The average time score of 2.9114 units with a standard deviation of 0.402 indicates varying durations across entities, from a minimum of 2 units to a maximum of 5 units, illustrating procedural consistency. Cost which had a mean score value of 1.7243 ranges from 1 to 5 units, indicating varied cost controls. On the other hand, procurement performance that utilizes the value of time and cost metrics was found to have a mean score of 3.857 units that range from a minimum of 2.7143 to a maximum of 4.6, reflecting varying levels of operational effectiveness. Those performance indicators provide a structure that help assess the efficiency of procurement planning in Tanzanian Parastatal organizations and their significance for strategic decision-making and performance improvement.

Source: Field data (2024)

The results of a multiple regression analysis examining the effects of procurement planning assessment on public procurement performance within Tanzanian Parastatal organizations. In this regression model, two independent variables are considered: "Resources capability assessment" and "Stakeholders' expectations assessment," along with a constant term. The coefficients for these variables represent the estimated change in the dependent variable (procurement performance) for a one-unit change in each independent variable, holding other variables constant. The coefficient for "Resources capability assessment" is 0.3347, with a standard error of 0.0232. This indicates that for each unit increase in resources capability assessment, there is an estimated increase of 0.3347 units in procurement performance. The t-value of 18.34 indicates that this coefficient is statistically significant at the 0.05 level, with a p-value of 0.00. Similarly, the coefficient for "Stakeholders' expectations assessment" is 0.4572, with a standard error of 0.0342. This suggests that for each unit increase in stakeholders' expectations assessment, there is an estimated increase of 0.4572 units in procurement performance. Like the previous variable, this coefficient is also statistically significant at the 0.05 level, with a t-value of 14.34 and a p-value of 0.00. The constant term in the model is 2.143, indicating the estimated procurement performance when both independent variables are zero. The overall fit of the model is assessed by the R-squared value, which is

0.786 in this case. This suggests that approximately 78.6% of the variation in procurement performance is explained by the independent variables included in the model. The F-test statistic is 74.643 with a p-value of 0.000, indicating that the overall regression model is statistically significant at the 0.05 level, implying that at least one of the independent variables significantly predicts procurement performance. In terms of model evaluation criteria, both the Akaike Information Criterion (AIC) and the Bayesian Information Criterion (BIC) are provided. Lower values of these criteria indicate a better fit of the model. The results found from inferential statistical was aligned with the results form interview with Key Informants during in-dept interview one of the KII was noted saying that;

"Our procurement planning assessment starts with a comprehensive needs assessment involving all departments. We then prioritize based on urgency and budget availability, followed by a detailed market assessment to identify potential suppliers." (HOD of Procurement, Interviewer No.1, 2024).

Also, HOD further contributed saying that;

"Resource availability, compliance with regulatory frameworks, and the need to achieve cost efficiency are key factors influencing our strategic procurement practices."

Another Head of procurement from Interviewer No.2 contributed by adding to the discussion by saying that;

"We follow a structured approach that includes stakeholder consultations, budget alignment, and a thorough review of previous procurement outcomes to refine our strategies." (HOD of Procurement, Interviewer No.2, 2024).

"Stakeholder expectations, market conditions, and past performance data play significant roles in shaping our strategic procurement choices." (HOD of Procurement, Interviewer No.2, 2024).

Moreover, a participant from Interviewer No.3 contributed during an interview saying;

"Strategic planning and implementation are pivotal in achieving our organizational goals, as they streamline processes, foster innovation, and ensure we get the best value for money." (HOD of Procurement, Interviewer No.3, 2024).

In summary, the results of this multiple regression analysis suggest that both resources capability assessment and stakeholders' expectations assessment have significant positive effects on public procurement performance within Tanzanian Parastatal organizations. The model provides a good fit to the data, explaining a substantial portion of the variance in procurement performance.

Table 3. Multiple regression showing effects of procurement Planning assessment on public procurement performance in Tanzania Parastatal organizations.

Procurement performance	Coef.	St .Err.	t-value	p-value	[95% Conf. Interval]
-------------------------	-------	----------	---------	---------	----------------------

Resources capability assessment	.3347	.0232	18.34	0.00	.681	.906
Stakeholders' expectations assessment	.4572	.0342	14.34	0.00	-.383	-.2
Constant	2.143	0.0214				
Mean dependent var	2.11		SD dependent var		0.436	
R-squared	0.786		Number of observations		134	
F-test	74.643		Prob > F		0.000	
Akaike crit. (AIC)	154.384		Bayesian crit. (BIC)		133.301	

5. Summary of the Findings

This study investigated the factors influencing procurement performance in Tanzania's Parastatal organizations, focusing on the Strategic Procurement Planning Analysis, the Choice of Strategic Practices, and Strategic Procurement Planning Implementation. Specifically, the study examined the influence of these factors on procurement performance within three key Parastatal organizations. By delving into these areas, the study aimed to provide insights into enhancing procurement practices and performance in these vital public sector entities.

5.1 Conclusion

The results of this multiple regression analysis suggested that both resources capability assessment and stakeholders' expectations assessment have significant positive effects on public procurement performance within Parastatal organizations.

These findings align with previous research emphasizing the importance of thorough assessment in procurement planning (Chesseto et al., 2019). However, despite the proactive engagement in assessment, challenges such as resource constraints and stakeholder conflicts were prevalent, therefore suggesting areas are required for improvement. In an effort to improve on resources capability assessment as well as stakeholders' expectations assessment for organizations, the following activities can be undertaken. This may involve procuring better data collection equipment and methods and means of analyzing the resources in a better way. The weakness on the side of stakeholders can be addressed by direct consultations and feedback from stakeholders to improve the strategies applied to procurement. Strategic planning and assessment training aimed at the procurement teams will increase the likelihood of adequate assessment processes. Incorporating these analyses into organizational planning initiatives fosters conformity with general objectives, while constant checks and appraisals provide feedback to develop corresponding monitoring and evaluation frameworks.

Therefore, procurement planning plays a pivotal role in driving procurement performance. Organizations that conduct thorough analyses of resource capabilities and stakeholders' expectations tend to achieve better procurement outcomes. This underscores the importance of strategic decision-making in shaping procurement trajectories and aligning procurement activities with organizational goals and stakeholder needs.

5.2 Implication of the Study

Overall, this study underscores the importance of strategic management in driving procurement performance within Parastatal organizations. By prioritizing strategic planning, meticulous implementation, and fostering adaptability, organizations can optimize their procurement processes and achieve superior performance outcomes. These findings have significant implications for policymakers, practitioners, and scholars in the field of public procurement, providing valuable insights into strategies for enhancing organizational effectiveness and efficiency.

5.3 Recommendation

Based on the findings of this study, the following are the recommendations for government, policymakers, Prime Minister's Office Labor, Youth, Employment and Persons with Disability (PMO-LYED), and specifically at the three parastatal organizations selected in this study. Enhance Strategic Procurement Planning Practices: Parastatal organizations should prioritize the enhancement of strategic procurement planning assessment by investing in resource capability assessment and stakeholder engagement. This involves regularly assessing the organization's resources, including finances, personnel, and technology, to ensure alignment with procurement activities. Additionally, formalizing processes for gathering input from stakeholders such as suppliers, end-users, and regulatory bodies can provide valuable insights to inform procurement strategies and plans.

5.4 Areas for Further Study

The potential areas for future studies is exploring the impact of digitalization of technologies on Procurement Performance: With the increasing adoption of digital technologies in procurement processes, further studies could investigate the impact of digitalization on procurement performance within Parastatal organizations. This could involve examining how technologies such as e-procurement platforms, blockchain, and artificial intelligence influence efficiency, transparency, and compliance in procurement practices.

5.5 Study Contribution

The study conclusion will contribute to the existing body of knowledge and aid for the future research on the similar subject. Also, the study adds to the shortage of literature that explored the procurement planning compliance on performance of public procurement in context of Tanzania. Moreover, the outcome provides a benchmark for further studies where authors will have empirical evidence to assess for their studies

Challenges Facing Recruitment Process on Employees' Performance: A Case of National Microfinance Bank in Dodoma

Mwanaisha Mchomvu Rahib¹ & Godson Mtallo²

¹College of Business Education, Tanzania

²College of Business Education, Tanzania

Abstract

The study explored challenges facing recruitment process on employees' performance; a case of National Microfinance Bank in Dodoma. The study used mixed research approach in which the survey research design was employed. The population of the study was employees of NMB bank, Dodoma, in which the sample size of the study was 43 respondents. The study used both random and purposive sampling techniques. Primary data was collected using questionnaires and interviews. The study found challenges facing recruitment process include technical know-how, the budget insufficiency, and time biasness. Owing to the findings researcher recommends that the institution should not be biased. It is also recommended that rules and regulations should be effective. Policies and plans should be planned in such a way that effective recruitment process is enhanced. Furthermore, it is recommended that other institutions in the country should make sure that competence-based recruitment is in place.

Keywords: *Challenges; Recruitment Process; Employees' Performance*

Introduction

The recruitment process plays a pivotal role in shaping the performance and productivity of employees in any organization. A well-executed recruitment strategy ensures the selection of qualified candidates who fit the organizational culture and contribute effectively to the company's goals. However, many organizations, including financial institutions like National Microfinance Bank (NMB) in Dodoma, face numerous challenges during the recruitment process, which can adversely affect employee performance.

One significant challenge in the recruitment process is the attraction of qualified candidates. As noted by Ahmed (2019), organizations often struggle to draw in candidates with the requisite skills and qualifications due to the competitive nature of the job market. This issue is exacerbated in specialized sectors such as microfinance, where the demand for skilled professionals frequently surpasses the supply. Another challenge is the retention of talent during the recruitment process. Higher turnover rates among potential candidates can be

attributed to various factors, including lengthy recruitment procedures and better offers from competing organizations (Smith, 2020).

The efficiency of the recruitment process is crucial, as prolonged hiring times can lead to the loss of top talent to competitors. Furthermore, the integration of technology in recruitment processes has introduced both opportunities and challenges. While tools such as Applicant Tracking Systems (ATS) have streamlined the recruitment process, their improper implementation can lead to biases and the overlooking of potentially excellent candidates (Johnson, 2021). Ensuring that technology is used effectively and ethically is essential for fair and efficient recruitment.

The alignment of recruitment strategies with organizational goals is another area of concern. According to Brown (2018), a misalignment can result in the hiring of individuals who do not resonate with the company's vision and objectives, thus affecting overall performance. Recruitment should not only focus on filling vacancies but also on finding candidates who can contribute to the long-term success of the organization.

In the context of NMB in Dodoma, these challenges are particularly pronounced due to the bank's strategic importance in fostering financial inclusion and economic development. As Mushi (2017) points out, microfinance institutions are pivotal in providing financial services to underserved populations, and their success heavily relies on the competency and performance of their employees. Addressing these challenges requires a multifaceted approach that includes improving the employer brand, streamlining the recruitment process, leveraging technology effectively, and aligning recruitment practices with strategic goals. By tackling these issues, NMB can enhance its recruitment process, thereby improving employee performance and contributing to its mission of financial inclusion.

Methods

Research Approach

This study adopted a mixed-methods approach, integrating both qualitative and quantitative methodologies. A mixed approach refers to a research survey that blends qualitative and quantitative methods, ideas, approaches, and characteristics within a single study (Johnson & Christensen, 2019). Qualitative data were gathered through interviews and documentary reviews, while quantitative data were obtained via a survey questionnaire.

Research Design

The study used survey research design. Whereby Creswell (2019) defines survey research design as a one stop design in which researcher collects data only once from the field. Survey research design was chosen because it allows researchers to collect data from a large number of respondents efficiently; furthermore, survey research design is relatively cost-effective compared to other research methods.

Population of the study

A target population denotes a cohort of individuals or organizations sharing identifiable common characteristics (Creswell, 2019). In the context of this study, the target population will be the employees of four NMB branches which are Mazengo, Bahi, UDOM and Chamwino with a total of 48 employees.

Sample Size

This research involved a sample size comprising 43 participants selected from four (4) NMB branches as follows; Chamwino 12 respondents, Mazengo 14 respondents, Bahi 09 respondents and UDOM 08 respondents. According to the central limit theorem, it is evidenced that a sample size of 30 or more is often considered sufficient to make reasonable statistical inferences about a population (Kumar, 2021). Additionally, interviews were carried out with 10 key informants, specifically the leaders of five distinct units within National Microfinance Bank branches in Dodoma.

Sampling Technique

Sampling refers to the method of selecting a subset from a larger population (Johnson & Christensen, 2019). In this research, both simple random and purposive sampling methods were utilized to gather both quantitative and qualitative data.

Methods of Data Collection

According to Johnson & Christensen (2019), in a research study, data acquisition methods involve physical analysis. They can be classified into two main types: primary and secondary data. Hence, this study utilized interviews and questionnaires as techniques for gathering data.

Data Analysis

This study utilized content analysis for qualitative data and conducted quantitative data analysis using Statistical Package for Social Sciences (SPSS) version 20. The following econometric equation of multiple regressions was used to perform the analysis in each specific objective.

Results and Discussion

Findings on regard to challenges facing recruitment process on employees' performance were as follows. Findings were as follows; 55.8 percent of the respondents strongly disagreed, 11.6 percent of the respondents disagreed, 11.6 percent of the respondents were neutral, 9.3 percent of the respondents agreed and 11.6 percent of the respondents strongly agreed (see Table 1). These findings show that to the majority the process of recruitment is not affected by technical know-how. These findings are similar to those by Anggesti et al (2023) who found that technical know-how does not affect the process of recruitment.

Table 1: The process of recruitment is affected by technical know how

	Frequency	Percent	Valid Percent	Cumulative Percent

Strongly disagree	24	55.8	55.8	55.8
Disagree	5	11.6	11.6	67.4
Neutral	5	11.6	11.6	79.1
Agree	4	9.3	9.3	88.4
Strongly agree	5	11.6	11.6	100.0
Total	43	100.0	100.0	

Source: Field data, 2024

Secondly researcher wanted to know whether the budget towards recruitment process is sufficient. Findings were as follows; 67.4 percent of the respondents strongly disagreed, 7.0 percent of the respondents disagreed, 11.6 percent of the respondents were neutral, 9.3 percent of the respondents agreed and 4.7 percent of the respondents strongly agreed (see Table 2). These findings according to the majority of respondents the budget towards recruitment process is not sufficient. These findings are similar to those by Anyango et al (2019) who also found that in most organizations budget towards recruitment process is not sufficient.

Table 2: The budget towards recruitment process is sufficient

	Frequency	Percent	Valid Percent	Cumulative Percent
Strongly disagree	29	67.4	67.4	67.4
Disagree	3	7.0	7.0	74.4
Neutral	5	11.6	11.6	86.0
Agree	4	9.3	9.3	95.3
Strongly agree	2	4.7	4.7	100.0
Total	43	100.0	100.0	

Source: Field data, 2024

Thirdly, researcher wanted to know whether there is enough time to recruit an employee in the organization. Findings were as follows; 9.3 percent of the respondents strongly disagreed, 58.1 percent of the respondents disagreed, 11.6 percent of the respondents were neutral, 11.6 percent of the respondents agreed and 9.3 percent of the respondents strongly agreed (see Table 3). To the majority of the respondents (58.1%) there is no enough time to recruit and employee in an organization. These findings are similar to those by Arifin et al (2020) who also found that time to recruit and employee a worker is not enough in most organizations.

Table 3: There is enough time to recruit an employee in your organization

	Frequency	Percent	Valid Percent	Cumulative Percent
Strongly disagree	4	9.3	9.3	9.3
Disagree	25	58.1	58.1	67.4
Neutral	5	11.6	11.6	79.1
Agree	5	11.6	11.6	90.7
Strongly agree	4	9.3	9.3	100.0

Total	43	100.0	100.0
-------	----	-------	-------

Source: Field data, 2024

Fourthly, researcher wanted to know whether the recruitment process is not biased. Findings were as follows; 65.1 percent of the respondents strongly disagreed, 7.0 percent of the respondents disagreed, 11.6 percent of the respondents were neutral, 9.3 percent of the respondents agreed and 7.0 percent of the respondents strongly agreed (see Table 4). To the majority of the respondents (65.1%) recruitment process is biased. These findings are similar to those by Bakhshwain and Javed (2021) who found that recruitment process is biased in most organizations.

Table 4: The recruitment process is not biased

	Frequency	Percent	Valid Percent	Cumulative Percent
Strongly disagree	28	65.1	65.1	65.1
Disagree	3	7.0	7.0	72.1
Neutral	5	11.6	11.6	83.7
Agree	4	9.3	9.3	93.0
Strongly agree	3	7.0	7.0	100.0
Total	43	100.0	100.0	

Source: Field data, 2024

Findings in relation to challenges facing recruitment process showed that the process of recruitment is not affected by technical know-how. For that matter technical know-how is not a challenge facing recruitment process. The study found that the budget towards recruitment process is not sufficient. For that matter budget is one of the challenges facing recruitment process. The study also found that there is no enough time to recruit an employee in the organization. For that matter insufficient time is a challenge facing recruitment process. It was also found that the recruitment process is biased. For that matter biasness is a challenge facing recruitment. In a nutshell challenge facing recruitment process include budget, lack of sufficient time and biasness. The interview with one respondent from the human resource unit pointed out that budget, time limit and biasness are some of the challenges facing recruitment process. This was as quoted below;

“...budget is a very big challenge in the recruitment process. But also time limit and biasness also give challenges in the recruitment process...”

Furthermore, researcher also carried out multiple linear regression between employee performance which was the dependent variable and technical know-how, budget, time factor and biasness which were the independent variables.

The mean VIF was found to be 2.22 (see Table 5). If mean VIF is greater than 10 there is a problem of multicollinearity. By getting mean VIF less than 10 it implies that these variables had no problem of multicollinearity.

Table 5 Multicollinearity assumption on Challenges facing recruitment process

Variable	VIF	Tolerance
Technical know-how	2.96	0.341296
Budget	2.73	0.366300
Time factor	1.63	0.613496
Biasness	1.54	0.649350
Mean VIF	2.22	

Figure 1 show P-P plots for employee performance. Values of residuals fall around 45° indicating that there was a linear relationship between independent variables and dependent variable.

Figure 1: Normal P-P plot for linear relationship assumption on Challenges facing recruitment process

Figure 2 shows histogram of employee performance. The distribution of residuals has a roughly bell shape as shown by red lines indicating that residuals are normally distributed.

Figure 2: Histogram of residuals for Employee performance on Challenges facing recruitment process

The autocorrelation assumption was checked using Durbin-Watson statistic. Results in Table 6 show that the DW statistic was 2.01 indicating that there was no autocorrelation. Findings were as follows; the coefficient for technical know-how was found to be -0.2119. This variable was statistically significant at five percent level of significance. This implies that for a unit increase technical know-how implementation there was 0.2119 units decrease in employee performance (see Table 6). This implies that the process of recruitment is not affected by technical know-how. The coefficient for budget was found to be -0.0428. This variable was statistically significant at one percent level of significance. This implies that for a unit increase budget there was 0.0428 units decrease in employee performance (see Table 7). This implies that the budget towards recruitment process is not sufficient.

The coefficient for time factor was found to be -0.3752. This variable was statistically significant at one percent level of significance. This implies that for a unit increase in time factor there was 0.3752 units decrease in employee performance (see Table 7). This implies that there is not enough time to recruit an employee in the organization. The coefficient for biasness was found to be -0.1367. This variable was statistically significant at ten percent level of significance. This implies that for a unit increase biasness there was 0.1367 units decrease in employee performance (see Table 7). This implies that the recruitment process is biased.

Table 7: Linear Regression Results on Challenges facing recruitment process
Dependent variable: Employee performance

Variable	Coeff	Std. error	Sig
Technical know-how	-0.2119**	0.0778	0.010
Budget	-0.0428***	0.0964	0.000
Time factor	-0.3752***	0.1051	0.001
Biasness	-0.1367*	0.0833	0.098
Constant	0.7057	0.4163	0.008

Number of Obs. = 43	Prob>	F	=	R ²	=	Adj. R ²	=
	0.0000			0.5288		0.4792	
Durbin-Watson	2.01						

Legend:

* = $P < 0.1$, ** = $P < 0.05$, *** = $P < 0.01$

Conclusion

It is concluded that the process of recruitment is not affected by technical know-how, the budget for recruitment process is not sufficient, time for recruitment is not enough but also the recruitment process is biased.

Recommendations

It is therefore recommended that the institution should focus more on knowledge and abilities during recruitment process. The institution should increase the budget and time for recruitment process. It is also recommended that the institution should not be biased. It is also recommended that rules and regulations should be effective. Policies and plans should be planned in such a way that effective recruitment process is enhanced. Furthermore, it is recommended that other institutions in the country should make sure that competence-based recruitment is in place.

Assessment of Financial Literacy Level Among Small Medical Entrepreneurs and its Impact on Business Performance. A Case Study of Katavi Region

Neema Chenge¹ & Kembo Bwana²

¹College of business Education (CBE) Dodoma, Email: drneemachengeofficial@gmail.com

² College of business Education (CBE) Dodoma

Abstract

The study assessment of financial literacy levels among small medical entrepreneurs and its impacts on business performance” aimed to evaluate the financial literacy levels of small medical entrepreneurs and analyze its subsequent effects on their business outcomes. That is to examine the influence of financial literacy on the business performance. The study employed a mixed-methods approach, combining quantitative surveys with qualitative interviews to gather a comprehensive understanding of financial literacy among small medical entrepreneurs. A sample of 340 entrepreneurs was selected, ensuring diversity in terms of gender, age and educational background to represent the broader population accurately. Multiple regression analysis was applied to test the influence of financial literacy on business performance by controlling manager’s/owner’s profile and small medical entrepreneur’s specific characteristics. Multiple regression results prove that financial literacy has a positive and significant impact on business performance. Managers/Business owners with financial literacy skills understand business-related financial concepts including debts, savings, insurance and investment which ensure the good performance of their business. The findings of this study have shown that financial literacy among entrepreneurs can improve performance on their businesses. These findings can add value to previous studies while further highlighting the existence of a significant influence of financial literacy on performance. Government agencies and corporations recognize the importance of financial literacy among medical entrepreneurs.

Therefore, proactive efforts need to be accelerated to provide an adequate level of financial literacy among entrepreneurs. Furthermore, entrepreneurial finance can be introduced in formal and non-formal education to ensure that every layer of society enjoys the benefits regardless of their economic status.

Keywords: *Financial literacy, business performance, medical entrepreneurs*

1.0 Introduction

1.1 Background of the Study

Entrepreneurs play a pivotal role in driving economic development and innovation. Their ability to navigate the intricate financial aspects of business is fundamental to the success and sustainability of their ventures. Financial literacy defined as the comprehension and application of financial knowledge is increasingly organized as a key determinant of entrepreneurial success (Mitchell and Lusardi, 2015). As the landscape of entrepreneurship evolves, understanding the financial literacy levels among entrepreneurs becomes essential for fostering a resilient and thriving entrepreneurial ecosystem.

Financial literacy is more than just understanding basic financial concepts, it encompasses the skills necessary to make informed financial decisions in the dynamic and often unpredictable world of entrepreneurship. The link between financial literacy and business success has been established in various studies (Kaplan and Stromberg, 2009). Entrepreneurs with a solid grasp of financial principles are better equipped to manage cash-flow, allocate resources efficiently and navigate the complexities of financial markets.

Numerous studies have emphasized the importance of financial literacy among entrepreneurs. For instance, Lusardi and Tufano (2009) highlighted the impact of financial literacy on entrepreneurial success, emphasizing the need for business owners to possess a strong understanding of financial concepts, Debt literacy, financial experiences and over-in-debtiness (NBER Working Paper No. 14808).

Additionally, studies by Cole and Shastry (2009) delivered into the relationship between financial literacy and entrepreneurial behavior suggesting that entrepreneurs with higher financial literacy levels are better equipped to make informed financial decisions. The effects of education, financial literacy and cognitive ability on the financial market participation (Harvard Business School Finance Working Paper No. 09-71).

Entrepreneurs encounter a myriad of financial of financial challenges including securing, funding, managing debts and optimizing investment decisions. These challenges are compounded by uncertainties inherent in entrepreneurial ventures making financial literacy a crucial tool for mitigating risks and maximizing opportunities (Shane and Venkataraman, 2000).

This research aimed to access the financial literacy levels among small medical entrepreneurs and its impact on business performance, specifically focusing on financial knowledge, attitudes

and behaviors, by pinpointing the strength and weaknesses in entrepreneurs, educators and business support organizations. The main goal was to inform targeted interventions and educational initiatives that can enhance the financial capabilities of entrepreneurs fostering a more resilient and sustainable entrepreneurial ecosystem.

2.0 Literature Review

A literature review is the systematic and comprehensive review of the published and unpublished work in the area of interest of the researcher. The literature reviewed in the context of financial literacy of entrepreneurs recognized the potential consequences of their financial decision on their business. This part consists of two sections, theoretical literature review and empirical literature review.

2.1 Theoretical Literature Review

The earliest known use of the term financial literacy can be traced back to 1992, when a report for the National Foundation for Educational research (NFER) commissioned by NatWest Bank defined financial literacy as the ability to make informed judgements and take effective decisions regarding the use and management of money (Noctor et al, 1992).

Financial literacy as a theoretical was championed by the Jumpstart survey of financial literacy in its inaugural 1997 study survey of financial literacy among high school students. In this study of jumpstart defined financial literacy as the ability to use knowledge and skills to manage one's financial resources effectively for lifetime financial security.

One of the first institutions to introduce the concept of financial literacy on a large scale was OECD. The international Network on financial Education has defined financial literacy as a combination of awareness, knowledge, skills, attitude and behavior necessary to make sound financial decisions and ultimately achieve individual wellbeing (Atkinson and Messy, 2012). This definition is now globally acknowledged and was also endorsed by the G20 leaders in 2012 (G20, 2012).

The definition makes it clear that financial literacy is something more than knowledge; it also includes attitudes, behaviors and skills. It stresses the importance of the decision-making applying knowledge and skills to a real-life process and it indicates that the impact should improve one's financial wellbeing (Atkinson and Messy, 2012).

According to PISA (2017) "Financial literacy is knowledge and understanding of financial concepts and risk, motivation and confidence to apply such knowledge and understanding to make effective financial well-being of individuals and society and enable participation in economic life.

According to Brown et al. (2006), financial literacy for small business owners must contemplate the ability to read and understand fundamental financial statements as well as the

ability to read numbers in order to make informed judgments and to make effective decisions regarding the use and management of money.

A recent work from two authors describes financial literacy as the ability to understand and use business financial statements to generate key financial ratios to evaluate and manage a business (Pearl and Eileen 2014). Despite the definition of financial literacy regarding personal financial issues be more developed and widely accepted, the definition of financial literacy is much more demanding not only for financial knowledge which must contemplate the capability to read and understand financial statement information but also in financial behavior with the habits concerned with the analysis of financial information and financial preferences or attitude which must be positively correlated with financial knowledge and behavior in the moment of taking daily management decisions.

Motivation theory of financial literacy suggests that measures of financial literacy should be related to financial behavior that is in the consumer's best interests Hilgert et al. (2003). In the context of financial literacy, this theory is related to how individuals manage their ability to understand financial products and services. To be well literate to a variety of financial products has a positive impact on business performance and success.

Strong performance and business sustainability are the key objectives in any business, including small medical enterprises (Madrid-Guijarro et al., 2007). Accordingly, firms and communities can reap benefits through the withdrawal of resources, creating employment opportunities and creating wealth (Ahmad and Abdul Ghani, 2013). However, small medical enterprises are often associated with sluggish growth, unsatisfactory sales, lack of competitiveness, and fragility.

Yusuf and Dansu (2013) stated that small medical enterprises are firms that cannot last long. Zakaria (2013) claimed that although the percentage of small medical enterprises is larger than that of large firms, the small medical enterprises sector shows no internal or external strengths. Therefore, measuring performance over time is very important, especially in a volatile business environment (Najmi et al., 2005). Given that small medical enterprise's firms constitute the majority of enterprises in a country, studying the performance of small medical enterprises is important.
